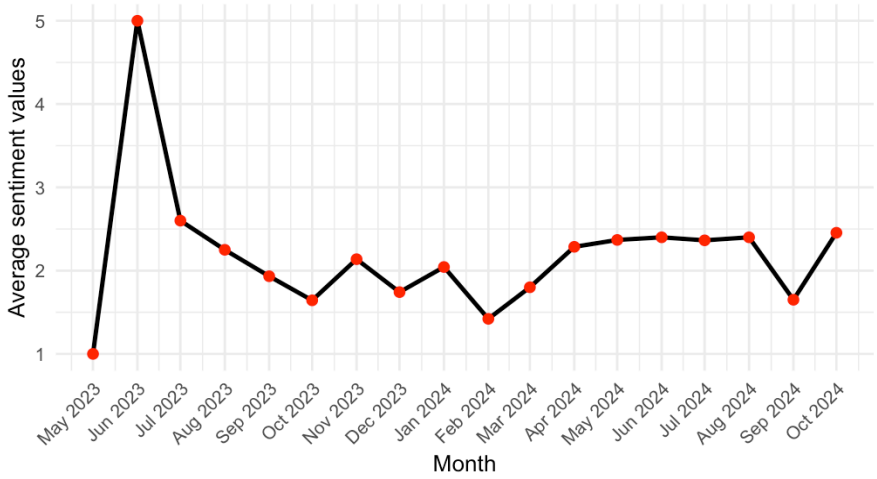
Finally, over a year after the event, Intesa Sanpaolo reports satisfaction with the outcomes, with approximately 350,000 customers successfully transferred and over 500,000 new accounts opened (Wired, 2023).

Sentiment Analysis



For the purpose of this study the evaluation of both VCC and VCD levels is assumed to reflect customer satisfaction with the transition to Isybank and the new fully digital service. Several scholars have linked the concept of VCC to customer satisfaction, considering it a key determinant of co-creation and identifying a positive relationship between satisfaction and VCC (Vega-Vasquez et al., 2013; Cambra-Fierro et al., 2018).

This relationship allows us to employ sentiment analysis as a method, given that it has been widely used to assess customer satisfaction levels (Andrian et al., 2022). Sentiment analysis is defined as the computational study of people's opinions, attitudes, and emotions toward entities, and it enables the identification of sentiment polarity within text data that consumers spontaneously publish on blogs, forums, and social networks. This research method is particularly suitable for this study due to the high media resonance of the case and the large number of customers involved in the transition from Intesa Sanpaolo to Isybank. The analysis of online discussions regarding the forced migration provides a substantial amount of data, allowing for a more precise examination of the phenomenon.

At this exploratory stage of the research, we analyzed 1,191 posts, comments, and reviews from customers involved in the transition, collected across online forums (Telefonino.net, Fibraclick Forum), review platforms (Trustpilot), and social media (Reddit, Facebook). Among the various sentiment analysis approaches, we adopted the Bidirectional Encoder Representations from Transformers (BERT) model, which has been identified by Alparthi and Mishra (2021) as highly effective for sentiment classification tasks. BERT processes text in a bidirectional manner, analyzing the context both before and after each word in a sentence, thereby improving text comprehension and enhancing sentiment analysis accuracy. The model's output quantifies sentiment on a five-point scale from 1 (very negative) - which reflects high dissatisfaction and so, VCD - to 5 (very positive) that signifies maximum satisfaction and thus, VCC.

This methodological approach enables a data-driven assessment of customer sentiment regarding the migration to Isybank, providing valuable insights into the extent of VCC and VCD in this transition.

Results.

Preliminary findings of this study, covering the period from May 2023 to October 2024, reveal several insights. During May and June-when customers could still exercise their right to withdraw-sentiment was highly positive. This suggests that more attentive customers, who systematically used digital channels, became aware of the transition early and responded favorably to the initiative.

However, around the withdrawal deadline in July, sentiment dropped sharply and remained consistently below an average value of 2.5. From March 2023 onward, sentiment values showed a slight upward trend. This shift may be attributed to multiple factors: first, the precautionary measure issued by the Italian Antitrust Authority, which required explicit consent for the transfer, leading to a decline in negative comments about the forced migration. Additionally, users who had already been transferred may have started to appreciate the fully digital service.

The slight decline observed between August and September 2024 could reflect dissatisfaction among some customers following the completion of the second transfer phase. However, sentiment stabilized from October onward, returning to the levels recorded between April and early August.

Overall, a preliminary analysis of posts and comments indicates a highly negative sentiment during the forced transfer period (May 2023 to March 2024), followed by a gradual improvement in the subsequent months. This trend suggests initially high levels of VCD, with a slight upward shift that could hint at a move toward increased satisfaction, potentially associated with VCC. However, due to the limited timeframe and the relatively small sample of posts and comments analyzed, at this stage it is still not possible to determine whether the negative sentiment observed is merely temporary.

Research limitations. *The analysis conducted is based on a deductive approach, as no feedback was received from the Intesa Sanpaolo group regarding the actual dynamics that led the top management to choose these specific transfer methods. Therefore, we defer the identification of the drivers behind this more aggressive approach to the introduction of the innovation to future developments of the research.*

Moreover, using BERT for sentiment analysis requires training on large corpora, and given that our dataset is relatively small, its performance may be compromised potentially resulting in inaccurate interpretations of the analyzed sentences (Alapharti and Mishra, 2021) and a constrained understanding of the overall patterns.
Additionally, the analysis did not consider the topics discussed in the individual posts and comments analyzed. Therefore, future developments of this paper should not only incorporate a larger sample but also include a more in-depth examination of the discussed topics through textual analysis. This would help separate complaints related to the transfer itself from those related to dissatisfaction with the services offered by Isybank.

Managerial implications. *Our findings suggest that the forced transfer initiated by top management led to substantial customer dissatisfaction, resulting in significant VCD. Notably, this process did not appear to transition into VCC at least within the period analyzed as evidenced by the predominantly negative sentiment observed. Although a slight improvement in sentiment was detected over time, it remained below the neutrality threshold even more than a year after the event. Moreover, the transfer itself does not seem to have yielded positive results, as out of 2 million transferred customers, only 17.5% ultimately accepted the transition (laRepubblica, 2025).*

For the affected customers, the approach adopted by top management appears to have triggered high levels of VCD, attributable to multiple factors. Beyond the voluntary hidden communication strategies that failed to adequately inform customers about the transfer, the process likely fostered a loss of trust and an imbalance of power-where customers felt deprived of their ability to choose where to manage their financial assets. These elements, recognized as key drivers of VCD (Järvi et al., 2018; Vafeas et al., 2016), may have further intensified negative sentiment toward Isybank. As a result, the reputational damage suffered by Intesa Sanpaolo risked extending to its newly established digital-only bank, potentially discouraging customer engagement with innovative financial services and hindering the broader adoption of digital banking solutions.

From a customer relationship management perspective, this strategy likely weakened long-standing relationships with some customers. While not all dissatisfied customers abandoned Intesa Sanpaolo-some reopened their-the approach represents a missed opportunity for customer retention and long-term loyalty. Given the increasing competitiveness of the banking sector, fostering strong customer relationships is essential to enhancing commitment and reducing churn (Wongsansukcharoen, 2022; Ganaie and Bhat, 2020). Consequently, forcing the transition as a mechanism to drive innovation adoption seems to have backfired, partially failing to preserve prior investments in customer retention strategies.

However, an alternative perspective suggests that this situation may have generated certain positive outcomes. The extensive media attention surrounding the event may have contributed to heightened awareness of Isybank, attracting new customers intrigued by the digital-only banking proposition. This is supported by data indicating that Isybank acquired approximately 500,000 new customers within a few months of its launch. In this sense, the dissatisfaction of some customers may have inadvertently created an opportunity to strengthen brand visibility and facilitate future VCC with new adopters.

Despite these mixed outcomes, our findings highlight key managerial considerations for future strategic decision-making, particularly in strategic communication for digital transformation initiatives. A critical issue was that the forced migration involved a digital-only bank that initially lacked several essential services typically offered by Intesa Sanpaolo. Research on digital banking adoption (Park et al., 2024; Rogers, 2010) emphasizes the importance of perceived compatibility, which refers to the alignment between new services and customers' existing banking habits. The absence of key functionalities likely weakened this alignment, increasing customer resistance. This underscores the need for organizations implementing aggressive strategies to ensure that digital offerings provide at least an equivalent level of service to traditional banking alternatives.

Additionally, the communication strategy failed to effectively highlight the relative advantage of the digital bank, seemingly assuming that customers would recognize its benefits only after adoption. Our partial findings suggest that this assumption has not held so far, as dissatisfaction persisted over time. This highlights the importance of proactively conveying the benefits of digital transformation, rather than relying on post-adoption experiences to drive customer acceptance.

Furthermore, research suggests that allowing potential customers to experience a digital-only bank before full adoption significantly increases the likelihood of innovation acceptance (Park et al, 2024; Rogers, 2010). From this perspective, an alternative approach could involve implementing a forced temporary trial period, where customers are introduced to the new service with the option to revert to their previous banking arrangement. Such an approach may help alleviate concerns about the transition, enabling customers to objectively evaluate the benefits of digital-only banking without feeling coerced into an irreversible change.

In conclusion, future top managers navigating similar challenges may still opt for aggressive transition strategies but should take appropriate precautions to limit VCD exclusively to the resource reallocation phase, rather than allowing it to extend to broader aspects such as loss of trust in the institution itself. In this regard, we encourage top management to place greater emphasis on organized listening activities, particularly in the post–forced transition phase. Such process, aimed at supporting reflective communication practices, can help mitigate excessive VCD through timely and targeted interventions. This approach could facilitate a faster recovery in terms of VCC, ultimately increasing the likelihood of a successful digital transformation.

Originality of the paper. *This study provides several insights into the literature on VCC and co-destruction, the digitalization of the banking sector-particularly the introduction of digital-only banks-and strategic communication.*

First, it expands the concept of intentional VCD as Plé and Chumpitaz Caceres (2010) originally defined this as the deliberate misuse of resources by one service system to gain an advantage in VCC at the expense of others. However, by analyzing the role of strategic communication, this study introduces a new perspective, suggesting that VCD is not merely a negative outcome but can serve as a temporary phase that enables greater VCC in the long term, particularly in the context of innovation introduction. In this regard, understanding social and market dynamics by the top management may lead banks to adopt a more assertive strategic approach that could help prevent stagnation in the banking sector and reduce consumer resistance to innovation. This dynamic is particularly evident in the banking sector, where only through high-level digitalization can banks achieve key benefits such as faster execution, further cost reductions, streamlined decision-making, enhanced innovation through new products, and greater customer trust through fraud protection systems, more effective customer identity verification, anti-money laundering measures, and more accurate credit risk analysis (Davenport and Mittal, 2023). These benefits, in turn, would provide a valid justification for the top management's decision to trigger temporary VCD to pave the way for improved results in the future for both banks and their customers

Furthermore, this study explores a case that has received limited attention in the academic literature despite widespread media coverage. The visibility of this case provides an opportunity to analyze consumer opinions in spaces outside the control of Intesa Sanpaolo, offering a clearer understanding of the levels of VCC and co-destruction experienced by customers transferred to Isybank. However. to further validate our assumptions, we recommend conducting additional sentiment analysis over time to confirm the presence of a significant increase toward a more positive sentiment. Having already observed a slight improvement in sentiment in our preliminary data, despite it still being indicative of VCD, if further measurements register an increase in sentiment, they will be interpreted as a rise in

VCC, confirming VCD as a temporary phase in response to the aggressive strategy implemented by the Intesa Sanpaolo Group to introduce their new fully digital banking service.

Key words: *Digital-only banks, FinTech, Strategic Communication, Value Co-Destruction*

Strategic Brand Management in Luxury Tourism: A Multimodal Discourse Analysis of Mangia's Online Communication

WALTER SPEZZANO[1] GIUSEPPINA LO MASCOLO[2] CAMILLA VÁSQUEZ[3]

Abstract

Luxury tourism is shifting from material opulence to experiential consumption, where exclusivity is defined by authenticity, immersion, and emotional connection. This study examines multimodal online communication in luxury brand management, analysing how verbal and visual elements on Mangia's official website construct a persuasive narrative and reinforce the brand's exclusivity. Drawing on Dann's (1996) rhetorical framework, the study identifies key verbal, visual, and combined techniques used to shape the brand's identity and frame luxury tourism. The findings reveal that multimodal discourse enhances the experiential value, aligning with contemporary luxury tourism trends. However, as a preliminary study, the analysis is limited to the website's homepage, with future research extending to social media platforms to further assess how multimodal discourse contributes to strategic brand management in luxury tourism. The study offers managerial insights, emphasising the importance of multimodal strategies in communicating the exclusivity and authenticity of luxury tourism experiences.

Framing of the research. *Luxury tourism is a dynamic and evolving niche market that reflects wide-ranging societal trends towards experiential consumption. Traditionally associated with opulence and exclusivity, luxury is increasingly defined by unique and immersive experiences that align with the personal values and aspirations of affluent tourists (Iloranta, 2021; Kemp & Dłużewska, 2023). This shift suggests that luxury tourism is not merely about high spending but also about fostering memorable moments that enhance personal well-being. As Iloranta & Komppula (2021) argue, luxury tourism has the potential to lead the post-pandemic recovery of the hospitality and tourism industry by attracting high-spending visitors and contributing to economic resilience and market development (Thirumaran & Raghav, 2017).*

The motivations driving luxury tourism consumption are multifaceted and segmented. Zhang et al. (2022) highlight that luxury travellers are not a homogenous group but consist of diverse segments with distinct travel planning behaviours. Perceptions of quality and exclusivity are often shaped by social and financial expectations, with travellers seeking experiences that enhance both social status and personal identity (Marcão et al., 2024). Hung et al. (2018) further emphasise the experiential dimension of luxury tourism, noting that social media interactions, experiential value, emotional connections, gamification, and brand community identification all play vital roles in shaping how consumers perceive and interact with luxury brands.

Social identity also plays a crucial role in shaping consumer choices. In many cultures, luxury experiences serve as status symbols, reinforcing social belonging (Jiang & Shan, 2018). Yang & Mattila (2013) argue that status-seeking behaviours influence consumer preferences, with luxury tourism offerings often functioning as markers of exclusivity and prestige. This aligns with research by Lai et al. (2022) and Shukla et al. (2016), who state that consumers engage in conspicuous consumption to enhance their social standing, aligning themselves with brands that symbolise prestige and exclusivity.

Beyond social identity, emotional connections to luxury brands further reinforce consumer engagement. Peng & Chen (2019) assert that strong emotional attachments to luxury hotel brands increase repurchase intention, while Hyun & Kim (2012) demonstrate that rapport-building in luxury restaurants fosters deeper brand attachment. This suggests that personalised service is not merely an operational component but a critical factor in sustaining long-term consumer satisfaction and loyalty. Given the significance of emotional engagement in consumer-brand relationships, luxury brands must develop communication strategies that reflect evolving consumer expectations rather than relying on standardised messaging.

However, many luxury brands continue to rely on standardised communication strategies that fail to address the complexity of evolving consumer mindsets (Mušanović et al., 2023; Seo et al., 2019). In an increasingly digitalised landscape, brands must craft compelling narratives that resonate with affluent consumers on a deeper level. Digital platforms have emerged as essential tools for constructing these narratives, allowing brands to create aspirational images, reinforce exclusivity, and foster community engagement. Given that brand perception is shaped not only by

functional attributes but also by symbolic and experiential dimensions (Kowalczyk & Mitchell, 2021; Peng & Chen, 2019), a deeper exploration of online brand communication is warranted. Conte et al. (2024) stress that the development of a distinctive and robust brand identity is fundamental to the brand-building process: organisations define the components of their brand identity internally and subsequently convey it externally to shape a desired brand image, reputation, and a cohesive understanding of the brand among stakeholders.

In the digital era, luxury tourism branding has become increasingly multimodal, integrating linguistic and visual elements to craft compelling brand narratives (Thirumaran et al., 2021). Digital platforms play a pivotal role in creating a sense of exclusivity and community among affluent consumers, influencing both brand engagement and travel decisions (Giglio et al., 2020). The visual nature of websites and social media, for instance, enhances engagement by reinforcing aspirational luxury experiences. Effective luxury branding, therefore, extends beyond purely verbal communication to encompass multimodal strategies that shape consumer perceptions and interactions with luxury tourism brands (Lai et al., 2022).

Multimodality is a set of diverse, yet related approaches to the study of how meaning is created through the interaction of different semiotic resources (Jewitt et al., 2025). It is particularly relevant to brand communication in digital contexts, where the strategic interplay of semiotic systems is essential in shaping an effective brand identity. Kress (2010) refers to semiotic systems as 'modes', defining them as 'socially shaped and culturally given resources for making meaning' (p. 79). Studying brand communication from a multimodal perspective provides deeper insights into how brand narratives are constructed and perceived in the digital space.

Despite the growing recognition of multimodal strategies in digital branding, little research has examined how luxury tourism brands leverage multimodal discourse to construct their online identity and reinforce exclusivity. Additionally, significant gaps remain in understanding the communication strategies employed by luxury tourism brands (Carrasco-Santos et al., 2023). Iloranta (2021) highlights that much of the existing literature is dominated by quantitative approaches, often overlooking qualitative insights. By examining the interplay of verbal and visual elements, this study aims to deepen the understanding of how luxury tourism brands construct their online identity, influencing consumer perceptions and reinforcing exclusivity through multimodal discourse. Specifically, this paper investigates the case of Mangia's, an Italian luxury hospitality brand operating in Sicily and Sardinia, to explore how its multimodal communication strategies shape brand identity and frame luxury tourism on its official website (http://www.mangias.com/en).

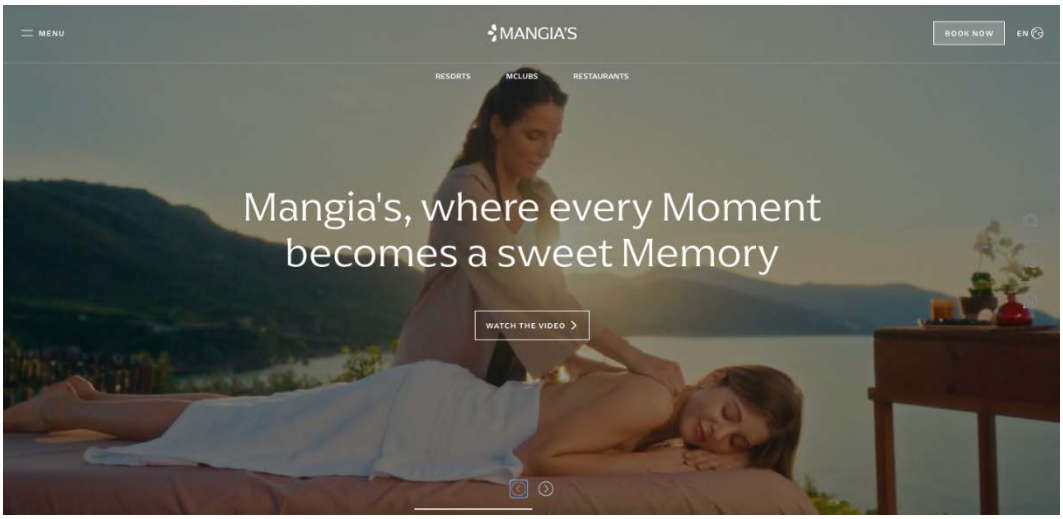
Purpose of the paper. *The purpose of this study is twofold: on the one hand, it investigates how a luxury hospitality brand employs multimodal rhetorical strategies to construct its identity online; on the other hand, it examines how luxury tourism is framed through persuasive storytelling. Using Mangia's as a case study, the paper explores how verbal and visual elements on its official website contribute to a cohesive brand narrative on luxury tourism that communicate exclusivity, authenticity, and experiential value. The overall objective of this research is to analyse the brand's multimodal communication across both its official website and social media platforms. However, as this paper is a preliminary version, the analysis presented here focuses solely on the website.*

Methodology. *The present study draws on the rhetorical framework developed by Dann (1996), a foundational model in tourism discourse analysis that is particularly insightful for examining how persuasive meaning is shaped in hospitality branding. The framework includes three categories of rhetorical techniques:* ***verbal*** *(i.e. comparison, key words and keying, testimony, humour, languaging, and ego-targeting),* ***visual*** *(i.e. colour, format, visual cliché, and connotation procedures), and* ***combined*** *(i.e. puzzles, temporal contrast, collage, ousting the competition, infraction of taboo, and significant omission). This approach is particularly well suited for analysing how language and imagery are strategically integrated to communicate exclusivity and authenticity in tourism experiences.*

The choice to rely on Dann's framework at this stage is deliberate. As the goal is to analyse how traditional rhetorical strategies are recontextualised in digital storytelling, Dann offers a systematic, discourse-oriented lens that reveals the underlying persuasive logic of multimodal content. This methodological choice is not intended to exclude more recent developments (e.g. Kress & van Leeuwen, 2020). These perspectives will inform the next stage of the research, which will expand the analysis to social media and integrate more recent approaches to digital multimodality.

By starting from a foundational rhetorical model, this preliminary analysis offers a structured entry point into the study of multimodal digital brand discourse in luxury hospitality.

Results. *The homepage of Mangia's official website features a dynamic headline including two videos that play sequentially. In the middle of each video, a key slogan appears, summarising the scene's message. The first video (Figure 1) constructs a compelling multimodal narrative that merges dreamlike visuals with emotionally evocative verbal techniques. The use of photogenia (Barthes, 1982) entails soft, ethereal lighting that frames the experience as an almost mythical escape from the ordinary. The color palette creates an almost surreal atmosphere, reinforcing the aspirational and exclusive nature of the luxury tourism experience. The hazy lighting and softened edges contribute to a dreamlike quality, subtly distancing the viewer from reality and placing them in an idealised version of a Mangia's resort. The video employs large, Italian-style rectangular frames that highlight breathtaking landscapes and high-end hospitality services, ensuring that every scene is meticulously crafted to evoke indulgence and relaxation.*



The video also features the staff of the resort engaged in their work, highlighting various hospitality roles such as gardening, mixing a cocktail, setting up the room, plating a dish, welcoming a guest at the check-in, arranging the restaurant, and organising the external pool area. Among the most visually striking moments is an outdoor spa treatment, where the setting highlights the natural landscape while paradoxically incorporating very indoor-looking furnishings,

further reinforcing the dreamlike, hypercurated luxury experience. The massage therapist's attire also stands out-it is noticeably different from a typical service-worker uniform, blending seamlessly with the setting to contribute to the video's fantasy-like aesthetic rather than a traditional hospitality scenario. Concluding the video with close-up shots of key staff members-including the housekeeper, chef, barman, lifeguard, and receptionist-humanises Mangia's brand identity, fostering a sense of authenticity and connection.

This surreal, highly polished visual scene is further enhanced by the video's verbal techniques, which construct a powerful emotional connection with potential tourists. The slogan appearing mid-video employs comparison to highlight the uniqueness of the Mangia's experience, positioning it as a transformative journey that turns moments into 'sweet memories'. This metaphor appeals to emotions associated with nostalgia, joy, and exclusivity, reinforcing the contemporary shift in luxury tourism towards experiential consumption. The narrative emphasises how the experience at Mangia's transcends reality, creating a new, idyllic version of life that guests can only access through this exclusive brand. Furthermore, by using significant omission, the video avoids showcasing any logistical or practical aspects of the resort experience, such as crowded areas, instead maintaining the illusion of a flawless, private dream world.

The video employs a multimodal discourse that is aspirational, emotional, and immersive. It appeals to affluent tourists who seek not only exclusivity and prestige but also the transformative power of a hypercurated, almost surreal luxury experience. Through its dreamlike aesthetic and emotionally engaging messaging, Mangia's positions itself as a gateway to a world where luxury transcends reality, offering guests an unparalleled, once-in-a-lifetime experience.

Figure 1. Homepage of Mangia's Official Website: Video 1

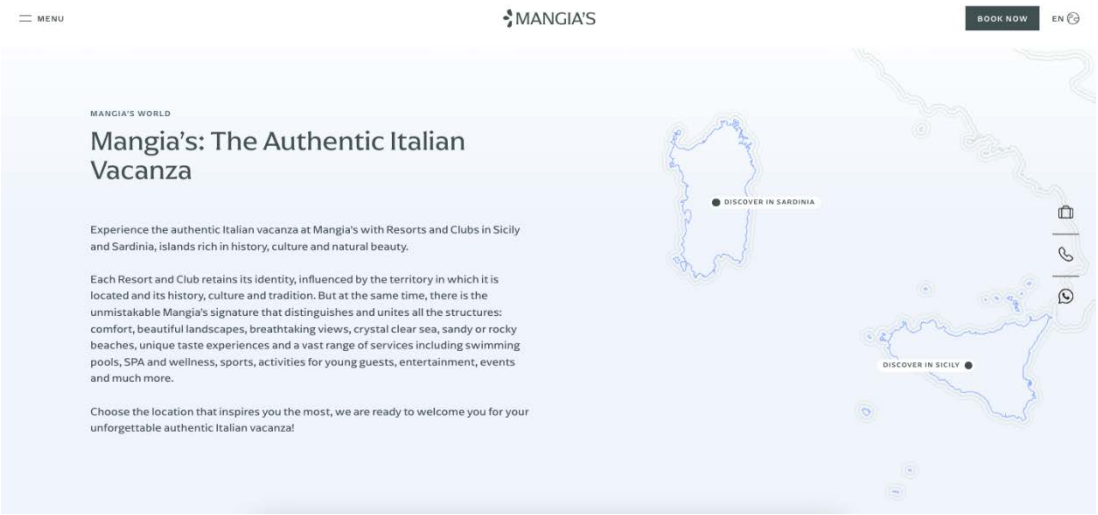
The second video (Figure 2) adopts a more grounded yet equally immersive approach, shifting from surreal dreamscapes to a narrative that emphasises an authentic and refined luxury experience. The color scheme harmonises warm and cool tones, reflecting a balance between relaxation and vibrant activities. The format relies on large, Italian-style frames that showcase landscapes, resort amenities, and intimate moments, reinforcing the exclusivity of Mangia's brand by crafting a highly immersive Italian experience. The video incorporates visual storytelling by following a chronological structure that portrays a typical day at Mangia's resorts. It begins with the moment the guest wakes up and continues by showcasing a seamless flow of experiences designed for relaxation and indulgence. The sequence unfolds with breakfast on the balcony, an invigorating outdoor shower under the sun, sunbathing and swimming, spending time at the beach, enjoying an aperitif by the sea or on a terrace at sunset, having dinner, and ending the day by joining a festive local celebration. This structured narrative highlights how Mangia's offers a perfectly curated day of leisure, catering to guests who seek effortless luxury from morning to night. The video strongly emphasises how every part of the guest's day is thoughtfully orchestrated, ensuring a seamless transition from one luxurious moment to the next. The use of photogenia ensures that each moment is visually polished, reinforcing the aspirational nature of the experience. Every activity is depicted with careful attention to detail, evoking a sense of exclusivity and indulgence that defines Mangia's brand.

This highly immersive visual scene is reinforced through the video's verbal techniques, which deepen the sense of emotional connection. The slogan appearing within the video highlights the authenticity of the experience being offered. The use of code-switching in 'the authentic Italian vacanza' strengthens the cultural richness and legitimacy of the brand experience, making the audience feel as though they are not just visiting Italy but fully immersing themselves in its traditions, daily rhythms, and refined elegance. Additionally, 'live a love like Italy' adds another emotional layer, evoking themes of romance and relaxation, aligning with luxury travellers' desires for a carefully curated and meaningful escape.

By integrating visual and verbal elements, this video effectively reinforces Mangia's brand identity as a leader in luxury tourism that offers a rich, diverse, and indulgent guest experience. The multimodal approach ensures that the aspirational and emotional aspects of tourism are highlighted, catering to affluent consumers who prioritise seamless luxury, exclusivity, and effortless enjoyment in their holiday choices. Through its carefully crafted combination of sensory

and emotional appeal, the video presents Mangia's resorts not just as luxury accommodations but as destinations where every moment is curated to provide an authentic Italian experience.

Figure 2. Homepage of Mangia's Official Website: Video 2



In the Mangia's World section (Figure 3), the use of the map of Sicily and Sardinia as the primary visual element is a striking choice that enhances the brand's luxurious entity. The minimalist design of the map, with its simple blue and white colour scheme, invokes a sense of sophistication, aligning with the luxury brand's positioning. Colour is used to convey serenity and elegance, and the clean lines and simplicity of the map's design add to the idea that these destinations are refined and untouched by commercialisation. The format of the image is rectangular, focusing the viewer's attention solely on Sicily and Sardinia as the primary destinations. The map's depiction of geographical locations without imagery of lush landscapes or tourist-heavy visuals reinforces the idea that these destinations are exclusive, not overcrowded or cliché.

From a verbal perspective, the repetition of 'authentic' solidifies the notion that the experience offered is true to Italian traditions, setting Mangia's apart from other luxury brands. 'Unmistakable Mangia's signature' serves as a guarantee, emphasising the brand's authority and trustworthiness. The call to action 'choose the location that inspires you the most' personalises the message, making the addressee feel empowered to select their ideal destination.

The combination of these visual and verbal techniques creates a cohesive narrative. The minimalist map encourages the viewer to imagine the beauty and exclusivity of Sicily and Sardinia, with the accompanying text guiding the addressee's perception towards a sense of luxurious discovery.

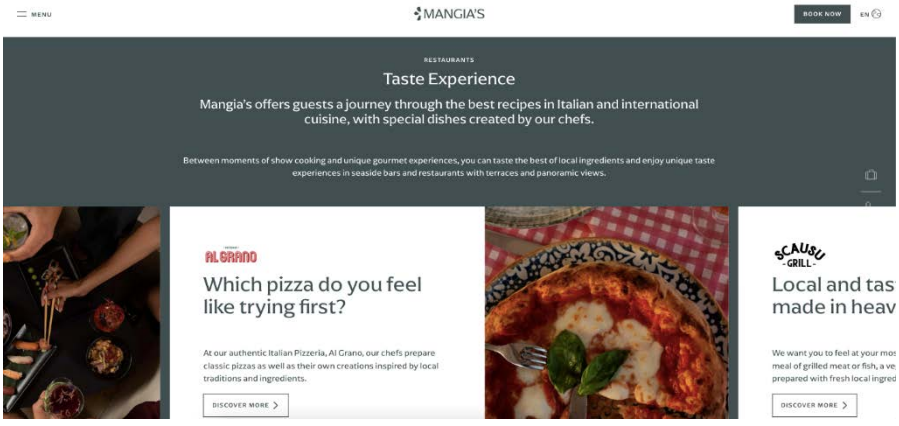
Figure 3. Homepage of Mangia's Official Website: Mangia's World Section

The resorts section (Figure 4) uses visual techniques to convey a sense of space, serenity, and high-end leisure. The expansive panorama of the resorts' surroundings, with lush greenery and tranquil waters, instantly evokes feelings of relaxation and escape. The warm golden tones of the sunlight suggest a peaceful, luxurious experience, highlighting the resorts' connection with nature and tranquility. This aligns with visual clichés of luxury tourism, using pristine landscapes and idyllic scenery to enhance the perception of these resorts as idealised escapes.

The 'authentic Italian experience' is again verbally emphasised, stressing that the resorts are distinctive not only by their locations but by their connection to the cultural essence of Sicily and Sardinia. The phrase 'unique locations' adds further prestige, reinforcing the perception of exclusivity and high quality. Additionally, 'live the authentic Italian vacanza' and 'enjoy moments of relax and adventure' speak directly to the addressee's personal experience, offering them the opportunity to immerse themselves in a high-quality, culturally rich experience.

The multimodal narrative appears persuasive, appealing to the addressee's desire for peace, luxury, and authenticity. The stunning imagery is not merely a scenic view but a carefully crafted representation of the experience the brand is offering, supported by the brand's verbal messaging that positions Mangia's resorts as an exclusive and enriching choice.

Figure 4. Homepage of Mangia's Official Website: Resorts Section

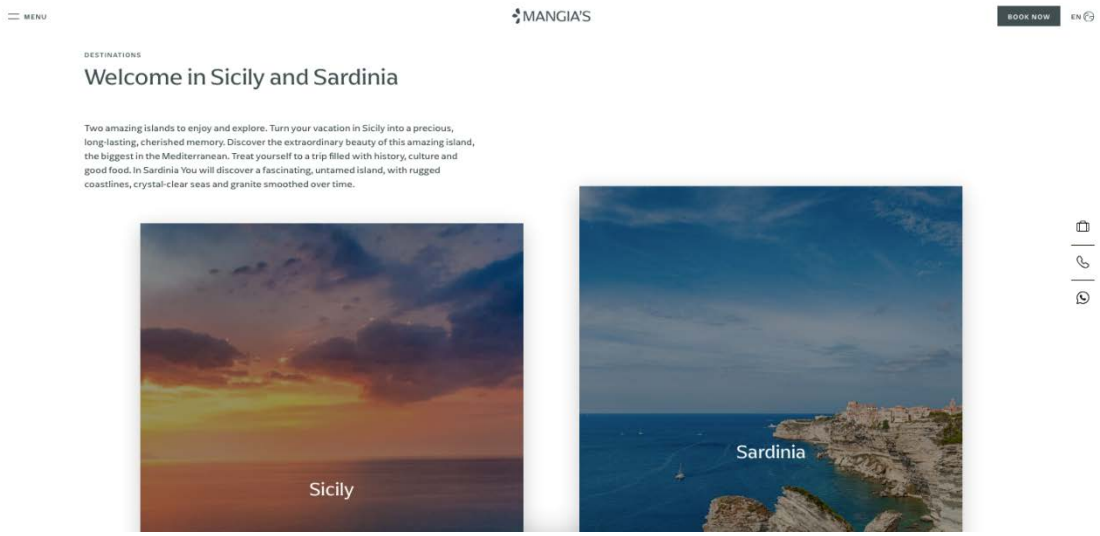


In the restaurants section (Figure 5), the image of a pizza dish serves as an enticing visual that underscores the brand's commitment to authenticity and quality. The vibrant colours of the ceramic-made dish and the pizza evoke warmth, freshness, and traditional Italian flavours. These visual clichés immediately connect the viewer with Italian culture, reinforcing the authenticity of the dining experience. The close-up format of the image brings attention to the textures and ingredients, conveying a sense of high-quality craftsmanship. The colour used in the dish itself is vivid, which not only makes the food appear appetising but also suggests an inviting, luxurious meal experience. The image of sushi emphasises the international food offering of the brand.

The phrase 'best recipes' functions as a key word, capturing the reader's attention by suggesting that only the finest food experiences are offered. The term 'journey', used as a metaphor, adds an experiential dimension to the dining experience, indicating that it is more than just a meal; it is an adventure that promises to satisfy both the body and the senses. The reference to 'special dishes created by our chefs' invokes the authority of the chefs and the expertise behind the meals. This could be interpreted as a subtle endorsement, inviting potential guests to trust the culinary prowess of Mangia's. The sentence 'you can taste the best' appeals directly to the addressee, making the message more engaging, while 'which pizza do you feel like trying first?' brings in an element of humour.

The visuals of fresh, high-quality food, combined with text emphasising culinary authenticity and expertise, create a compelling image of Mangia's as a brand that embodies both luxury and the essence of Italian dining. This combination engages the addressee's senses and emotions, transforming the meal into a multisensory journey of taste and culture.

Figure 5. Homepage of Mangia's Official Website: Restaurants Section

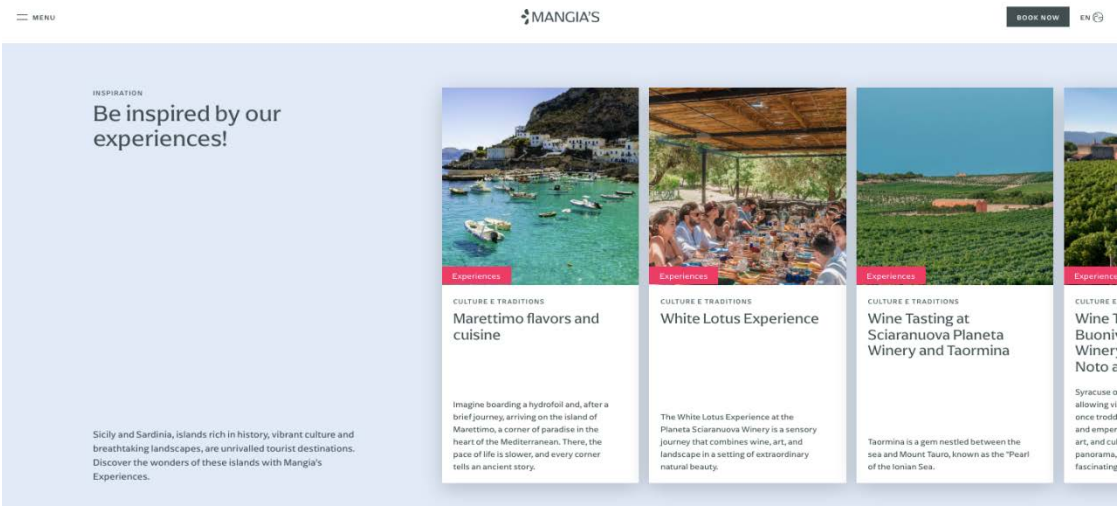


In the destinations section (Figure 6), the imagery of a sunrise over Sicily and a clear coastal view of Sardinia creates an idealised, tranquil representation of these islands. The warm hues of the sunrise evoke feelings of calmness and peace, aligning with the emotional connection that luxury travellers seek in their holiday experiences. The golden tones of the sunrise, combined with the deep blues of the sea, create a sense of relaxation and exclusivity, suggesting that these islands are not just tourist destinations but sanctuaries for escape and well-being. These visuals align with well-established clichés of idyllic island getaways, leveraging familiar tropes of untouched coastal beauty and tranquility.

Linguistically, Sicily and Sardinia are framed as premier tourist destinations, emphasising their amazing qualities. The phrase 'to enjoy and explore' suggests an immersive experience, positioning the islands not only as places for relaxation but also as destinations to be actively engaged with on a deeper level. The sentence 'turn your vacation in Sicily into a precious, long-lasting, cherished memory' personalises the message, making the addressee feel that their experience will be meaningful and special. Additionally, references to history, culture, and good food appeal to the luxury traveller's desire for enriching experiences that extend beyond relaxation, reinforcing the aspirational nature of the destination.

Multimodal discourse in this section creates an emotional narrative that invites the addressee to imagine themselves experiencing these islands as places of beauty, serenity, and personal significance. By framing Sicily and Sardina as transformative destinations, the message reinforces the brand's aspirational appeal.

Figure 6. Homepage of Mangia's Official Website: Destinations Section



The final section of the website's homepage (Figure 7) presents luxury experiences-such as 'Marettimo Flavors and Cuisine', 'White Lotus Experience', and 'Wine Tasting at Sciaranuova Planeta Winery and Taormina'-using a minimalist design in shades of blue to evoke sophistication and elegance. These experiences are positioned as unrivalled, with the descriptive adjectives 'rich', 'vibrant', and 'breathtaking' reinforcing their allure. The use of key words such as 'history' and 'culture' appeals to affluent travellers seeking enriching experiences, while the phrase 'be inspired by our experiences' invites personal engagement.

In the 'Marettimo Flavors and Cuisine' subsection, the image of boats in Marettimo's pristine waters is paired with verbal metaphors like 'corner of paradise' and 'heart of the Mediterranean', enhancing the destination's authenticity and tranquil appeal. Visual and verbal techniques combine to create an immersive experience, encouraging the viewer to imagine embarking on a unique culinary journey.

The 'White Lotus Experience' subsection uses imagery of people dining together in a vineyard, evoking a serene and welcoming atmosphere. This visual representation underscores the conviviality and communal nature of Italian dining culture, where meals are not merely about food but about sharing moments of connection and togetherness. The phrases 'sensory journey' and 'extraordinary natural beauty' evoke a transformative, immersive luxury experience. The reference to the 'White Lotus' series adds prestige, reinforcing the offering's exclusivity. By integrating visual and verbal techniques, this section positions the experience as both immediate and enduring, presenting it as a cultural and sensory journey.

In the 'Wine Tasting at Sciaranuova Planeta Winery and Taormina' subsection, an image of a vineyard enhances the authenticity of the experience, helping the addressee envision it more vividly. The strategic use of metaphors such as 'gem' and 'pearl of the Ionian Sea' elevates the status of the destination. This combination of visual and verbal techniques enhances the luxury of the offering, positioning it as an authentic and unforgettable event.

Figure 7. Homepage of Mangia's Official Website: Experiences Section

In conclusion, Mangia's establishes its brand identity online by strategically integrating visual, verbal, and interactive elements to shape a narrative of desire, exclusivity, authenticity, and cultural richness. Through minimalist design, calming colours, and evocative imagery, the brand reinforces its luxurious identity and positioning. The verbal techniques engage the addressee emotionally, inviting them to personally connect with the brand and envision themselves as part of an exclusive experience.

By framing luxury tourism as a transformative journey that extends beyond relaxation to encompass deep cultural engagement and personal enrichment, Mangia's effectively redefines the luxury tourism experience. It positions its offerings not merely as high-end services but as unique, immersive experiences that appeal to affluent travellers' desires for authenticity, status, and memorable moments. The distinctiveness of Sicily and Sardinia further strengthens this narrative by presenting the two islands as destinations that promise both physical and emotional detachment from everyday life, heightening their appeal as aspirational and culturally immersive retreats. Through this multimodal approach, Mangia's successfully frames luxury tourism as an experience that blends relaxation with a personal connection to Italy's rich heritage-one deeply tied to the distinctive charm and seclusion of its main islands.

Research limitations. *This paper is a preliminary version of broader research examining Mangia's multimodal brand communication across its official website and social media. A key limitation is its ongoing nature, as only the website's homepage has been analysed so far. Future research will extend to social media platforms, where the dynamic and interactive nature of digital content may offer deeper insights into the multimodal construction of the brand's identity and the representation of luxury tourism across multiple channels.*

Managerial implications. *This study underscores the strategic relevance of multimodal rhetoric in luxury hospitality branding. Even in digital contexts, rhetorical devices such as emotional appeals, selective omission, and symbolic imagery remain powerful tools for crafting persuasive narratives. The case of Mangia's illustrates how brands can humanise their identity, reinforce exclusivity, and convey authenticity through carefully orchestrated multimodal discourse. Managers should take note of how seemingly traditional techniques-when adapted to contemporary digital formats-can still resonate with today's experiential consumers.*

By adopting a systematic rhetorical lens, this study provides hospitality professionals with a structured model for assessing their own brand messaging. Future managerial efforts should focus on refining the interplay between linguistic and visual storytelling, particularly in cross-platform strategies that span from official websites to social media content.

Originality of the paper. *This study advances research on multimodal brand communication in luxury tourism by examining how visual and verbal elements interact in the digital landscape. Unlike previous studies that focus primarily on quantitative brand perception or linguistic analysis, this research applies Dann's (1996) rhetorical framework to explore how visuals and language combine to construct brand identity and shape the framing of luxury tourism online. By analysing a luxury hospitality brand, the study demonstrates how multimodal strategies reinforce exclusivity, authenticity, and experiential value in digital branding. As digital communication continues to evolve, this study provides a foundation for future research on how luxury tourism brands leverage multimodal storytelling to engage high-net-worth travellers in an increasingly digitalised marketplace.*

Key words: *strategic communication; digital branding; tourism discourse; multimodality; luxury tourism*

Strategic management in the public sector: new leadership models to navigate the turbulent post-Covid era

DARIO NATALE PALMUCCI[1] CHRISTIAN DI PRIMA[2] DEVID SPARAPANI[3] ALBERTO FERRARIS[4]

Abstract

Although across all sectors and business processes there are paradigm shifts, due to the technological-digital invasion and socio-economic upheavals that radically change the way people are motivated and sustainable strategies are implemented, the ability of any organization to survive still rely on its leaders' ability to adapt to these changes and make decisions. Public sector is not excluded from these changes: then the aim of this study is to shed light on leadership in the context of the public sector. Specifically, the objective is to understand the challenges experienced by new leaders of the public sector in light of the upheavals of the actual unstable and complex digitalized post-covid era. Then, since leaders plays a key role to manage these difficulties (and although the attention on leadership evolvement has grown), scholars' effort mainly focused on examining these dynamics into the private sector. Evidence of this is a recent leadership model proposed in the literature (named STP leadership) that has been developed only considering private organizations. In contrast this work, aims to understand whether such recent leadership conceptualization can also be implemented in public administration contexts. To do so, it delves into viewpoints of employees working in the public sector and the analysis of guidelines researched within the public sector together, providing a more comprehensive understanding, enriching the knowledge about leadership and public sector strategic management by analysing new directions taken to deal with the actual constraints and turbulence of the market.

Framing of the research. *The concept of leadership has deep roots in ancient times and has evolved over time. Particularly in the work and business context, in recent decades, leadership styles have evolved from traditional, authoritarian, and task-focused approaches to more participatory models. These newer models place greater emphasis on people and aim to create more comfortable work environments, in response to significant organizational and social changes (Stone & Patterson, 2023). In order to provide a solid theoretical framework, in according with recent published studies on the topic (Palmucci & Ferraris, 2025) actual leadership theorizations can be categorized as follow:*

- *Theories that focus on the leader/follower relationship: Transformational and transactional leadership are two key styles focused on the leader-follower relationship. Transformational leadership involves inspiring and motivating team members to exceed expectations, emphasizing personal and organizational growth through deep relationships and emotional engagement (Khalili, 2016). These leaders create a compelling vision, foster critical thinking, and support individual development, promoting innovation and long-term change (Humphreys & Einstein, 2003). In contrast, transactional leadership focuses on structure, organization, and performance, using a system of rewards and punishments to ensure adherence to clear roles and processes (Afshari & Gibson, 2016). It prioritizes stability, efficiency, and measurable short-term results but may limit creativity and adaptability, making it more suitable for routine or highly structured environments (Febrian et al., 2023).*
- *Theories focused on particular characteristics of the leader: Some leadership theories focus on specific leader characteristics and define leadership styles based on these traits. Authentic leadership, for example, emphasizes integrity, transparency, and genuine alignment with one's values, fostering trust and respect through clear and open communication (Avolio & Gardner, 2005). Servant leadership instead (more a 'management philosophy' than a style), prioritizes serving others, focusing on the needs of the team, organization, or community over personal ambition (Parris & Peachey, 2013). Servant leaders show a strong inclination to support others, promoting followers' development and well-being, in contrast to traditional leadership models that emphasized authority, power, and control. Lastly here, inclusive leadership promotes integration, respect, and appreciation of diversity within a team or organization (Tran & Carey, 2017). It is based on the idea that everyone, regardless of background, identity, or perspective, can significantly contribute to collective success. This approach aims to create an*

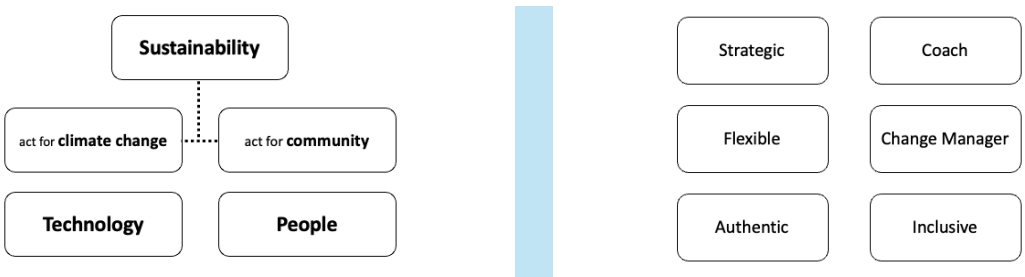
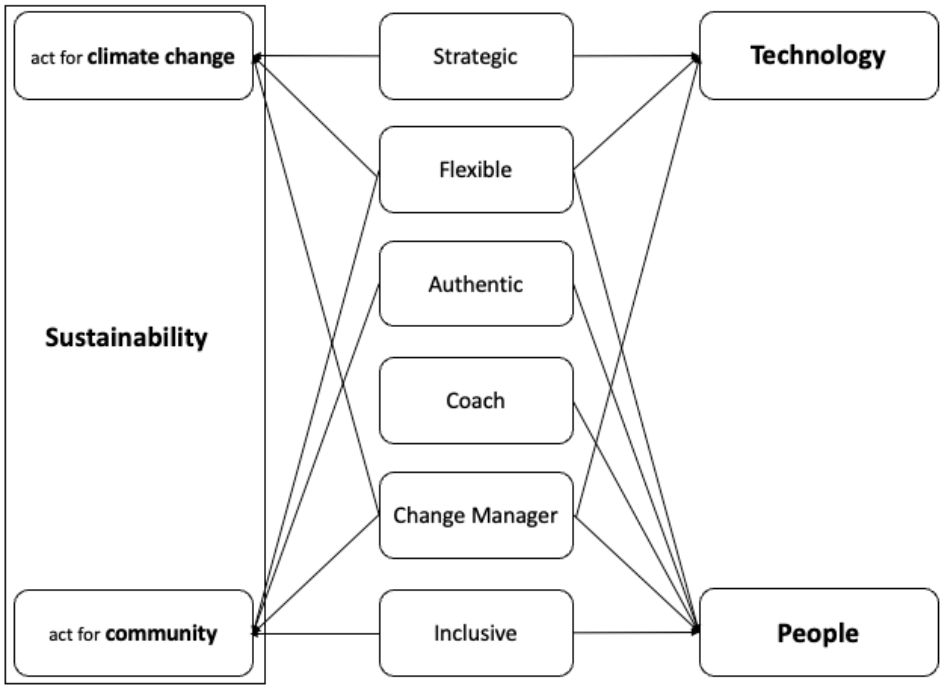
DOI 10.7433/SRECP.SP.2025.01



environment where individuals feel welcomed, respected, and encouraged to participate fully according to their unique qualities (Korkmaz et al., 2022).

- *Theories that broaden the horizon to different situations/contexts= Some leadership theories extend beyond the workplace into broader contexts, highlighting the importance of adaptability, well-being, and a holistic approach to leadership success. This is the case of Situational leadership, a management model that emphasizes adapting leadership style to specific circumstances and the needs of the team, moving away from predefined behavior patterns (Thompson & Vecchio, 2009). It suggests that effective leaders adjust their behavior based on the maturity and development of followers and the specifics of the context. This approach values flexibility and personalized treatment to enhance trust and competence within the team (Ahern & Loh, 2021). Another relevant model is the total leadership one, a theorization that goes beyond professional life, focusing on work, family, and community (Friedman, 2014). In particular it aims to help leaders create synergy between different life aspects, make conscious decisions, and achieve a balanced and meaningful life. The model emphasizes strategies for managing time, balancing commitments, and setting clear boundaries between roles.*
- *Theories that emphasize innovation and digitalization= Innovative and digital leadership are two modern theories with a forward-looking approach. Both styles emphasize adaptability, collaboration, and maintaining a balance between technological advancements and human-centric leadership, contributing to sustainable and beneficial growth for organizations (Palmucci & Ferraris, 2025). More in particular, innovative leadership aims to inspire change and promote creative ideas within teams, focusing on anticipating change, taking unconventional approaches, and transforming opportunities into strategic advantages (Şen & Eren, 2012). Key traits include openness to change, a future-oriented vision, fostering creativity, empathy, active listening, and agile decision-making. Digital leadership instead, focuses on managing change in technology-driven contexts (Gledson et al., 2024). It involves leveraging digital tools, promoting innovation, and guiding teams through digital transformations. Digital leaders need strong technological competence, adaptability, and effective management of distributed teams. While technology-focused, they also prioritize people, enhancing digital skills and creating inclusive environments (Turyadi et al., 2023).*

The theories described represent the body of research on leadership and also the baseline for actual leadership development programs present in the organizations. That said, as scholars' effort and journey to understand leaders' new challenges, skills and is still ongoing (Fullan et al., 2024). On this direction, a recent published work found that actual leaders' areas of intervention in this complex post-COVID era are Sustainability (referred to act for climate change and act for the community), Technology and People - from here the definition STP leader- (Palmucci et al., 2025). Figure 1 below shows these areas of intervention and the six relevant skills needed to manage these three challenges. In other words the new leader must be: Strategic, Flexible, Authentic, Coach, Change Manager, Inclusive. In summary, the authors, in order to fully understand the dynamics of what they define as the new leadership, emphasize the need to consider the reference context in which leaders operate and to analyze the challenges of the present. Through a study involving companies of various sizes, they found that, to lead organizations in today's complex reality, the new leader must primarily focus on three areas: sustainability (acting to mitigate climate change and serve the community), technology (promoting digital transition and encouraging the use of innovative technologies), and people (focusing on what is necessary to motivate an increasingly diverse workforce compared to the past). Furthermore, the model does not only list the challenges faced by new leaders but also the specific skills required to successfully tackle these challenges, which represent the essential toolkit for managing modern organizations. As shown in Figure 2 below, the model graphically summarizes with arrows the skills needed for each area of intervention (e.g. Flexibility is required for all challenges, while Coach skills are needed only for the area of intervention of "People").



That specified, moving to the gap that this work aim to address, actual innovative models of leadership (including STP one) scarcely refer to the context of the public employment. It is to say that, although organizations are facing new constraints because of the digital transition and the need to manage renovate people needs and new sustainable requirements (Palmucci et al., 2025)- and despite these transitions have impacted organizations of all sectors and the public one is not excluded - evidences on the applicability of modern conceptualizations of leadership to have a more comprehensive understanding of leadership in the public context are still missing.

Fig. 1: STP leadership model: areas of intervention and skills needed to the new leaders

Purpose of the paper. *This research aims to shed light on leadership into the public organizational contexts, in particular on the challenges faced by leaders of the public sector, as well as the attitudes required to face the paradigmatic changes of this complex post Covid era. Therefore, this work aims to thoroughly understand leadership in the public sector by gathering perspectives from various civil servants working in different public institutions at different level. More concretely it seeks to determine whether the recent STP leadership model proposed in the literature can be implemented and considered valid in the public sector as well. The final output is to present concrete managerial implications and suggestions that top management in the public sector can utilize to equip their own context with effective leadership, thereby fostering a comprehensive understanding of the topic. In summary, we specifically evaluate the possibility to implement the STP model on the public sector.*

Methodology. *This study combines the analysis of some recent actual directives and guidelines promoted by the Italian Ministry of Public Administration with a qualitative methodology based on 15 interviews with civil servants working in different public institutions in Italy. In order to understand the current direction of leadership within the public sector, these resources have been thoroughly analysed to determine whether they contain references to (and emphasize the importance of) the core principles of the STP leadership model: sustainability, technology, and people. The documents of particular relevance that have been considered are:*

An important published article named "People at the Center: a Public-Private Dialogue on Strategic People Management": this document (that followed the conference of January 16, 2025 chaired by the Minister of Public Administration and from which this article emerged) outlines the objective of the public administration to initiate a strategic discussion and a structured and innovative dialogue between professionals and organizations in the public and private sectors on the topic of human resources management. This document describes how public organizations are responsible for representing the most virtuous and responsible behaviors in the eyes of citizens, employees, public and private stakeholders and public opinion in general and how, in order to address the most crucial challenges posed by contemporary complexity;

A new Directive from the Ministry of Public Administration on training and development of human capital: which is a guideline act that indicates the objectives, cross-cutting training areas and tools to support the training of public personnel;

The training catalogue of the National School of Administration (SNA): which is the institution responsible for selecting, recruiting and training managers and officials of the Italian Public Administration. In particular, we analyzyed the training course offered on the topic of leadership;

With regard to the qualitative study instead, the decision to collect qualitative data through interviews was primarily informed by previous research demonstrating that interviews are an effective method for evaluating managerial aspects in the public sector (Mergel, 2021). Regarding the sample, a heterogeneous selection of participants from different branches of the public sector was adopted. This choice aligns with the exploratory nature of the study, ensuring a broader understanding of the phenomenon and enhancing the generalizability of the findings (Palmucci, 2023). Specifically, data were gathered from public employees at different hierarchical levels, in line with prior studies that have remarked the possibility to understand these dynamics through interviews (Van Wart, 2016). Furthermore, collecting data from workers across different branches of the public sectors and organizational settings aimed to enhance the study's exploratory impact of the study (Gustafsson, 2017). Therefore, participants were initially contacted to gauge their willingness to participate in the study and were provided with a general overview of its purpose. In the first part of the interview, demographic data (e.g., age, seniority level) and contextual information regarding their job position were collected. Subsequently, individual virtual interviews were conducted, each lasting an average of 30 minutes. Prior to data collection, participants were assured of the anonymity and confidentiality of their responses. The interview protocol included semi-structured questions, allowing participants to share their experiences after they were shown the STP model (Figure 2) and encouraged to discuss if it can be appropriate in the context of the public sector. Additionally, participants provided concrete examples of issues they faced, strategies they employed to navigate the actual complex reality, and both the communication difficulties and advantages they experienced. In cases where participants seemed to be very proactive, they were also invited to propose improvements to the model adoption in the public sector. The interviews concluded with a general discussion on participants' perceptions of growing concerns related to leadership and public sector difficulties. After 15 interviews, we noticed data saturation (Aldiabat & Le Navenec, 2018) and we stopped interviewing subjects. Following data collection, the research team transcribed the qualitative responses, assigned preliminary codes, identified recurring themes, examined variations, and ensured the reliability and validity of findings in line with established qualitative research methodologies as in Gioia et al., 2013.

Results. *As seen in the previous part, this study is focused on the analysis of documentations, guidelines and directives combined with interviews to employees working in different Italian public institutions. Therefore, the results are summarized as follow:*

<u>STP model can be applied to the public sector</u>= Thanks to the data analysis we can confirm that the new theorization of leadership proposed in the literature and that summarizes the 3 areas of intervention for the nowadays leader in a) sustainability; b) technology c) people. In particular with regard to the interviews, all participants indicated that these 3 areas are the same one with which today leader need to struggle to manage the complex reality. When asked participants to indicate additional, none reported another important area not considered from the model. On this direction one interviewee said: "these are exactly the areas that guide not only leaders but all operations at work. In addition, I think that is the combination of these 3 factors that should be pursued in each operation and at all levels. Not only, if I think about the sustainability part, I can say that probably this is more valid in the public sector than in the private as to act for the community is the core value of civil servants". Not only from interviews but also from the analysis of the documentations and guidelines it is possible to appreciate the effort to move the Italian public sector in the direction of this new actual challenges. Thanks to its strategic approach the Ministry of Public Administration is trying to lead an epochal change, making the administrative machine more modern, efficient, citizen-oriented and transforming the Public Administration into a model of excellence through cutting-edge ways of working that foster sustainability, digitalization and attention to human capital, adopting innovative policies that combine efficiency, processes simplification, environmental responsibility and new flexible and advanced technological and digital working methods. The article named "People at the Center: a Public-Private Dialogue on Strategic People Management" for example describes how public organizations are responsible for representing the most virtuous behaviors in the eyes of citizens, employees, public and private stakeholders and public opinion in general and how, in order to address the most crucial challenges posed by contemporary complexity, it is up to the leadership of public organizations to initiate the necessary change processes while keeping the course on 3 pillars: sustainability, technology and people. Specifically, public organizations with an innovative approach aim to achieve superior performance and create new forms of competitive advantage using the integration of 3 ESG parameters/criteria of sustainability: environment (environmental sustainability), social (social responsibility) and governance (good administration).

The first pillar, sustainability, is the core value of the mission and administrative action implemented by public organizations and is the expression of a change aimed at creating public value and pursuing sustainable objectives in terms of use of resources and environmental impact. According to the document analyzed, to lead the ongoing change is an essential need to develop a culture of sustainability in which operational efficiency is accompanied by a solid ethical vision that respects natural and social resources. In other words, the public sector entrusts the leadership role to individuals capable of making fundamental strategic and operational choices: a prepared top management that acts for the creation of public value and the development of the community in a sustainable way. In this direction, a director interviewed stated: "employees should never forget that they are providing a service to the community, this is why that sense of social utility value must be encouraged and promoted with determination".

The second pillar, technology, is the foundation of the digital transition in public employment, a revolution that sees the development of technologies at the service of people and the community. Innovations - including artificial intelligence and automation - are fundamental tools to enhance the effectiveness of public administrations. The advent of digital

technologies has already greatly enhanced and simplified many bureaucratic and administrative activities, effectively supporting human work. The focus should be on creating an harmonious combination of human and artificial working and creative capacity, improving efficiency and increasing productivity without losing sight of the humanization of work. As with all aspects of digital transformation, the successful implementation of digital technologies in public employment will rely less on technological capacity itself and more on human adaptability. Therefore, public leadership must focus on fostering technology adoption in ways that seamlessly integrate machine potential with human capabilities. The third pillar, people, serves as the foundation of public organizations, which operate both with and for individuals. In this context, the concept of "sustainability of people" has become central, emphasizing a holistic approach to human capital management. This approach integrates key elements such as diversity and inclusion, employee well-being and safety, fair compensation, talent recognition, soft skills development, and continuous workforce reskilling and upskilling. It is to say that, in the evolving model of public employment, people should not be just participants but the driving force behind organizational success. It is crucial to implement strategies that not only meet present demands but also anticipate future challenges. This forward-thinking perspective fosters inclusive and intelligent personnel management, ensuring that every individual is valued. Leadership plays a pivotal role in this transformation by cultivating trust, actively listening to employees' needs, and implementing innovative, forward-looking solutions. A reference to the STP system is also present in the new Directive on training and development of human capital, which is a guideline act that indicates the objectives, cross-cutting training areas and tools to support the training of public personnel. In the current economic and social context, characterized by rapid technological advances, continuous changes in the expectations of citizens and users of services, and global challenges, staff training is essential to allow public administrations to achieve adequate performance that, in terms of quantity and quality, can satisfy the demands and needs expressed by the community. Staff training is, first and foremost, a catalyst for productivity and organizational efficiency: people who receive training in the areas of ecological, technological transition and people development are better prepared to make decisions that contribute to the creation of public value, to reducing inequalities and to strengthening social equity and inclusiveness in the provision of services. Training programs cover, among other topics, skills for the implementation of the ecological transition (sustainability), the digital transition (technological advancement) and people development in line with the European Commission Communication on strengthening the European administrative space (ComPAct). The interdependent nature of the three transitions is quite evident and administrations are called upon to activate and adopt change processes that concern or combine the digital, ecological and personal dimensions and that require the activation of leadership skills, soft skills, as well as the adoption of principles and values common to public work. To do this, the National School of Administration (SNA) is offering 7 specific courses on the topic of leadership and ad hoc professional training reserved to public managers during 2025. To conclude, the STP model seems to fit doubtless the case of the public work and on this direction, one of the civil servants interviewed said: "STP model is extremely valid within our context that I think it is very important for leaders to get know this model and understand how it works; they must be aware of these three areas and find the right balance among them to keep the public sector system running. I would make it mandatory within the leadership courses".

<u>The most relevant area of intervention is "People" and the most relevant skills is "Flexibility"</u>= As seen just above from the analysis of documentations and directives, the focus on People is doubtless the key for public organizations and this is aligned with what found in the qualitative study. In fact all interviewees convene that the most important area of intervention is People. In particular a participant reported: "If I had to weigh the significance of the three areas, I would say 50% goes to People, while Technology and Sustainability each account for 25%". Another participant also stated: "focus on people is more important than ever, in fact if before it was traditionally seen as a stable and economically favourable career choice, the post-COVID socio-economic changes have challenged this perception. It is the case of new generations of workers who are less attracted to lifelong jobs, preferring diverse experiences (and increased mobility within the EU and technological advancements make better opportunities more accessible). Also, it is the case of slow wage adjustments in response to inflation that make public sector jobs often less competitive, with many positions remaining unfilled or new hires often leaving within months as it is happening to us". Regarding skills, most interviewees agree that flexibility is the key competence. As one participant put it: "Without flexibility, you cannot lead a public institution. It means being open to discussion, accepting feedback and criticism, and continuously improving". Another interviewee also stated: "Flexibility is the core skill, as it allows leaders to adapt to new technologies and procedures while also understanding and supporting their team".

Research limitations. *This study has certain limitations. Firstly, the constraints relate to the chosen approach. To avoid further fragmentation of managerial knowledge and enhance the validity of the findings, it is crucial to collect additional data, potentially incorporating diverse data collection methods (e.g., quantitative analysis). Moreover, further data collection also outside the solely Italian context will contribute to a deeper understanding of the phenomenon from both theoretical and managerial perspective and will help in defining control variables to keep under control. Additionally regarding the skills "Strategic", from the interviews emerged that organizations need "Strategies of people management", and this calls in for further studies to first evaluate if this can be considered for area of intervention "People" (and not only act for climate change (S) and technology (T), and also reveals as in this work the analysis of the skills has been given little relevance comparing to areas of intervention. Curiously for participant, "training" seems to be more important than recruitment in public contexts as few interviewees reported that, since people are not directly*

selected from the manager but are simply assigned to them after a public competition, then according to participants the only way for supervisors to guarantee performance is to understand the people in their team and, as a sport coach does, find the best way to "make each player perform". This aspect, although can be understandable, should be validated by considering in future studies a sample which includes additional job positions and levels.

Managerial implications. *As for managerial implications, the results of this study may be a useful strategic tool for the Italian public sector top management and professionals. It is to say that, if it is true that the STP leadership model is valid also within the context of the public sector, then its principle can be surely divulgated in form of training programme within leadership path designed for directors and top managers (or within some training catalogue of the National School of Administration - SNA). An additional managerial implication regards the possibility to empower managers by teaching them some coaching skills (in line with one of the skills indicated in the STP leadership model). This seems to be particular relevant as, unlike in the private sector, where hiring managers can directly choose their own resource, in the public sector instead resources "arrive" in managers' team because they won a public competition process, so for leaders it is extremely important to understand the players they have and try to get the best out of them. With regard to the sustainability area (S), and in particular the "act for community" dimension, policies should be updated to include the respect of few values as baseline of any contract. In other words, in order to guarantee value, employees of the public sector should constantly keep in mind that they are providing a service to the community and thus this sense of "social utility" must be constantly encouraged and promoted with determination in policies and communication campaigns.*

Originality of the paper. *This piece of work is relevant for top managers for directors and top leaders in the public sector, for managers to get aligned on actual challenges in their daily work, but also for the scientific community aiming to enhance their understanding of the matter of leadership. This because if studies on leadership in the private sector are relevant and continuously updated, in the public context the relevance of leadership in shaping efficient strategies is often not directly considered. In addition, previous research focused often on interviews only, only one organizational context or consideration on policies and directives, whereas this study combines qualitative study with documents and directives analysis and explores diverse viewpoints from civil servants working at different level, offering a more holistic understanding on the topic of leadership and in particular trying to implement an already recognized new model (STP) generated in the private sector to the cause of the public one. In addition, the diverse sample of participants interviewed represents different work environments across different sectors (increasing the generalizability of the findings) in diverse domains as also done in previous studies (Bresciani et al., 2016).*

Key words: *leadership; public sector; strategic management;*

Do Financial Indicators Affect Employee Resilience? Examining the Mediating Role of Employee Motivation

MEYSAM SALIMI[1] FRANCESCO MASSARA[2] FRANCESCO DE MATTEO[3]

Employee resilience has gained increasing attention as a critical factor in organizational success; yet limited research has examined the role of financial indicators-such as total assets, turnover, and labor costs-in shaping resilience outcomes. This study investigates the influence of these financial indicators on employee resilience, with a particular focus on the mediating role of employee motivation. Drawing on the Conservation of Resources (COR) Theory, we hypothesize that financial stability (i.e., total assets, staff investment, and turnover rate) influences resilience both directly and indirectly through its impact on employee motivation; however, the effect varies depending on the specific financial indicator. Using a structural equation modeling approach, we analyze data from a sample of 1,463 Italian employees to assess these relationships. Our findings suggest that financial stability (i.e., high total assets and staff investment) enhances employee motivation, which in turn strengthens resilience. However, high turnover rates weaken motivation, thereby reducing resilience, highlighting the importance of employee retention strategies. This study provides both theoretical and practical implications for organizations seeking to cultivate a resilient workforce in response to financial conditions.

Keywords: *Financial stability, Resilience, Motivation, COR*

Introduction

Employee resilience has emerged as a critical factor in contemporary organizations, influencing both individual and organizational performance in dynamic and uncertain work environments (Bardoel et al., 2014; Long et al., 2025). Resilience enables employees to cope with job-related stress, maintain performance under pressure, and adapt to change (Youssef & Luthans, 2007; Nguyen et al., 2024). In today's competitive business landscape, where economic fluctuations and workplace demands are constantly evolving, fostering employee resilience is essential for sustaining productivity and organizational stability (Cooper et al., 2019). Despite its recognized importance, limited research has examined the financial determinants of employee resilience, particularly how organizational financial indicators influence motivation, which in turn enhances resilience (Luthans et al., 2020).

Resilience plays a crucial role in workplace sustainability by enabling employees to effectively manage high workloads, collaborate with others, and use workplace challenges as opportunities for growth (Robertson et al., 2015). Organizations benefit from a resilient workforce through reduced absenteeism, higher engagement, and improved adaptability to economic and structural shifts (Avey et al., 2011). While previous studies have focused on individual traits that contribute to resilience (King et al., 2016), there is a growing need to investigate external organizational factors, such as financial stability and resource allocation, that may shape resilience indirectly through employee motivation (Deci & Ryan, 2000). Although research on employee resilience has expanded in recent years, existing studies primarily emphasize psychological and behavioral aspects, overlooking the financial underpinnings that influence resilience development (Luthans et al., 2020; Cooper et al., 2019). While financial indicators such as the operating ratio, long-term debt ratio, and long-term debt per capital (Prysmakova et al., 2019; Lau & Roopnarain, 2014) have been linked to employee motivation, other indicators, such as total assets, turnover rate, and labor costs, have not yet been explored, and their impact on employee motivation and resilience remains underexamined. This study seeks to bridge this gap by examining how financial indicators shape employee motivation and, in turn, resilience. Specifically, our research investigates the mediating role of employee motivation in the relationship between financial indicators and resilience, thereby addressing a crucial missing link in organizational resilience literature.

Based on an analysis of information from a sample 1463 Italian employees, this study aims to contribute to the understanding of the mechanisms through which financial indicators influence employee resilience. We hypothesize that financial indicators directly impact employee motivation, which subsequently enhances resilience. Furthermore, we

propose that motivation serves as a mediating factor between financial indicators and employee resilience. By empirically testing these relationships, we seek to provide a nuanced understanding of how financial stability, resource investment, and compensation structures contribute to workforce resilience. Adopting the theoretical lenses of COR theory we argue, resource availability and financial stability (i.e., total assets and turnover rate) play a significant role in shaping employee motivation, which in turn enhances resilience. This research underscores the importance of financial resource allocation in fostering a resilient workforce, offering theoretical and managerial insights into resilience-building strategies. By highlighting the mediating role of motivation, our study provides a fresh perspective on the indirect influence of financial conditions on employee resilience. These insights have practical implications for human resource managers, organizational leaders, and policymakers seeking to enhance employee resilience through financial and motivational strategies.

Financial Indicators and Employee Motivation

There are several reasons that explain the relationship between financial indicators and employee motivation. First, consistent with the Conservation of Resources (COR) Theory (Hobfoll, 1989), employees strive to preserve valuable resources, and uncertainty about financial conditions leads to stress and demotivation. Higher financial stability (i.e., total assets and turnover rate) enhances employees' sense of job security and psychological safety, ultimately leading to higher motivation. As noted by Prysmakova et al. (2019), financial stability positively correlates with employee motivation and retention. Likewise, Jiang et al. (2012) demonstrated that organizations with higher financial performance tend to have lower turnover rates and higher employee engagement. Second, organizations with strong financial performance can invest in employee growth and workplace improvements, thereby fostering long-term intrinsic motivation. Companies with higher total assets and labor cost investments have the ability to allocate more resources to training, skill development, and career growth opportunities. In turn, skill mastery serves as a key driver of intrinsic motivation (Gagné & Deci, 2005). As noted by Noe et al. (2017), financial investment in employee training significantly boosts intrinsic motivation. Similarly, Taris & Schaufeli (2015) found that organizations with higher labor costs allocate more resources to personal and professional growth, further enhancing intrinsic motivation. Third, financial indicators such as low turnover rates signal a stable and supportive work environment, strengthening employees' sense of belonging and purpose-two critical factors in intrinsic motivation. As noted by Dysvik & Kuvaas (2010), employees working in companies with low turnover rates experience stronger intrinsic motivation, primarily due to increased social support and a stronger organizational culture. Building on these arguments, we hypothesize that:

H1: Financial indicators (i.e. total asset, turnover rate and labor costs) positively affect employee motivation.

Employee Motivation and Employee Resilience

Consistent with the COR theory (Hobfoll, 1989), motivated employees accumulate psychological resources (e.g., self-efficacy, optimism) that enhance their ability to withstand adversity. In this view intrinsically motivated employees experience higher resilience because they are more likely to engage in adaptive coping strategies when faced with workplace stressors. As noted by Luthans et al. (2007), intrinsic motivation is positively associated with psychological capital, which includes resilience (as well as optimism, and self-efficacy). In another example, Ryan & Deci (2020) demonstrated that employees with high intrinsic motivation are more likely to use problem-focused coping strategies, which help them manage high workloads effectively. Moreover, intrinsically motivated employees who find joy and personal meaning in their work are more likely to build strong interpersonal relationships, which are essential for workplace resilience. As noted by Dutton et al. (2014) employees with high intrinsic motivation actively build social resources, which improves their resilience in handling workplace stressors. Lastly, employees with intrinsic motivation view workplace change as a learning opportunity rather than a disruption, making them more adaptable and resilient to organizational transformations. As noted by Frazier et al. (2013), individuals with high intrinsic motivation show greater psychological flexibility, which improves resilience in the face of uncertainty. Likewise, Seidel et al. (2024) demonstrated that intrinsically motivated individuals are more likely to embrace change, rather than resist it. Building on these arguments, we hypothesize that:

H2: Employee motivation positively affects employee resilience.

Financial indicators, employee motivation and employee resilience

Consistent with previous discussion strong financial performance (e.g., high total assets, stable turnover rate, and adequate labor costs) allows organizations to create a motivating work environment (i.e. by offering better compensation, training, and growth opportunities). When employees feel valued and supported, they develop intrinsic motivation (Gagné & Deci, 2005), leading to greater resilience in handling work challenges (Seidel et al. 2024). In this view, intrinsic motivation acts as a psychological buffer against work stress as motivated employees perceive high workloads and workplace challenges as opportunities for growth rather than as threats, increasing their ability to sustain resilience. Relatedly, intrinsic motivation enhances adaptability and collaboration, strengthening resilience (Frazier et al., 2013). Building on these arguments, we hypothesize that:

H3: Employee motivation mediates financial indicators and employee resilience.

Methods

Data collection and sample

To test the hypotheses formulated above, we built a database that combined two sources of information. First, we conducted a survey to collect data from five major monobrand retailers in various sectors in Italy. In total, over 3000 questionnaires were sent to sales assistant and store managers, of these, 1752 workers completed the questionnaires. Due to excessive missing values, 289 observations were dropped, resulting in a final sample of 1463 participants and a 58.4% response rate. Most participants were female (83.25%), and were 26-35 years old (36.71%). Second, for financial data, we exploit the financial statements available in the AIDA (Analisi Informatizzata Delle Aziende) database by Bureau Van Dijk, which is the Italian subset of the Orbis/Amadeus database, collecting information on "all Italian companies" that are required to file their accounts. The AIDA database accounts for more than 6.49 million companies and cooperatives as of March 2025 and has been widely used in other Italian studies.

Measures

We used measures validated in prior research. Financial indicators (i.e., total assets, labor cost, and turnover rate) were measured using the average of total assets, labor cost per employee, and turnover per employee, adjusted for firm size, based on data from the AIDA dataset for the study period (2015–2022). For employee motivation, we relied on three items adapted from Gagné et al. (2010), validated in previous studies. Respondents answered the items using a five-point scale (1 = never to 5 = always). A sample item is: "I enjoy this work very much." The Cronbach's alpha for this scale was 0.823. For employee resilience, we used three items developed by Näswall et al. (2019), namely "I successfully manage a high workload for long periods of time.", "I effectively collb -orate with others to handle challenges at work.", and "I use change at work as an opportunity for growth." Cronbach's alpha for this scale was 0.825. Control variables included in the analyses are gender (1 = male, 0 = female), age (1 = 18-25, 2 = 26-35, 3 =36-45, 4=46-55. 5=56-65 and 6 = ≥ 65), worker role (1 = sale assistant, 0 = store manager), and employment contract (1 = permanent contract, 0 = temporary).

Analytical procedure

This study employs Structural Equation Modeling (SEM) and excludes observations with over 10% missing data to prevent bias. To identify possible outliers and control the risk of multicollinearity, we calculated Mahalanobis distances, and the variance inflation factors (VIFs) respectively. The results ruled out the possibility for outliers and the VIFs, including for all interactions, amounted less than 2, which were far from the threshold of 10, suggesting there is no issue of multicollinearity (Menard, 1995).

To assess the extent to which the five variables were distinct, a Confirmatory Factor Analysis (CFA) was conducted. The assumptions about a good model fit analyzing absolute, relative, and parsimonious indices as well as constructs' reliability and validity were checked. Subsequently, to test the hypotheses, we conducted a path analysis to estimate coefficients. In addition to the check of direct effects, we used the bootstrapping technique to estimate indirect effects. Data were bootstrapped with 5000 sample replications and 95% confidence intervals. Also, the representation of the significant moderation effect between the standardized variables (Aiken et al., 1991) was provided. Finally, the mediation effect was evaluated.

Results

Hypothesis testing

Means, standard deviations, and correlations among the variables are reported in Table 1.

Table 1: Descriptive statistics and correlations

		Mean	SD	1	2	3	4	5	6	7	8	9	10	11	12
1	Employee resilience	.017	.727												
2	Employee motivation	.036	.716	.44											
3	Total assets	8.50	195.87	-.02	-.00										
4	Turnover	1.08	.324	-.05	-.08	.93									
5	Labor costs	9.85	.401	.07	.09	-.72	-.86								
6	Age	2.62	1.049	.07	.09	-.10	-.19	.01							
7	Work role [a]	.648	.478	-.16	-.20	.05	.12	-.05	-.23						
8	Gender [b]	.833	.374	.01	.12	.13	.04	.11	-.02	.16					
9	Permanent contract	.751	.433	.02	-.01	-.22	-.19	.14	.30	-.23	-.02				
10	Employee flexibility	.012	.558	.55	.34	-.02	-.03	.07	-.05	-.16	.04	.02			
11	Perceived organization support	.027	.863	.32	.63	-.02	-.09	.07	.07	-.09	.09	-.01	.22		
12	Organizational training	-.041	105.63	.19	.42	-.09	-.12	.00	.13	-.13	.00	.03	.12	.66	
13	Job satisfaction	.036	.829	.35	.76	.00	-.07	.08	.10	-.25	.09	.01	.26	.64	.41

Note: Coefficients greater than .06 are significant at p < .01 (two-tailed); Number of observations = 1463.

a. The reference group is store manager.

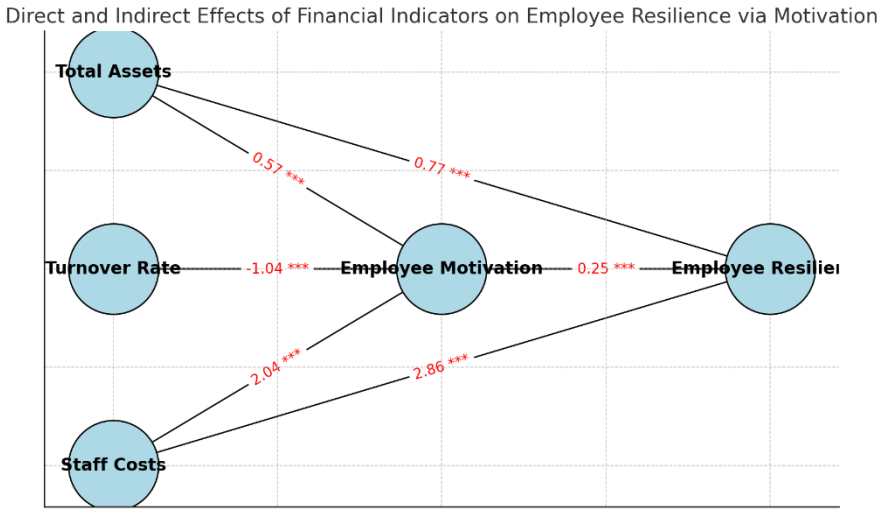
b. The reference group is female.

Direct effects of the control variables are reported in Table 2.

Table 2: Direct effects of the control variables

	Motivation	Resilience
Age	.02 (.01)**	.04*** (.01)
Work role (sales assistant)	-.05 (.02)**	.01 (.03)
Gender (female)	.06 (.03)**	-.04 (.04)
Permanent contract	-.06 (.02)**	.003 (.03)
Employee flexibility	.17 (.02)***	.59*** (.03)
Perceived organization support	16 (.02)***	.06 ** (.03)
Organizational training	.02 (.01)	-.01 (.02)
Job satisfaction	.48 (.02)***	.007 (.03)

Note: standard errors in parentheses. *p < .10, **p < .05, ***p < .01



Bootstrapping analyses were used to test the mediation effects. Table 3 shows the estimates of the indirect effects and the bootstrap confidence intervals. Statistically significant relationships are represented by the intervals which do not include 0. Figure 1 reports that while total assets and staff investment (i.e. labor cost per employees) positively related to employee motivation (β =.57, p < .001) and (β =2.04, p < .001) respectively, employee turnover negatively relates to employee motivation (β =-1.04, p < .001), supporting partially Hypothesis 1. As for H2 our findings suggest that employee motivation is positively relate to employee resilience ((β =.25, p < .001), supporting Hypothesis 2. Results in Table 3 also reveal a positive significant indirect effect of financial indicators on employee resilience (estimate = .20, CI [.04, .23] for total asset; estimate =.50, CI [.16, .84] for labor costs and estimate = -.25, CI [-,43 -.08] for employee turnover). However, Hypothesis-3 is partially accepted since the direct effect of financial indicators on employee resilience is significant (see Figure 1).

Table 3: Indirect effects and moderated mediation

	estimate	95% CI
Indirect effects		
Total assets →Motivation →Resilience	.20	[.04, .23]
Labor costs → Motivation → Resilience	.50	[.16, .84]
Turnover→ Motivation → Resilience	-.25	[-.43, -.08]

Note: CI = confidence interval (bootstrap)

Figure 1:

Robustness test

To address the potential for common method bias (CMB), which can arise from collecting all measures from the same source at the same time, we implemented several strategies. First, we adhered to the guidelines proposed by Podsakoff et al. (2003) during the survey design. To create psychological separation, we included additional questions about workers' years of experience and employment time (e.g., full-time, part time: 10-20 hours or more than 20 hours per week), divided the survey into sections with detailed introductory instructions, and required respondents to refocus their attention before moving to the next section. Free-text boxes and varied rating scales were also incorporated to capture respondents'

opinions and reduce monotony before completing subsequent scales. We complemented these design measures with Harman's one-factor test (Harman, 1976) using exploratory principal components factor analysis. The analysis indicated that the variance explained by a single factor was below the commonly accepted threshold of 50%. Subsequently, following prior literature, we assessed CMB using the common latent factor (CLF) technique (Clarke & Higgs, 2020) to calculate the percentage of variance attributable to CMB. In this process, we introduced a CLF and constrained its factor loadings to be equal with all indicator variables. We then ran both models (with and without the CLF) for comparison. Our analysis indicated that the inclusion of the CLF did not significantly alter the parameter estimates, and the variance explained by the CLF was 0.10, well below the 0.2 threshold, suggesting no significant CMB.

Discussion

The present study sheds light on three aspects of financial indicators-total assets, labor costs and turnover rate-and their association with employee motivation as a mechanism facilitating employee resilience. It also contributes to the related literature in several ways.

First, our findings highlight the significant role of financial indicators in shaping both employee motivation and employee resilience, although the impact varies depending on the specific indicator considered. This result aligns with prior research suggesting that individuals' work-related attitudes and behaviors are influenced by financial stability and organizational resource availability (Prysmakova et al., 2019; Deci & Ryan, 2000). Our results confirm that financial stability measured through total assets and labor cost investment positively influences employee motivation. This finding supports the COR theory (Hobfoll, 1989), suggesting that employees seek to preserve and accumulate resources that provide a sense of security and career growth. When organizations allocate financial resources effectively (i.e. through competitive salaries, training investments, job security or better wellbeing) employees perceive greater value in their roles, which enhances intrinsic motivation (Gagné & Deci, 2005). However, we also found that high turnover rates negatively impact motivation, possibly due to heightened job insecurity and instability. Frequent employee departures may disrupt workplace cohesion, leading to uncertainty about career progression and reducing autonomy, competence, and relatedness-the core psychological needs essential for intrinsic motivation (Deci & Ryan, 2000). This underscores the importance of retention strategies and stable employment policies in sustaining motivation levels.

Second, and consistent with our expectations, we found employee motivation was positively linked to resilience, indicating that motivated employees are better equipped to handle stress, adapt to change, and maintain performance under challenging conditions (Youssef & Luthans, 2007). Employees who find their work engaging and aligned with their values are more likely to perceive challenges as opportunities rather than threats (Robertson et al., 2015). Furthermore, motivation fosters higher levels of psychological capital, which strengthens coping mechanisms and resilience in demanding work environments (Luthans et al., 2020). Third, our findings also confirm that employee motivation mediates the relationship between financial indicators and resilience, meaning that financial stability alone does not directly (but partially) enhance resilience; rather, it works by fostering a motivated workforce. This aligns with previous studies suggests that organizational resources (e.g., financial stability) promote motivation (Bakker & Mostert, 2024), which in turn strengthens employees' ability to manage stress and adversity. This mediation effect highlights a critical implication that simply improving financial performance does not automatically lead to a resilient workforce. Instead, organizations must ensure that financial investments are directed toward employee motivation (maybe by enhancing employee well-being, development, and job satisfaction).

While this study provides valuable insights, it has some limitations. First, the reliance on self-reported cross-sectional data may introduce biases such as CMB, and prevent a causal interpretation of the relationships. Future research could incorporate longitudinal data or objective performance measures to validate these findings. Additionally, cultural and industry differences may moderate these relationships, suggesting the need for cross-country comparisons to explore how financial indicators impact employee motivation and resilience in diverse economic settings.

Conclusion

Overall, this study highlights that financial indicators play a crucial role in shaping employee motivation, which in turn enhances resilience. However, the impact of financial stability varies depending on the specific indicator, while higher total assets and staff investment boost motivation, high turnover undermines it. These findings suggest that financial stability alone is not enough and organizations must strategically allocate resources to foster motivation and thereby their employee resilience.

Market demand shocks, bottom-up approach to firm's risk analysis, and risk-return arbitrages

ANTONIO RENZI[1] PIETRO TARAGONI[2] GIANLUCA VAGNANI[3] PAOLO SAONA HOFFMANN[4]

Abstract

In recent decades, firms have increasingly faced shocks in demand caused by factors both endogenous and exogenous to the economic system. Indeed, in several industries, mainly in those characterized by strong interconnections with other industries and with the dynamics of macroeconomic variables, firms are increasingly subject to extraordinary positive and negative change in demand for their goods. In this vein, the risk-return profile of individual firms tends to alternate optimal conditions with suboptimal ones. The present paper aims to develop a theoretical framework focused on the opportunity to exploit positive and negative shocks in demand to take advantages in terms of risk-return arbitrages. To this end, our analysis emphasizes the role of unlevered risk (or operating risk) decomposition according to a managerial logic. This implies a risk-return modelling partially in contrast with traditional risk-return models coming from canonical financial theory.

Framing of the research. *We adopt a theoretical framework based on previous research that look at firm's risk analysis as a kind of puzzle where internal firm's features act as factors that amplify or mitigate the positive relationship between firm's risk and firm's expected profitability. Therefore, our theoretical framework is based on a bottom-up approach, i.e., on the main independent variables with respect to corporate performance volatility. Such independent variables are the firm's structural leverages and the volatility of the competitive environment.*

The application of traditional risk-return analysis requires adaptation processes concerning the internal features of the firm, its competitive environment and also its ability to apply risk transfer mechanisms that allow smooth corporate performance over time (Renzi, Taragoni, Vagnani, 2024; Vagnani, Renzi, Taragoni, 2025). In this vein, the present paper aims to deepen the following two topics: i) the bottom-up approach to measurement of unlevered specific risk (or unlevered idiosyncratic risk); ii) the conceptualization, in both quantitative and logical terms, of the exploitation of risk-return arbitrages based on management of the firm's real side, rather than its financial side. We define a bottom-up approach as a risk return analysis based on internal firm's fundamentals. It is in contrast with a top-down approach typically based on market model.

Finance and management studies have argued a close interlinking between firm's competitive environment and firm's risk-return profile: the drag effect of capital market returns on the return of an individual stock tend to be more intense in those industries characterized by high volatility. For instance, firms belonging to industries characterized by strong technological innovations, high cyclicality of demand and/or changes of price and cost per unit are, at an aggregate level, highly exposed to systemic risk. In this regard, financial analysts look at the volatility of a given industry as a proxy to reach volatility of those firms belonging to it. This kind of approximation is adopted especially in measuring unlevered risk of unlisted firms. Thus, according to this approach, each industry (or a sub part of it including comparable firms) is conceived as a sort of homogeneous cluster in terms of unlevered risk-return. From a practical point of view, the assumption according to which the firm performances volatility is strongly influenced by the industry where the firm works arises as the easiest manner to classify economic activities according to a risk-return perspective. However, this general logic, although widely adopted, appears limited in its scope as it does not allow to figure out the role played by specific firm's factors that affect the actual risk-return trade-off.

In fact, the general relationship between volatility at the industry and individual firm levels does not mean that idiosyncratic and systematic risk are completely exogenous to firm's strategies, its internal efficiency, kinds of investments, propensity in making innovation, organization capabilities, etc. Therefore, managerial actions may produce very different outcomes between the average industry's performance volatility and that of the firm. Furthermore, the size of the firm and its market power contribute to the misalignment between the volatility of the firm's performance and the average one at the industry level.

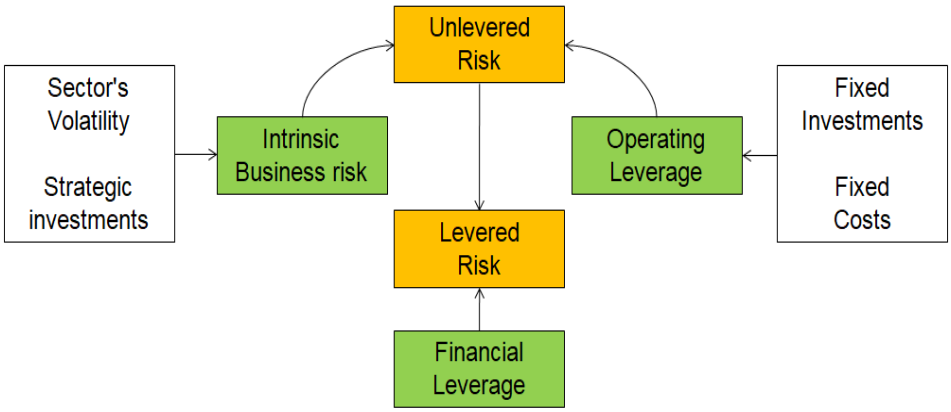
The bottom-up approach to risk-return analysis is rooted in the explication of firm's risk drivers coming from both the firm features and the environment where it operates. Internal drivers, which can be reached mainly from (current or expected) accounting data, arise as structural leverages, connected to the firm's real and financial structures. Conversely, environmental drivers are that part of volatility caused by competitive environment and thus qualify like determinants of business risk.

Adopting this perspective, the focus of the risk-return analysis concerns the combination of the firm's real/financial profile and its exposure to the degree of volatility inherent to its core business.

The main advantages of the bottom-up approach can be traced to:

- *greater differentiation of firms due to their strategic, industrial and financial features;*
- *the possibility to carry out risk-return estimation according to managerial logic, that is, oriented toward business control and planning, rather than short-term financial speculation;*
- *Solving practical problems on how to measure the systemic risk of unlisted companies, for which it is not possible to adopt in a straightforward way a top-down logic, based on the Market Model, which involves the estimation of a regression curvebased on the collection of historical data, referring to share prices.*

Furthermore, the bottom-up approach can be used for assessing the information efficiency of the capital market: the capital market capacity to discount fundamentals of listed firms is all the greater the more the results obtained using the bottom-up approach tend toward those resulting from the use of top-down one (Market Model). However, when comparing bottom-up estimates with top-down ones, consideration must be given to the subjective utility functions referring to different types of investors. For instance, in the case of an investor interested in short-term speculation, the effect exerted by corporate fundamentals on risk has a marginal relevance, in the sense that it is relevant only to the extent that corporate fundamentals produce short-term consequences on returns and stock prices. In contrast, for an investor interested in long-term speculation and/or active participation in the management of the issuing firm, the relationship between firm risk and their structural variables takes on greater significance with respect to asset allocation decisions.



Thus, the bottom-up approach needs a twofold contextualization: objective contextualization related to the characteristics of the firm; subjective contextualization concerning the investor pursuing a given equity investment.

In the following paragraphs, we assume, on the one hand, the perspective of the investor interested in the link between a firm's structural characteristics and its exposure to risk and, on the other hand, the perspective of the firm's manager interested in breaking down the drivers of firms' corporate volatility in order to inquire the managerial actions that make possible a change to the firm's risk-return trade-off.

In general, the bottom-up approach enriches risk-return analysis through the explication of firm's parameters, and it appears necessary especially when firm's risk estimation does not pursue strict financial objectives but qualifies as a decisional support tool.

Studies in bottom-up analysis (see among others: Blazenko, 1996; Griffin, Dugan, 2003; Hill, Stone, 1980; Huffman, 1989; Mandelker, Rhee, 1984; Peterson M. A., 1994; Renzi, 2012; Renzi, Sancetta, Orlando, 2012; Rubinstein, 1973) have identified intrinsic business risk, degree of operating leverage, and financial leverage as drivers of firm's risk (Figure 1).

Fig. 1: Firm's risk drivers

Intrinsic business risk concerns the volatility of revenues (thus the volatility related to demand and unit selling prices), induced by business choices and/or environmental factors. According to Chung (1989), every firm faces an intrinsic business risk mainly due to the cyclicality of its industry. From this perspective, intrinsic business risk emerges as an exogenous risk with respect to managerial choices.

When intrinsic business risk originates from exogenous forces, it is also referred to as environment risk (Pellicelli, 2004). Assuming this logic and reasoning in terms of systematic risk, unlevered beta is strongly influenced by intrinsic business risk, as the volatility that at any given time acts across all enterprises belonging to a certain industry.

However, Ross, Westerfield, and Jaffe (2002) have remarked that revenue volatility can also be caused by endogenous items. For instance, a firm's high propensity for innovation generates discontinuities regarding the sales volumes and prices it is able to pursue. This is true, for example, when the search for innovative products and/or processes is carried out internally through intensive R&D (Ho, Xu, Yap, 2004, p. 400).

However, it appears complex to make a sharp decomposition of intrinsic business risk into two distinct areas: the area of exogenous intrinsic business risk and that relating to the endogenous one. These areas, in fact, may have correlations, positive or negative, that are particularly fuzzy.

In the presence, for example, of radical innovations promoted by the company and parallel instability of certain macroeconomic or industry's factors, it is complex to establish the extent to which demand volatility is due to company decisions, or to dynamics that cannot be governed at the level of an individual firm. On the other hand, it is proper to assume that in some circumstances the endogenous and exogenous components of intrinsic business risk assume inverse trends. This could occur when innovation isolates the firm from external volatility factors. Consider, for example, the case of a product innovation whereby the firm creates a new target market. In this hypothesis, on the one hand, the firm self-generates a process of intrinsic business risk, due to the discontinuity inherent in the innovation; on the other hand, the firm eliminates the risk associated with the cyclicality of demand characterizing the initial industry to which it belongs.

Anyway, the intensity of intrinsic business risk on the volatility of operating results depends on the rigidity of costs and, therefore, on the structural profile of the firm. As fixed costs increase, in fact, the elasticity of EBIT (operating income) to sales revenues increases. This elasticity depends on the degree of operating leverage, which arises as an internal item of corporate performance volatility. The degree of operating leverage generates greater volatility in operating results than intrinsic business risk: in the case of high levels of operating leverage, small changes in revenues cause high percentage changes in EBIT. Firms operating with a higher leverage level than the average industry one have an advantage over their competitors in terms of potential exploitation of economies of scale, under conditions, however, of higher unlevered risk. Therefore, this kind of leverage takes on a twofold significance with respect to the evolutionary dynamics of the firm: it highlights the possibility, on the one hand of achieving improvements in profitability by leveraging sales, and on the other hand of not being able to adjust fixed costs to possible negative economic trends (Brigham, 1995, p. 425).

In summary, the combination of intrinsic business risk and operating leverage gives rise to unlevered risk (or operating risk), which is the volatility of firm performance tied to investments in real assets.

In unlevered conditions, endogenous equity cost management can take place within the limits of operating leverage maneuverability. These limits mostly depend on the three following factors: sunk costs which are the barriers to exit from certain activities; a minimum level of slack resources necessary to ensure the company's ability to adapt to new; scenarios and/or rapidly exploit growth opportunities; the expectations of stakeholders inside and outside the firm that often push management to accept, in order to safeguard "relational capital", losses in economic efficiency.

In levered conditions, financial risk must be added to unlevered risk, i.e., the instability that the capital structure produces on economic dynamics and the degree of capital placed to cover firm risk. To obtain the levered risk (total risk), it is necessary also to consider the effects that financing decisions of corporate assets have on the variability of net results and the adequacy of equity. This means that debt acts positively on the shareholder's minimum expected return (Modigliani, Miller 1958). Moreover, at a certain level of financial leverage the capital structure also amplifies the return expected by creditors because of the risk of financial distress, i.e., the possibility that the firm's equity may not be sufficient to cover large economic losses; in addition, there are additional costs, coming from the link between over-indebtedness of the firm and loss of trust in it by business stakeholders.

Purpose of the paper. *The paper's purpose is to conceptualize, in both quantitative and logical terms, the link between positive or negative shocks in demand and the firm's ability to exploit such shocks in terms of risk-return arbitrages.*

Methodology. *We adopt a theoretical methodological approach, which will be empirically tested in subsequent works. However, in developing our theoretical model we refer to the relationships between independent variables and the risk-return profile of the firm that have already been tested empirically and are easily demonstrated even through simple simulations.*

We begin by modeling the bottom-up approach to firm's unlevered risk analysis against shocks in market demand. In the following analysis we assume ROI (return on net investments) volatility as a proxy of unlevered specific risk ($\square_u$). In particular, given a certain probability's distribution, the IBR equals to:

$$\sigma_u = \sqrt{\sum_{i=1}^{n} p_i (ROI_i - \widetilde{ROI_i})^2} \quad [1.\text{a}]$$

Where ROI is given by the ratio between EBIT (Earnings Before Interest and Taxes) and NI (net investments). $\widetilde{ROI}$ *is the notation about expected average ROI over n scenarios:*

$$\widetilde{ROI} = \sum_{i=1}^{n} p_i(ROI_i)$$

Assuming historical data as proxy of expect results, □u is given by:

$$\sigma_u = \sqrt{\frac{\sum_{i=1}^{n} p_i(ROI_i - \widetilde{ROI_i})^2}{n}} \quad [2.a]$$

Equations [1] and [2] can be broken down as a function of intrinsic risk, degree of operating leverage and ROI's level.

The intrinsic business risk (IBR) is normally measured as a standard deviation of revenues (V) calculated stochastically or on historical data:

$$IBR = \sqrt{\left(\sum_{i=1}^{n} p_i(V_i - \tilde{V})\right)^2} \quad [3]$$

Where $\tilde{V}$ is the notation about average expected revenue:

$$\tilde{V} = \sum_{i=1}^{n} p_i(V_i)$$

Or assuming historical data as proxy of expect results, IRR is given by:

$$IBR = \sqrt{\left(\sum_{n=1}^{n} \frac{(Vi - \bar{V}}{n}\right)^2} \quad [4]$$

Where $\bar{V}$ is the notation about average revenue historically archived.

The Degree of Operating Leverage (DOL), as an endogenous driver of EBIT variability, can be measured by adopting a direct or an indirect approach. Adopting the directapproach, DOL is measured in the period between t_0 and t_1, as follows:

$$DOL = \frac{\frac{\Delta EBIT}{EBIT_{t0}}}{\frac{\Delta V}{V_{t0}}} = \left(\frac{\Delta EBIT}{EBIT_{t0}}\right)\left(\frac{V_{t0}}{\Delta V}\right) \quad [5]$$

Where EBIT is earnings before interest and taxes (operating income) and V sales revenue.

Imagining carrying out the analysis at time t_0, the application of Equation [5] requires estimating the expected trends of EBIT and V.

The indirect approach, on the other hand, allows us to determine the above elasticity degree by using values already accounted (Dugan, Shiver, 1992). This approach of estimatingoperating leverage assumes that the expected change in revenues is realized at the same fixed costs (FC), and unit contribution margin equal to the difference between the unit selling price (p) and the variable unit cost (c).

Specifically, because $EBIT_{t0} = V_{t0} - VC_{t0} - FC_{t0} = Q_{t0}(p - c) - CF_{t0}$, the Equation [5] can be replaced, in terms of Potential Degree of Operating Leverage (DOL_P):

$$DOL_P = \left(\frac{\Delta EBIT}{EBIT_{t0}}\right)\left(\frac{V_{t0}}{\Delta V}\right) = 1 + \frac{FC}{EBIT_{t0}} \quad [6]$$

With constants CF and p-c; non-constants Q

Where: Q are the quantities produced and sold; p - c is contribution margin per unit, and VC are variable costs (cQ).

Equation [6] shows that firm's vulnerability against shock in demand of its output mainly depends on fixed costs, as the elasticity of operating results to revenues mostly depends on the degree of cost rigidity (Ho, Xu, Yap, 2004, p.

396). For example, two firms working in the same industry with equal competitive ability but differentiated in terms of the incidence of fixed costs as a percentage of total costs, are characterized by a different elasticity of operating results to demand trends (De Medeiros, Gustosa, Dantas, 2006).

Now, maintaining the assumption of constants contribution margin per unit (p-c), net investments (NI) and fixed costs, the unlevered risk (□u), i.e. the standard deviation of ROI, can be decomposed as follows:

$$\sigma_u = \sqrt{\sum_{i=1}^{n} p_i \left(ROI_i - \widetilde{ROI}\right)^2} = \frac{IBR}{\widetilde{V}} \cdot \left|DOL_P\right| \cdot \left|\widetilde{ROI}\right| =$$

$$= \frac{IBR}{\widetilde{V}} \cdot \left|1 + \frac{FC}{\widetilde{EBIT}}\right| \cdot \left|\widetilde{ROI}\right| \quad [1.b]$$

In Equation [1.b], both the potential degree of operating leverage and the average expected ROI are calculated in absolute value, as volatility only makes logical sense if it takes on positive or zero value[5].

Basically, Equation [1.b] consists of transforming the analysis of operating elasticity into that of unlevered volatility.

Both Equations [1.b] and [2.b] are consistent with the risk-return logic. Indeed, the average ROI, calculated as an expected probabilistic value or deriving from the observation of historical data, is positively correlated with the standard deviation □u. According to Equation [1.b], the average expected ROI is given by:

$$\widetilde{ROI} = \frac{\sigma_u}{\frac{IBR}{\widetilde{V}} \cdot DOL_P} \quad [7]$$

Basically, Equation [7] expresses the positive or negative expected return as the transformation rate of the risk drivers into unlevered volatility, caused by expected volatility of market demand.

Results. *The management can use the above risk-return decompositions in order to reach the proper trade-off between operating profitability and unlevered volatility, linked just to dynamic of goods' demand, taking into account the firm's evolutionary phase, its strategic objectives, and the related risk propensity of the shareholders. In other words, the proposed approach allows the search for optimal conditions (in both objective and subjective terms) about the firm's risk-return profile, by acting on firm's fundamentals.*

Of course, the maneuverability of independent variables is not absolute. For instance, the reduction in fixed costs, aimed at decreasing the dependence of ROI dynamic to market demand volatility, should be carried out in compliance with constraints concerning the minimum production necessary to satisfy current and/or estimated demand, the carrying out of administrative and other activities, different forms of sunk costs, etc. Also, strategies focused on an increase of expected ROI would be done taking into account several limits, especially in terms of the maximum level of sustainable unlevered volatility.

Furthermore, in Equation [7] the expected ROI is expressed recursively with respect to its determinants, the latter in turn related to each other. For example, each choice concerning the fixed costs' size acts simultaneously on: EBIT (therefore on ROI) and DOLP. The same reasoning works with respect to other independent variables, such as expected sales revenues, variable costs, price and cost per unit.

Therefore, the risk-return optimization against market demand volatility arises as a kind of managerial puzzle, where the search for the proper combination between expected average ROI and unlevered volatility can be carried out through an arbitrage's perspective between the variables in play. This approach requires as fundamental conditions the ROI's growth without new investments and incremental risk. Indeed, an arbitrage advantage arises when the economic agent can increase his or her profitability, keeping stable both volatility and the amount of capital employed.

Given the level of net investments, the risk-return relationship improves with each improvement in internal efficiency. In other words, rationalization processes in the use of internal resources lead to an increase in the expected average ROI for a given of unlevered risk. In this vein, risk-return optimization depends strongly on the exploitation of margins efficiency in internal resources. It implies a possible arbitrage profit typically linked to a rationalization at an organizational level or to processes of fixed costs' externalization, for example, through the outsourcing of activities that stiffen operating costs, i.e., activities acting positively on potential operating leverage.

On the other hand, the ROI's growth is based on an improvement in contribution margin, deriving for example from a greater price per unit as a consequence of higher costumers' awareness about the intrinsic value of the goods produced by the firm. It arises as incomplete arbitrage since the increase in ROI corresponds to an increase in unlevered risk.

5 Obviously, if such variables are positives, it is not necessary to use the absolute value notation (| …|).

Therefore, in the context of a static analysis, where fixed costs can vary since firm's structure changes but within the chosen structure remain constant against the scenarios associated with the expected demand, these kinds of arbitrages are framed as follows:

- *complete arbitrage, i.e., growth in expected ROI, linked to a lower level of fixed costs which is assumed as constant for each scenario regarding expected demand;*
- *incomplete arbitrage, i.e., growth in expected ROI, linked to a higher level of contribution margin (sales revenue - variable costs).*

Formally, assuming growth in expected ROI and positive DOL_P, the complete arbitrage can be framed as follows:

Complete arbitrage

$$\sigma_{u(\text{st.B})} = \sigma_{u(\text{st.A})}$$

$$\frac{IBR}{\widetilde{V}} \cdot \left(1 + \frac{FC_{(\text{st.B})}}{EBIT_{(\text{st.B})}}\right) \cdot \widetilde{ROI}_{(\text{st.B})} - \frac{IBR}{\widetilde{V}} \cdot \left(1 + \frac{FC_{(\text{st.A})}}{EBIT_{(\text{st.A})}}\right) \cdot \widetilde{ROI}_{(\text{st.A})} = 0$$

$$\left(1 + \frac{FC_{(\text{st.B})}}{EBIT_{(\text{st.B})}}\right) < \left(1 + \frac{FC_{(\text{st.A})}}{EBIT_{(\text{st.A})}}\right); \; \widetilde{ROI}_{(\text{st.B})} > \widetilde{ROI}_{(\text{st.A})}$$

Where st.A and st.B are notations of firm's state A and firm's state B, each characterized by a certain level of fixed costs.

In the case incomplete arbitrage, the growth in expected ROI coming by an increase in the contribution margin determines the following risk-return effect into the same firm state (stA; stA):*

Incomplete arbitrage

$$\sigma_{u(\text{st.A*})} > \sigma_{u(\text{st.A})}$$

$$\frac{IBR}{\widetilde{V}} \cdot \left(1 + \frac{FC_{(\text{st.A*})}}{EBIT_{(\text{st.A*})}}\right) \cdot \widetilde{ROI}_{(\text{st.A*})} - \frac{IBR}{\widetilde{V}} \cdot \left(1 + \frac{FC_{(\text{st.A})}}{EBIT_{(\text{st.A})}}\right) \cdot \widetilde{ROI}_{(\text{st.A})} > 0$$

$$\widetilde{ROI}_{(\text{st.A*})} > \widetilde{ROI}_{(\text{st.A})}$$

The above arbitrage types (complete and incomplete arbitrage) are based on the idea that the firm can assume different structural states, each characterized by a stable level of fixed costs. When the expected ROI's growth depends on a change in the structural state, thanks to the achievement of efficiency objectives in terms of reduction in fixed costs, an optimization process arises, i.e., expected ROI's growth for a given level of risk. Conversely, when the expected ROI's growth does not envisage a new structural state, therefore is pursued without changing the level of fixed costs, the arbitrage is limited, as the expectation of growth in profitability implies greater unlevered risk. As a result, an incomplete arbitrage derives from the decision to increase the expectation of profitability, without making new investments but increasing the level of unlevered risk with respect to demand volatility.

Assuming full management awareness of the risk-return effects, actions aimed at incomplete arbitrage characterize firms with a high propensity to support a higher unlevered risk for taking a higher operating profitability. However, it would be wrong to frame complete and incomplete arbitrage only from a subjective point of view. Indeed, complete and incomplete arbitrages depend on several objective factors such as the actual possibility to reduce fixed cost, the maneuverability of purchase and sales prices, technological innovations, etc.

Furthermore, the above considerations regarding arbitrage in terms of risk-return trade-off must be contextualized in a medium-long term perspective. For instance, the benefit, in terms of risk-return trade-off, deriving from a reduction in fixed costs could, in the medium run, lead to a decrease in profitability. It could happen if this manner to improve efficiency would reduce the key resources on which the firm can leverage to maintain or improve its competitive advantage.

Ultimately, based on our theoretical model, we argue that structural flexibility allows to increase the expected profitability for a given level of risk, the latter considered in terms of symmetric volatility. In particular, given the volatility in expected demand, the results deriving from our theoretical are the following: the decomposition of idiosyncratic operating risk; the identification of possible risk-return arbitrages. In this regard, our theoretical framework suggests two kinds of risk-return arbitrage: first, complete arbitrage that arises when, for a given level of unlevered risk, the growth in operating profitability occurs; second, incomplete arbitrage that arises when the growth in operating profitability is offset by a positive change in unlevered risk.

These kinds of risk-return arbitrage are closely linked to the firm's ability to combine a potential positive shock in sales revenues to structural efficiency improvements achievable in terms of internal processes or through outsourcing

mechanisms. In the opposite situation, that is, of a potential reduction in market demand, structural flexibility emerges as a sort of real option capable of partially immunizing the firm against potential crisis conditions.

Research limitations. *The paper represents the starting point for future research. Therefore, its main limitations are the lack of an empirical test about the proposed model and some simplifications about the dynamic of key variables.*

Managerial implications. *Our theoretical risk-return modeling allows us to look at risk-return trade-off according to managerial logic, that is, oriented toward business control and planning, rather than short-term financial speculation. Furthermore, our theoretical proposal assumes managerial importance, as it provides the tools to maneuver the risk-return trade-off, seeking optimal conditions from both a subjective and objective points of view, the latter linked for example to the risk propensity of management.*

With regard the proposed arbitrage puzzle, our approach could allow firms to scale operations up or down based on demand fluctuations, minimizing exposure to negative demand shocks while maintaining efficiency during positive demand spikes. Likewise, managers can optimize the DOL by reducing fixed costs during periods of high market volatility, and increase fixed costs during periods of stable or growing markets. Finally, implementing a dual arbitrage strategy. Under complete arbitrage, managers should prioritize structural efficiency improvements to achieve higher expected ROI without additional risk (e.g., reducing fixed costs through automation or outsourcing); whereas under incomplete arbitrage, when demand allows, firms can increase contribution margins through price adjustments, but they must accept a higher unlevered risk. Therefore, the proposed theoretical framework assumes particular relevance in a logic of ambidextrous organization, in terms of adopting exploration and exploitation strategies with respect to demand positive and negative shocks (Tushman, O'Reilly III, 1996; He, Wong, 2004; Gatti, Volpe, Vagnani, 2015).

Originality of the paper. *The paper, although linked to previous theories and models, develops a new risk-return modeling that can lead to a reworking in the risk management of non-financial firms as well as in the firm's evaluation processes with particular reference to the cost of capital estimation.*

Key words*: shock in demand sales; unlevered risk; risk-return arbitrage; bottom-up approach*

Managerial Capabilities Revisited: A Bibliometric Journey Through Theory and Practice

MARIA GRAZIA STRANO[1]

Abstract

This paper provides a domain-based literature review of managerial capabilities, based on a bibliometric analysis, aiming to synthesize existing research and delineate potential future research trajectories. In an evolving and increasingly competitive business environment, firms must continuously adapt, positioning managerial capabilities as a pivotal element in sustaining competitive advantage. This study explores the theoretical evolution of managerial capabilities, distinguishing between dynamic capabilities - concerned with resource reconfiguration - and managerial capabilities, which encompass strategic decision-making, leadership, and the optimal allocation of resources.

The literature review highlights the interplay of managerial cognition, social capital, and human capital in the development of dynamic capabilities, and wants to answer the following research questions: What are the main topics related to managerial capabilities research, and how have these topics evolved over time? Which major theories can be applied to explain them?

Findings indicate a transition from conventional human capital theories to a more refined conceptualization of dynamic managerial capabilities. Furthermore, the study underscores the influence of external factors - such as digital transformation and market changes - on managerial roles and competencies. This research contributes to both academia and managerial practice, offering insights that can inform management training programs and policy development. It highlights the necessity of cultivating managerial capabilities that foster agility, innovation, and resilience within organizations.

Methodologically, the study follows a bibliometric approach, leveraging the Scopus and Web of Science databases while adhering to the PRISMA protocol. A sample of 190 peer-reviewed articles was examined using VOS Viewer and Bibliometrix software, revealing six thematic clusters, including managerial work, dynamic capabilities, compensation, and strategic transformation.

Although the study adheres to a rigorous methodological framework, certain limitations must be acknowledged, including potential selection biases and the rapidly evolving nature of the field. Nevertheless, this research serves as a foundational study, offering an integrated theoretical perspective that bridges existing gaps and provides a structured pathway for future inquiries into managerial capabilities.

Framing of the research. *In an ever-changing world, organizations need to keep up with the competitive environment for their survival and growth. In the last decades, the management and strategy literature has given more space to the study of managerial capabilities, due to their contribution to the firms' success in dynamic and competitive business landscapes (Teece, 2007; Helfat & Martin, 2015).*

Teece (2014, p. 328) *was the first to introduce in the management literature the concept of "capability", defining it as "a set of current or potential activities that utilize the firm's productive resources to make and/or deliver products and services". Whether ordinary or dynamic, these capabilities can be acquired through both organizational resources and histories, giving the chance to respond to changes in the environment* (Teece, Pisano, & Shuen, 1997). *A key element of the debate concerns the relationship between dynamic capabilities and managerial capabilities; while the former is tied to the company's ability to reconfigure its resources, the latter is generally defined as the set of skills, knowledge and experience that managers use to make strategic decisions, drive change and optimise corporate resources* (Adner & Helfat, 2003). *Thanks to their competences, managers can make decisions and manage resources, playing a central role in the business.*

The process of developing dynamic capabilities is highly dependent on the decisions and actions of managers, who find new value-enhancing combinations by aligning specialized assets; indeed, according to Teece (2007)*, the three key functions of dynamic capabilities (sensing, seizing and transforming) have to be possessed by managers and executives to recognise the opportunities, transform them into strategic actions and adapt them. Giving a broader explanation of these capabilities, sensing refers to the company's ability to detect changes in the market, new technological opportunities, customer needs or emerging threats. If the managers have strong analytical and cognitive skills, strategic*

DOI 10.7433/SRECP.SP.2025.01

vision, and external relations to gather critical information from partners, customers, competitors and institutions, they will be able to spot the opportunities before competitors. Once identified, managers' decision-making skills, leadership, and resource management allow the organisation to seize the chance for capitalising on it through investments, innovative approaches, and new strategies. Finally, because companies must continually adapt to change, they must implement resource reconfiguration and organisational adaptation (transforming). For this reason, executives must have skills that enable them to redefine processes, train employees, acquire new competencies and adapt the corporate culture (Teece, 2007). *Since managers drive the sensing, seizing and transforming processes, it could be said that dynamic capabilities do not exist without managerial capabilities. Improving managerial capabilities means making the organisation more agile, innovative and resilient.*

Notably, it is valuable to mention that while some studies adopt an organisational perspective, examining how managerial capabilities translate into dynamic business capabilities and influence the competitive advantage of the company (Eisenhardt & Martin, 2000; Augier & Teece, 2009; Teece, 2012), others focus on the individual level, analysing the role of managers in strategic development with its specific competences (Adner & Helfat, 2003; Helfat & Martin, 2015; Helfat & Peteraf, 2015). Among these, Adner and Helfat (2003) *pinpointed three essential foundations of dynamic managerial capabilities (DMC) that facilitate the orchestration of strategic change: managerial cognition, managerial social capital, and managerial human capital, which can be summarised as follows:*

- *managerial cognition: mental models and beliefs, mental processes, and emotions.*
- *managerial social capital: relationships, both formal and informal, that managers establish with individuals and can be used to obtain resources and information.*
- *managerial human capital: all the core characteristics that human capital comprises.*

Not only can these three aspects singularly characterise managers and their strategic actions but also associated with each other (Adner & Helfat, 2003). *In addition to this, external factors such as digital transformation, sustainability and global crises (e.g. COVID-19 pandemic) are redefining the role of managerial capabilities, introducing new challenges for managers.*

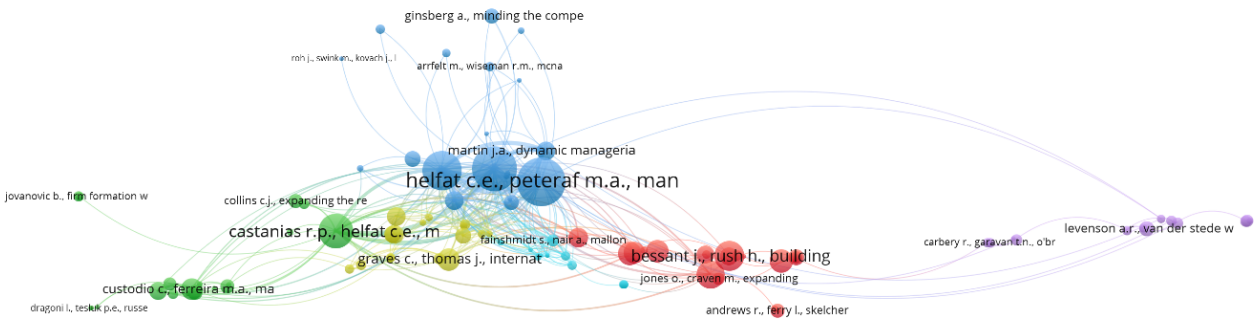
The above discussed represent the main theoretical foundations of managerial capabilities. Remarkably, the literature in this regard is fragmented; indeed, strategic success can be explained differently and with a different lens, depending on the aspects, strategies, resources and actors employed in the process. Furthermore, while the dynamic capabilities perspective focuses generally on their impact on strategic change, dynamic managerial capabilities theory proposes to investigate the managerial impact on strategic change. This theoretical fragmentation can be considered one of the gaps in the literature. Similarly, previous studies mainly address the listing or effect of certain capabilities, without exploring the extent to which managers' capabilities spread and are absorbed by the organisation. Finally, prior research suggests that there are sectoral differences in the effectiveness of DMCs, but there are not enough studies, for example, that explore whether different public sector institutions, such as municipalities, might require different managerial capabilities than others. For this reason, this bibliographic literature review includes within it studies that apply different frameworks and measurements, and that belong to various sectors, to structure this knowledge and lay the foundation for advancing it.

To sum up, this literature review aims at synthesising the state of the art of research, identifying key theoretical perspectives and proposing future directions for the study of managerial capabilities.

Purpose of the paper. *Managerial capabilities represent a key element in the managerial and strategic research landscape, as they directly influence the ability of firms to achieve and maintain a sustainable competitive advantage* (Adner & Helfat, 2003). *Although numerous studies have been conducted on this topic in recent years, the literature appears fragmented and characterised by heterogeneous theoretical approaches* (Helfat & Martin, 2015). *This fragmentation is given by the different approaches used to conceptualize, assess and evaluate the managerial competences in the various fields and sectors, making challenging the generalizations, as well as the comparisons. Additionally, the separation between dynamic capabilities and dynamic managerial capabilities has resulted in distinct research paths that do not always intersect, leaving important questions about their relationship and boundaries unresolved. In this regard, some yet unexplored aspects concern the development of DMCs (whether they are innate in managers or whether and how they can be developed), how they are used by organisations, how their impact on strategic success can be assessed, what role the manager's experience plays in the development of certain skills. It would also be interesting to investigate the extent to which DMCs help to overcome organisational rigidity and promote change and innovation. Finally, there is a lack of studies exploring how the internal and external context modulates the effectiveness of DMCs, where internal context, for example, refers to corporate culture and governance, and external factors such as geographical and cultural differences, market and regulatory changes. Hence, the purpose is to analyse the existing literature on managerial capabilities, providing a structured overview of the research conducted to date, and therefore try to unite both theoretical strands to give a single theoretical view on this topic, suggesting unexplored areas for future study.*

Specifically, this study will map the existing literature on managerial capabilities, classifying studies according to their theoretical perspectives, with the aim of analysing the evolution of research over time and proposing a future research agenda. Moreover, thanks to this analysis, it will be possible to study how the concept has transformed in response to changes in the economic and technological environment, evaluating possible gaps in the literature. Bibliometric analysis is needed to examine the role of managerial capabilities within established theoretical frameworks, shedding light on the analysis of temporal trends in academic publications, and highlighting how key themes have

changed since the 1990s. Furthermore, it is possible to assess the most widely used research methodologies and identify areas where research is still limited or contradictory.



Methodologically, the study is based on the analysis of academic literature published in peer-reviewed journals, using the Scopus and Web of Science databases to scrutinize the most relevant contributions. The application of software such as VOS Viewer and Bibliometrix will offer the chance to critically assess previous studies and thematic evolutions, highlighting emerging trends and potential areas for future development. In this context, using a bibliometric approach provides a clear advantage, allowing for a systematic and objective mapping of the field by identifying key scholars, dominant theories, and emerging research trends. Unlike traditional literature reviews, which mainly offer a qualitative summary, bibliometric analysis takes a data-driven approach to track how discussions on managerial capabilities have evolved over time and pinpoint areas that need further exploration. By applying advanced bibliometric techniques, this study moves beyond simply summarizing existing research, offering a deeper look into the structure of the field, uncovering theoretical links, highlighting gaps, and suggesting new directions for future studies.

The contribution of this research is threefold: to propose an up-to-date study that delves into the subject of managerial capabilities. Indeed, previous studies in the literature concern either dynamic capabilities or dynamic managerial capabilities, while the present study focuses on managers and their capabilities, both in the public and private spheres. The research offers practical implications for managers and policymakers. From an academic perspective, these findings add to the ongoing debate on the role and significance of managerial capabilities, shedding light on new directions for both theoretical exploration and empirical research. On a practical level, the study provides useful insights for managers and policymakers, helping them identify the most critical managerial capabilities in fast-changing business environments and offering guidance on how to strengthen them through focused leadership development and talent management initiatives. The analysis leads to a better understanding of managerial capabilities for driving change and innovation, giving insights for the development of management training programmes, and identifying which capabilities are most significant for success in business or public administration. By mapping key competencies, the research offers guidance on how organizations can enhance their leadership capabilities to foster agility, innovation, and resilience in dynamic environments. Finally, the study can propose an innovative theoretical model that synthesises the main contributions emerging from the literature, highlights theoretical connections and proposes new variables to be tested in future studies

Methodology. *To conduct this domain-based literature review, the guidelines indicated by Kraus* (2022) *and Paul and Criado* (2020) *were followed. This short paper reports a bibliometric analysis on which a systematic and critical analysis of articles dealing with 'managerial capabilities' will be developed later. The protocol applied for the selection of the articles is PRISMA. The databases used to search for articles were Scopus and Web of Science, showing papers that had the selected keywords in the title, abstract and authors' keyword published until 2024. These results were further filtered, considering business and economics as subject areas, English as language and peer-reviewed articles and reviews as document types. With this further selection, the search yielded 1178 results from Web of Science and 1855 from Scopus. The results were downloaded, duplicates removed and entered in an Excel sheet for mapping and analysis, resulting in a total of 2077 articles. By authors' choice, the ABS journal list was used, selecting articles in journals 3* and above. The list was reduced to 382 documents, which were individually studied by the authors, excluding articles that dealt with finance and did not have managers as their object of study. The authors also discussed a few doubts concerning the inclusion or exclusion of articles referring to different research areas, project managers and supply managers. After debating the reasons for inclusion, the decision was to consider the articles that developed these subjects in the corporate environment. This step reduced the sample of articles to 190. These were analysed with the VOS viewer software, considering articles that had at least 2 citations, bringing the selection down to 102 papers. The sample and individual clusters were then analysed with the software Bibliometrix.*

Results. *The final sample of articles contains 102 articles which, due to similarity, can be divided into 6 clusters (Figure 1).*

Fig. 1: Clusters from VOS Viewer

Analysing the total sample of the 102 articles, they span the period from 1981 to 2023. The three main sources are the Journal of Business Research, Strategic Management Journal and International Journal of Hospitality Management,

while the three main articles are Helfat and Peteraf's "Managerial cognitive capabilities and the microfoundations of dynamic capabilities" (2015), Adner and Helfat's "Corporate effects and dynamic managerial capabilities" (2003), and lastly, the one titled "Managerial resources and rents" by Castanias and Helfat (1991). *The first thing that stands out and can be deduced is that Helfat is recognized as one of the leading scholars in this field. Moreover, analysing these top three articles, it becomes evident that the first two focus on dynamic managerial capabilities, whereas the third article addresses managerial resources and their impact on a firm's competitive advantage. It highlights the relationship between managerial capabilities and corporate resources: indeed, the concept of Dynamic Managerial Capabilities (DMC) can be linked to the topic of corporate resources through the role of managers in recognising, configuring and transforming resources to generate and sustain a competitive advantage, linking back to the theoretical frameworks mainly used (resource-based view and dynamic capabilities). Corporate success relies not just on having resources, but also on managerial competence in deploying them effectively and efficiently.*

Focusing on the thematic map of keywords (Figures 2-3-4), it results in an evolution and specification of the concept of the human capital into capabilities and dynamic (managerial) capabilities. Figure 2 illustrates the thematic evolution of topics within the entire sample, dividing the analysis into two time periods with 2014 as a cutting point-chosen because the most influential article was published in 2015. Further detail provided in Figures 3 and 4 reveals specific topics and keywords addressed by previous studies in two distinct intervals: 1981-2014 and 2015-2023. These figures clearly show that while earlier research predominantly focused on concepts like 'resourcefulness' and related skills, in recent years, the scholarly attention has shifted substantially toward 'dynamic capabilities' and 'dynamic managerial capabilities'.

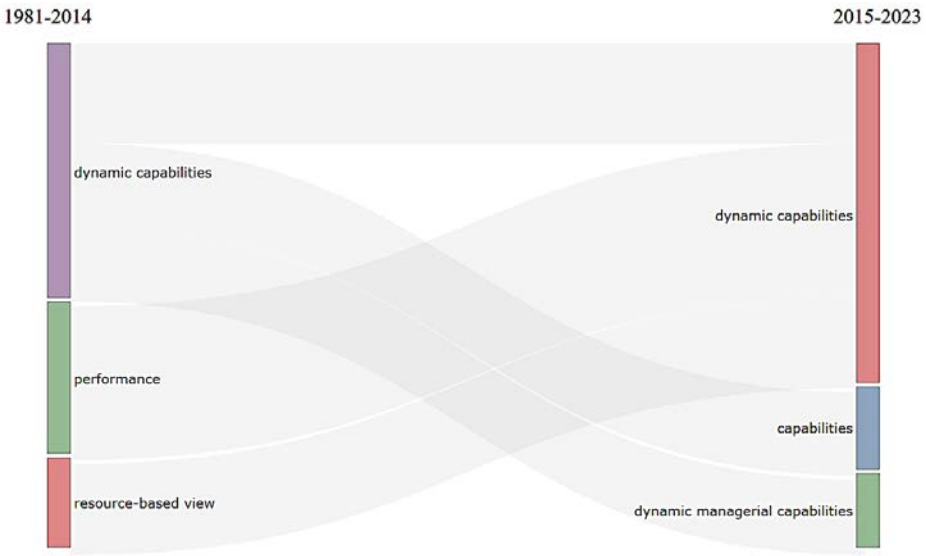

Fig. 3: Network - Thematic evolution (period 1981-2014)

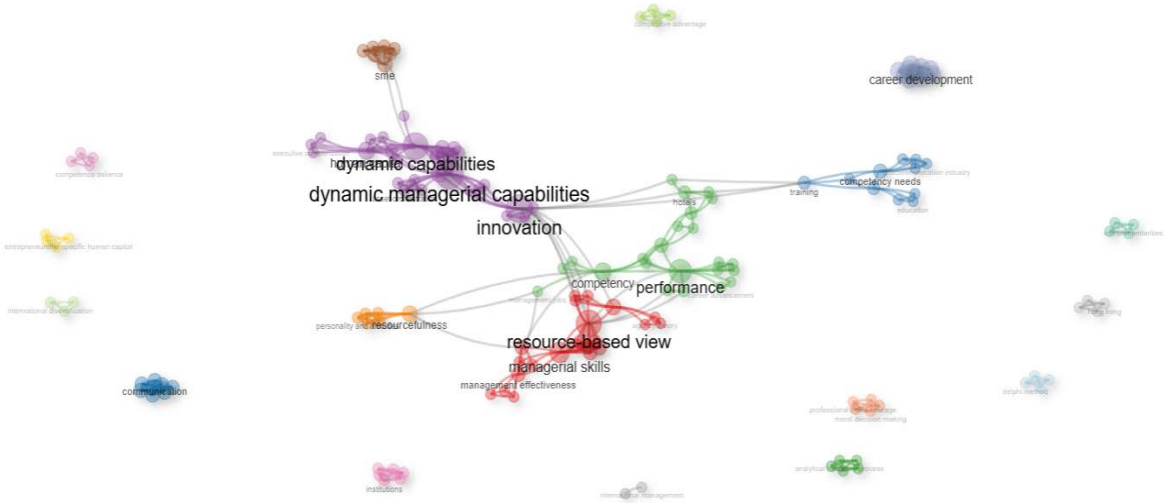

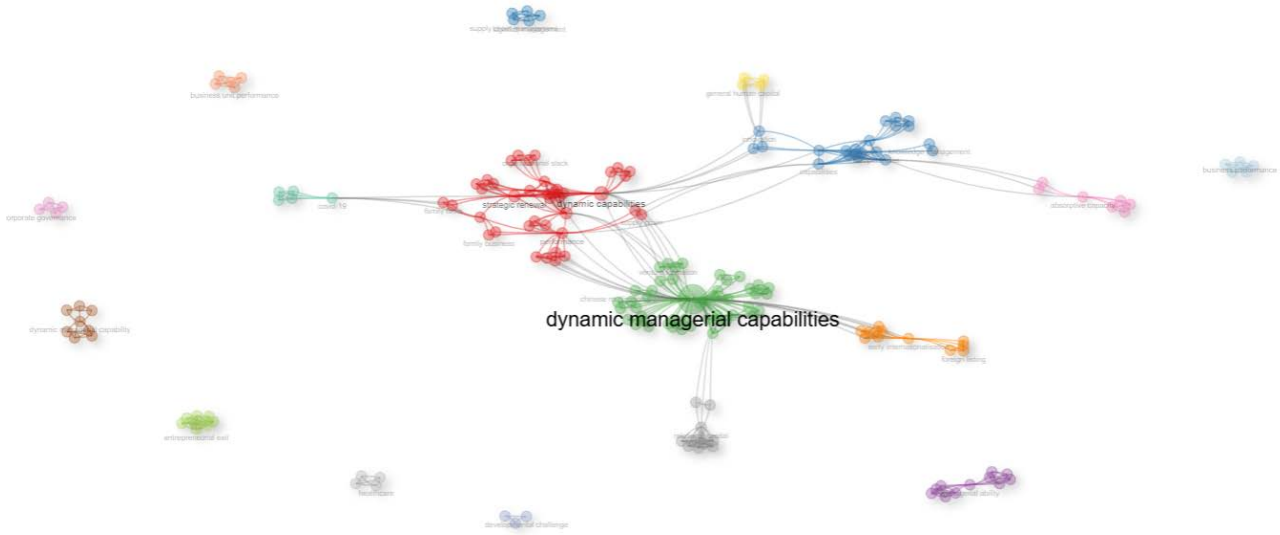

Fig. 4: Network - Thematic evolution (period 2015-2023)

Regarding individual clusters, an analysis was made by studying co-occurrence and co-citation. These are the clusters description, and the main results obtained:

- *Cluster 1: The managerial work*

This cluster is the biggest one, with 21 documents. Although the co-occurrence reports keywords such as 'performance' and 'resource-based view', the co-citation emphasises that the most cited articles concern the nature of managerial work.

- *Cluster 2: Dynamic managerial capabilities and compensation*

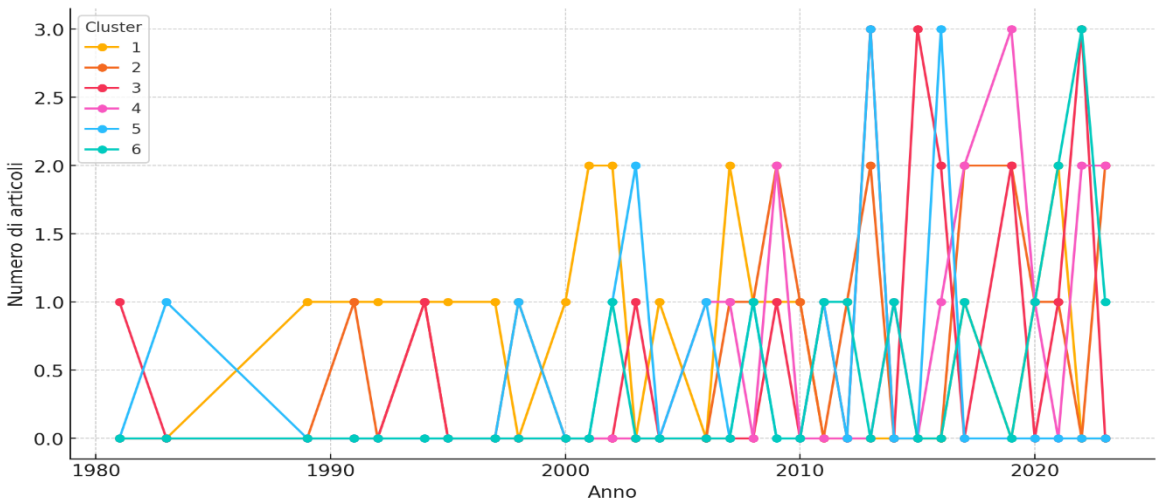
This cluster comprises 19 articles. In this case, there appears to be a moderate alignment between co-occurrence and co-citation patterns. In fact, the most recurring keywords and the most cited articles deal with dynamic managerial capabilities and compensation of managers.

- *Cluster 3: Dynamic Managerial Capabilities*

This cluster, with 19 articles, is the one only focused on dynamic managerial capabilities and resource assets.

- *Cluster 4: Dynamic (Managerial) Capabilities and family firms*

It contains 16 articles exploring dynamic capabilities and Dynamic Managerial Capabilities (DMC), specifically focusing on their application within family firms and examining how these capabilities can enhance firm performance.



- *Cluster 5: The traits of supply chain managers*

The 14 articles of this cluster are mainly about managerial competences in supply chain management and logistics. Articles with project managers as subject matter have also been brought together in this cluster.

- *Cluster 6: Capabilities for the strategic change*

The analysis carried out on this cluster reports interesting data, as the 13 articles link the literature on dynamic capabilities and DMC to strategic change. In a nutshell, the articles develop how DMCs can be applied to bring about strategic change within public and private organisations.

Fig. 5: Evolution of the research studies per cluster

A key aspect in the study of these clusters is to identify their relationships, evolutions (Figure 5) and possible gaps. The first link that can be evaluated is between clusters 3 and 6. Both focus on the role of dynamic capabilities in innovation and strategic change management. In recent years, the number of articles in this area has seen a significant increase, suggesting a growing interest in the role of adaptive management in innovation, digital transformation and business crisis response. Future research could explore how these capabilities influence the resilience of companies in contexts of high uncertainty. Clusters 1 and 2, on the other hand, whose research production has been growing steadily, show that the link between corporate resources, human capital and performance is still a topic of interest for organisations. The explanation for this trend may lie in the fact that organisations have an interest in knowing how to manage human capital, skills, compensation levels and diversity on company boards in a balanced way. One potential area of research could be examining how human capital affects a company's ability to innovate. Lastly, in clusters 4 and 5 managerial skills play a key role in the management of family businesses and logistics, and their ability to adapt to economic, technological and market changes. These are established and continuously updated research areas too. Future studies could explore the role of managerial skills in the generational success of family businesses.

Within the sample, some studies concern managerial capabilities within public administration (PA) (e.g. local governments and health care services). Analysing Clusters 5 and 1, compared to the others, we can observe some divergences in the roles and competences required of managers in these two fields. While business managers must be performance-oriented and adapt quickly to changes, in public contexts, managers are more oriented towards managing transparency, regulations and accountability. Moreover, performance is not only measured in economic terms, but also through public service efficiency indicators. The biggest difference lies in the fact that human capital (i.e. people's skills, knowledge and abilities) is an essential resource in public administration, but personnel management is less dynamic than in the private sector. In the private sector, companies can hire and promote based on performance, they can manage bonuses and compensation, as well as evaluation mechanisms. In the PA, on the other hand, selection and promotion processes are often governed by rigid regulations, public competitions and formal criteria that make it more difficult to adapt to organisational needs, remuneration is standardised with fewer possibilities to customise compensation and incentives. Finally, in the private sphere, managers can fast adapt organisational strategies according to market changes. In the PA, bureaucracy and administrative procedures can slow down the adoption of new personnel management practices, making it more difficult to implement innovative strategies.

These differences between the two areas shed light on the fact that the topic of managerial capabilities has further gaps in the literature. Since there are not many studies dealing with the competences of PA managers, it would be interesting to conduct future research to investigate which managerial skills are most effective in improving public sector performance, how dynamic capabilities can be applied to PA to improve efficiency and innovation? As already highlighted for businesses, one could investigate how digitisation is changing the skills required of managers inside and outside PA.

In conclusion, this literature review aims to broaden the analysis of the theoretical frameworks used to study managerial capabilities, provide a critical and systematic interpretation of the main articles and suggest new research gaps to advance the topic from other different perspectives.

Research limitations. *The steps followed to select the articles and analyse them are based on the PRISMA protocol, which makes the replicability of the study possible. However, there are subjective selection criteria that constitute a limitation of the research. Even if systematic selection criteria are adopted, there is always the possibility of inclusion bias, whereby some relevant articles might be excluded due to the keywords chosen, the sources consulted, or the time limits imposed. Moreover, the categorisation of studies, the links between theories, and the conclusions also depend on the author's interpretation, again leading to a bias based on the writer's point of view. Furthermore, as these are rapidly evolving areas of research, the sample of studies may not include recently published studies.*

Managerial implications. *The insights provided by this literature review carry significant implications for managerial practice. By identifying the most critical managerial skills highlighted in recent research, the findings help managers and organizational leaders prioritize which competencies should be developed or reinforced to thrive in today's rapidly changing business environment. Specifically, managers can leverage these results to design targeted training, reskilling, and upskilling initiatives, ensuring that managerial development aligns with the strategic needs driven by digitalization, innovation, and market turbulence. Additionally, this review highlights the relationship between managerial capabilities and organizational context, underlining the importance of aligning individual managerial competencies with broader organizational governance and culture. Practically, this suggests managers and policymakers should foster environments that actively support managerial agility, adaptive decision-making, and innovation. Recognizing these competencies as dynamic rather than static allows organizations to better assess managerial potential, personalize leadership development initiatives, and increase organizational responsiveness to external disruptions and strategic opportunities.*

Originality of the paper. *This paper enhances the current literature on managerial capabilities by systematically integrating and synthesizing fragmented research streams into a comprehensive, structured, and coherent theoretical framework. Unlike previous literature reviews, which have predominantly focused on either dynamic capabilities or dynamic managerial capabilities in isolation, this study bridges these conceptual divides, providing a holistic understanding of how managerial competencies evolve and interact with organizational and environmental contexts. Methodologically, the adoption of advanced bibliometric techniques (VOS Viewer and Bibliometrix) offers a novel, data-driven approach to mapping the evolution of managerial capability research, clearly identifying influential studies,*

emerging themes, and knowledge gaps. Furthermore, the review broadens the scope of existing research by explicitly including both private and public sector contexts, highlighting sector-specific managerial competencies and illustrating how context significantly shapes managerial requirements. Thus, the originality of this study resides not only in its methodological rigor but also in its integrative perspective, comprehensive scope, and practical relevance, providing valuable guidance for future theoretical exploration and empirical investigation.

Key words: *dynamic managerial capabilities; managerial competences; managerial skills; managers; company managers; dynamic capabilities*

Circular Economy Disclosure and ESG Performance: Measuring Impact Beyond Greenwashing

CHIARA LEGGERINI[1] MARTINA PERCUOCO[2] IRENE RICCIARDI[3] ANNA PRISCO[4]

Abstract

The increasing focus on environmental sustainability has led firms to adopt circular economy (CE) practices, yet concerns persist about their genuine impact versus greenwashing strategies. This study examines whether CE disclosure enhances ESG performance or serves as a mere reputational tool. Applying institutional theory, the research investigates the effects of energy efficiency, resource reduction, water efficiency, and emissions reduction disclosures on ESG scores. Additionally, the moderating role of external audits is analyzed to determine their influence on policy credibility and greenwashing mitigation. A quantitative empirical approach is employed, analyzing data from 921 European firms (2015-2024) sourced from Thomson Reuters, and Orbis. Multiple regression models assess the impact of CE disclosure, incorporating audit interactions. Results indicate that while CE disclosure generally improves ESG scores, energy efficiency and resource reduction disclosures have the strongest effects. Water efficiency and emissions reduction show weaker impacts. External audits, when considered alone, exhibit a negative relation with ESG scores, likely due to compliance constraints. However, their interaction with specific CE disclosures enhances ESG performance, reinforcing the credibility of sustainability commitments. The findings contribute to the greenwashing debate, highlighting the role of external audits in strengthening the effectiveness of CE disclosure. Implications for corporate governance, investment decisions, and regulatory frameworks emphasize the need for transparent and verifiable sustainability reporting.

Key words: *Circular economy; CE; ESG score; sustainability disclosure; external audit; greenwashing.*

Framing of the research. *In recent decades, the growing focus on environmental sustainability has prompted firms to reconsider their production and consumption models (Schroeder et al. 2019). Within this context, the circular economy (CE) has emerged as a key paradigm for reducing environmental impact by closing production loops through reuse, recycling, and waste reduction (Geisendorf and Pietrulla 2018). CE operates on three core principles: preserving natural capital, maximizing resource returns, and improving system efficiency (Ellen MacArthur Foundation 2015). It goes beyond the concept of sustainability by transforming production and consumption processes into circular systems designed to minimize emissions and reduce the depletion of natural resources (Geissdoerfer et al. 2017). The growing interest in this practice has raised concerns about the risk of greenwashing. Recent scandals (Chevron, ExxonMobil, Shell, etc..) have revealed that firms often misleadingly emphasise their environmental credentials without genuinely adopting sustainable practices. This not only undermines consumer trust but also hampers progress toward a truly sustainable ecological transition. Therefore, the question remains whether disclosure on circular economy adopted by firms has a tangible impact on their ESG score or if it primarily serves as marketing strategies aimed at enhancing corporate reputation without delivering substantial changes, i.e., greenwashing (De Freitas Netto et al. 2020). To analyze the relationship, the lens of institutional theory was adopted (DiMaggio and Powell 1983). Institutional theory views firms as actors operating within a social framework of norms, values, and imperatives that define acceptable behavior (Oliver 1997; Carpenter and Feroz 2001). Institutional pressure, in fact, encourages firms to respond to environmental issues (Dubey et al. 2015; Daddi et al. 2016). This theory has been widely employed as a theoretical framework to analyze firm strategies in response to climate change challenges (Greenwood et al. 2011; Alonso-Almeida et al. 2021).*

Purpose of the paper. *Although greenwashing as an academic topic is not entirely unexplored, the current body of research remains rather limited (Choudhury et al. 2024). This paper aims to address this research gap by examining whether circular economy disclosure communicated by firms has a measurable impact on their ESG score. Additionally, it explores the moderating role of external audits in enhancing the effectiveness of these practices.*

This study focuses specifically on five key hypotheses. The first four hypotheses investigate whether there is a direct relation between circular economy disclosure (represented by energy efficiency disclosure, resource reduction disclosure, water efficiency disclosure and emission reduction disclosure) and ESG score. It assumes that adopting circular practices may positively contribute to improve ESG score but also considers the possibility that it might be employed as a greenwashing tool, yielding no concrete effects (Choudhury et al., 2024). Based on this we assume the following hypothesis:

H1: Energy efficiency disclosure has a positive effect on ESG score
H2: Resource reduction disclosure has a positive effect on firm ESG score
H3: Water efficiency disclosure has a positive effect on water consumption reduction performance
H4: Emission reduction disclosure has a positive effect on emission reduction performance

The relationship between circular economy disclosure communicated by firms and their ESG score is positively moderated by external audits, as independent verification enhances policy credibility and effectiveness. Audits reduce greenwashing risks by ensuring transparency and compliance, thereby strengthening stakeholder trust and reinforcing the alignment of corporate actions with sustainability commitments (Wijen 2014). Thus, we propose the following hypothesis.

H5: Extern audit committees as independent monitors moderate the relationship between circular economy disclosure and ESG performance

Methodology. *To address these research questions, we adopt an empirical quantitative approach based on the analysis of panel data collected from a sample of listed European firms that have publicly disclosed their adoption of circular economy policies (Greene, 2011; Wooldridge, 2019). One of the main methodological challenges in studying corporate disclosures and environmental performance is the potential issue of endogeneity, which arises due to reverse causality or omitted variable bias. To mitigate this concern, we lag all independent variables by one year, following best practices in corporate governance and sustainability research (Liang et al., 2013; Ashwin et al., 2015). The lag structure helps to establish a more plausible causal relationship between circular economy disclosure and environmental performance by ensuring that changes in the independent variables precede the observed outcomes.*

We employ a multiple regression model to analyze the impact of different types of circular economy disclosure on firms' environmental performance. Specifically, circular economy disclosure is operationalized through four key dimensions:Energy efficiency disclosure, Resource reduction disclosure, Water efficiency disclosure, and Emissions disclosure. Each of these variables captures distinct aspects of a firm's circular economy strategy and its commitment to sustainability.

Given the panel structure of the dataset, we considered both fixed effects (FE) and random effects (RE) models to control for unobserved heterogeneity (Greene, 2011; Wooldridge, 2019). To determine the most appropriate estimator, we conducted the Hausman test, which compares the consistency of fixed and random effects estimators (Greene, 2011; Wooldridge, 2019). The test results favored the random effects model, indicating that individual firm effects are uncorrelated with the independent variables and allowing for more efficient estimation (Greene, 2011). Random effects estimation is particularly suitable when analyzing datasets with large cross-sectional variation across firms and when the time dimension is relatively short (Wooldridge, 2019).

To analyze the relationship between circular economy disclosure and ESG performance, a multiple regression model was developed as follows, where circular economy disclosure is defined as energy efficiency disclosure, resource reduction disclosure, water efficiency disclosure and emissions disclosure:

Model 1: ESG score = f(Energy Efficiency disclosure + Control variables)
Model 3: ESG score = f(Resource Reduction disclosure + Control variables)
Model 5: ESG score = f(Water Efficiency disclosure + Control variables)
Model 7: ESG score = f(Emissions disclosure + Control variables)

To determine the influence of external audits, a model of interaction between circular economy disclosure and external audit was considered:

*Model 2: ESG score = f(Energy Efficiency disclosure*External Audit + Control variables)*
*Model 4: ESG score = f(Resource Reduction disclosure*External Audit + Control variables)*
*Model 6: ESG score = f(Water Efficiency disclosure*External Audit + Control variables)*
*Model 8: ESG score = f(Emissions disclosure*External Audit + Control variables)*

The research sample comprises 921 European firms observed over a ten-year period from 2015 to 2024, ensuring a broad and comprehensive dataset that captures longitudinal trends in corporate environmental performance and circular economy (CE) disclosure.

To construct the dataset, we integrated information from two well-established databases. Data on firms' circular economy disclosure and ESG performance were sourced from Thomson Reuters, a widely recognized provider of sustainability-related corporate information. This dataset ensures consistency in ESG reporting and allows for a detailed examination of how firms communicate their circular economy initiatives, such as energy efficiency, resource reduction, water efficiency, and emissions management.

Additionally, we supplemented the dataset with financial and firm-level information from the Orbis database, provided by Bureau Van Dijk. Orbis offers detailed financial statistics, ownership structures, and industry classifications, enabling a robust control for firm-specific characteristics such as size, profitability, and leverage.

The combination of these two databases ensures a comprehensive and reliable dataset, allowing for a nuanced analysis of the relationship between circular economy disclosure and environmental performance while accounting for financial and structural heterogeneity across firms.

Table 1 reports the sources and definitions of the dependent, independent and control variables.

Table 1 Variables definitions

Variable	Definition	Source
Dependent variables		
ESG Score	Measures a firm's environmental, social, and governance performance, providing an overall sustainability assessment.	Thomson Reuters
Independent variables		
CSR Sustainability External Audit	Dummy variable taking the value 1 if a firm undergoes an external audit for CSR sustainability, and 0 otherwise.	Thomson Reuters
Energy Efficiency disclosure	Dummy variable taking the value 1 if a firm has implemented energy efficiency policies, and 0 otherwise.	Thomson Reuters
Resource Reduction disclosure	Dummy variable taking the value 1 if a firm has policies aimed at reducing resource consumption, and 0 otherwise.	Thomson Reuters
Water Efficiency disclosure	Dummy variable taking the value 1 if a firm has water efficiency measures in place, and 0 otherwise.	Thomson Reuters
Emissions disclosure	Dummy variable taking the value 1 if a firm has an emissions reduction policy, and 0 otherwise.	Thomson Reuters
Control variables		
Age of the firm	Number of years since the firm was founded.	ORBIS
Board Size	Total number of directors on the firm's board.	ORBIS
Firm size	Total assets or revenue of the firm (measured in thousands).	ORBIS
ROA (Return on Assets)	Ratio of income to total assets, representing firm profitability.	ORBIS
Industry Variables	Dummy variables indicating the sector in which the firm operates (i.e., Accommodation, Administration, Agriculture, Arts, Construction, Electricity, Estate, Finance, Health, IT, Manufacturing, Mining quarrying, Servis, Professions, Public administration, Trade, Transportation).	ORBIS

Results. *To ensure the robustness of our analysis, we assessed variance inflation factors (VIF) to detect potential multicollinearity issues among the independent variables. Multicollinearity can distort regression estimates, making it critical to confirm that the explanatory variables are sufficiently independent. A commonly used threshold for concern is a VIF value exceeding 10 (Shrestha 2022), which would indicate significant multicollinearity. However, in our analysis, the average VIF value is 5.1, well below the critical threshold, suggesting that multicollinearity is not a major concern (Shrestha, 2022). This ensures that the estimated coefficients remain reliable and interpretable (Shrestha 2022).*

Table 2 provides a comprehensive summary of the descriptive statistics for the full sample. The ESG Score, our key dependent variable, exhibits a mean value of 60.302 and a standard deviation of 17.438, indicating a moderate degree of variability in firms' ESG performance. The ESG scores range from a minimum of 0.627 to a maximum of 95.747, reflecting substantial disparities among firms in terms of their sustainability practices. This wide dispersion suggests that while some firms have strong ESG performance and are proactive in sustainability initiatives, others demonstrate significantly weaker ESG engagement. The presence of firms with both exceptionally high and low ESG scores underscores the heterogeneity in corporate sustainability strategies across industries and countries.

Table 2 Descriptive statistics

Variable	Obs	Mean	Std. Dev.	Min	Max
ESG Score	8290	60.302	17.438	0.627	95.747

**** p<0.01, ** p<0.05, * p<0.1*

The coefficient for CSR Sustainability External Audit is negative and highly significant across all models, ranging from -3.548 (p<0.001) to -12.50 (p<0.001). This suggests that the presence of an external audit mechanism for CSR

sustainability may be associated with a lower ESG Score. This could indicate potential inefficiencies or rigidities introduced by external audits, which might limit the effectiveness of sustainability initiatives.

The Energy Efficiency disclosure variable has a positive and significant impact on ESG Score, with coefficients of 7.108 ($p<0.001$) and 2.427 ($p<0.05$), implying that energy efficiency disclosure contribute positively to ESG performance. Interestingly, its interaction with CSR Sustainability External Audit results in a positive and significant coefficient of 4.932 ($p<0.001$). This suggests that, although external audits alone have a negative impact, when combined with energy efficiency disclosure, they may enhance ESG performance, possibly by ensuring stricter compliance and effectiveness.

Similarly, the Resource Reduction disclosure has a strong positive effect, with coefficients of 10.94 ($p<0.001$) and 2.256 (not significant), reinforcing the idea that resource efficiency is beneficial for ESG outcomes. Notably, its interaction with CSR Sustainability External Audit produces a significant positive coefficient of 9.198 ($p<0.001$), suggesting that external audits might strengthen the effectiveness of resource reduction disclosure by enhancing transparency and accountability.

The Water Efficiency disclosure variable also shows a positive and significant impact on ESG performance, with coefficients of 3.058 ($p<0.001$) and 2.847 ($p<0.01$). However, its interaction with CSR Sustainability External Audit is not significant (0.232), indicating that external audits do not significantly alter the impact of water efficiency disclosure on ESG outcomes.

Lastly, the Emissions disclosure variable has a positive and significant effect on ESG Score, with coefficients of 6.891 ($p<0.001$) and 4.051 ($p<0.05$), confirming that firms with emissions disclosure tend to perform better in ESG metrics. However, its interaction with CSR Sustainability External Audit results in a non-significant coefficient of 3.052, suggesting that external audits do not substantially influence the effectiveness of emissions-related disclosure.

These findings highlight that CSR Sustainability External Audits alone tend to have a negative impact on ESG performance, potentially due to bureaucratic constraints or compliance burdens. However, when combined with specific sustainability disclosure, especially Energy Efficiency and Resource Reduction disclosure, they can enhance ESG outcomes. This suggests that external audits may be most effective when integrated with concrete sustainability measures rather than functioning as standalone mechanisms.

Research limitations. *This study offers valuable insights into the relationship between corporate circular economy disclosure, ESG scores, and external audits but has limitations. Causality cannot be firmly established due to its observational nature, as unobserved factors like industry dynamics or regulatory pressures may influence results. The role of external audits is context-dependent, varying by audit firm credibility, regulatory frameworks, and industry norms. Future research using experimental or longitudinal methods and broader samples could enhance causal inference and external validity.*

Managerial implications. *From a practical standpoint, this study offers valuable implications for firms, investors, and regulators, while also providing strategic insights for corporate leaders and decision-makers seeking to enhance sustainability performance.*

For firms, the findings emphasize the need to go beyond symbolic sustainability commitments and integrate circular economy initiatives into core business operations. This means that firms should not only disclose their sustainability efforts but also develop measurable strategies that align with ESG objectives, ensuring that circular economy adoption leads to concrete improvements in resource efficiency, emissions reduction, and environmental responsibility. By doing so, firms can strengthen their corporate reputation, mitigate regulatory risks, and build long-term stakeholder trust, which in turn fosters competitive advantages in a market increasingly focused on sustainability. Moreover, embedding independent audits as part of the corporate sustainability strategy can help firms differentiate themselves by demonstrating credible environmental responsibility, reducing accusations of greenwashing, and enhancing investor confidence.

The study underscores the broader managerial imperative of integrating ESG verification into corporate governance. By institutionalizing external oversight mechanisms, firms can foster a culture of accountability, drive continuous improvement, and ultimately position themselves as industry leaders in the transition toward a more sustainable economy. Managers should view external audits not as a regulatory burden but as a value-adding process that enhances transparency, credibility, and operational efficiency. Furthermore, this study suggests that firms should adopt internal performance metrics that align with ESG goals to proactively measure their progress on circular economy initiatives, allowing for data-driven decision-making and better alignment with stakeholder expectations.

For investors, the study provides a critical lens through which to evaluate corporate sustainability claims, enabling them to distinguish between genuine ESG commitment and superficial greenwashing. By integrating independent verification as a key criterion in investment evaluations, investors can make more informed capital allocation decisions, prioritizing firms that demonstrate tangible progress toward sustainability goals rather than merely issuing symbolic sustainability reports. This approach supports responsible investment strategies, such as ESG screening, impact investing, and engagement-based investment approaches, which are increasingly shaping global capital markets. Additionally, investors can use these findings to engage with firms and encourage stronger circular economy governance mechanisms, influencing corporate behavior through shareholder activism and engagement.

For policymakers and regulatory bodies, the research reinforces the necessity of robust sustainability reporting standards and the promotion of independent audits as a safeguard against misleading ESG disclosures. Given the growing risk of greenwashing, regulators should focus on enhancing transparency requirements, strengthening

verification mechanisms, and introducing mandatory sustainability audits for firms claiming circular economy adoption. Additionally, the study highlights the importance of harmonized ESG reporting frameworks, which would ensure that firms across different sectors and jurisdictions adhere to consistent, comparable sustainability metrics. Such regulatory interventions would not only protect investors from misleading ESG claims but also encourage firms to adopt genuine, performance-driven sustainability practices, thus reinforcing the role of circular economy disclosure as a mechanism for real environmental impact rather than a mere public relations tool.

By addressing these key areas, this study contributes to shaping corporate sustainability strategies, enhancing investor decision-making, and informing regulatory frameworks, ultimately supporting the broader transition to a more transparent, accountable, and sustainable economic system.

Originality of the paper. *While the adoption of circular economy disclosure has been widely discussed in sustainability and corporate governance literature, the originality of this study lies in addressing a key question that remains relatively unexplored, namely, whether such disclosures have a tangible impact on ESG scores or if they are primarily employed as greenwashing tools. Many firms publicly communicate their commitment to circular economy principles, yet the extent to which these disclosures translate into measurable environmental improvements remains unclear. This research aims to bridge this gap by providing empirical evidence on whether circular economy disclosures genuinely influence corporate ESG performance or if they are simply used to enhance corporate reputation without substantive operational changes.*

A further novel aspect of this study is the introduction of a moderating factor: the role of external audits. While prior research has explored the impact of disclosure on sustainability outcomes, few studies have investigated the role of external verification mechanisms in reinforcing or mitigating the effectiveness of circular economy commitments. By incorporating external audits as a moderating factor, this study examines whether independent verification processes enhance the credibility of CE disclosures and strengthen their link to ESG performance or, conversely, whether firms engage in disclosure practices regardless of third-party oversight.

Moreover, the multi-level analytical framework employed in this study represents a significant theoretical and empirical contribution. Rather than analyzing CE disclosure in isolation, this research explores the interaction between disclosure, external verification, and ESG performance, thus expanding our understanding of how external dynamics influence corporate environmental outcomes. By doing so, the study moves beyond the traditional debate on the effectiveness of sustainability disclosure and sheds light on the mechanisms that determine whether disclosure leads to substantive changes or remains superficial.

This research is particularly relevant in the context of increasing regulatory scrutiny on corporate sustainability claims. With stakeholders, investors, and policymakers demanding greater transparency and accountability, understanding whether firms' CE disclosures are trustworthy indicators of ESG performance or strategic communication tools is critical for shaping regulatory policies and corporate governance best practices. By addressing these pressing concerns, this study offers a timely and valuable contribution to the discourse on corporate sustainability, helping distinguish between genuine environmental commitments and symbolic sustainability rhetoric.

Board gender diversity, spillover effects on managerial training and firm performance

ANNA MENOZZI[1] ROBERTO GABRIELE[2] OKSANA TOKARCHUK[3]

Abstract

This study provides the framework and the methodological premises for studying the relevance of board gender diversity in firms' decisions to engage in managerial training and the ultimate effect on firm performance. Results will be based on a unique, manually compiled panel dataset of 12234 listed and non-listed Italian firms observed from 2010 to 2018: we expect that having more women on the board enhances the likelihood that firms invest in managerial education, especially for women, and that this leads to higher performance in terms of productivity. The paper will contribute to the evidence that board diversity matters to firm value by influencing the decision-making process and the accumulation of managerial human capital.

Framing of the research. *Boardroom gender diversity has become an important policy focus in many countries. Initiatives ranging from mandatory gender quotas to voluntary targets and disclosure requirements have been implemented to increase the representation of women on corporate boards (ASX, 2009; Davies, 2011; Deloitte, 2011). The underlying rationale is that greater gender diversity in the boardroom could have significant effects on corporate governance and firm performance. More specifically, there are three main arguments for positive effects of board gender diversity. The first one relates to creating equal opportunities for men and women within the organization. The second one relates to firm performance: drawing board appointments from a larger pool including all genders creates the conditions to improve results through increasing the chances to attain a higher degree of board independence (Carter et al., 2003) and higher board effectiveness (Nielsen and Huse, 2010) through a stricter monitoring on CEOs and higher meeting attendance (Adams and Ferreira, 2009). The third argument in favor of board diversity relates to the spillover effects it creates, that is the expectations that more women on the ultimate level of decision-making at the firm increases gender equality at the other levels.*

The empirical analysis of the effect of board diversity on firm performance is challenged by endogeneity concerns, as better performing firms may be more likely to appoint female directors. This methodological issue may be overcome by exploiting the institutional interventions that created discontinuity in the female representation in board directors. For example, Ferrari et al. (2022) take advantage of the staggered implementation of the Italian quota law, introduced in 2011, to investigate the effect on board composition and firm operating and financial performance in listed companies observed from 2007 to 2014. Results suggest that quota changed the selection process for the entire board, since boards with more women show higher average education levels and fewer older members. In addition, greater female board representation reduces stock price volatility and have no significant negative impact on firms' operating and financial performance.

Another way to mitigate the endogeneity issue, which would limit the ability of empirical studies to establish a causal relationship between board diversity and firm performance, is to focus the analysis on the specific actions taken by the board (Adams et al., 2010). Indeed, one important channel through which board gender diversity may influence firm performance is its impact on the board's decision-making.

In this study, we examine a specific spillover effect: firms' investment in managerial training. We investigate whether more diverse boards of directors are more likely to invest in accumulating C-suite intellectual capital and whether they do so differently for female and male managers. Since board diversity reflects potential differences in decision-making tendencies across boards with varying gender compositions, particularly regarding decisions that may affect gender disparities within the firm, a more gender-diverse board may be more inclined to prioritize investments in employee training and development. This accumulation of human capital could serve as a key driver of firm productivity and long-term performance. Supporting this argument, Tate and Yang (2011) find that an important externality of female corporate leadership is improved workplace conditions and greater training opportunities for women throughout the firm. et al. (2019) attest a positive gender spillover effect of Italian board quotas on earnings for managers at higher levels in the firm, but negative effects for lower levels. von Essen and Smith (2024) explore the effect of board diversity in the reduction of compensation or representation gaps and conclude that both the "quantity", i.e. the number or share of female board members, and the "quality" of them, i.e. their power and network, matter, and the quality spillover effects seem to dominate over quantity. If having a woman on the board (or at the limit, only one woman) becomes merely symbolic, with limited power, no significant effect on firm performance or governance is expected. This suggests that a critical mass of women is necessary to influence board decisions (Kanter, 1977). Conversely, the absence of positive effects, or even the presence of negative effects, resulting from increased female representation on boards may be attributed to the 'queen bee' phenomenon, where some women in leadership positions may be reluctant to support or may even hinder the advancement of other women (Derks et al., 2016). The board quality may be interpreted as the power to influence board decisions, then built through (and proxied by) the directors' experience and connections. In addition, a female chairman is surely important for the decisions that may affect the executives gender equality.

Purpose of the paper. *This study aims to analyze both the spillover effects of board diversity on investment in managerial human capital and the factors that may confound the relationship between board diversity and firm performance. By doing so, we contribute to the literature on the spillover effects of board diversity by examining the impact of female representation on boards of directors on firms' decisions to invest in managerial training for women versus men. Additionally, we seek to provide meaningful evidence on the impact of board gender diversity on firm performance. Specifically, we investigate whether the appointment of female directors influences firms' propensity to invest in management training, particularly for female managers, and whether these human capital investments ultimately lead to improved firm productivity. While previous research has explored the effects of board diversity on corporate governance, decision-making, and financial performance, relatively little attention has been devoted to understanding how board composition affects long-term investments in workforce development. Managerial training is a critical driver of leadership progression, and investigating its allocation across gender lines provides valuable insights into the extent to which diverse boards actively contribute to reducing gender disparities in career advancement. Our study seeks to fill this gap by examining whether board diversity influences not only the quantity of investment in managerial training but also its distribution between male and female managers. Furthermore, this study acknowledges that the impact of board gender diversity on human capital investments may depend on multiple underlying factors. In particular, we consider whether the quality of female board members, measured in terms of their professional experience, leadership roles, and network influence, plays a moderating role in shaping firms' training decisions. This perspective aligns with prior research suggesting that not all women on boards wield the same level of influence, and that the power and connectivity of female directors can significantly affect their ability to drive organizational change. By focusing on both listed and non-listed firms, we also provide a broader perspective on how board diversity influences managerial training investments across different corporate structures. Listed firms are subject to stronger regulatory pressures and public scrutiny, whereas non-listed firms may have greater flexibility in governance choices, potentially leading to different dynamics in how board diversity translates into training decisions. Our dataset allows us to explore these variations, offering a nuanced understanding of how institutional factors shape the relationship between board composition and human capital development and firm performance. Ultimately, this study contributes to the broader policy debate on gender quotas and board diversity regulations by assessing whether increasing the number of women on boards translates into meaningful career development opportunities for female managers, rather than serving as a symbolic compliance measure. Our findings are expected to provide empirical evidence on whether board diversity policies contribute to long-term improvements in firm productivity by fostering investments in managerial skills and leadership development.*

Methodology. *The empirical analysis is based on a nine-year unique panel dataset, created by merging three complementary datasets, the one including information on board of directors, another one containing information on managerial training and the last one with data on firm accounting information. The first dataset was manually compiled by retrieving the relevant data from the Italian section of the Bureau van Dijk database. This includes the full personal details of directors and their charge in the board. The directors' gender has been verified, amended if needed, and added, when missing, by cross-checking the first names with several repositories of names in several languages. The directors' age has been derived from their date of birth and the tenure from the presence in the board over the longest period for which directors' personal details are available in the Bureau van Dijk dataset, that is since 2000. The dataset referred to the firm investment in managerial education includes information provided by Fondirigenti, an Italian interprofessional fund established in 2004 to finance such educational activities to the senior management of firms adhering to the Fondirigenti fund itself. The dataset includes the number of managers in training, days spent on training, total hours, and overall training expenditure of a sample of such firms, that are Italian listed and non-listed companies active in several industrial sectors and adhering to the Fondirigenti fund. All information is detailed for male and female managers. The third dataset provides firms' accounting data, enabling the construction of firm-level indicators, such as sector of activity, sales, value-added, fixed capital stock, number of employees, labor costs, and other financial variables. This matching process yields a robust firm-level panel dataset covering 9 years from 2010 to 2018, consisting of 12234 firms, with reliable and comprehensive information on board of directors and senior management training practices.*

Following Tokarchuk and Gabriele (2023), the production technology assumed in this analysis is Cobb–Douglas (Levinshon and Petrin, 2003):

$$y_t = \beta_0 + \beta_l l_t + \beta_k k_t + \beta_m m_t + w_t + \eta_t \qquad [1]$$

where y_t is the logarithm of the firm's output (value-added) in year t, l_t and m_t are the logarithms of the labor and of the intermediate input, respectively, k_t is the logarithm of capital. The error has two components: the transmitted productivity, given by w_t, and an error term, η_t, which is assumed uncorrelated with the inputs.

The effect of board gender diversity on managerial training and on firm performance is investigated through a two-step regression analysis. First, we estimate the effect of board characteristics, and in particular of board diversity, on firm investment in training male, female or all managers. In the second step, we regress firm TFP obtained using [1] on the firm training investment and the relevant board characteristics: this analysis concerns "active" firms only, that is firms that actually decide to invest in managerial training. The second step of analysis consists in the estimation of the following model:

$$\ln(TFP_{i,t}) = \beta_0 + \beta_1 \ln(TrPC_{i,t-1}) + \beta_2 BoardCharacteristics_{i,t-1} + \beta_3 X_{i,t-1} + IMR_{i,t-1} + \tau_t + \varepsilon_{i,t} \quad [2]$$

The variable $TFP_{i,t}$ represents the productivity of the given firm in a given year. The variable $TrPC$ represents the overall number of training hours used by firm i in year t for all senior managers in the firm or, alternatively, the share or the level of training hours devoted to female managers; $BoardCharacteristics_{i,t-1}$ is a vector of variables related to board composition and characteristics, $X_{i,t-1}$ is a vector of independent covariates: firm size, age, sector of activity (SIC two-digit level), and the geographical area of activity at NUTS 1 level. To control for the impact of business cycles, the variable τ_t is included as a time dummy. The variable $IMR_{i,t-1}$ is the inverse Mills ratio, calculated based on [1] and included in the instrumental variable regression model to address potential selection bias. Board characteristics relate to the firm's governance mechanisms and to both the "quantity" and the "quality" of directors; they are captured by variables measuring board size, the directors' mean age, their tenure, whether they are executive or not, the number of female directors, whether there is only one female director or more, the share of female directors, duality, female duality, female CEO and female chairman.

The estimation of Equation [2] employs IV techniques to account for the potential endogeneity of the training variables, since more productive firms may engage in more training activities thanks to greater resource availability, or a better understanding of the value derived from manager training. The external instrument chosen is the annual funds made available to each firm by Fondirigenti and earmarked for senior manager training (variable "Credit"). This funding is generated through administrative regulations tied to the firm membership to Fondirigenti. Specifically, Fondirigenti sets aside a portion of the annual fee owed by firms —0.30% of total yearly senior managers' wages— in a dedicated fund, accessible solely for investment in senior managers training. This fund expires after three years, after which the firm loses access to it, and Fondirigenti reallocates the funds for other purposes. The variable "Credit" exhibits a significant correlation with yearly training hours and expenditure and its correlation with TFP is negligible. Consequently, the number of training hours and expenditure are contingent on the annual training budget allocated to each firm, which, ex ante, correlates with training hours but not with firm performance. To mitigate the potential simultaneity bias, all independent variables are lagged by one period with respect to the dependent variable. Additionally, robust standard errors are computed, to address heteroskedasticity. In both steps of the analysis, we adopt the approach of Ferrari et al. (2022) for the sub-sample of listed firms to identify the effect of gender quotas (and board characteristics) on firms' training decisions and performance. Although the quotas apply to listed (and state-owned) firms only, we repeat the exercise for the entire sample, assuming that the policy also increased non-listed firms' awareness of the importance of board diversity.

Results. *To date, the results remain preliminary and are primarily descriptive and exploratory in nature. "Active" firms, i.e. firms that invest in any training activity for managers during the sample period, represent about 30 percent of the sample. Small firms, with fewer than fifty employees, constitute 48 percent of the total sample, while medium and large firms (more than fifty employees) make up around 91 percent of the firms using training services. Most firms (about 77 percent) are located in North Italy, and around 78 percent have been in business for over 14 years. The sample is predominantly (almost 70 percent) composed of firms operating in the manufacturing sector. We anticipate that simply increasing the number of women on the board of directors will have little or no immediate impact on firms' decisions to invest in them in the short term, and thus on firm performance. However, we expect a more significant effect in the long run, particularly when female representation on the board reaches a certain threshold. As in Tokarchuk and Gabriele (2023), we expect a positive effect of senior management training on firm productivity, an effect that is even stronger when female managers participate in such training activities.*

Research limitations. *Although the substantial dimension of the final dataset guarantees the validity of the explorative investigation proposed in the work, the sample size is constrained by the number of firms for which Fondirigenti provides information on training hours and investment.*

The dataset contains the information of training hours possibly provided by each firm to male and female managers: as such, it allows for a comparison of the effect of board gender diversity between firms that utilized the training opportunities offered by their association with Fondirigenti and those that did not invest in managerial training despite

the availability of dedicated funds. Yet the information on the total number of female and male managers at firm level is missing and this limitation makes it impossible to evaluate whether the possible lack of involvement of female managers is due to the absence of female senior managers in the firm.

Future research may include in the analysis a measure of directors' power measured in terms of interlocking and their previous experience as directors or executives in other firms.

Managerial implications. *This study contributes to the discussion on what factors increase women's professional development in firms. If confirmed, the results suggest that the positive effect of female board representation on female managerial training and firm performance implies that quota regulations, such as the 2026 EU regulation requiring 40% women on the boards of the largest companies, can influence the organization's gender gap through changes in the firm's decision-making processes and may ultimately improve firm performance. Also, board gender diversity may be a way to change firm culture and gender norms, by inducing firms to invest in women's human capital. Additionally, board gender diversity may serve as a catalyst for cultural and structural transformation, inducing firms to invest in women's human capital and fostering a more inclusive leadership pipeline. The presence of strong female networks within firms may further enhance these effects, as women directors with well-established professional ties can facilitate the promotion of female executives. However, as prior research suggests, the magnitude of these spillovers may remain limited unless broader organizational and societal factors, such as retention policies for women in senior roles and work-life balance considerations, are also addressed. Finally, this research stems from an important collaboration between academia and external stakeholders, a prerequisite for scientific inquiry to amplify its real-world impact. By analyzing firms that actively engage in managerial training initiatives, we provide practical insights for policymakers and business leaders seeking to design interventions that go beyond quotas and create sustainable pathways for female career progression in both listed and unlisted firms.*

Originality of the paper. *Italy provides an interesting setting to study the impact of board gender diversity on firms' decisions to invest in managerial training and the subsequent effects on firm performance, particularly given the introduction of a gender quota law for boards of listed companies in 2011. Furthermore, Italy ranks poorly on gender equality indices, making the quota, seen as a necessary intervention to accelerate progress, a highly relevant issue in the national debate. This study adds to the literature by exploring how and when female board members contribute to gender-progressive spillovers within firms. While previous research has primarily focused on the representation effect of women on boards, our work delves deeper into the mechanisms through which board diversity influences managerial training investments. Specifically, we investigate whether the presence of female directors translates into targeted human capital investments for female managers and whether these investments yield productivity gains for firms. Furthermore, our study acknowledges that not all women on boards have equal influence. We extend the discussion by considering the role of director power in driving spillover effects, thereby contributing to the broader debate on the importance of quality over quantity in board diversity policies. The uniqueness of the data on managerial training investments, provided by Fondirigenti, ensures the originality of the results. By leveraging a diverse sample of firms, including both listed and non-listed companies, over an extended period, this study provides robust empirical evidence on the long-term organizational impact of board gender diversity. Additionally, our findings offer valuable insights into the conditions under which quota regulations can lead to meaningful changes in firm culture, gender norms, and leadership structures.*

Track 12
Supply Chain Management, Logistics & Operations

Fostering humanitarian supply chain towards positive environmental sustainability impact. Insights from experiences in logistics operations

ALESSANDRA COZZOLINO[1]

Abstract

The paper highlights the emerging issue concerning range and variety of challenges to implement solutions that offer positive environmentally sustainable impact in humanitarian logistics - HL. While HL inherently contribute to social sustainability by alleviating the suffering of those in need, and its economic effort is under continuous attention, its unintended adverse environmental impact has been overlooked to date. The immediate response to disasters, for example, while well intended, sometimes causes avoidable humanitarian challenges later on: drinking water may be essential, but it is not necessary to provide it in small plastic bottles; injections may save lives, but inappropriately discarded syringes are hazardous. The present work aims at focusing on real world impact research to solve practical problems and combining theoretical improvements in the discipline. A structured literature review on the topic is combined with actual case studies and experiences in the logistics operations.

Framing of the research. *Since the growing attention on climate change and sustainability bringing Environmental, Social & Governance - ESG accountability to global supply chains, this paper aims to underline the potential that Humanitarian Logistics - HL has toward sustainability in the Triple Bottom Line - TBL (economic, social and environmental) direction, with a specific focus on greening the humanitarian supply chain.*

The specific context of analysis is the HL, responding to the urgent call for more humanitarian research to address emerging challenges in a complex world (World Economic Forum, 2024). This is also noted very recently by the Director of the Harvard Humanitarian Initiative (2024). According to the report of the Office for the Coordination of Humanitarian Affairs - OCHA, COVID-19, the climate crisis, conflicts and catastrophes are major factors that increased humanitarian needs in 2022, leading to 274 million people needing humanitarian assistance and defining the importance of HL activities (Fan et al., 2023). In the past decade, humanitarian crises have escalated in both frequency and intensity - ranging from climate change-induced disasters to protracted conflicts and pandemics: over 299 million people needed humanitarian assistance and protection in 2024, marking a staggering increase from previous years. In 2025, 305 million people around the world will require urgent humanitarian assistance and protection, as multiple crises escalate with devastating consequences for the people affected by them (OCHA, 2024). In an era marked by unprecedented global challenges, supply chain dynamics within the humanitarian context are more impactful than ever, as HL is pivotal for delivering vital aid to those impacted by crises, according to the last report by the Center for Humanitarian Logistics and Regional Development - CHORD (2025).

HL is a relatively new research area that has grown steadily (Kembro et al., 2024; Altay et al., 2021). It considers people, resources, knowledge, and activities involved in planning, implementing, and controlling efficient and effective flows and storage of materials from the points of origin to the place where they are needed when a disaster or an emergency occurs, with the mission of saving lives and alleviating the suffering of affected populations (Van Wassenhove, 2006; Thomas and Fritz, 2006; Kovács & Spens, 2007; Tomasini & Van Wassenhove, 2009; Christopher & Tatham, 2011; Cozzolino, 2012; Kovács et al., 2017; Cozzolino, 2021; Altay et al., 2021)

Purpose of the paper. *While HL inherently contribute to social sustainability by alleviating the suffering of those in need, and its economic effort is under continuous attention, its unintended adverse environmental impact has been overlooked to date (Zarei et al., 2019).*

Key stakeholders rightfully highlight the need to delicately balance environmental consciousness, and the overarching objective of providing sustained, reliable aid to the maximum number of people during crises. To meet this pressing need to better embed scalable, environmentally sensitive delivery solutions, while still empowering humanitarian practitioners to save lives, the sector has looked to pursue a systematic, targeted approach to more climate-friendly humanitarian efforts. There are three definitive areas to be managed from logistics' activities: decarbonisation of equipment and transport, green procurement, and mitigation of the waste generated by operations. For example, the United Nations Logistics Cluster coordinates the "Waste management and measuring, Reverse logistics, Environmentally sustainable procurement and transport, and Circular economy" (WREC) project, alongside a coalition of humanitarian organisations, to offer awareness building, practical guidance, and real time environmental expertise to help the sector expand its "do-no-harm" mandate to the natural environment (Logistics Cluster, 2022).

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

A new challenge that has emerged in the academic literature is then greening the humanitarian supply chain - HSC (Kovács and Spens, 2009). The immediate response to disasters, while well intended, sometimes causes avoidable humanitarian challenges later on: drinking water may be essential, but it is not necessary to provide it in small plastic bottles; injections may save lives, but inappropriately discarded syringes are hazardous (Corbett et al., 2022). Moreover, climate change has a great impact on humanitarian assistance, and humanitarian assistance, especially logistics support, is expected to grow substantially due to climate change (Kovács and Spens, 2009).

The need to consider green supply chain principles and practices in the relief supply chain is growing its evidence (Sarkis et al., 2013, 2012). Only some studies have beginning to address this question, e.g., Kovács (2011), Abrahamas (2014), Haavisto and Kovács (2014), Kunz and Gold (2015), Jilani et al. (2018). Other studies on green HSCs have focused on only one specific area, such as product design or procurement for examples, leaving a holistic view to future research (Zarei et al., 2019). More recent contributions are specifically on barriers to sustainability in HSC (Bag et al, 2022)

Although the topic of this paper is highly crucial and holds a central position in the actual debate, limited research has been conducted on this specific aspect, and the literature remains highly fragmented. According to these considerations, then the aim of this research is the following:

RQ1 - What concrete initiatives can be implemented to greening the humanitarian supply chain?

RQ2 - How they can be organized?

To pursue the objectives of this study, the research combines a literature review with an explorative empirical investigation to identify concrete initiatives of greening the humanitarian supply chain within the HL context. This approach is useful for better understanding this real-world phenomenon not only theoretically but also from the perspectives of practical initiatives and implementations. Additionally, the paper proposes an initial conceptual framework that want to capture the key elements of greening the humanitarian supply chain and lays a foundation for future inquiries that can accelerate progress in advancing knowledge in this topic.

Methodology. *The research combines a literature review with an explorative qualitative empirical investigation.*

In the search for experiences and empirical cases, for the empirical part, the following sources were selected: secondary sources, i.e. academic publications related to previously carried out studies; documentary analysis, i.e. internal reports of humanitarian organizations and private companies, conference proceedings, press releases, etcetera; participation in academic and corporate webinars. 31 short desk cases have been analyzed from 2007 to now, in different countries and different areas of implementation (transport, packaging, procurement, etcetera).

Results.

Literature review

Research definitions

In business management literature, the most widely quoted definition of sustainability is by the Brundtland Report (1987) where it is defined as the development that meets the need of the present without compromising the ability of future generations to meet their own needs. Elkington's Cannibals with Forks: The Triple Bottom Line of 21st Century Business (1997) offers an inspiring metaphor that challenges contemporary corporations to simultaneously deliver the triple bottom line (TBL) of economic prosperity, environmental quality and social equity.

Christopher (1992), among others authors, defines "supply chain" as a network of organizations involved, through upstream (supply) and downstream (distribution) relationships, in the various processes that give value to products and services offered to the final consumer, and "supply chain management" as the management of upstream and downstream relationships with suppliers and customers to deliver superior customer value at less cost to the supply chain as a whole.

Considering that twenty-first century organizations have pressured by different stakeholders to incorporate sustainability goals into the management of their supply chains, Seuring and Müller (2008) defined "sustainable supply chain management" as the management of materials, information and capital flows as well as cooperation among companies along the supply chain while integrating goals from all three dimensions of sustainable development—economic, social and environmental, which are derived from customer and stakeholder requirements.

By extension and drawing from Christopher's (1992) definition of a supply chain, an "humanitarian supply chain" is defined as the network of organizations that are involved in the design, management and coordination of the different processes and activities that include preparedness, planning, procurement, storage, transportation and distribution of emergency goods and services from the point of origin to the point of consumption, with the purpose of alleviating the suffering of people and communities affected by disasters whether they are natural or man-made (Laguna-Salvadó et al., 2019). And a "sustainable humanitarian supply chain" - SHSC combines the two concepts together.

Research gaps

Cao et al. (2018) observed that, contrary to what can be said of commercial supply chains, sustainability in the disaster context, being in its early stage, is considered by just a few researchers. In a recent literature review, Dubey and Gunasekaran (2016) also observed that there are relatively few contributions which focus on SHSCs. Therefore, the SHSC concept is still far from attaining maturity. One of the recent attempts comes from Klumpp et al. (2015) who proposed a

definition for "sustainable humanitarian operations" built on a combination of humanitarian operations' objectives, logistics definition (from the CSCMP) and the Brundtland sustainable development definition: "sustainable humanitarian logistics has the objective to assure every human being—especially in situations of disasters and emergencies—a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services by planning, implementing, and controlling the efficient, effective forward and reverse flow and storage of goods, services and related information throughout the whole SC in a manner that meets the needs of the present without compromising the ability of future generations to meet their own needs".

Laguna-Salvadó et al. (2017) developed a conceptual performance framework for the sustainability of HSC operations based on the TBL model and taking inspiration from the "house of sustainable supply chain management" by Teuteberg and Wittstruck (2010): this model has been called the "house of sustainable humanitarian supply chain operations", and it is an attempt to design a framework that includes the economic, social and environmental dimensions of sustainability, and that can be used for studying the performance of SHSCs. It proposes a set of performance measures classified on the TBL performance dimensions that should be considered for SHSC decision-making, covering the HSC main processes, i.e. source, make and deliver (Laguna-Salvadó et al., 2019).

Corbett et al. (2022) identified five areas in Sustainable humanitarian operations: material convergence, coordination between humanitarian organizations (HOs), logistics, partnerships with industry, and health. The discussions demonstrate the possibility of better integrating sustainability with humanitarian operations despite the inherent tension between the immediate need to save lives and the longer-term perspective associated with sustainability. This requires that various stakeholders think differently about the balance between short-term and long-term interventions, the metrics and incentives they apply, and the role of local versus global organizations.

*Other studies have been developed literature review on sustainable humanitarian supply chain management themes (*Anjomshoae *et al., 2023; Nawazish et al., 2023) or proposing a framework on it (Kunz & Gold, 2015; Haavisto & Kovács, 2014). Some authors use the term "Circular" humanitarian supply chain for disaster response (Baharmand, 2024).*

In this paper, we are going to focus on the environmental aspect so that the terms "sustainable supply chain" (SSC) and "green supply chain" (GSC) even if are sometimes used interchangeably and ambiguously are not the same, and in this case the focus is on greening the HSC. In fact, the term "green" should be restricted to the environmental dimension of sustainability, while the term "sustainability" should be used when studying the three dimensions. Our argument is in line with Ashby et al. (2012) who established that SSC management is an extension of GSC management since the latter only considers the environmental aspect of a sustainable business.

The environmental dimension in the "house of sustainable HSC operations" is composed of two main measures (Laguna-Salvadó et al., 2017): pollution reduction and resource conservation. The material flow processes have a direct impact on both measures. The aim of pollution reduction is to decrease the emission of harmful or poisonous substances such as CO2 into the atmosphere, mainly depending on the choice of transportation modes and distances between suppliers and beneficiaries. Resource conservation is about the reasonable use and protection of valuable resources such as trees, minerals, wildlife and water, with respect to the choice of packaging materials, handling processes or recovery policies.

The most recent contributions (Altay et al., 2023; Merdivenci et al, 2023; Nawazish et al., 2023; Tuomala et al., 2022; Fuli et al., 2020; Jilani et al., 2018; Abrahams, 2014) report that there are, in particular, some real strategies whose implementation is aimed solely at reducing the environmental impact of the humanitarian supply chain and they can be summarize in the following ones:

1) *Transport optimization: use of low-emission vehicles, optimization of routes to reduce fuel consumption and CO2 emissions;*
2) *Eco-friendly packaging: replace single-use plastic packaging with recyclable biodegradable materials;*
3) *Responsible waste management: implement recycling and safe waste disposal practices in the intervention areas (recycling of materials used for relief to the safe management of medical waste, to avoid environmental contamination);*
4) *Sustainable procurement: prefer the procurement of goods from local suppliers who adopt sustainable practices, this reduces the environmental impact related to transportation over a distance and on the portal local economies, reduce the need for large storages by reducing waste;*
5) *Use of renewable energy: implement the use of renewable energy sources (solar panels), to power logistics operations and rescue centers in order to limit polluting emissions.*

Following these strategies specifically related to logistics operations the empirical part has been developed.

Insights from experiences and cases

The results of the empirical part will be presented during the Conference.

Research limitations. *In this version of the research the main limitation arises from a solely desk analysis; the 31 cases are very short in their description an without a quantification of their impacts. The next step should be integrating*

with on field study with interviews to the actors who proposed, implemented and beneficed of the sustainable initiatives investigated.

Managerial implications. *The study can be useful for professionals and managers from both the humanitarian and commercial sectors, since working together in HL can benefit humanitarian organizations and companies, especially in complex efforts, where the relief operation can make the difference between death and life. Also, because humanitarian operations and logistics are big business and, unfortunately, disaster relief is, and will continue to be, a growth market.*

Originality of the paper. *Although the topic of this paper is highly crucial and holds a central position in the actual debate, limited research has been conducted in this specific area and the literature remains fragmented. This study can be useful in academia because, given the increased research interest in HL and in greening the supply chain, a clear focus on what concrete initiatives can be implemented to greening the humanitarian supply chain (RQ1) and how they can be organized (RQ2) is important for the development of a theoretical framework inside the discipline.*

Key words: *humanitarian logistics; humanitarian supply chain; environmental sustainability; green; logistics operations.*

Green Logistics Practices Driving Buyer Decision-Making: A Study on Logistics Service Provider Selection

CHIARA SGUIZZARDI[1] BENEDETTA BALDI[2]

Abstract

The logistics and transport sector generates over a third of global CO2 emissions, significantly contributing to a company's Scope 3 emissions. As regulatory targets become increasingly demanding, the selection of logistics service providers plays a crucial role for logistics buyers attempting to meet sustainability goals. In response, logistics service providers have been implementing a variety of green logistics practices to reduce their impact on the natural environment. The research aims to determine the most important green logistics practices influencing logistics buyers' decisions in the context of logistics service providers' selection. Grounded in behavioral decision theory, we test our hypotheses by conducting a series of scenario-based experiments with logistics and supply chain managers as respondents. The findings of this research aim at providing timely and practical guidance for managers at logistics service provider firms seeking to align their sustainability initiatives with buyer expectations.

Framing of the research. *Environmental sustainability and greenhouse gas (GHG) emissions receive significant attention at the managerial and regulatory levels due to their connection to climate change. The saliency of global warming and reduction of greenhouse gas emissions is supported by visible actions such as the Paris Climate Agreement - which focuses on the adoption and financing of GHG emissions mitigation (United Nations, 2020) - and the growing number of companies committing to Science Based Targets for emissions reduction (Science Based Targets, 2021). Moreover, recent regulations such as the European Corporate Sustainability Reporting Directive (European Commission, 2025), require an increasing number of companies to report not only direct GHG emissions (i.e., Scope 1 emissions) (Greenhouse Gas Protocol, 2024) but also indirect emissions happening in their supply chains (i.e., Scope 2 and Scope 3 emissions). Such requirements prompt companies to establish emission reduction strategies beyond their four walls (De Stefano & Montes-Sancho, 2024; Hettler & Graf-Vlachy, 2024; Villena & Dhanorkar, 2020), placing outsourced logistics practices under the spotlight.*

In this context, companies' selection of more environmentally-sustainable logistics service providers (LSPs) has a key role to play in meeting the demanding targets now established by legislators and policymakers. The logistics and transport sector represents the largest-emitting sector in numerous developed countries, generates over a third of global CO_2 emissions (Huge-Brodin et al., 2020; ISO, 2025), and is forecasted to keep growing. In addition, these activities largely contribute to a company's Scope 3 emissions. Against this backdrop, broadening LSPs' selection criteria to include their environmental impact is a big managerial concern, at least within logistics and supply chain functions. On their side, LSPs have been developing a variety of logistics-related initiatives to reduce their impact on the natural environment, broadly referred to as "green logistics practices" (GLPs) (Evangelista et al., 2017; Prataviera et al., 2023).

Extant research has highlighted a mismatch between LSPs' green offering and logistics buyers' green demands (Martinsen & Huge-Brodin, 2014; Huge-Brodin et al., 2020; Jazairy & Von Haartman, 2020). This misalignment slows the actual adoption of GLPs and consequently hinders the progress in mitigating the environmental impact of logistics and transport activities. Moreover, while previous research showed that environmental performance acts as a differentiator in supplier selection decisions (Davis-Sramek et al., 2020; Thomas et al., 2016), research concerning LSPs largely treats GLPs as a singular entity, failing to establish focused inquiries for each GLP (Jazairy & Von Haartman, 2020). Understanding logistics and supply chain managers' decision-making in their selection of LSPs when incorporating environmental criteria still represents a gap. This gap is further exacerbated by the lack of clear environmental performance metrics (Canal Vieira et al., 2024; Miemczyk et al., 2012) that managers could rationally evaluate and compare against a long-established set of criteria (i.e., cost, service, capability) (Davis-Sramek et al., 2018; Meixell & Norbis 2008).

Therefore, the present study aims at understanding which intra-organizational and inter-organizational GLPs influence a logistics buyer's selection when outsourcing logistics and transport activities to different possible LSPs. To ensure considering a comprehensive categorization of GLPs, we leverage previous contributions (e.g. Centobelli et al., 2017; Colicchia et al., 2013) and rely particularly on the work by Prataviera et al. (2023). Our study aims at answering

DOI 10.7433/SRECP.SP.2025.01

the following research question: "which GLP or combination of GLPs is most important in LSPs selection?". We turn to behavioral decision theory (BDT) to understand how managers evaluate practices in sustainable LSP selection for decision-making.

Purpose of the paper. *The purpose of this research is to determine which GLPs are most important for LSPs selection decisions. To do so, rather than relying on prescriptive frameworks, this research utilizes a theory-based empirical approach to determine managers' decision-making in an outsourcing logistics and transport selection context. Insights from BDT inform the development of hypotheses that predict a relationship between the implementation of specific GLPs by LSPs and the purchase intentions of a logistics buyer.*

Logistics service providers selection and sustainable offerings. *Green supply chain management refers to the integration of environmental concerns within supply chain management (Carter & Rogers, 2008; Seuring & Müller, 2008), with the aim to reduce the negative environmental impact of supply chain activities. As logistics determines a great share of companies' carbon footprint, in the past decade, green logistics has gained momentum, and a variety of GLPs have been adopted and implemented in practice. Likewise, the issue has been widely investigated and discussed in previous research (Jazairy et al., 2024; Prataviera et al., 2023), which has come to classify such practices as internal - including green warehousing, innovative packaging design and management, distribution planning and transportation execution, and internal management tools such as traceability - or external (i.e., green purchasing, collaboration with customers, other collaborations) (Centobelli et al., 2020).*

When discussing green logistics, LSPs are considered key players as they manage the systems and actually perform the operations that ultimately produce emissions (Huge-Brodin et al., 2020). From a LSP perspective, previous research has investigated the role of other stakeholders, together with contextual factors, to explain the adoption of GLPs (Centobelli et al., 2017; Prataviera et al., 2023; Schmidt et al., 2017). From a logistics buyer perspective, research has emphasized that purchasing managers are including environmental performance evaluations alongside economic criteria when selecting suppliers (Foerstl et al., 2015; Goebel et al., 2012). Experimental evidence has further supported that when environmental performance is incorporated as a criterion, it can serve as a differentiator in selection decisions (Davis-Sramek et al., 2020; Thomas et al., 2016). However, LSPs and their customers (i.e., logistics buyers) have different perspectives on environmental sustainability and extant studies point to poor alignment and mismatch between LSPs offerings and buyers' requirements (Huge-Brodin et al., 2020; Jazairy et al., 2021). It remains unclear the managers' decision-making in an LSP-selection situation, and how they evaluate individual GLPs or combinations of them, in a context characterized by scarce environmental performance metrics on one side and increasing pressure to report and reduce Scope 3 emissions on the other. To understand how decision-makers make value judgments in green LSPs selection, we turn to theoretical insights from BDT (Morton & Fasolo, 2009).

Behavioral decision theory. *Scholars have long been intrigued by how individuals choose among various alternatives (Roe et al., 2001). The evolution of behavioral decision theory began in the 1950s, a period during which the assumptions of rational choice theory were increasingly questioned (Slovic, 1995). Instead of assuming that a decision maker has the computational ability to determine the option that maximizes expected utility (Bettman et al., 1998), it is argued that individuals aim for outcomes that are satisfactory but not necessarily maximized. This shift in perspective paved the way for an approach to decision-making grounded in the concept of bounded rationality-which acknowledges inherent limits in information processing capacity (Simon, 1955; Bettman et al., 1998). Further developments in BDT have underscored that, due to these cognitive capacity constraints, decision-makers employ a range of information processing and decision-making strategies (Roe et al., 2001; Jiang & Punj, 2008).*

Moreover, there is a growing consensus among behavioral researchers that preferences are not simply revealed during the decision process; rather, they are actively constructed as individuals selectively draw upon both the information at hand and what is stored in memory (Slovic, 1995; Bettman et al., 1998; Anderson & Clemen, 2013) when they are making a choice. This dynamic often requires decision-makers to face challenging trade-offs among alternatives, a central theme in the literature on preference construction (Payne et al., 1999). Although this approach has not been widely applied in empirical sustainable supply chain management research, understanding how managers build preferences in their decision-making can offer critical insights.

According to BDT, when decisions become cognitively demanding, decision-makers tend to rely on simple heuristics or "rules of thumb" instead of taking the time to consider possible trade-offs among options (Morton & Fasolo, 2009). In such cases, a preference is formed by creating a dominance relationship, and one criterion in the choice set overshadows all others. This strategy simplifies the decision-making process by denoting one criterion as the most critical factor (Bettman et al., 1998; Montgomery, 1983). Building on these insights, BDT suggests that in LSP selection, a dominance relationship can emerge when evaluations of the different GLPs are considered in light of their salience and the justifiability of prioritizing one over the others (Bettman et al., 1998).

Building on previous research, which indicates that LSPs engage more extensively in selling GLPs than shippers (i.e., logistics buyers) do in buying them (Abbasi & Nilsson, 2016; Martinsen & Björklund, 2012; Wolf & Seuring, 2010) and that this situation is not uniformly applicable to all GLPs nor to all purchasing phases (Jazairy & Von Haartman, 2020), we argue that logistics buyers form their preferences on different GLPs based on individual value judgments (i.e., heuristics and "rules of thumbs"). In line with this thought, we adopt insights from BDT, which emphasizes that managerial preferences' construction happens through salience and justifiability. First, decision-makers process information selectively, with attention given to the most salient dimension among a choice of options. As a result, they examine alternatives and place more significance on that dimension (Jiang & Punj, 2008). Second, decision-makers are

held accountable and must often be able to justify or provide reasons for a decision (Shafir et al., 1993). Bettman et al. (1998) assert that decision-makers look for a strong case for justification. This theoretical perspective provides the rationale to hypothesize that the internal practices related to green packaging design and management, as well as the internal practices linked to supply chain traceability, will be the most important. Furthermore, external practices related to green monitoring and data sharing will strengthen buyers' selection decisions.

Methodology. *To test the relationships proposed in the hypotheses, we use a series of scenario-based between-subjects behavioral experiments (Rungtusanatham et al., 2011). This approach aligns with other supply chain studies that examine human behavior and decision-making (Eckerd & Bendoly, 2011; Tokar, 2010; Zhu et al., 2024). Experimental designs leverage the power of random assignment, isolate effects from potential confounding conditions, enable manipulation of variables of interest, and maximize the internal validity of the research (Knemeyer & Naylor, 2011). Scenario-based experimental designs are particularly useful because they enable the study of situations where organizations may be unwilling to share confidential details (Thomas et al., 2010). This research will be conducted with a focus on what participants would do in specific scenarios in a situation that did not have an optimal solution. Therefore, participants will be given a set of instructions among which specifically stated that there will be no right or wrong answers.*

The behavioral experiments will use different scenarios to manipulate the GLP in a LSP selection context. Data will be collected via the online crowdsourcing platform Prolific Academic through a survey built on the Qualtrics software. Respondents will be full-time working managers operating in the logistics and supply chain functions. Internal GLP adoption is the main independent variable with four levels of treatment (green warehousing, innovative packaging design and management, distribution planning and transportation execution, and supply chain traceability). Independent variable effects will be measured on the dependent variable of purchase intention, defined as the willingness to buy the service of a specific LSP (Hardesty et al., 2002). External GLP adoption is the moderator variable manipulated with three levels of treatment (green purchasing, collaboration with customers, and other collaborations). We will collect participants' demographic information such as their age, specific role in the company, and information about their companies, such as the industry sector.

Expected results. *Logistics buyers making LSP selection decisions with green supply chain management concerns will form their preference based on the salience of GLPs information and on the justifiability of their choices. Among the internal GLPs, we expect logistics buyers to be more likely to perceive packaging and traceability of emissions data practices as the most salient in the LSP selection decision. Indeed, logistics buyers may highly emphasize green packaging due to their role and responsibility in applying eco-design regulations to reduce product waste (Lun et al., 2015; Sureeyatanapas et al., 2018). Likewise, traceability of emissions data is considered salient as it may be used for reporting and communication purposes, thus anticipating positive consequences for the buyers' own firm.*

Furthermore, as managers making LSP selection decisions must be able to justify their choice, focusing on the most prominent dimension constitutes a sound argument (Irwin & Davis, 1995). Here, the increased sensitivity of final consumers with respect to climate change issues and firms' sustainability initiatives, together with the role of extant reporting requirements, make decisions of prioritizing packaging and emissions data more defensible.

In sum, we expect two categories of internal green logistics practices, namely those related to green packaging and management and those related to supply chain traceability with emissions data, to emerge as especially influential. These practices are likely to prevail in the decision-making process as they align with managers' need to justify choices based on familiar and measurable criteria, thereby creating a dominance relationship in which packaging practices and traceability of emissions data stand out as critical factors in the selection of logistics service providers.

Following a similar reasoning, we expect that among the external GLPs, logistics buyers will be more positively influenced by green monitoring and data sharing. These practices will reinforce their selection decisions.

Research limitations. *This research presents some inherent limitations. From a methodological perspective, scenario-based experimental methods, while strong in internal validity, often suffer from lower external validity. Additionally, the scenario-based experimental design captures buyers' intentions but does not measure actual or observed behavior in decision-making contexts. Although this approach aligns with the study's objectives, it may lack realism, which could limit the generalizability of the findings. This study focuses on the single perspective of logistics buyers, excluding the perspectives of LSPs and other stakeholders, such as consumers.*

Managerial implications. *This research aims at providing timely guidance for managers at logistics service provider firms seeking to align their sustainability initiatives with buyer expectations. Indeed, we enlighten the decision-making process of logistics buyers, providing information regarding selection criteria that can be used by LSPs to market their GLPs and to maximize the fit between green logistics offerings and requirements. Ultimately, bridging the gap between LSPs offerings and buyer expectations remains a central challenge in achieving a more sustainable logistics ecosystem.*

Originality of the paper. *Recent European directives requiring firms to report supply chain emissions (primarily Scope 3 emissions) have placed LSPs under increasing scrutiny, making GLPs more relevant than ever for logistics buyers. Despite growing attention, prior studies have tended either to treat GLPs as a single, monolithic construct or to focus qualitatively on a single practice, leaving the combined effect of multiple GLPs on managerial decision-making unexplored. To our knowledge, there is no empirical research simultaneously testing the relative importance of different internal and external GLPs on managerial decision-making behavior. This research addresses that gap by employing an*

experimental design to test managers' decisions with respect to different GLPs, thus providing a more nuanced view of how logistics buyers evaluate sustainable offerings.

A key contribution lies in the application of behavioral decision theory, which illuminates how individual-level cognitive processes - beyond stakeholder and contextual factors that have been investigated in previous literature to explain GLP adoption - influence the decisions about GLPs. In doing so, we offer a novel perspective that bridges theoretical insights on decision-making with the practical realities of LPS selection. Our focus on both internal and external GLPs provides timely guidance for logistics managers seeking to align their sustainability initiatives with buyer expectations. Moreover, our findings pave the way for future research to explore how different types of buyers, as well as diverse functional roles within firms, may further shape the importance attached to various GLPs.

Natural resource scarcity and green supply chain management of the firm

FRANCESCO GHEZZI[1] ELEONORA ANNUNZIATA[2] FRANCESCO RIZZI[3]

Abstract

Natural resource scarcity (NRS) poses a growing challenge for firms and supply chains, as dependence on scarce resources threatens both financial performance (FP) and organizational survival. To address these challenges, firms increasingly adopt green supply chain management (GSCM) practices aimed at mitigating the adverse effects of NRS. However, existing studies on the relationship between GSCM and FP have produced mixed results, as the benefits of GSCM unfold over the long term and are influenced by various indirect factors. This paper aims to study the relationship between GSCM practices and FP of the firm, and to understand how NRS shapes this relationship. We conceptualize the influence of NRS through four distinct types of uncertainty perceived by firms: ecological, regulatory, market, and stakeholder reputation uncertainties, and propose that this influence can be studied as a moderation effect that weakens (in the case of ecological uncertainty) or strengthens (for regulatory, market and stakeholders' reputation uncertainties) the relationship depending on whether the uncertainty involves organizational interrelationships or directly nature. Analysis of a sample of large firms in natural-resource intensive industries for the period of 2014–2023 consistently supports our theoretical propositions. The findings contribute to advancing research on natural resource management and supply chains by demonstrating the indirect effects of NRS on the relationship between GSCM and FP, and analyzing simultaneously both physical and non-physical drivers of business responses to NRS.

Keywords: *natural resource scarcity; green supply chain management; financial performance; carbon disclosure project; sustainability*

Framing of the research. *Natural resource scarcity (NRS) is one of the most pressing Grand Challenges which our society needs to face in the upcoming years (George et al., 2015; George et al., 2016). NRS is primarily caused by human-driven overexploitation of natural ecosystems that generate resources, along with climate change, biodiversity loss, and other interrelated global challenges (Rockstrom et al., 2009). Its effects on firms are becoming increasingly apparent and critical to the firms' survival, whenever dependent on scarce natural resources to operate their business (Tashman, 2021). Starting from the end of the 20th century, NRS has driven an ever-increasing vulnerability of long and complex supply chains (Wagner & Bode, 2008), whose impacts were made clear both by climate-change led natural disasters and by anthropogenic disasters as the pandemic outbreak in 2020 and the Russian-Ukrainian conflict in 2022.*

Facing increasing exposure to NRS, it is critical for firms and supply chains to mitigate and address its consequences by implementing green supply chain management (GSCM) practices. Tashman and Rivera (2016) were the first to highlight how direct dependence on scarce natural resources influences firm behavior. They demonstrated that NRS creates uncertainty for the firm concerning direct access to natural resources (ecological uncertainty), prompting them to adopt resource-intensive adaptation strategies (Tashman & Rivera, 2016). However, NRS introduces uncertainty for the firm also regarding the consequences on other organizations of its ecological impacts. This broader uncertainty manifests as regulatory uncertainty (Kassinis & Vafeas, 2006), market uncertainty (Paulraj & Chen, 2007; Wong et al., 2011), and stakeholders' reputation uncertainty (Sharma & Enriques, 2005; Kassinis & Vafeas, 2006). According to Tashman and Rivera (2016), firms respond to these uncertainties differently depending on whether the uncertainty stems from relationships with other organizations or with nature. However, existing research has not adequately addressed both physical and non-physical drivers of business responses to NRS (Unter et al., 2024).

While some firms and industries have a direct dependence on natural resources, it can also be indirect, arising from organizational interdependencies with other upstream or downstream supply chain actors outside the firm's control (Tashman & Rivera, 2016; Kalaitzi et al., 2018). George et al. (2015) emphasize the need for more research on natural resource and GSCM, as the existing literature lacks a comprehensive understanding of how NRS contributes to supply chain disruptions and, more broadly, affects firm performance.

This study aims to fill that gap by examining the effects of these four types of uncertainty as perceived by firms on the relationship between GSCM and financial performance (FP) of the firm. The paper thus emphasizes the supply chain level, where GSCM involves strategically integrating environmental considerations into both forward and reverse logistics. This integration is achieved through implementing various environmental practices aimed at minimizing negative environmental impacts throughout the supply chain (Zhu & Sarkis, 2004; Srivastava, 2007). GSCM practices are generally classified into internal and external practices (Zhu & Sarkis, 2004; Zhu & Sarkis, 2006; Choudary & Sangwan, 2022; Lee et al., 2012).

Internal practices include Internal Environmental Management (IEM) and Eco-Design (ECD). IEM practices focus on reducing pollutants' emissions, minimizing waste and e-waste, lowering water consumption, enhancing policies for water and energy efficiency, and initiating environmental restoration efforts. In contrast, ECD practices emphasize designing products for reuse and recycling, incorporating features that promote responsible usage, and implementing environmental labeling and marketing (Miroshnychenko et al., 2017; Ortas et al., 2014; Laari et al., 2018; Kong et al., 2021). These internal practices can be managed independently by firms to mitigate environmentally harmful activities within their operations (Jell-Ojobor & Raha, 2022).

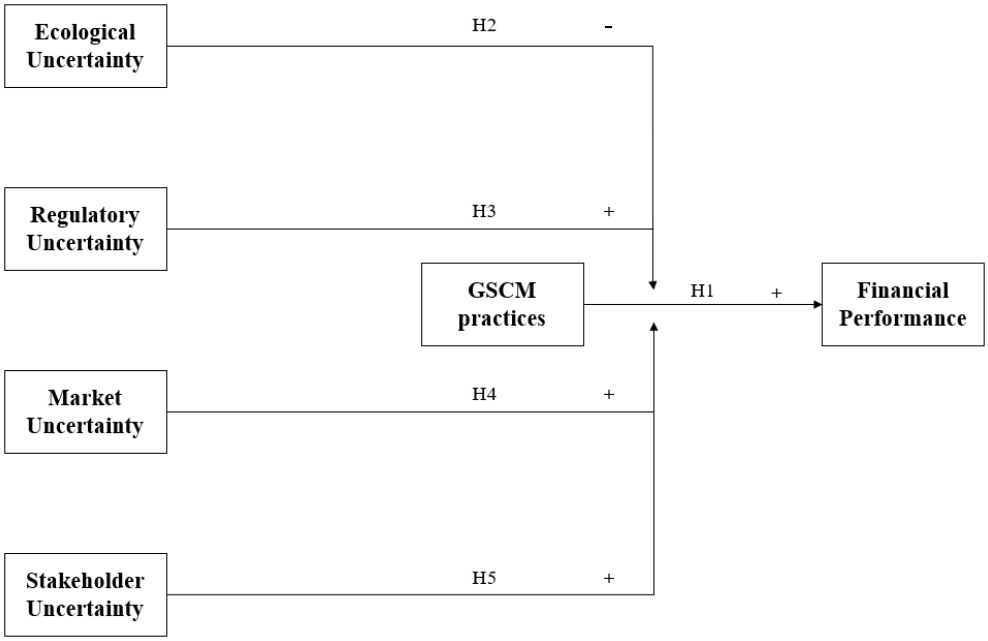
External practices encompass Green Purchasing (GPU) and Cooperation with Customers and Suppliers (COP) on environmental objectives. GPU involves integrating environmental criteria into procurement decisions, including sourcing materials, selecting suppliers, and terminating partnerships when criteria are unmet. COP includes collaborative efforts with customers and suppliers to reduce the environmental impact of the supply chain, such as shared responsibility policies, joint investments, cooperative eco-design initiatives, and environmental training (Miroshnychenko et al., 2017; Ortas et al., 2014; Laari et al., 2018; Feng et al., 2018). Unlike internal practices, external GSCM practices require coordinated efforts with external stakeholders, such as suppliers and customers, to be effectively implemented (Jell-Ojobor & Raha, 2022).

Purpose of the paper. *We study the relationship between GSCM practices and FP of the firm and explore the mechanisms by which uncertainties created by NRS affect this relationship. When investigating the impact of GSCM practices on FP, literature lacks agreement between short-term perspective studies which affirms no significant influence of GSCM practices on FP (Laari et al., 2018; Feng et al., 2018; Rodríguez-González et al., 2022) and the long-term investigations which instead have proposed a positive influence on FP (Jell-Ojobor & Raha, 2022; Miroshnychenko et al, 2017). We postulate that the effect of GSCM practices on FP is positive in the long term as a reflection of the reduction in firm's environmental impact, increased eco-efficiency and/or better collaborations with supply chain members for environmental goals (Dangelico & Pontrandolfo, 2015; Porter & Van der Linde, 1995; Zhu & Sarkis, 2004). As such, we formulate the following hypothesis:*

H1. *Adoption of GSCM practices has a positive effect on firms' FP in the long term.*

If GSCM practices indeed affect a firm's financial performance, the objective of this paper is to understand how the effect may vary under NRS. Examining the boundary conditions developing from NRS can enhance the understanding of the mechanism underlying the main effect and contribute to advancing research in GSCM, corporate FP and natural resource scarcity. We build on the Natural Resource Dependence Theory (NRDT) to analyze the contingency effects of NRS. NRDT is a theoretical perspective envisioned to consider the effects of NRS on firms whenever they are dependent on scarce natural resources (Tashman, 2021). Therefore, the uncertainty perceived by the firm may direct GSCM practices more towards eco-innovation rather than compliance with environmental regulations, or more towards collaboration with partners rather than internal eco-efficiency. We argue that the study of the indirect influences helps the comprehension of the mechanisms by which the relationship between GSCM practices and FP develops throughout time (Feng et al., 2018; Zhao et al., 2021), and propose that the influence of NRS can be studied as a moderation effect that weakens (ecological uncertainty) or strengthens (regulatory, market and stakeholders' reputation uncertainties) the relationship depending on whether the uncertainty involves organizational interrelationships or directly nature. This could happen since the direct relationship between firms and the natural environment does not involve organizational interdependence, meaning firms encounter fewer limitations from other organizations in their resource use, while when other organizations are involved then the firm perceives to be constrained in limiting natural resource exploitation (Tashman & Rivera, 2016; Ostrom, 1999; Kassinis & Vafeas, 2006; Paulraj & Chen, 2007; Sharma & Henriques, 2005). We thus propose the following hypotheses:

H2. *Ecological uncertainty negatively moderates the relationship between GSCM practices and FP.*



H3. *Environmental regulatory uncertainty positively moderates the relationship between GSCM practices and FP.*

H4. *Market environmental uncertainty positively moderates the relationship between GSCM practices and FP.*

H5. *Stakeholder environmental reputation uncertainty positively moderates the relationship between GSCM practices and FP.*

Figure 1 *presents the theoretical model of the study.*

Fig. 1: theoretical model and hypotheses

Methodology. *The data for this study is drawn from various reliable sources. We begin by collecting GSCM data from the Environmental, Social, and Corporate Governance (ESG) module of the London Stock Exchange Group (LSEG) Refinitiv Workspace. This module provides comprehensive insights across numerous ESG themes, including emissions, environmental product innovation, human rights, and supply chain management (LSEG, 2024).*

To complement this, we integrate financial and accounting information, such as firm size, profitability, and industry sector, using the LSEG Workspace Ownership module. Additionally, we gather data on firms' perceived uncertainty variables-acting as moderating variables-from the Carbon Disclosure Project (CDP). As a non-profit organization, CDP has conducted annual surveys since 2003, collecting extensive data on climate change and its implications for businesses, alongside information related to forests, water security, biodiversity, and supply chain management. With what it claims to be the world's largest primary corporate climate change database (CDP, 2024), CDP offers consistent assessments of climate change-related risks by directly addressing physical and regulatory factors relevant to environmental and natural resource management. The choice to use CDP data for building uncertainty variables is based on its systematic approach to evaluating environmental risks since the inception of its surveys. Its methodology effectively captures the physical and regulatory factors that potentially impact business activities, making it a valuable source for our analysis.

The actual sample, upon which this abstract was drafted, comprises 1,895 firm-year observations from 302 companies spanning 37 countries and five industries over a ten-year period (2014–2023), where both LSEG and CDP data are available. The sample is going to be refined and enlarged in the next developments of this research. To ensure relevance, we focus exclusively on firms operating in natural-resource-intensive industries identified by previous research as particularly vulnerable to NRS concerns: Energy, Metals & Mining, Utilities, Food Products, and Paper & Forest Products (Sharma & Henriques, 2005; Dias et al., 2022; de Abreu et al., 2017; Bowen et al., 2018). The industry breakdown shows a heavy representation of Utilities, Energy, and Metals & Mining, while companies from the Paper & Forestry and Food sectors are less prevalent. Geographically, most of the sample originates from the United States, followed by other major Anglo-Saxon economies like Canada, the United Kingdom, and Australia, along with significant portions from Italy and Brazil. The remaining data encompasses companies from various countries worldwide. Consistent with the methodologies used by Wang and Sarkis (2013) and Jell-Ojobor and Raha (2022) in similar panel data studies, we include only firms with complete data for every year within the study period to maintain a balanced panel dataset.

Following the approach of Jell-Ojobor and Raha (2022), we operationalize our dependent variable of financial performance through two indicators, ***Return on Assets (ROA)*** *and* ***Return on Equity (ROE)****. ROA measures a company's operational efficiency by dividing its net income after taxes by its total assets. Meanwhile, ROE evaluates a company's financial performance by dividing its net income after taxes by the book value of equity. To reduce the weight of extreme outliers, ROA and ROE have been winsorized at the 1th and 99th percentiles. The independent variable in our model is GSCM practices, which is operationalized through 4 subdimensions (Zhu and Sarkis, 2006):* ***internal environmental management (IEM)****,* ***eco-design (ECD)****,* ***green purchasing (GPU)*** *and* ***cooperation with customers and suppliers (COP)****. GSCM practices variable is measured as the sum of IEM, ECD, GPU and COP. For the moderating variables, we utilized data from the "Risk and Opportunities" section of the Climate Change questionnaire provided by the CDP (CDP, 2023). This section requires firms to identify their perceived environmental risks, which are categorized into eight*

types: current regulation, emerging regulation, legal, technology, market, reputation, acute physical, and chronic physical. To construct these variables, we grouped the risks as follows:

- ***Environmental Regulatory Uncertainty (re_unc):*** *Derived from current regulation, emerging regulation, and legal risks.*
- ***Market Environmental Uncertainty (ma_unc):*** *Built using technology and market risks.*
- ***Environmental Stakeholders' Uncertainty (st_unc):*** *Based on reputation risks.*
- ***Ecological Uncertainty (ec_unc):*** *Formed by combining acute physical and chronic physical risks.*

For each identified risk, firms disclose both the likelihood and magnitude of impact. We measured each uncertainty variable using a risk exposure formula commonly applied in supply chain risk management (Tummala & Schoenherr, 2011). This formula calculates risk exposure as the product of a consequence index (magnitude of impacts) and a probability index (likelihood of impacts). To account for the additive nature of multiple risks perceived by a firm within the same category, we added a constant when more than one risk type was reported (Bergmann et al., 2016). If a firm did not report any risk related to a specific category (e.g., reputation risk), the corresponding uncertainty variable was set to zero. Finally, following Miroshnychenko et al. (2017), financial leverage, firm size, country, industry and year dummies are included as control variables.

In order to test the hypotheses of this paper, we employed the following as base model:

$$FP_{it}=b_0+b_1(GSCM_{it-1})+b_2(ec_unc_{it-1})+b_3(ma_unc_{it-1})+b_4(st_unc_{it-1})+ \\ +b_5(re_unc_{it-1})+b_6(controls_{it-1})+d_{year}+err_{it}$$

Building on prior research on social and environmental responsibility (Gao & Bansal, 2013; Miroshnychenko et al., 2017; Jell-Ojobor & Raha, 2022; Hart & Ahuja, 1996; Wang & Sarkis, 2013), we posited that the benefits of implementing GSCM practices would materialize with a time lag of at least one year. To address potential endogeneity, we applied a one-year lag to the GSCM practices, uncertainty variables, and control variables. To examine the moderating effect of each uncertainty variable, we introduced interaction effects by creating additional models where each uncertainty variable interacted individually with GSCM practices. This approach allowed us to test the distinct moderating role of each uncertainty type. We employed a fixed effects estimator to account for omitted variable bias, specifically using firm fixed effects to control for time-invariant unobserved heterogeneity across firms. The decision to use the fixed effects estimator was based on the results of Hausman's (1978) test, which demonstrated a significant difference between fixed and random effects estimators ($p < 0.001$ for both ROA and ROE). This outcome suggests strong correlations between regressors and error terms, confirming that the fixed effects model was the appropriate choice. Accordingly, we applied a panel linear regression model with firm fixed effects to effectively capture time-invariant characteristics and between-firm heterogeneity (Wooldridge, 2002).

Results. *As an on-going project, results are yet to come in their final form. The dataset is still to be consolidated and this prevents the chance to present the final outcomes. However,* **Table 1** *presents some preliminary findings based on the firms analyzed so far.*

Models 1 and 2 examine the main effects of GSCM practices in the previous year on firm's ROA and ROE, respectively. In support of Hypothesis 1, the results indicate that the adoption of GSCM practices brings an increase of 0,0029 units of ROA (0,29%) and of 0,0043 units of ROA (0,43%). P-values indicate high significance of both relationships.

Models 3-10 test the interaction effects between GSCM practices and the four uncertainty variables on financial performance, which is measured both as ROA and ROE for each interaction effect. Hypothesis 2 predicts that ecological uncertainty weakens the effect of GSCM practices on FP, and it is supported by the results of models 3-4, in which the interaction term GSCM x ec_unc is negative and significant ($\beta = -0.0055$, $p = 0.007$ for ROA; $\beta = -0.0091$, $p = 0.012$ for ROE). Hypothesis 3 which predicts that regulatory uncertainty strengthens the effect of GSCM practices on FP is supported by model 7 ($\beta = 0.0064$, $p = 0.001$), however the interaction term is not significant in model 8, suggesting a different interpretation between ROA and ROE as dependent variable. The same holds for Hypothesis 5 which predicts that stakeholders' reputation uncertainty strengthens the effect of GSCM practices on FP. It is supported by model 9 ($\beta = 0.0062$, $p = 0.023$), but not by model 10. Finally, models 5-6 test Hypothesis 4 which predicts that market uncertainty strengthens the effect of GSCM practices on FP. However, the hypothesis is not supported as the interaction term is not significant in both models.

Research limitations. *The first limitation of this research is related to the use of firms' voluntarily self-disclosed CDP data for measuring uncertainty variables. This could have introduced self-selection bias as firms might have done it to respond to external pressures or compensating significant environmental impacts. However, as we measured perceived uncertainty the very choice to disclose to CDP could be a signal of effective perception of ecological uncertainty, thus limiting the bias. More*over, *market uncertainty turned out to be not significant in positively mediating the relationship between GSCM practices and FP. We attribute the non-significance of market uncertainty to how it was measured by the data employed, as the CDP questionnaire only refers to non-supply chain-related technological risks or general market and product substitution threats. We call for future research to better measure this construct and understand its role in the relationship between GSCM practices and FP.*

Managerial implications. T*he results of this paper are highly relevant for managers operating in natural resource-intensive industries. This paper clearly articulates the distinction between short-term and long-term GSCM practices implementation. Although these practices may involve short-term costs by restricting the exploitation of scarce natural resources, their effectiveness will ultimately decline if NRS is not adequately addressed. In such cases, the ecological threat could surpass the firm's capacity to respond effectively. This highlights the importance of treating natural resource scarcity not as a temporary crisis but as a persistent risk demanding proactive and comprehensive management. Failure to do so may result in far more severe long-term consequences. Therefore, managers of natural resource-intensive firms should leverage the results of this study and recognize that GSCM practices can bring a competitive advantage in the long term and ultimately improve financial performance.*

Originality of the paper. *The findings of this paper bring important novelty to the GSCM literature, showing how the relationship with FP develops in the long-term, as well as the indirect effects that intervene in the relationship because of the uncertainty perceived from the dependence on scarce natural resources. Although previous literature has produced mixed results on the GSCM-FP relationships in the short vs long-term, we argue that these different points of view could have been produced by the very nature of this relationship, which develops in the long term, making room for indirect factors to intervene and skew towards more positive or more negative outcomes on firm's performance. Therefore, after demonstrating a significant positive effect of GSCM on the financial performance of the firm in the long term, meaning that, at least in natural-resource intensive industries, adoption of sustainable practices brings competitive advantage to the firm, we reveal important indirect effects related to NRS that shape the relationship in the long-term. Specifically, ecological uncertainty weakens the positive effect of GSCM on FP: this implies that direct dependence on scarce resources may intensify in the long-term making it challenging for firms to adopt sustainable practices when ecological uncertainty is high. On the contrary, regulatory and stakeholders' reputation uncertainty strengthen the positive effect of GSCM on FP, meaning that adoption of sustainable practices is able to mitigate the impacts of such risks for the firm as the external stakeholders that may pose these risks on the firm will presumably react positively to GSCM adoption.*

In this way, we contribute to the advancement of research on natural resource management and the supply chain (George et al., 2015), and address the gap of literature analyzing simultaneously both physical and non-physical drivers of business responses to NRS (Unter et al., 2024).

The Role of Consumers in Circular Supply Chains: A Multi-Sector Case Study

LAURA BRAVI[1] FABIO MUSSO[2] ALESSIO TRAVASI[3] GIADA PIERLI[4]

Abstract

The transition from a linear to a circular economic model is a critical response to growing environmental concerns and resource scarcity. The circular economy (CE) promotes sustainability by integrating reuse, recycling, and remanufacturing practices, with circular supply chains playing a fundamental role in ensuring continuous reintegration of materials. However, closing circularity loops remains a challenge, largely due to inconsistent consumer engagement. This paper investigates the role of consumers in CE across three industries - furniture (IKEA), cosmetics (Sephora), and fashion (Gruppo Calzedonia) - through a multiple case study approach. Findings reveal that while businesses have implemented various CE initiatives, consumer participation is inconsistent due to logistical, financial, and behavioral barriers. IKEA's circular supply chain strategy includes take-back and resale programs to extend product lifecycles, yet convenience issues hinder full consumer adoption. Sephora's circularity loop for cosmetic packaging faces limitations due to a lack of financial incentives, impacting consumer motivation. Gruppo Calzedonia's closed-loop textile recycling system has demonstrated effectiveness in incentivizing customer participation through discount-based take-back schemes, though awareness remains a challenge. This study highlights the importance of financial incentives, convenience, and consumer education in fostering engagement with CE initiatives. Theoretical contributions include integrating behavioral economics into CE research and emphasizing the need for interdisciplinary approaches that connect consumer psychology, circular supply chain management, and sustainability studies. From a managerial perspective, businesses should streamline take-back programs, enhance incentive structures, and leverage digital tools to facilitate consumer participation in circularity loops. Additionally, regulatory frameworks must support consumer-centric policies, such as standardized labeling and tax incentives for sustainable purchasing behavior. By providing a comparative cross-sector analysis, this research offers valuable insights into improving consumer participation in circular supply chains and strengthening circularity loops. Future studies should explore cultural and regional differences in consumer engagement, the role of emerging technologies in supporting CE models, and strategies to overcome behavioral resistance to sustainability practices.

Framing of the research. *The transition from a linear to a circular economic model is a response to increasing environmental concerns and resource scarcity. The traditional linear economy, based on the "take-make-use-dispose" approach (Kirchherr et al., 2017; Nikolova & Ness, 2022), has reached its limits, making the shift toward circular economy (CE) models imperative (Vidal-Ayuso et al., 2023). CE emphasizes minimizing waste and maximizing the life cycle of products by incorporating concepts such as recycling, refurbishing, reusing, and remanufacturing. The fundamental principle of CE is the creation of circular loops within supply chains, ensuring that products and materials are continuously reintegrated into the economy instead of being discarded.*

Circular supply chains play a crucial role in achieving sustainability goals. Unlike traditional supply chains, which follow a linear path from raw materials to disposal, circular supply chains are designed to retain value by looping products and materials back into the production cycle. This model integrates closed-loop supply chains, in which goods are either returned to the producer for refurbishment or repurposed into new products (Confente, 2020). Closed-loop systems enable businesses to extend product lifecycles, reduce dependency on virgin raw materials, and lower overall environmental impact.

Circular business models are increasingly relying on industrial symbiosis, where companies collaborate to minimize waste and share resources across industries. This approach enhances resource efficiency by ensuring that waste or by-products from one company serve as raw materials for another. Such partnerships not only reduce environmental impact but also create economic benefits through cost savings and innovation in material reuse (Lieder & Rashid, 2016).

Transparency and consumer education on these interconnected circular systems are essential to reinforcing trust and participation in circular economy initiatives (Geissdoerfer et al., 2017).

However, the success of circular supply chains largely depends on consumer participation. Consumers are no longer passive buyers but active contributors to CE models. Their role extends beyond purchasing decisions to include responsible disposal, participation in take-back programs, and choosing products designed for longevity (Camacho-Otero et al., 2020; Mugge, 2018). In fact, unlike traditional linear models where consumers are passive end-users, circular supply chains require consumers to take an active role in product lifecycle extension. This includes not only responsible purchasing but also engagement in reuse, recycling, and upcycling initiatives. The success of circular models depends on consumers' willingness to participate in take-back schemes, adopt sustainable consumption habits, and demand transparency regarding product circularity. As highlighted in recent research, fostering consumer awareness and incentivizing behavioural change are essential to closing circularity loops and ensuring long-term sustainability. The engagement of consumers in circular loops influences key sustainability indicators, such as reduced waste production, lower carbon emissions, and decreased consumption of natural resources (Bocken et al., 2016; Frishammar & Parida, 2019).

Despite the clear benefits of consumer involvement, literature has identified a gap in understanding consumer behavior within the CE framework. Many studies focus on the business-side implementation of circular models, often overlooking the critical role of consumers in post-consumption phases (Vidal-Ayuso et al., 2023). The traditional economic perspective has often treated consumers as end-users rather than active participants in supply chains. This oversight is particularly evident in studies on waste management, product lifecycle extension, and the adoption of sustainable consumption patterns (Maitre-Ekern & Dalhammar, 2019).

A key challenge in achieving circularity is educating consumers about their role in sustaining circular supply chains. Many consumers lack awareness regarding the impact of their choices, such as selecting durable products, properly recycling materials, and engaging in refurbishment or resale initiatives (Testa et al., 2020; Vehmas et al., 2018). Furthermore, behavioral barriers, such as convenience, perceived effort, and economic incentives, significantly influence consumer participation (Asikis et al., 2023). Businesses must address these challenges through targeted marketing campaigns, incentives, and transparent communication of sustainability benefits (Tabas et al., 2025).

One of the major barriers to consumer participation in circular economy initiatives is the perceived lack of convenience and economic incentives (White et al., 2019; Camacho-Otero et al., 2020). Many studies indicate that consumers are more likely to engage in take-back programs and recycling schemes when financial benefits, such as vouchers or discounts, are provided (Testa et al., 2020; Lieder & Rashid, 2016). Moreover, psychological factors, including effort perception and trust in the recycling process, influence participation rates (Vermunt et al., 2019). To enhance consumer engagement, businesses should design seamless and rewarding circular programs that minimize logistical burdens, offer tangible incentives, and transparently communicate the impact of consumer actions on sustainability.

To bridge this gap, this paper investigates how consumers contribute to CE in three key industries: furniture, cosmetics, and fashion. These sectors have implemented various strategies to involve consumers, such as product take-back schemes, resale programs, and recycling initiatives. By analyzing these cases, this paper aims to fill the gap in understanding consumer engagement in CE and its implications for businesses. The selected case studies illustrate both successful consumer engagement strategies and persistent challenges in closing the material cycle.

Consumer participation in CE represents a significant shift in market dynamics. Traditional business models relied on continuous consumption, whereas circular models emphasize long-term value retention. As a result, companies must rethink their supply chains and redefine their relationships with consumers. The demand for sustainable and circular products is increasing, pushing retailers and manufacturers to adapt their strategies accordingly (Zeng et al., 2015; Rivera & Lallmahomed, 2016). The integration of digital tools, such as product tracking systems, repair tutorials, and online marketplaces for second-hand goods, has also facilitated consumer involvement in CE (Özkan, 2021; Van Weelden et al., 2016). Emerging technologies like blockchain and AI are also gaining attention for their potential to enhance transparency, traceability, and personalization in circular supply chains (Geissdoerfer et al., 2017; Tabas et al., 2025).

In summary, while businesses have made strides in adopting circular models, the active engagement of consumers remains a decisive factor in achieving sustainability goals. This paper contributes to existing literature by highlighting the need for a more comprehensive approach that includes consumer education, incentives, and systemic changes in business operations to promote circularity.

Purpose of the paper. *The primary objective of this paper is to assess the extent of consumer involvement in CE and its effectiveness in achieving sustainability goals. The study seeks to:*

- *examine how leading companies across different industries integrate consumer participation into their CE strategies.*
- *Identify key challenges and barriers faced by consumers in adopting circular behaviors.*
- *Propose actionable strategies for businesses to enhance consumer engagement in CE practices.*

By addressing these objectives, the paper contributes to bridging the gap between theoretical CE models and practical implementation, emphasizing the necessity of consumer awareness and active participation.

Methodology. *This study adopts a qualitative research design based on a multiple case study approach, allowing for a comprehensive understanding of consumer participation in CE across different industries. The multiple case study methodology, as described by Yin (2009), enables the comparison of diverse practices within different sectors, identifying similarities, variations, and best practices in consumer engagement. This method is particularly suited to studying real-*

world applications of circular economic initiatives and their effectiveness in influencing consumer behavior (Tisdell et al., 2025).

Data collection was conducted by gathering data from corporate sustainability reports, company websites, press releases, and publicly available business documents. Additionally, social media platforms and online consumer forums were analyzed to capture consumer sentiments and behaviors regarding CE initiatives. Other data to be discussed within the cases was derived from academic literature, government and institutional reports, and industry publications that discuss the role of consumers in circular economy models.

To ensure data reliability and validity, triangulation was employed by cross-referencing findings from multiple sources. The time frame for data collection spanned from March to April 2024, providing a current snapshot of CE initiatives and consumer engagement trends. All initiatives were still active at the time of data collection.

The selection of case studies was based on three primary criteria:

1. *Industry Relevance: the cases were chosen from industries with significant environmental footprints, namely furniture (IKEA), cosmetics (Sephora), and fashion (Gruppo Calzedonia). These sectors represent areas where consumer participation is critical in achieving CE objectives.*
2. *Implementation of Circular Initiatives: companies were selected based on their active implementation of CE strategies, including take-back programs, product resale models, recycling initiatives, and circular product designs.*
3. *Consumer Engagement Efforts: the study focuses on companies that have made explicit efforts to involve consumers in their circular supply chains, through incentives, awareness campaigns, and innovative CE practices.*

Each case study was analyzed through the lens of consumer engagement in CE. The following dimensions were considered:

– *Consumer Participation Mechanisms: how companies encourage customers to return, reuse, or recycle products.*
– *Effectiveness of Circular Initiatives: the impact of CE programs in terms of product lifecycle extension, waste reduction, and consumer adoption rates.*
– *Barriers to Consumer Engagement: challenges faced by businesses and consumers, such as logistical constraints, awareness gaps, and financial considerations.*

To structure the analysis, the collected data was categorized into themes that reflect consumer behaviors and company strategies. Pattern matching and thematic coding were applied to extract key insights, following established qualitative analysis techniques (Miles & Huberman, 1994). Thematic coding was conducted manually using an iterative process. Emerging themes were first identified inductively from the data, then refined through cross-case comparisons to ensure consistency. Particular attention was paid to recurring patterns related to consumer motivations, perceived barriers, and company communication strategies.

The findings provide an empirical foundation for understanding consumer engagement in CE and offer practical recommendations for improving participation rates in circular business models. The multiple case study approach allows for the identification of industry-specific factors while also highlighting overarching trends applicable across sectors.

Results. *The findings presented in the following sections derive from triangulated analysis of corporate documents, sustainability reports, and consumer-generated content from online platforms and forums. Each case integrates company-provided data with consumer perspectives and academic literature to offer a balanced interpretation. Where strategic recommendations are proposed, these are either derived from patterns in consumer feedback, consistent practices across cases, or grounded in existing literature on CE and consumer behavior.*

***Furniture Sector - The Case of IKEA**. The furniture industry has a significant environmental impact due to its extensive use of natural resources, including wood, metals, and plastics. Many furniture products are discarded after short-term use, contributing to landfill waste. However, circular business models in this sector aim to extend product lifecycles and enhance sustainability.*

IKEA has taken a leading role in integrating CE principles into its operations. The company has committed to becoming fully circular by 2030, implementing take-back schemes, and using recycled materials in production. One of the most notable initiatives is the "Buy Back & Resell" program, where customers can return used furniture in exchange for store credits. These items are then resold in IKEA's "Circular Hubs."

However, logistical challenges remain. Customers must transport fully assembled furniture, which can be cumbersome. Additionally, the financial incentives offered might not be sufficient to motivate large-scale participation. To enhance engagement, IKEA has explored partnerships with third-party logistics providers to facilitate product returns.

While IKEA's 'Buy Back & Resell' program represents a strong commitment to circularity, logistical challenges remain a significant barrier to consumer participation. One of the primary obstacles, as emerged from a consumer forum, is the requirement for customers to transport fully assembled furniture back to stores, which can be cumbersome and costly. Currently, IKEA offers rental van services through external providers, but the additional expense may discourage participation. A potential improvement would be the development of an in-house pick-up service, making returns more accessible and financially viable. By reducing logistical burdens and providing direct home collection options, IKEA could further increase engagement in its circular economy initiatives.

Digital tools, such as an online resale marketplace, are also being developed to streamline the process. Moreover, the company has been investing in modular and reparable furniture designs, making it easier for consumers to replace parts instead of discarding whole products.

Cosmetics Sector - The Case of Sephora. *The cosmetics industry faces unique sustainability challenges due to product packaging and the difficulty of recycling small plastic containers. Many beauty products consist of mixed materials that traditional recycling streams cannot process efficiently. Sephora has launched the "Beauty (Re)Purposed" initiative, a recycling program aimed at reducing waste from cosmetic packaging. Customers can return used beauty containers to designated collection bins in stores. Sephora collaborates with Pact Collective, a non-profit specializing in sustainable disposal solutions, to recycle or repurpose these materials. While this initiative represents progress, consumer participation remains limited due to a lack of direct incentives. In addition, the program is currently limited to the United States and Canada, restricting its potential global impact. Expanding the initiative to European markets, where consumer awareness of sustainability is growing, could substantially increase participation rates and enhance brand reputation. Additionally, incorporating financial incentives, such as store credits or loyalty points for returned packaging, could further motivate consumer engagement. By broadening geographical reach and offering tangible benefits, Sephora can strengthen its role in driving circularity in the beauty sector.*

Unlike programs that offer discounts or vouchers for returns, Sephora's program relies on consumers' intrinsic motivation for sustainability. Expanding the initiative to include financial incentives or loyalty points could enhance participation. Furthermore, the company has started experimenting with refill stations for certain beauty products, allowing customers to reuse original containers instead of purchasing new ones. This approach has been met with mixed reactions, as refill accessibility varies by location and product availability.

Fashion Sector - The Case of Gruppo Calzedonia. *The fashion industry is one of the largest contributors to environmental pollution, particularly due to fast fashion's rapid consumption cycles. Many brands are now shifting toward circular models to encourage recycling and reuse.*

Gruppo Calzedonia has implemented multiple CE initiatives across its brands, including Intimissimi, Tezenis, and Falconeri. One of the key programs involves garment collection bins in retail stores. Customers can deposit used clothing in exchange for vouchers applicable toward new purchases.

This initiative effectively incentivizes consumer participation by providing tangible benefits. However, raising awareness remains a challenge. Many consumers are not fully informed about textile recycling processes or the environmental impact of discarded garments. To improve engagement, Gruppo Calzedonia has invested in educational campaigns and digital outreach efforts. Enhancing transparency regarding these post-consumer recycling processes - by sharing data on material recovery rates and product reintegration - could increase consumer trust and engagement. Communicating the end-use of recycled textiles can reinforce the credibility of circular initiatives and motivate greater consumer participation.

Another challenge is the processing of collected garments. The company collaborates with textile recycling firms to ensure the materials are properly sorted and repurposed. Some fabrics are reintroduced into production cycles, while others are redirected for alternative uses, such as insulation materials. Additionally, efforts are being made to develop closed-loop recycling techniques that would allow garments to be broken down and turned into new textiles with minimal degradation, ensuring that fabric quality remains high throughout multiple recycling cycles.

By integrating these advanced strategies, Gruppo Calzedonia is not only promoting sustainable practices but also addressing concerns regarding overproduction and waste management in the fashion industry. However, further consumer engagement strategies are needed to expand participation, including enhanced transparency in the recycling process and partnerships with eco-conscious fashion influencers.

Future efforts should focus on refining incentive structures, expanding digital tools to facilitate consumer engagement, and strengthening partnerships between businesses and sustainability organizations. By addressing these challenges, companies can ensure more effective consumer integration into circular economy initiatives.

The cross-case findings suggest that consumer participation in CE initiatives is influenced by a combination of structural factors (e.g., convenience and incentives) and cognitive-behavioral dimensions (e.g., awareness, trust in recycling). These insights extend the Theory of Planned Behavior (Ajzen, 1991), highlighting how contextual enablers can interact with attitudes and perceived behavioral control in the domain of circular consumption. The study thus contributes to an emerging stream of literature advocating for the integration of behavioral economics and supply chain sustainability (e.g., Mugge, 2018; Vermunt et al., 2019).

Research limitations. *The study is limited by its focus on three industries, potentially restricting generalizability to other sectors. Data collection relied on publicly available information, which may not capture all aspects of company initiatives or consumer perspectives. Further research could incorporate consumer surveys and interviews to gain deeper insights into behavioral motivations and barriers.*

Managerial implications. *The managerial recommendations outlined below are directly derived from patterns observed across the three case studies, particularly recurring consumer barriers (e.g., logistical complexity, limited incentives) and engagement strategies (e.g., voucher schemes, resale platforms) reported in the findings section.*

The findings of this study have significant implications for both theory and practice, emphasizing the role of consumers in circular economy (CE) and circular supply chains. The engagement of consumers is not merely a supporting factor but a central component of circular business models.

From a theoretical standpoint, this study enriches existing literature by demonstrating how consumer engagement directly influences the effectiveness of circular supply chains. While many studies focus on technological and organizational aspects of CE, this research shifts the emphasis toward behavioral dynamics, showing that consumer participation is indispensable in closing material loops.

First, the study reinforces the idea that circular supply chains are incomplete without active consumer involvement. Traditional supply chain theories have long considered end-users as passive actors, but CE models demand a reconceptualization where consumers play an active role in product life extension. Integrating behavioral economics into supply chain management research can provide deeper insights into how consumer actions (e.g., returning, recycling) affect overall sustainability outcomes.

Second, the study supports the application of psychological and behavioral models, such as the Theory of Planned Behavior (Ajzen, 1991), within circular business contexts. By identifying financial incentives, convenience, and sustainability awareness as key motivators, the research aligns with prior consumer behavior studies but contextualizes them within circular business ecosystems.

Third, it highlights the need for an interdisciplinary approach, where supply chain management, consumer psychology, and sustainability studies converge. Future research should explore consumer engagement in different cultural contexts, testing how societal values influence participation in CE initiatives.

For businesses, the findings underscore several strategies to optimize consumer involvement in circular supply chains. First of all, businesses should make circular participation more rewarding and seamless. Case studies show that financial incentives, such as vouchers or discounts, significantly increase consumer engagement. For example, IKEA's buy-back program provides economic motivation for customers to return used furniture, while Gruppo Calzedonia's voucher-based textile collection program effectively encourages participation. Companies should further explore tiered reward systems to incentivize frequent participation.

Moreover, logistical convenience remains a critical barrier. Many consumers hesitate to engage in take-back programs due to transportation challenges or perceived complexity. Businesses should simplify return processes through home pick-up services, digital resale platforms, and automated return kiosks in stores.

A major challenge in circular supply chains is consumer awareness. Many consumers are unaware of the benefits of CE or how their participation contributes to sustainability. Businesses should invest in educational campaigns, leveraging social media, influencer marketing, and interactive digital content to inform customers about circular initiatives.

Additionally, transparency in recycling and repurposing processes is crucial. Companies should publicly share data on the impact of their CE programs, demonstrating how returned products are reintegrated into production. This builds consumer trust, enhances participation, and increases transparency by providing detailed insights into post-collection processes, including how materials are sorted, reused, or repurposed. Additionally, integrating digital tracking tools, such as QR codes on take-back products that allow consumers to follow their item's journey, could reinforce consumer confidence and encourage long-term participation in circular initiatives.

Governments and regulatory bodies can accelerate consumer participation by implementing supportive policies. Businesses should advocate standardized CE regulations, such as extended producer responsibility (EPR) schemes that mandate corporate accountability for post-consumer waste. Tax incentives and subsidies for consumers participating in CE programs could further encourage sustainable behaviors.

Inter-industry collaboration is also essential. Shared infrastructure for material collection and processing can lower costs and improve efficiency. For example, the fashion industry could develop unified textile recycling networks, enabling different brands to share logistics for garment collection and reuse.

In this panorama, technology plays a crucial role in scaling CE initiatives. Businesses should leverage AI-driven consumer insights to personalize CE programs, targeting consumers with tailored incentives based on purchasing and return behaviors. Blockchain technology can enhance traceability in circular supply chains, providing verifiable records of product lifecycle stages and reassure consumers that their efforts contribute to real sustainability outcomes.

Additionally, digital resale platforms, like those being developed by IKEA, can facilitate peer-to-peer product exchanges, extending product lifecycles beyond business-controlled resale systems.

In conclusion, this study highlights the critical role of consumers in driving the success of CE initiatives and circular supply chains. While businesses have made significant strides in developing circular programs, fostering deeper consumer engagement remains a key challenge. Future research should continue exploring the intersection of consumer psychology, corporate strategy, and regulatory support to advance CE implementation on a larger scale.

Originality of the paper. *This study contributes to the literature by emphasizing consumer participation as a key element in circular economy (CE) initiatives and circular supply chains. Unlike prior research that primarily focuses on technological advancements and corporate sustainability strategies, this paper highlights the often-overlooked role of consumers in sustaining circular loops. A distinctive aspect of this research is its multi-sectoral approach, examining CE adoption in the furniture, cosmetics, and fashion industries. Each sector presents unique challenges in engaging consumers, from logistical barriers in furniture take-back programs to consumer reluctance in recycling cosmetic packaging and fashion waste. By comparing these sectors, this study offers a broader understanding of the mechanisms that influence consumer participation in CE initiatives.*

Furthermore, this research draws on behavioral economics (e.g., consumer responsiveness to incentives and effort minimization) and consumer psychology (e.g., perceived effort, trust, and sustainability attitudes) to interpret the

motivations behind participation in CE initiatives. These theoretical lenses helped frame the coding categories and guide the interpretation of patterns in consumer engagement across the cases. Unlike prior studies that assume rational consumer behavior in sustainability efforts, this paper acknowledges the complexities of consumer engagement, including barriers such as convenience perception, trust in recycling processes, and habitual purchasing behaviors.

From a methodological standpoint, the use of multiple case studies enhances the applicability of findings across industries. By selecting established global brands (IKEA, Sephora, and Gruppo Calzedonia), the research ensures that the results are relevant to a variety of business contexts, from multinational corporations to smaller enterprises aiming to implement circular models.

Moreover, this study highlights the potential of digital innovations in fostering consumer participation in CE. Emerging technologies such as blockchain for product traceability, AI-driven personalized sustainability recommendations, and online resale platforms are identified as promising tools for engaging consumers in circular business models. The role of digital transformation in CE adoption remains an underexplored area in existing literature, and this research sheds light on its potential impact.

Key words: *Circular economy, consumer behavior, sustainability, recycling, business models, case study.*

Traceability in Circular Supply Chains: the role of digital technologies

SARA SAVY[1] NADIA DI PAOLA[2] SILVIA COSIMATO[3] ROBERTO VONA[4] NUNZIA CAPOBIANCO[5]

Abstract

Integrating circularity into supply chain management is imperative. Companies are increasingly expected to take proactive steps toward environmental sustainability. Issues such as resource waste, air pollution, and the use of non-recyclable materials are critical challenges in supply chain management. Supply chain mapping has emerged as a fundamental tool for tracking raw materials, waste production, emissions, and the overall sustainability performance. This study contributes to the literature on supply chain mapping, specifically within a stream of research that investigates product traceability from a circularity perspective. A central focus of this research is the technological advancements that enable product traceability, with a particular focus on emerging tools such as the Digital Product Passport (DPP), which is recognized as a key enabler of circular supply chains. Through a bibliometric literature review, this study aimed to explore these themes, advance the existing knowledge, and identify research gaps. The main findings revealed a predominant focus on upstream and midstream traceability, whereas research on downstream product tracking, particularly in the context of reuse and recycling, remains largely underdeveloped. Furthermore, the role of DPPs in post-production tracking, particularly in monitoring product components with a focus on recycling and reuse, remains an unexplored research avenue.

Framing of the research. *Given the increasing intricacy and geographical diversification of supply chain networks, supply chain mapping has become imperative for ensuring visibility, traceability, and sustainability (Mubarik et al., 2021). Research has demonstrated that a lack of visibility within supply networks hinders the exchange of critical information, impeding the ability to respond promptly to sudden disruptions (Ali et al., 2022; Mubarik & Khan, 2024). This issue was exemplified during the global pandemic caused by COVID-19.*

Mubarik et al. (2021) defined supply chain mapping as an organization's capability to trace its upstream, downstream, and process value chains using advanced digital technologies. This approach is crucial for ensuring operational sustainability and providing comprehensive visibility to suppliers and customers throughout the network. Such visibility enables the identification of potential bottlenecks and enhances decision-making within the supply chain (Pengzhong Li, 2011). Conversely, inadequate mapping can undermine business sustainability and negatively impact strategic competitiveness and organizational reputation (Khan, 2022).

Supply chain mapping is linked to three concepts: visibility, transparency, and traceability. All these concepts have emerged as interrelated, and are often used complementary and sometimes wrongly synonymous (Sodhi & Tang, 2019; Budler et al., 2024).

To understand this disclosure better, it is good to visualize the differences between these concepts. Supply chain mapping is a graphic representation of all flows of materials, information, and financial resources throughout the supply network, beyond the first tier of suppliers (Wilhelm et al., 2016; Barroso et al.,2011). Visibility, enabled by supply chain mapping, is the capability for firms to see across their supply chains, in other words, to access accurate, timely, and relevant information across SC. Once visibility is achieved, firms can decide whether or how to disclose this information to external stakeholders. Transparency is the extensive disclosure of information regarding supply chain operations, product origins, and cost structures to a broad range of stakeholders, and implies an openness that extends beyond the supply chain (Sunny et al., 2020).

Traceability refers to the ability to track the history, application, and location of products, components, and materials throughout every stage of the supply chain in real time (ISO, 9000/BS 5750) (Budler et al., 2024; McGrath et al., 2021).

In summary, these four concepts are not only distinct but also mutually reinforcing: mapping lays the groundwork for visibility, visibility enables transparency, and traceability provides the data infrastructure necessary to ensure both visible and transparent supply chains.

DOI 10.7433/SRECP.SP.2025.01

This research focuses on traceability despite the importance of noticing the interconnection of these concepts.

The rapid advancement of digital technologies (DT), including Artificial Intelligence (AI), pervasive computing, digital twins, 5G, augmented reality (AR), virtual reality (VR), advanced analytics, and blockchain technologies, has transformed the configuration, coordination, and management of supply chains (Di Paola et al., 2023; Mubarik & Khan, 2024). In this context, these technologies have emerged as enablers of product traceability along global supply chains, facilitating the real-time monitoring of materials, products, and transactions, supporting the accurate mapping of supply chain activities, and providing organizations with insights into the origin of each product component (Mubarik & Khan, 2024). This capability allows companies to track energy and material consumption at each supply chain stage and manage reverse flows including disposal, recycling, and waste management (Dahlmann & Bulck, 2020). This capability stems from two key technological functions: enhancing collaboration and facilitating information exchanges. These functions enable companies to make informed decisions, support sustainable management strategies, and reduce uncertainty by preventing potentially harmful environmental issues (Ranasinghe et al., 2024).

Given the increasing frequency of extreme climate crises, the urgency to adopt sustainable practices has intensified, thereby highlighting the role of supply chain mapping in mitigating adverse socio-environmental impacts (Kusi-Sarpong et al., 2019). In this context, supply chain mapping is recognized as critical for achieving sustainability because it enables detailed tracking of the flow of goods and services, facilitating the identification and reduction of waste in business processes (Mubarik, 2023). In doing so, advanced technologies are essential to ensure compliance with environmental and social standards (Khan et al. 2022), as well as to support the adoption of green technologies, waste reduction through operational efficiency, and the implementation of recycling and upcycling practices.

The concept of a circular supply chain has recently emerged as an innovative approach that integrates sustainability principles with the potential for digitalization. Implementing circularity is essential in the current global economic landscape, where only 7.2% of secondary materials are consumed by the global economy, resulting in a significant loss of raw materials that can otherwise be reused, thus enhancing environmental and economic sustainability. This also shows a decline in global circularity that had a 21% drop in five years, while in the same time frame, the total amount of materials consumed by the global economy has reached 582 billion tons of materials (Circle Economy, 2024). Supply chain traceability is crucial for proactively tracking resource loss and facilitating reuse, recycling, or disposal.

Emerging technologies, particularly blockchains, play a pivotal role in promoting circular economy practices by enabling highly traceable and transparent supply chains (Oguntegbe et al., 2021). By integrating advanced technologies such as RFID and GPS, blockchain effectively addresses the challenges related to environmental, financial, and social sustainability. It allows comprehensive monitoring of product life cycles, from raw materials to finished goods, and subsequent recycling stages. Consequently, adopting blockchain in circular supply chains represents a strategic step toward enhanced sustainability by optimizing resource use and ensuring unique transparency in the value chain (Centobelli et al., 2022). However, achieving effective traceability across the entire supply chain remains challenging owing to the complexity of global supply networks and extensive product flows.

Digital Product Passport (DPP) has emerged as a key tool within the framework of circular economic initiatives related to supply chain mapping. DPP is an electronic tool designed to record, process, and share product information across supply chains, government agencies, consumers, and waste management sectors. Its primary objective is to digitalize and modernize product data, facilitating industrial transition toward circularity and carbon neutrality (Koppelaar et al., 2023). This tool exemplifies how tracking products, components, and raw materials throughout the supply chain, from sourcing to end products, can support sustainable business decisions and optimize product recovery and reuse before they become waste (European Commission, 2024).

The DPP is part of the regulation approved by the European Union in April 2024 under the Eco-Design for Sustainable Products Regulation (ESPR), aligned with the European Green Deal. This regulation aims to enhance transparency across the entire product value chain by providing comprehensive information about product origins, materials, environmental impacts, and disposal recommendations (European Commission, 2024). Currently, several DPP variants are tailored to different products and purposes. The mandatory implementation began with industrial batteries and electric vehicles in January 2026, followed by expansion to other product categories. Although the DPP's adoption is still in its early stages, it is rapidly accelerating owing to the European Commission's political support (Zhang & Seuring, 2024). This digitalization initiative is expected to play a crucial role in driving circularity, transparency, and sustainability across global supply chains.

Purpose of the paper. *The primary objective of this study is to enhance the discourse on supply chain circularity by conducting an in-depth examination of the relationship between circularity and traceability, with particular emphasis on the technologies that enable such tracking. This review aims to support circularity studies by integrating the emerging discussion on digital product passports (DPP), which has gained prominence in recent years. The decision to undertake a systematic literature review stems from the limited methodological rigor observed in articles addressing these emerging topics in order to identify research gaps and delineate the principal thematic clusters associated with these subjects. Moreover, most of the literature on this topic does not explicitly focus on tracking capabilities but rather addresses broader themes related to transparency and visibility, often overlooking the specific contribution of these capabilities to enabling circularity and focusing on the tracking capability to achieve transparency in supply chains (Sunny et al., 2020; Duan et al., 2019; Sodhi et al., 2019; Montecchi et al., 2021).*

Methodology. *This study adopts a systematic literature review (SLR) to identify the state of the art and critically outlines future research directions. This systematic literature review addresses two research questions:*

RQ1.What are the key research themes and emerging research areas related to product or component traceability for improving supply chain circularity?

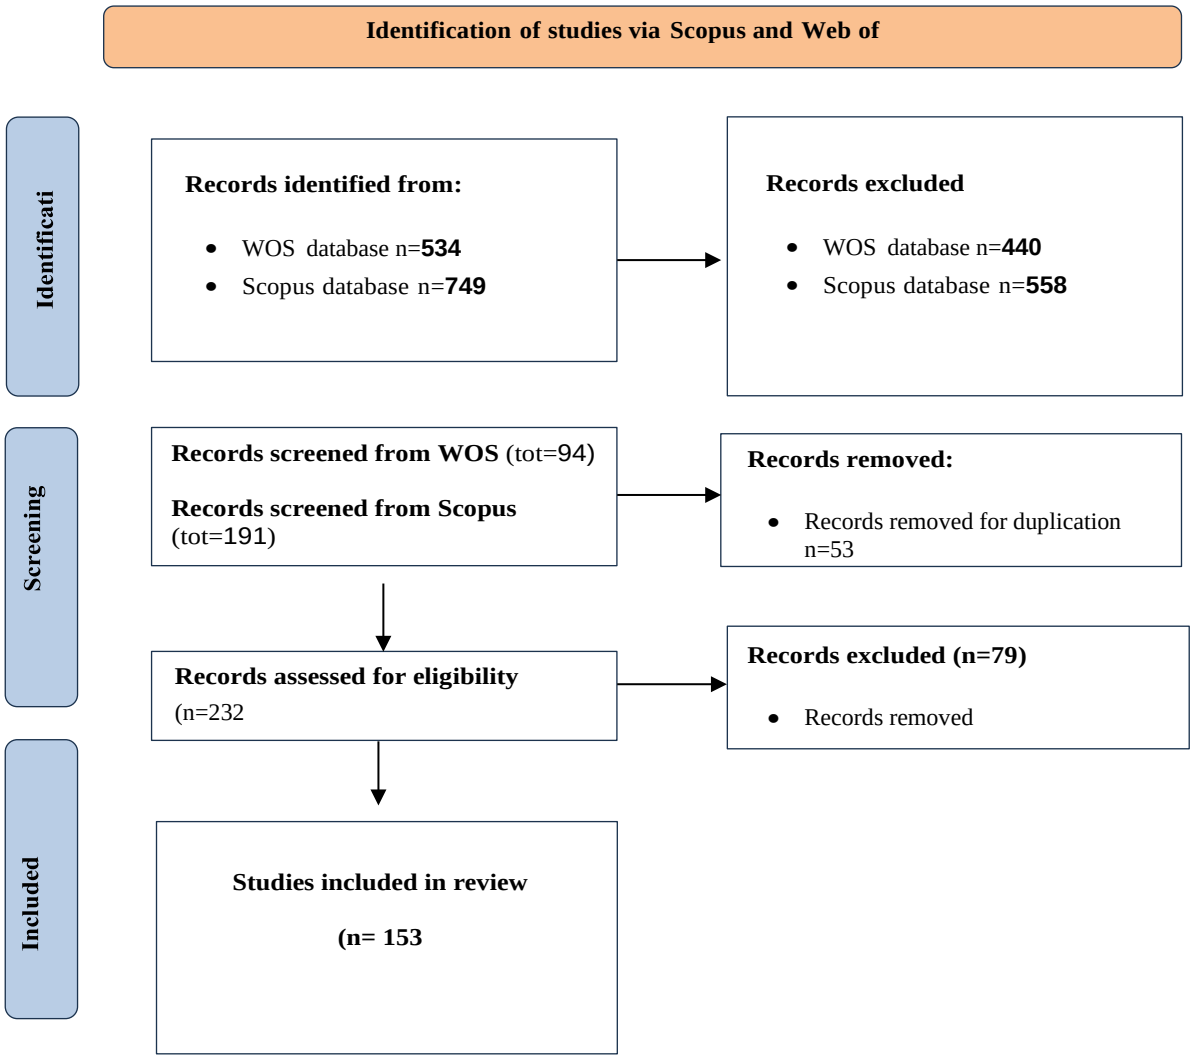
RQ2.What are the main research trends and thematic clusters related to circularity and traceability relationships?

This method allows for a systematic, transparent, and reproducible analysis of academic papers on a specific topic, minimizing biases and leading to reliable conclusions. To conduct a systematic literature review, an appropriate query was formulated to investigate the subject of interest thoroughly. The search terms were tested to refine the most suitable query. Adjustments were made before finalizing the sample selection by evaluating the search terms and inclusion criteria on a preliminary dataset (Snyder, 2019). The final query resulted from a deliberate selection process and multiple iterations, which helped identify the most relevant terms and avoid deviation from the core research topic. This review focuses on the relationship between product traceability through the supply chain with different technologies (such as blockchain, digital twins, and AI) and supply chain sustainability or circularity. After several tests, we decided to focus on circular supply chains (CSC) with a focus on products' end-of-life management. Since this study specifically examines the application of different traceability technologies, several terms related to Industry 4.0, were included in the query.

The final query was:

Query: ((("passport" AND ("digital" OR "product*" OR " material*" OR "battery" OR "building*" OR "recycling" OR "resource*")) OR ("traceability" AND ("product*" OR "component*" OR "supply chain" OR "resource*")) OR "product map*" OR "resource map*"))AND ("supply chain" AND ("circular*" OR "sustainab*" OR "closed-loop" OR "reverse" OR "remanufactur*" OR "reus*" OR "recycl*" OR "eco-design" OR "product lifecycle" OR "end-of-life management" OR "waste management" OR "resource efficiency" OR "material recovery" OR "remanufacturing" OR "refurbish*" OR "upcycl*" OR "downcycl*" OR "waste valorization" OR "secondary raw materials" OR "zero waste" OR "carbon neutral" OR "carbon footprint" OR "industrial symbiosis")) AND ("blockchain" OR "digital twin" OR "RFID" OR "IoT" OR "Internet of Things" OR "sensor technology" OR "big data" OR "artificial intelligence" OR "machine learning" OR "data analytics" OR "cloud computing" OR "smart contract" OR "distributed ledger")*

The search was conducted using Web of Science (WoS) and Scopus databases, yielding initial results of 532 and 749 documents, respectively. These preliminary results were obtained without applying a filter. All articles that contained defined query terms in their keywords, titles, and abstracts were included. Subsequently, the inclusion and exclusion criteria were set to determine the final sample.



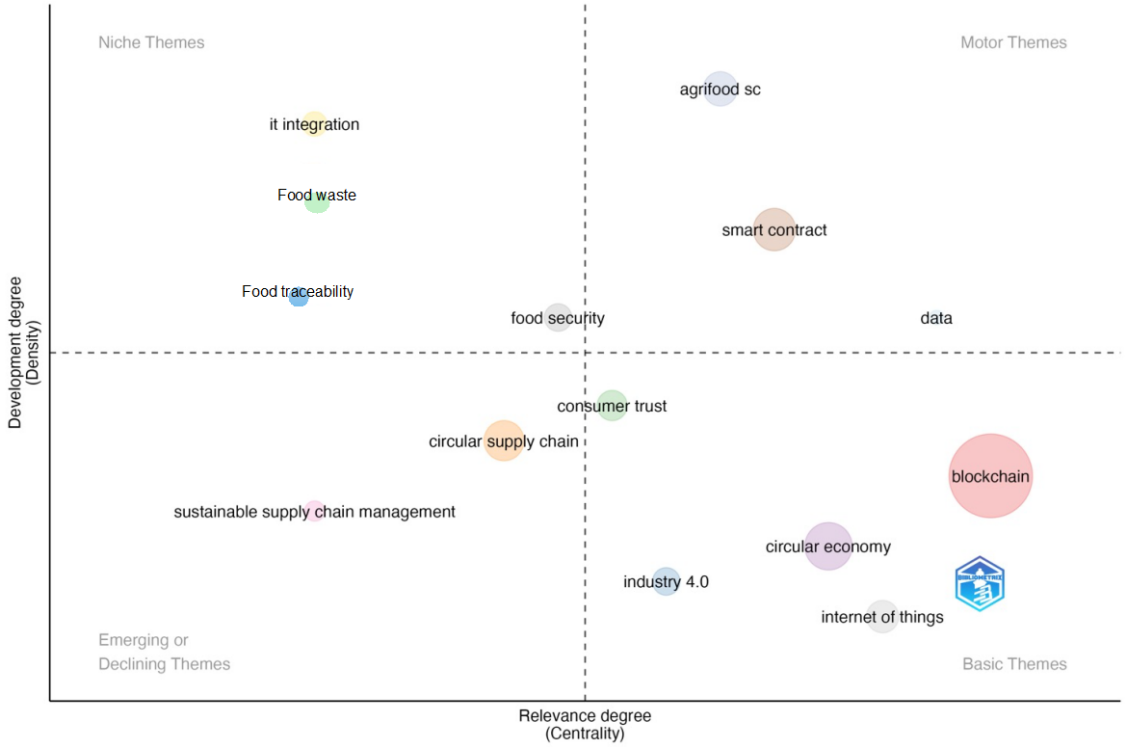
The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework (Figure 1) was used to define the selection process (Moher et al., 2009). Three basic filters were utilized to identify pertinent manuscripts: (1) selection was restricted to papers authored in English; (2) inclusion was limited to papers classified within the domains of business, management, and economics in WOS, and business, management, and accounting in Scopus, as this corresponds to the focus of the study; and review articles were excluded to prevent potential adverse effects on the research outcomes. A language filter was applied to avoid interpretative biases resulting from limited proficiency in other languages, and because English is an international language for academic papers. Applying these inclusion criteria, 440 papers from the WoS and 558 from Scopus were excluded, reducing the dataset to 287 papers. Then, 53 duplicates were removed using the bibliometrix software.

The second step was screening the initial sample based on abstract reading to assess their alignment with the research topic. This process excluded 79 studies that did not meet the inclusion criteria. Papers that did not focus on the research topics were excluded. Specifically, papers that discussed traceability without making a direct link to circularity achieved through these practices, or conversely, those that concentrated on specific supply chain sustainability practices without addressing tracking mechanisms, were excluded. Bibliometric review papers were excluded because they were not aligned with the objectives of this study and would have distorted the results. Consequently, 153 papers were included in the review, meeting the inclusion criteria and addressing the research topics. A preliminary analysis of these papers was conducted using bibliometric software to set the final sample for a deeper analysis that involved a complete reading of the papers and further bibliometric analysis to better address the research questions at the core of this analysis.

From 2003 to 2025, the average annual growth rate of the published papers was 9.25%. Notably, 2024 saw a significant increase in the number of published papers compared with previous years. According to the analysis of the first 100 articles using bibliometrix, an average of 8 papers were published annually from 2003 to 2022. This figure jumped to 34 papers by 2023 and 54 papers by 2024, reflecting a marked increase in the interest in these topics.

The top ten keywords identified were blockchain, sustainability, traceability, supply chain, blockchain technology, circular economy, supply chain management, transparency, food supply chain, and the Internet of Things. This reflects the main thematic clusters on which the papers included in the review were focused.

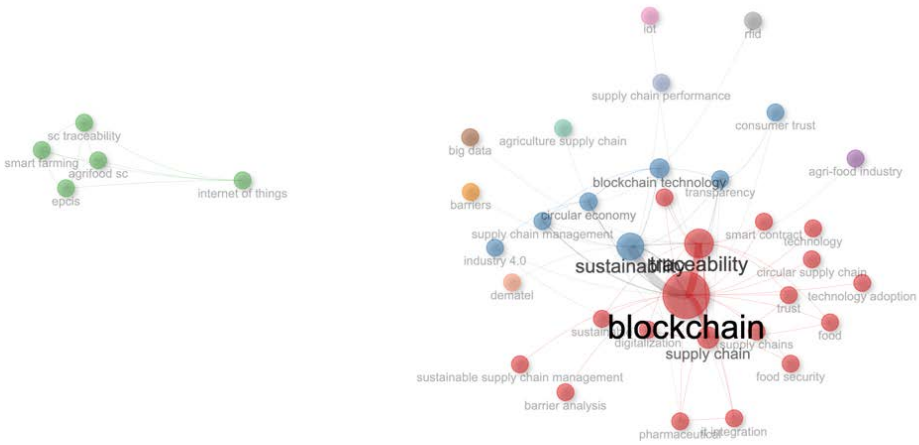
Figure: the prisma model



Source: authors' elaboration.

Results. *This systematic literature review provides a comprehensive overview of how the topic of traceability, aimed at achieving circularity, has been addressed in the existing research. This study contributes to the theoretical advancement of this field by identifying directions for future research. The intermediate results obtained from this preliminary analysis to answer the research questions are summarized below.*

To address the first research question, the abstracts were analyzed, and a thematic map (Figure 2) was generated using the Bibliometrix software. This analysis facilitated the identification of the main research themes. The main research themes in product and component traceability focus on attaining circularity in the supply chain, predominantly centered on the utilization of blockchain technology that appear in the basic themes quadrant (bottom right). Blockchain has emerged as a central tool for traceability, playing a critical role in enhancing transparency and accountability in supply chains, particularly with respect to circularity initiatives. The second prominent theme focuses on the food supply chain (upper right) where multiple studies have explored the traceability of food products as a means of reducing food waste and increasing consumer trust that are in the niche themes quadrant that includes well-structured themes but peripheral to the broader research field. The third key research area addresses the barriers faced by companies in adopting various traceability technologies, highlighting the challenges in the implementation of efficient tracking systems. Additionally, two emerging research areas (situated in the emerging or declining themes quadrant) related to traceability for achieving supply chain circularity have been identified: the use of tools such as digital product passports (DPP), which, although still underexplored, is identified as a promising approach, particularly for downstream mapping. Even though consumer trust is a traditional theme, it appears as an emergent theme in this field. Costumer trust in sustainable, recycled, or upcycled products has surfaced as a relevant theme, with traceability seen as a vital mechanism for enhancing consumer confidence in such products.



Notably, themes such as consumer trust, food traceability, and food security appear near the center of the map, suggesting their transitional nature and bridging role between technological and sustainability-focused discussions.

Figure 2 Thematic map

To address the second research question, a co-occurrence network (Figure 3) was created. It reveals two distinct thematic clusters, shedding light on the key research areas linking blockchain, traceability, and circular supply chain.

Figure 3 co-occurrence network

The first and most prominent cluster centers on blockchain technology and its role in supply chain traceability. Keywords such as "traceability," "sustainability," "digitalization" and "supply chains" are strongly interconnected, emphasizing how blockchain facilitates transparency, smart contracts, and technological adoption. In addition, key subtopics such as food security and pharmaceutical supply chains have emerged, indicating the application of blockchain-based traceability across various industries (Oguntegbe et al., 2022). This cluster highlights the dominant research focus on using blockchain to enhance pre-production and in-production traceability and ensure supply chain efficiency and compliance.

In this cluster, most studies primarily focus on impacts such as CO2 emissions, resource waste, and the exchange of information to reduce information asymmetries and achieve greater efficiency (Enayati et al., 2024; Zakaria et al., 2023)). Second, a smaller number of studies have focused on the issue of trust and the role of the consumer in achieving circularity. (Centobelli and al., 2022; Niu et al., 2022; Balzarova et al., 2022).

The second cluster is centered on sustainability, circular economy, and supply chain management. Key terms such as "circular economy," "supply chain management," "industry 4.0," and "barriers" indicate that this research stream explores the challenges and strategic implications of integrating circularity into supply chains. Topics like "transparency" and "blockchain technology" suggest that blockchain is also investigated as an enabler of sustainable supply chain practices.

A thematic analysis of the abstracts reveals that most studies focus on pre-production traceability (upstream and midstream), where circularity is integrated with supply chain efficiency, from raw material sourcing to product manufacturing and service delivery. By contrast, post-production traceability (downstream), which involves tracking products for reuse or recycling, remains an emerging and underdeveloped research area. Additionally, existing studies are largely concentrated on specific sectors, primarily the agri-food industry, with limited research applicable to other industries. The analysis shows that the contribution of Digital Product Passports (DPP) as a tool for companies, not only during production but also post-production, for tracking product components with a focus on recycling or reuse, remains underexplored. Product end-of-life remains an emerging area within the contribution of traceability to circularity.

Research limitations. *A key limitation of this literature review is the selection of sources, as the choice of databases (Web of Science and Scopus) and inclusion/exclusion criteria may have influenced the completeness of the analysis. Furthermore, academic literature may neglect practical approaches or emerging innovations that have not yet been documented in academic research. The decision to exclude so-called "grey literature" enhances the replicability and rigor of the study; however, it also restricts the diversity and flexibility of the findings (Adams et al., 2017). The inclusion of studies published in non-academic outlets accounts for emerging trends, whereas academic findings may not yet be evident because of the lengthy publication process (Rojon et al., 2021). Another limitation could be the choice to focus only on traceability and not on transparency or visibility in the query used, although these concepts often recur in research. The aim of this choice was to concentrate the analysis only on this topic and its peculiarity; however, this could limit the selection of papers included in the review.*

Managerial implications. *This study has several practical implications for the traceability and circularity of products. Given the increasing relevance of contributing to the circular economy, it has become essential to understand how proactive measures can be taken to achieve this, particularly by identifying technologies that can support its implementation. The findings of this study may offer managers a more structured perspective on the importance of traceability along the supply chain, and how it actively contributes to the reuse and recycling of materials throughout the entire supply network. Various technologies have enhanced traceability and led to the development of different tools that facilitate tracking, benefiting both managers and end consumers. These tools not only improve sustainability but also enhance supply chain resilience by fostering transparency, strengthening trust among stakeholders, and enabling the identification of bottlenecks and unsustainable processes (Khan et al., 2022). Among the emerging tools, Digital Product Passport (DPP) is gaining prominence, as it enables managers to access comprehensive information about product components, thereby supporting the circularity of the entire supply chain. This study explores how managers can leverage the DPP, assess its actual impact on circularity, and identify potential barriers to its implementation.*

Originality of the paper. *Despite the growing interest in circular supply chains, few literature reviews have comprehensively explored the relationship between product traceability and circular economy. Existing studies often focus on specific technologies, such as blockchain, or examine traceability within individual industries, without providing a broader perspective on how different tracking technologies contribute to circularity. Moreover, the role of digital product passports (DPP) in enabling circular supply chains remains largely underexplored in literature reviews. Most existing studies either discuss the concepts, challenges, and opportunities of DPP implementation, analyze its definitions and theoretical foundations, or examine case studies on how the DPP supports sustainable and circular practices (Munaro e Tavares,2021; Walden e al., 2021; Zhan et. Al.,2024).*

This review aims to bridge this gap by systematically analyzing the various technologies used for tracking product components along the supply chain and assessing their role in achieving circularity. By integrating insights into tools such as DPP, this study provides a more comprehensive understanding of product traceability as a key enabler of circular supply chains, and identifies critical gaps in the existing literature.

Key words: *supply chain, traceability, blockchain, Digital product passport, supply chain mapping, product traceability*

Transizione circolare nella gestione dei rifiuti tessili nell'Unione Europea. Barriere sistemiche ed opportunità strategiche

ALICE GUZZETTI[1] VALERIA BELVEDERE[2]

Abstract

L'Unione Europea sta affrontando un momento critico di transizione verso una gestione circolare dei rifiuti tessili, spinta da crescenti preoccupazioni ambientali, l'attuazione di rigorose normative quali la Responsabilità Estesa del Produttore (EPR) e il Regolamento sull' Ecodesign dei Prodotti Sostenibili (ESPR). Questo studio esplora ostacoli e opportunità nell'ecosistema della gestione dei rifiuti tessili nell'UE attraverso un'approfondita revisione della letteratura e interviste semi-strutturate con stakeholder lungo tutta la filiera del rifiuto tessile. Sono identificati dodici ostacoli ad una gestione efficace dei rifiuti tessili, categorizzati in quattro temi principali, ma anche nove opportunità di sviluppo, anch'esse raggruppate in quattro temi. I risultati sottolineano la necessità di un approccio sistemico e multi-stakeholder per guidare il settore tessile europeo verso la circolarità. Fornendo indicazioni operative e raccomandazioni pratiche, questa ricerca contribuisce al dibattito più ampio sulle pratiche di economia circolare nel settore tessile e offre una roadmap per permettere agli stakeholder di navigare tra le complessità di questa transizione.

Framing of the research. *L'industria tessile è tra i principali responsabili del degrado ambientale globale (EEA, 2014; EEA, 2019). Nel corso del tempo, la produzione e il consumo di prodotti tessili è cresciuto considerevolmente, accompagnato dal corrispondente aumento della generazione di rifiuti (Ütebay et al., 2019; EEA, 2024). L'esportazione di questi rifiuti a paesi extra-UE è triplicata, soprattutto a causa di un'infrastruttura comunitaria insufficiente per il riutilizzo e il riciclo (EEA, 2024; Watson et al., 2020).*

Riconoscendo questi effetti negativi, le Nazioni Unite hanno incluso l'industria tessile tra gli Obiettivi di Sviluppo Sostenibile (SDG), con l'intento di migliorare le pratiche industriali attraverso l'innovazione e l'incoraggiamento di un consumo sostenibile (UN, 2015). Nel 2022, la Commissione Europea ha introdotto la Strategia dell'UE per il tessile sostenibile e circolare nell'ambito del Piano d'Azione per l'Economia Circolare (CEAP) del Green Deal. Questa strategia prevede una trasformazione dell'industria tessile entro il 2030, garantendo che tutti i prodotti tessili venduti nell'UE siano durevoli, riciclabili, privi di sostanze tossiche e realizzati in modo sostenibile (European Commision, 2022). Ulteriori iniziative intraprese comprendono il Regolamento sull'Ecodesign dei Prodotti Sostenibili (ESPR), che stabilirà norme obbligatorie per la riparabilità e la durabilità dei prodotti tessili e regole più severe per scoraggiare o proibire la distruzione di capi invenduti, oltre a nuovi criteri per le dichiarazioni ambientali, e l'obbligo del Digital Product Passport (DPP), l'identità digitale di ogni singolo capo d'abbigliamento commercializzato in Europa.

Mentre i governi e gli organismi sovranazionali spingono la transizione verso un'economia circolare attraverso legislazioni e direttive top-down, sono essenziali anche maggiori sforzi bottom-up da parte delle realtà industriali (Bressanelli et al., 2019). A livello di supply chain, la configurazione della supply chain a ciclo chiuso (Closed-loop SC) consiste nella progettazione, controllo e gestione di un sistema che massimizzi la creazione di valore durante l'intero ciclo di vita del prodotto (Govindan et al., 2015). Tale processo implica la gestione efficace ed efficiente di una serie di attività volte a recuperare il valore dai prodotti che percorrono un flusso inverso. Un'attività centrale nella supply chain a ciclo chiuso è la Logistica Inversa (RL), definita come "Il processo di pianificazione, implementazione e controllo del flusso efficiente ed economico di materie prime, scorte in lavorazione, prodotti finiti e relative informazioni dal punto di consumo al punto d'origine per recuperare valore o smaltire correttamente" (Rogers & Tibben-Lembke, 1999, p.2). L'obiettivo fondamentale della RL è recuperare e, se possibile, creare valore dalla gestione di questo flusso inverso, sia attraverso operazioni di riprocessamento che attraverso lo smaltimento diretto e indiretto dei materiali.

Secondo Hazen et al. (2012), in relazione al potenziale valore residuo recuperabile da un'azienda, le alternative spaziano da: (1) riuso e rivendita; (2) ricondizionamento del prodotto; (3) recupero o riciclo dei materiali; (4) smaltimento.

I rifiuti tessili sono solitamente classificati in due gruppi in base a quando vengono generati: pre-consumo e post-consumo. I rifiuti pre-consumo sono materiali scartati prima di raggiungere i consumatori, generati tipicamente durante i processi produttivi, come scarti, sfridi e articoli invenduti o resi. I rifiuti post-consumo comprendono tessili e

DOI 10.7433/SRECP.SP.2025.01

abbigliamento usati e poi scartati dai consumatori a causa di danni, usura o cambiamenti nelle tendenze della moda. Il riciclo tessile si riferisce prevalentemente al riprocessamento dei rifiuti tessili pre- o post-consumo per utilizzarli in nuovi prodotti tessili o non tessili (Sandin & Peters, 2018). Le modalità di riciclo tessile sono tipicamente classificate come meccaniche, chimiche o termiche. Gli output di riciclo tessile includono soluzioni open-loop come fibre per isolamento, riempimento o tessuti non-tessuti per il settore automobilistico e altre industrie, nonché il riciclo da fibra a fibra. I flussi non raccolti separatamente e non selezionati per riuso o riciclo sono destinati alla termovalorizzazione o in discarica (Solis et al., 2024).

Purpose of the paper. *Nonostante sia stato suggerito alle aziende di trasformare il proprio modello da economia lineare a circolare, molte barriere ostacolano questa transizione. Galvão et al. (2018) identificano sette barriere: tecnologiche, politiche e regolatorie, finanziarie ed economiche, manageriali, indicatori di performance, relative al cliente e sociali. Nel settore tessile, Rathinamoorthy et al. (2019) includono a queste barriere una resistenza culturale al cambiamento, limitazioni tecnologiche, sfide di mercato e vincoli imposti da regolamenti governativi. Kumar e Suganya (2019) includono infrastrutture inadeguate per raccolta e selezione dei rifiuti, politiche insufficienti, bassa consapevolezza dei consumatori e resistenza al cambiamento.*

Più recentemente, Kazancoglu et al. (2024) identificano nove barriere principali alla transizione circolare nel tessile: management e decision-making, organizzazione del lavoro, sfide di design, materiali, norme e regolamenti, mancanza di conoscenza, assenza di integrazione e collaborazione, costi e investimenti in infrastrutture tecnologiche. Nonostante il valore di questi risultati, il framework è stato sviluppato nel contesto turco, limitandone la generalizzabilità al contesto europeo, che sta attraversando una profonda trasformazione.

Sorgono infatti interrogativi circa l'efficacia degli interventi politici nel migliorare la gestione dei rifiuti tessili in Europa, e l'incremento dei flussi nella raccolta dei rifiuti che questi interventi porteranno necessiterà di investimenti significativi per potenziare le capacità di raccolta, selezione, riutilizzo e riciclo dei rifiuti tessili. Le strategie attuali si concentrano principalmente sul riciclo a circuito aperto, ma occorre sviluppare approcci complementari per una gestione sostenibile dei rifiuti post-raccolta (McKinsey & Company, 2022; Solis et al., 2024). Comprendere gli ostacoli e i fattori abilitanti per la transizione verso un'economia circolare in diversi contesti può supportare lo sviluppo di strategie mirate per il riciclo tessile sostenibile e pratiche di moda circolare (Abagnato et al., 2024; Charnley et al., 2024; Hartley et al., 2022).

Questo studio punta a colmare il divario di conoscenze, esplorando interdipendenze e fattori contestuali che influenzano tali barriere attraverso geografie, ambienti normativi e livelli di sviluppo industriale differenti. La domanda centrale di questa ricerca è:

RQ: Quali sono gli ostacoli alla gestione efficace dei rifiuti tessili in Unione Europea?

Methodology. *Alla luce delle lacune individuate nella letteratura esistente e del panorama normativo in rapida evoluzione, questo studio si pone i seguenti obiettivi:*

Valutare le sfide che gli attori dell'ecosistema del rifiuto tessile affrontano nell'adattarsi ai futuri requisiti normativi.

Esplorare le potenziali opportunità di sviluppo all'interno del settore.

Fornire raccomandazioni operative per gli stakeholder dell'ecosistema.

Dopo una prima fase di revisione della letteratura e di studio della normativa UE, le interviste semi-strutturate sono state selezionate come metodo efficace per la raccolta dei dati necessari a rispondere alla domanda di ricerca. Le interviste hanno coinvolto operatori lungo l'intera filiera tessile per ottenere approfondimenti sulle sfide strutturali, infrastrutturali e sistemiche, nonché sugli incentivi necessari per ampliare i sistemi di gestione dei rifiuti. Lo studio si è concentrato sul territorio dell'Unione Europea in quanto oggetto di una transizione normativa volta a promuovere un sistema tessile circolare (Kirchherr et al., 2018). I partecipanti sono stati accuratamente selezionati per il loro coinvolgimento nelle tecnologie o infrastrutture di gestione dei rifiuti nel mercato europeo, rappresentando varie fasi della catena del valore circolare. Nonostante il campione relativamente ridotto, le interviste hanno prodotto dati qualitativi ricchi, sfumati e dettagliati. Gli intervistati erano professionisti senior con una notevole esperienza e coinvolgimento in iniziative di economia circolare tessile. Le interviste sono state condotte da Dicembre 2024 a Febbraio 2025, registrate, trascritte e analizzate sistematicamente. La Tabella 1 delinea i profili dei nove partecipanti, descrivendo le tipologie organizzative, le zone geografiche di riferimento e i ruoli aziendali attuali. I partecipanti includevano rappresentanti di organizzazioni umanitarie, fornitori di tecnologie digitali, marchi globali della moda e consorzi per la gestione dei rifiuti tessili, ciascuno contribuendo a diversi aspetti della gestione dei rifiuti tessili.

Tab. 1: Partecipanti delle interviste - tipo di organizzazione, area geografica di operatività e ruolo dell'intervistato

#	Tipo di Azienda	Zona geografica	Ruolo dell'intervistato
1	Charity Collector for Resale & Recycle	Multinational	Marketing & Communication Manager
2	Charity Collector for Resale & Recycle	Multinational	CSR Manager & Corporate Partnership
3	Digital Technology Provider for Recycling & Repairing	Italy	Chief Marketing Officer
4	Digital Technology Provider for Traceability	France	Traceability Specialist
5	Digital Technology Provider for Traceability & Compliance Consultancy	Netherland	Head of Marketing
6	Global Brand	Multinational	Sustainability Specialist
7	Textile Waste Consortium	Italy	Textile Business Development Manager
8	Reverse Logistic Provider & Repairing	Italy	Sales Manager
9	Digital Technology Provider for Renting & Resale	Multinational	Founder & Chief Operating Officer

Gli argomenti affrontati nelle interviste hanno riguardato le operazioni aziendali, i processi di selezione dei rifiuti, la logistica, le partnership e l'adeguamento alle imminenti normative. L'analisi tematica è stata utilizzata come approccio migliore per analizzare i dati qualitativi raccolti in modo flessibile e sistematico (Clarke et al., 2013). L'analisi è iniziata con una fase di familiarizzazione con le trascrizioni delle interviste per identificare gli argomenti principali, seguita da un processo iterativo per individuare temi e relazioni all'interno dei dati. Attraverso questo processo sono state individuate 12 barriere, raggruppate in quattro categorie principali, e 9 opportunità suddivise in quattro temi.

Results. I *dati codificati sono stati suddivisi in quattro temi principali relativi agli ostacoli nella gestione dei rifiuti tessili e quattro opportunità di sviluppo, che sono presentati nell'analisi.*

Sfide nella gestione dei rifiuti tessili

1. Complessità normative

Frammentazione e mancato allineamento normativo tra Stati

Sebbene le normative EPR ed ESPR siano pensate per distribuire equamente le responsabilità della gestione dei rifiuti tra gli stakeholder, la loro implementazione frammentata tra gli Stati membri dell'UE crea oneri amministrativi e operativi per le aziende multinazionali, che devono affrontare standard divergenti e ciò causa inefficienze. Inoltre, la mancanza di una politica armonizzata a livello europeo aggrava i costi di conformità. Ad esempio, alcuni stati membri potrebbero ritardare o applicare in maniera inadeguata le direttive, generando incertezza per le aziende multinazionali. Tale disallineamento aumenta non solo il carico amministrativo ma disincentiva anche l'innovazione verso soluzioni circolari, poiché i marchi danno priorità alla conformità di base piuttosto che alla sostenibilità strategica.

Pratiche elusive

Le legislazioni che vietano pratiche insostenibili come la distruzione dei beni invenduti vengono aggirate da alcuni operatori con diverse soluzioni (ad esempio, rimozione delle etichette, smontaggio dei prodotti per il riciclo meccanico e esportazione all'estero). Le leggi si concentrano spesso su misure punitive piuttosto che su incentivi proattivi, non affrontando le ragioni per cui i brand preferiscono la distruzione al riuso. Tali scappatoie indeboliscono l'intento legislativo, perpetuando un ciclo in cui i rifiuti vengono occultati invece che valorizzati.

DPP come opportunità mancata

Nonostante il suo potenziale per migliorare trasparenza e tracciabilità, il DPP non è ancora percepito come uno strumento utile. Molti brand lo adottano in maniera reattiva per rispondere ai requisiti normativi piuttosto che integrarlo strategicamente nelle operazioni circolari. Questo riflette una sfida più ampia, in cui spesso i brand non hanno la capacità interna di elaborare e utilizzare strategicamente i dati dettagliati forniti dal DPP.

2. Limitazioni infrastrutturali e tecnologiche

Infrastruttura del riciclo sottosviluppata

L'infrastruttura europea del riciclo non è preparata per l'aumento imminente dei volumi di rifiuti tessili guidati dalle leggi sull'EPR. Gran parte delle strutture esistenti nell'UE sono ottimizzate per il downcycling, limitando il riciclo di alto valore. Gli investimenti in tecnologie di riciclo avanzate (ad es., riciclo chimico) sono stati sporadici, limitati a progetti pilota. La dipendenza dal downcycling perpetua un modello "lineare dentro circolare", in cui i rifiuti vengono deviati dalle discariche solo per perdere il loro valore materiale.

Mancanza di integrazione nei sistemi di selezione e separazione dei rifiuti e complessità dei materiali

I sistemi di selezione rimangono prevalentemente manuali o semi-automatizzati, risultando inefficienti e soggetti a errori. Questo problema è aggravato dalla presenza di fibre miste difficili da separare senza macchinari avanzati. Inoltre, le fibre miste e la bassa qualità dei capi provenienti dal fast fashion rendono tecnicamente ed economicamente difficile la selezione. Il riciclo fibra-fibra è economicamente fattibile per fibre di alto valore come cashmere, lana o poliestere poco mischiato con altre fibre derivate da plastica. Tuttavia, i nuovi materiali riciclati spesso superano il prezzo delle materie prime vergini, rendendo economicamente svantaggioso il loro utilizzo.

Over dipendenza dalle esportazioni

La dipendenza dai mercati asiatici per il riciclo evidenzia la fragilità economica e l'insostenibilità ambientale del sistema europeo. Le strutture europee non riescono a gestire la varietà dei flussi tessili, creando un collo di bottiglia.

3. Barriere economiche e operative

Alti costi delle soluzioni circolari

L'onere finanziario derivante dall'implementazione della logistica inversa, del riciclo e dei servizi di riparazione rende difficile scalare queste soluzioni. I costi di tali operazioni spesso superano quelli per la produzione di capi nuovi.

Complessità logistica

Gestire programmi di recupero e rifiuti post-consumo richiede significativi investimenti nella logistica inversa, che molti brand trovano dispendiosi in termini di risorse. Nella fase attuale, oltre a sporadici programmi di ritiro sviluppati da marchi di moda o rivenditori, la stragrande maggioranza dei rifiuti tessili post-consumo viene raccolta da aziende autorizzate che pagano le municipalità per la raccolta. Una volta raccolti, i rifiuti vengono spostati in centri di smistamento, che raramente sono gestiti da un singolo operatore, rendendo le operazioni logistiche ulteriormente frammentate e costose, senza alcun supporto finanziario.

Frammentazione lungo la catena del valore

Gli attori della filiera operano spesso in compartimenti stagni, generando inefficienze e ridondanze. Tale mancanza di collaborazione ostacola lo sviluppo di sistemi circolari coesi.

Inefficienze di mercato

L'eccesso di fibre riciclate di bassa qualità non trova un mercato di sbocco, causando saturazione e ulteriori costi di smaltimento. Questo deriva dalla sovrapproduzione di tessili a bassa qualità e durabilità, inadatti al riciclo di alta qualità. La sovrapproduzione di fibre riciclate di bassa qualità inonda i mercati di sbocco, soprattutto per usi come l'isolamento, che non riesce ad assorbire l'eccesso di offerta. Inoltre, considerando le fibre riciclate di bassa qualità, i marchi che non vogliono riprendere tali materiali, vedono il riciclaggio come un modo per smaltire i rifiuti, non riuscendo a implementare pratiche a ciclo chiuso.

4. Percezioni dei cittadini e consapevolezza dei consumatori

Disinformazione e scarsa consapevolezza

I cittadini spesso non sanno come smaltire correttamente i tessuti, in parte a causa di comunicazioni incoerenti da parte di operatori e comuni. Messaggi incoerenti e mancanza di campagne educative creano barriere alla partecipazione.

Cultura del rimpiazzo

La prevalenza di indumenti economici e di bassa qualità riduce la fattibilità degli sforzi di riparazione e riciclo, creando una cultura dell'usa e getta. Il fast-fashion ha radicato una mentalità in cui la riparazione o il riciclo sono percepiti come scomodi o inutili. Ciò è rafforzato dal costo estremamente basso dei nuovi indumenti. Mentre in alcuni stati membri come la Francia la riparazione è incoraggiata grazie a incentivi economici per i cittadini, le aziende non riescono a sviluppare servizi e infrastrutture di riparazione. Inoltre, per quanto riguarda il riutilizzo, il mercato dell'usato deve competere in termini di prezzo con gli indumenti di prima mano del fast-fashion, che scoraggiano i consumatori dall'acquistare articoli usati.

Opportunità di sviluppo

1. Momentum normativo che guida la circolarità

Esplorazione di modelli aziendali

Le direttive EPR ed Ecodesign presentano un'opportunità per standardizzare le pratiche di gestione dei rifiuti, promuovendo l'innovazione e la collaborazione lungo tutta la catena del valore. Con il divieto di distruzione di beni invenduti, i marchi devono esplorare soluzioni circolari e abbracciare la sostenibilità come vantaggio competitivo. Le aziende che adottano pratiche di gestione dei rifiuti trasparenti e sostenibili possono migliorare la reputazione del loro marchio e attrarre consumatori attenti all'ambiente. I governi dovrebbero fornire supporto finanziario per l'adozione di modelli circolari.

Servitizzazione del prodotto

Quando completamente integrato, il DPP può diventare uno strumento chiave per migliorare la trasparenza, ottimizzare la gestione dei rifiuti e fornire ai consumatori informazioni sui loro acquisti. Ad esempio, alcuni fornitori tecnologici hanno arricchito il DPP con funzionalità, come servizi di riparazione o piattaforme per la rivendita.

2. Progressi tecnologici

Industria 4.0

I sistemi di smistamento avanzati possono separare in modo efficiente i tessuti in base al tipo di fibra e alla qualità, aumentando i tassi di riciclaggio, riducendo la contaminazione e migliorando il recupero dei materiali per applicazioni di alto valore.

AI e soluzioni digitali

Le soluzioni digitali che impiegano l'abbinamento dei materiali AI e la tracciabilità della supply chain offrono opportunità per ottimizzare la gestione dei rifiuti e la logistica inversa, in particolare nei contesti pre-consumo. L'abilitazione della digitalizzazione potrebbe migliorare il processo decisionale, ridurre i costi e migliorare la collaborazione lungo la catena del valore.

3. Adozione di nuovi modelli di business circolari e collaborazioni

Da un punto di vista ambientale, le migliori opzioni praticabili per gestire i rifiuti pre e post-consumo prima del riciclaggio sono il riutilizzo e la rivendita e l'aggiornamento o l'upcycling del prodotto. Mentre le aziende spesso non dispongono di capacità specifiche, le partnership a livello di settore offrono la possibilità di condividere le conoscenze.

Mercati della rivendita e dell'usato

Questi modelli possono essere scalabili, vantaggiosi per l'ambiente ed economicamente sostenibili rispetto al riciclaggio. Aumentare la loro presenza sul mercato potrebbe ridurre significativamente gli sprechi tessili e la domanda di nuovi prodotti, offrendo ai marchi un ulteriore flusso di entrate.

Collaborazione lungo la catena del valore

La responsabilità condivisa e l'integrazione di soluzioni locali con le parti interessate dell'ecosistema possono gettare le basi per pratiche circolari su larga scala e condividere risorse, creando un sistema resiliente e chiudendo il cerchio sui rifiuti tessili. Inoltre, investire in impianti regionali di riciclaggio e riparazione può ridurre la dipendenza da lunghe catene di fornitura, ridurre i costi operativi, aumentare l'efficienza e allinearsi agli obiettivi di sostenibilità.

4. Coinvolgimento dei consumatori

Educazione

Informare i consumatori sui vantaggi del riciclo, del riutilizzo e della riparazione può spostare il comportamento verso un consumo sostenibile. Aumentare la partecipazione alle iniziative circolari può migliorare i tassi di raccolta e ridurre lo smaltimento in discarica o l'incenerimento.

Incentivi all'azione

Offrire incentivi finanziari o basati sulla convenienza ai consumatori per la partecipazione a pratiche circolari potrebbe guidare il coinvolgimento dei consumatori e creare una base di clienti fedeli per i marchi che adottano modelli

incentrati sulla sostenibilità. Iniziative come bonus di riparazione, sconti sull'usato o kit fai da te incoraggiano i consumatori ad adottare pratiche circolari.

Research limitations. *Questo studio fornisce un'esplorazione delle sfide e delle opportunità associate alla transizione verso una gestione sostenibile dei rifiuti tessili all'interno dell'Unione Europea. Sebbene i risultati offrano spunti preziosi, presentano al contempo diverse limitazioni. La ricerca si basa su interviste con stakeholder che rappresentano ruoli diversi nell'ecosistema dei rifiuti tessili, il che, sebbene ricco di prospettive, limita la generalizzabilità dei risultati. Inoltre, lo studio non approfondisce soluzioni circolari specifiche, concentrandosi invece su sfide e opportunità sistemiche più ampie. Pertanto, non fornisce una guida granulare per gli stakeholder che cercano di implementare particolari iniziative. Si incoraggia quindi un'indagine più approfondita su soluzioni circolari specifiche. Valutazioni dettagliate di tecnologie come il riciclaggio chimico, sistemi di smistamento automatizzati e progettazione di prodotti modulari fornirebbero spunti concreti per gli stakeholder del settore.*

L'attenzione geografica sull'Unione Europea introduce un ulteriore livello di specificità. Mentre la regione è leader mondiale nello sviluppo di quadri normativi come la Responsabilità estesa del produttore (EPR), i passaporti dei prodotti digitali (DPP) e le direttive sull'ecodesign, queste normative sono attualmente in una fase di recepimento, con gli stati membri in diverse fasi di adozione e implementazione. Questa incertezza normativa limita la capacità dello studio di valutare l'impatto a lungo termine di queste politiche o la loro scalabilità in diversi contesti. Di conseguenza, i risultati potrebbero non catturare completamente le dinamiche dei paesi al di fuori dell'UE o offrire un'applicabilità immediata in mercati meno regolamentati. La ricerca futura potrebbe affrontare queste limitazioni ampliando l'ambito di indagine e adottando metodologie complementari. Un campione più ampio e diversificato di stakeholder, tra cui decisori politici, consumatori e piccole imprese, arricchirebbe la comprensione delle barriere sistemiche e degli abilitatori. Studi comparativi in diverse regioni potrebbero illuminare come le diverse dinamiche normative, culturali e di mercato influenzano l'adozione di pratiche circolari. Inoltre, una ricerca longitudinale che monitori l'attuazione e l'impatto delle normative dell'UE potrebbe fornire preziose informazioni sulla loro efficacia e mettere in luce gli ambiti in cui è necessario apportare miglioramenti.

Managerial implications. *Questo studio sottolinea l'urgente necessità di una trasformazione sistemica nella gestione dei rifiuti tessili, allineando le pratiche ai principi dell'economia circolare in un momento di spinta legislativa all'economia circolare. La ricerca rivela che le sfide alla transizione sostenibile della gestione dei rifiuti tessili sono interconnesse e affrontarle richiede uno sforzo coordinato e multi-stakeholder tra regolamentazione, infrastruttura e coinvolgimento dei consumatori. Colmando le lacune identificate in letteratura, la ricerca futura può basarsi sulle fondamenta di questo studio offrendo una tabella di marcia più completa per la transizione verso un'economia tessile circolare. Sforzi congiunti sono essenziali per allineare il settore agli obiettivi di sostenibilità globali e mitigare l'impatto ambientale dell'industria della moda in modo efficace ed equo.*

Originality of the paper. *Per i decisori aziendali, questi risultati sottolineano l'importanza di adottare un approccio proattivo e strategico alla gestione dei rifiuti tessili. Investire in eco-design, tecnologie e iniziative di coinvolgimento dei consumatori non è solo un imperativo ambientale, ma un fattore di differenziazione competitiva fondamentale in un mercato sempre più attento alla sostenibilità. Le reti di collaborazione con riciclatori, decisori politici, fornitori di tecnologia e consorzi sono essenziali per affrontare le barriere sistemiche e scalare efficacemente le pratiche circolari, mentre infrastrutture condivise e hub di riciclaggio regionali possono ridurre i costi operativi e rendere le soluzioni circolari più accessibili ai marchi più piccoli.*

I decisori politici hanno anche un ruolo fondamentale nel promuovere la transizione verso la circolarità. L'introduzione di normative chiare e incentivi economici, come sussidi, incentivi fiscali e meccanismi di crediti di carbonio, ad esempio, può compensare gli elevati costi iniziali associati alle infrastrutture circolari e incoraggiare un'adozione più ampia. Le campagne educative tra comuni e cittadini sono ugualmente vitali, in quanto possono aumentare la consapevolezza e la partecipazione dei consumatori alle pratiche di gestione sostenibile dei rifiuti, promuovendo una cultura di responsabilità e coinvolgimento.

Affrontare queste sfide e cogliere le opportunità delineate in questo studio richiede un approccio sistemico e multi-stakeholder. L'allineamento di innovazione tecnologica, quadri normativi e strategie di coinvolgimento dei consumatori consentirà al settore di passare da una posizione reattiva a una proattiva, incorporando la circolarità come principio fondamentale piuttosto che come obbligo guidato dalla conformità. Questa transizione è essenziale non solo per mitigare gli impatti ambientali della produzione tessile e del consumo eccessivo, ma anche per promuovere la resilienza economica a lungo termine e il benessere sociale.

Developing a Capabilities Matrix for Agri-Food Companies in Piemonte

DARIO PEIRONE[1] JUDY YUEH LING SONG[2]

Abstract

The agri-food sector in Piemonte holds a pivotal position in Italy's food economy, distinguished by its culinary heritage and exceptional product quality. Home to 84 PDO and PGI-certified goods-including white truffles, fine wines (19 DOCG, 42 DOC), artisan cheeses, and traditional cured meats-the region combines rich gastronomic traditions with strong branding and international recognition, making it an exemplary setting for studying capability development and strategic positioning. Beyond its artisanal strengths, the sector also faces increasing pressure to enhance efficiency, innovation, and sustainability across its entire supply chain, from production to logistics and waste management. This study introduces a capabilities matrix to systematically assess competencies across the agri-food value chain, from production to waste management. Grounded in the resource-based view and dynamic capabilities framework, the matrix serves as an organisational tool that enables firms to leverage their strengths, address capability gaps, and optimise resource allocation. In doing so, it also facilitates cross-fertilisation of expertise, promotes knowledge transfer across the value chain, and supports sustainable growth and internationalisation. Notably, the matrix also functions as a strategic guide for investors, offering a structured overview of where key capabilities and growth opportunities reside across the ecosystem.

The research follows a multi-stage methodology, integrating a literature review, sector analysis, ongoing empirical data collection and interview. Initial study highlights significant capability variations in product processes, certification compliance, and digital adoption (e.g., blockchain for traceability, IoT for efficiency). The paper also underscores the role of regional heritage, collaborative networks, and regulatory frameworks in shaping competitiveness. At this stage, data collection is ongoing, with structured surveys and interviews capturing insights from SMEs, trade agencies, and industry stakeholders. Preliminary analysis is based on responses from 42 firms, providing an initial but incomplete view of the sector's capability landscape. As more data is collected, the capabilities matrix will be refined to reflect broader patterns, ultimately offering a comprehensive framework for firms, investors, policymakers, and trade organisations to navigate supply chain challenges, pursue international expansion, and drive innovation-led growth.

This research contributes to strategic management and regional development literature by offering a holistic, empirically grounded model that captures the interplay between traditional expertise, supply chain efficiencies, and modern competitive strategies in the agri-food sector. Future phases will validate the matrix, enhance its application, and develop actionable recommendations for sustainable and globally competitive growth.

Framing of the research. *In today's competitive global market, understanding and leveraging firm capabilities is critical for sustainable growth and internationalisation. Building on Piemonte's world-renowned gastronomic heritage introduced above-including truffles, wines, cheeses, and vermouth-the region offers an exceptional environment for studying capabilities. Initiatives like Slow Food, the Wine Bank, and the University of Gastronomic Sciences further strengthen this ecosystem. According to the ISMEA (2023), Piedmont ranks fourth in Italy for the economic impact of the IG sector with a value of 1,716 million euros generated in 2022 by 84 PDO IGP food and wine supply.*

Capability matrices have increasingly been used by trade agencies, development organisations, and industry actors around the world as tools to benchmark and visualise firm competencies across supply chains. These tools have proven effective in practice for mapping capabilities, identifying sector-wide strengths and gaps, and informing policy and strategic action. However, despite their widespread real-world use, there is limited academic literature that systematically explores or theorises the application of capability matrices in regional or sectoral contexts. Most scholarly treatments of capability matrices have focused on internal firm-level competencies, such as technological, strategic, and operational capabilities (Evaristo & Zaheer, 2014; Horn, 1999; Tho, 2018; Isobe, Makino, & Montgomery, 2008), with little emphasis on broader ecosystem-wide usage.

Addressing this gap, our study introduces a capabilities matrix specifically designed to reflect the unique structure, dynamics, and competitive environment of the agri-food industry in Piemonte. Based on original data and industry consultation, we construct a matrix that is grounded in the resource-based view (RBV) and dynamic capabilities

frameworks. Central to our framework is RBV, which asserts that a firm's unique resources-ranging from raw materials and modern production facilities to intangible resources such as traditional know-how and regional reputation-underpin its competitive advantage (Barney, 1991). Complementing the RBV is the dynamic capabilities framework, which emphasizes a firm's ability to build, integrate, and reconfigure its internal competencies in response to evolving consumer preferences, regulatory changes, and technological advancements (Teece et al., 1997). Within the Piemonte agri-food sector, this dual lens captures how firms leverage both tradition and innovation to sustain competitiveness. While capability matrices have occasionally been applied to global value chain research-such as Sato and Mai's (2009) work exploring firm-level learning trajectories in developing economies-there remains limited application within advanced regional economies or high-value agri-food systems. Our study builds on these insights by adapting the capability matrix to a complex, innovation-driven European agri-food context.

Developed in collaboration with the regional internationalisation agency and combining academic and industry expertise, the matrix was initially piloted using data from 120 SMEs compiled by a regional internationalisation agency under the Integrated Supply Chain Program (funded by European FESR). Our enhanced approach broadens both the scope and the pool of companies to cover the entire agri-food value chain. This expanded matrix not only provides a detailed snapshot of current competencies but also serves as a strategic tool for identifying strengths, addressing weaknesses, guiding resource allocation, and monitoring progress toward international market success.

Building on these theoretical foundations, our matrix captures a range of dimensions that characterise competitive strengths across the agri-food ecosystem. Specifically, the matrix incorporates ten major dimensions, identified through literature review, sectoral analysis, and industry consultation:

- *Products and Services (e.g., food products such as meats, dairy, bakery; non-food agricultural products such as biofuels, pharmaceuticals);*
- *Processes (primary, secondary, tertiary, covering raw material preparation, product refinement, and enhancement);*
- *Packaging (including in-house packaging, materials like glass, plastic, biodegradable, and technologies like vacuum packaging, aseptic processing);*
- *Logistics (storage, transportation, in-house logistics);*
- *Distribution (retail, wholesale, online channels, order fulfilment);*
- *Waste Management (recycling, edible and non-edible by-products);*
- *Technology (machinery, food technologies, precision farming, blockchain, IoT, artificial intelligence, data analytics);*
- *Sustainability and Innovation (corporate social responsibility, product and process innovation, supply chain transparency);*
- *Certifications (ISO 22000, BRCGS, IFS FOOD, FSSC 22000, HACCP, PDO/DOP, PGI/IGP, BIO, Slow Food, PAT);*
- *Financial and Market Performance (including export turnover).*

Another distinctive aspect of this framework is its attention to the regional ecosystem, which includes cultural, geographic, and institutional factors. By drawing on cluster and network theories (Porter, 1998; Todeva et al., 2007), we account for how geographic proximity, collaborative networks, and inter-firm knowledge exchange enhance regional competitiveness. This ecosystem approach allows the matrix to reveal not only individual firm capabilities but also the collective strengths and coordination mechanisms that drive sectoral performance.

By adapting and extending the capabilities matrix beyond its traditional firm-level use, this study provides a comprehensive, empirically grounded tool to diagnose capabilities, inform strategic decision-making, and guide sustainable, innovation-driven growth across the Piemonte agri-food sector. Future phases of the research will focus on validating the matrix through empirical testing, refining its application, and developing actionable recommendations for firms, policymakers, and industry stakeholders.

Purpose of the paper. *This project aims to develop a capabilities matrix that systematically maps competencies across the agri-food supply chain in the Piemonte region, offering firms, policymakers, and industry stakeholders a robust analytical framework for strategic decision-making. By identifying strengths and areas for improvement within and across firms, the matrix provides a foundation for informed resource allocation, strategic positioning, and innovation planning. It is designed to align organisational resources with long-term growth goals, enhance international competitiveness, and support sustainable development.*

Leveraging both academic and industry expertise, the framework now extends beyond the original SME dataset to include a wider pool of actors across the value chain. It builds on dimensions and indicators previously outlined-covering areas such as operational efficiency, technological integration, regulatory compliance, and certifications-to deliver a comprehensive assessment tool. In doing so, the matrix enables benchmarking across firms and highlights sector-wide capability gaps and synergies.

As highlighted by Mendes et al. (2023), visually mapping firm capabilities can reveal critical endogenous learning processes that strengthen competitiveness within global value chains. Accordingly, this project pursues the following key objectives: -

- *To refine and operationalise key dimensions defining competitive capabilities in the agri-food sector.*
- *To construct a capabilities matrix that identifies strengths and areas for improvement among regional firms.*
- *To provide actionable insights for government agencies and businesses to support international market expansion.*

Methodology. *This study employs a multi-stage research design to systematically capture and analyse the capabilities of agri-food firms in Piemonte. The approach integrates a comprehensive review of the literature on agri-food systems, capability mapping, and the above mentioned RBV and dynamic capabilities framework, with robust empirical analysis. As stated, Piemonte provides a fertile research setting, hosting approximately 52,500 firms, including 4,300 food and beverage companies, 300 agricultural machinery suppliers, and 47,900 agricultural and forestry enterprises. Given the pivotal role of SMEs in driving regional competitiveness and innovation, the study prioritises SMEs in its sampling strategy.*

From an identified population of 1,400 firms across the agri-food value chain, a purposive sample of 350 companies was selected to receive structured questionnaires. The sample was designed to ensure broad sectoral coverage, including SMEs, service providers, logistics companies, packaging firms, and waste management enterprises. The questionnaire was carefully developed to assess firm competencies across ten key dimensions mentioned in the earlier sections.

The idea of capability matrix draws inspiration from several foundational works: Sato and Mai (2009) on capability mapping in developing-country manufacturing sectors; Porter's (1998) cluster theory and Todeva et al. (2007) on network dynamics, which highlight the role of geographic proximity and inter-firm collaboration; and at the firm level, the resource-based view (Barney, 1991) and dynamic capabilities framework (Teece et al., 1997). Additionally, insights from Nonaka (1994) on organisational knowledge creation, Zahra and George (2002) on absorptive capacity, and Knight and Cavusgil (2004) on SME innovation and internationalisation informed the matrix design and empirical approach. Recent research by Peirone et al. (2024) further underscores the importance of agglomeration economies, innovation ecosystems, and cross-firm cooperation in shaping SME competency development, particularly within the Piemonte region-reinforcing the ecosystem-level focus of this study.

The mentioned theoretical alignment stirred us to build a context-specific matrix that captures both static resources and the dynamic processes firms use to adapt, innovate, and grow.

Matrix Dimension	***Sub-Dimensions / Indicators***	***Data Source***	***Theoretical Basis***
Products and Services	*Food products (meat, dairy, grains, condiments, etc.), beverages, non-food agri-products (bioenergy, cosmetics, fibers, etc.)*	*Structured variables*	*RBV - Product portfolio as firm resources*
Processes	*Food: Primary (e.g., butchering), Secondary (e.g., pasteurisation), Tertiary (e.g., meal production)*	*Production activity*	*RBV & Dynamic Capabilities - Efficiency and learning routines*
	Non-food: Raw material refinement to advanced synthesis	*Non-food process indicators*	
Packaging	*Materials (glass, plastic, biodegradable), techniques (MAP, vacuum, smart packaging)*	*Packaging-related items*	*RBV - Technological assets and IP*
Logistics	*Storage (dry, cold, controlled), transport (in-house, outsourced, land, air, sea)*	*Logistics variables*	*Dynamic Capabilities - Operational agility*
Distribution	*Channels (retail, online, wholesale, direct), customer service, order fulfilment*	*Distribution and channel strategy*	*Dynamic Capabilities - Market adaptation / responsiveness*
Waste Management	*Recycling, edible and non-edible by-products, composting, waste-to-energy*	*Waste processing options*	*RBV - Environmental and operational assets*
Technology	*Machineries, precision farming, AI, blockchain, IoT, food tech, packaging tech, data analytics*	*Indicators of Technology Utilisation*	*Dynamic Capabilities - Innovation processes*
Sustainability & Innovation	*CSR activities, product innovation, supply chain transparency*	*Sustainability indicators*	*Dynamic Capabilities - Sensing and seizing opportunities*
Certifications	*ISO, HACCP, BRCGS, IFS FOOD, DOCG, PDO, BIO, etc.*	*Firm-reported certifications*	*RBV - Institutional and reputational assets*
Financial & Market Performance	*Export turnover*	*Turnover data (2024)*	*RBV - Performance outcomes*

To enhance the robustness of findings, the next research phase will expand data collection, increase sectoral representation, and conduct follow-up interviews with key stakeholders. These qualitative insights will enrich and triangulate the quantitative results. Planned cross-sectional analyses will explore capability patterns across firm sizes, supply chain roles, and market orientations. While the matrix is tailored to Piemonte's context, it has been deliberately designed for adaptability, allowing for comparative application in other regional and national agri-food systems. This integrated mixed-methods approach positions the study to deliver an empirically grounded, theoretically informed, and practically actionable framework for managers, industry associations, and policymakers.

Results. *The preliminary analysis of responses from 42 agri-food firms in Piemonte offers an important early snapshot of the sector's capability landscape. Among the respondents, 93% are food producers or service providers, while 7% are non-food providers or services, underscoring the dominant role of food-related activities in the regional agri-food ecosystem.*

The analysis reveals a diverse pattern of specialisation across the ten dimensions of the competence's matrix. In terms of certifications, a core focus in capability building, 63.2% of firms report having HACCP, 36.8% IFS Food, 26.3% BRCGS Food, 15.8% ISO 22000, and 13.2% ISO 22004 certifications. From an RBV perspective, certifications can be understood as valuable and often inimitable resources, as they combine operational routines, specialised know-how, and reputational assets that enhance competitive advantage. While Barney's RBV framework broadly identifies resources that are valuable, rare, inimitable, and non-substitutable (VRIN), Gomillion (2017) specifically highlights certifications as

meeting these VRIN criteria. Achieving certification typically requires internal capability development, coordination across functions, and long-term reputation building, making it difficult for competitors to imitate. Furthermore, certifications act as powerful market signals, enhancing consumer trust, facilitating international market access, and strengthening supplier and partner relationships. From a dynamic capabilities' perspective, certifications also reflect firms' ability to sense regulatory demands, seize differentiation opportunities, and reconfigure processes to meet evolving quality standards, positioning them for sustained adaptability.

In the domain of sustainability and innovation, 12% of firms have implemented corporate social responsibility initiatives, 76% report product innovation activities, and 44% have engaged in measures to improve supply chain transparency. Adoption of advanced technologies remains modest: only 8.3% of firms report using blockchain and IoT, 8.3% are employing artificial intelligence, and 8.3% have adopted CRM or business intelligence systems. In contrast, data analytics is used extensively by 91.7% of firms. Traditional technologies continue to form the backbone of operations, with 94.9% using conventional machinery, 53.8% applying food technology, 43.6% employing packaging technology, and 2.6% still relying on manual cutting or portioning methods. Waste management practices show considerable variation: 51.4% of firms engage in recycling, 28.6% make use of by-products, 20% implement composting, and 2% convert waste into energy. Under the RBV, sustainability initiatives and technological assets represent valuable, and in some cases rare, resources that can augment firms' reputational standing, enhance operational efficiency, and increase customer loyalty. More critically, from a dynamic capabilities' lens, practices such as product innovation, transparency, and selective technological upgrading reflect a firm's ability to sense emergent market demands, seize competitive opportunities, and transform internal and external resource configurations. The low penetration of cutting-edge technologies such as AI, blockchain, and IoT, however, points to a capability gap that may hinder the sector's potential to enhance adaptive capacity and achieve sustained international competitiveness.

Regarding supply chain and logistics functions, 93.8% of firms reported engaging in distribution services, 43.8% in supply chain management, and 43.8% in the operation of storage facilities. Interestingly, only 16.3% of firms manage transportation in-house, while 56.1% outsource these functions, underscoring the growing importance of networked and collaborative operational models. From the RBV perspective, advanced logistics and supply chain management capabilities constitute valuable and, in some cases, rare resources that enable firms to differentiate service quality, enhance responsiveness, and lower operational risks. Firms' ability to reconfigure resources and processes in response to environmental uncertainty is showed, from a dynamic capabilities' perspective, by their orchestration of complex supply chain partnerships and adaptive responses to disruptions and market volatility.

Collectively, these preliminary insights illustrate a heterogeneous sector, marked by variation in technological integration, operational maturity, and sustainability orientation. The ongoing data collection phase will be complemented by targeted interviews with selected firms and industry stakeholders to contextualise these patterns and validate the robustness of the capabilities matrix. These interviews will also capture qualitative nuances not easily derived from survey data, enriching the analysis and informing further refinement of the matrix.

Subsequent work will focus on analysing the combined data to identify key capability patterns, complementarities, and gaps across firms and value chain stages. Based on these findings, we will refine the capabilities matrix to ensure it reflects the multidimensional nature of agri-food firm competencies. Building on the refined matrix, the project will develop strategic recommendations for agencies, policymakers, and industry stakeholders. These recommendations will focus on strengthening firms' internationalisation capacity, upgrading innovation capabilities, and supporting cross-sectoral learning.

The finalised capabilities matrix is intended to serve as the keystone of a strategic framework aimed at promoting diversification and cross-industry collaboration. By enabling firms to map their competencies and identify complementary partners, the framework will facilitate knowledge transfer, stimulate innovation, and enhance the sector's adaptive capacity in a rapidly changing market landscape.

Research limitations. *This study faces several limitations that warrant careful consideration. First, the ongoing nature of data collection across the Piemonte region introduces variability in response rates across different segments, which may limit the generalisability of the early findings. At this preliminary stage, the dataset remains limited, and further data collection will be necessary to strengthen the robustness of the capability's matrix and the subsequent analysis. Additionally, given Piemonte's unique cultural and geographical context, the analysis is inherently context specific. While the matrix has been tailored to this regional setting, its multidimensional design offers promising potential for transferability to agri-food sectors in other regional and national contexts. The methodology developed here is intentionally adaptable and could be applied in other regions to examine similar supply chain dynamics. Finally, considering rapidly evolving consumer preferences and technological innovations, this study provides a static snapshot that highlights the importance of future longitudinal research to capture temporal changes and industry shifts. Accordingly, all findings should be interpreted as preliminary and exploratory, pending further data collection and validation.*

Managerial implications. *The development of the capabilities matrix offers a strong organisational tool for firms, trade agencies, and policymakers operating within agri-food sector. By systematically mapping competencies across the supply chain-from production to waste management-it enables a granular understanding of strengths, gaps, and opportunities for strategic enhancement.*

One of the matrix's primary managerial contributions lies in its ability to align internal capabilities with strategic objectives. By providing an evidence-based snapshot of firm resources and functional maturity, the matrix supports

informed decision-making regarding investment priorities, resource allocation, and competitive positioning. This structured visibility allows firms to move beyond reactive strategies and adopt proactive approaches tailored to evolving market conditions.

The matrix also plays a key role in facilitating cross-sectoral learning. By identifying transferable competencies across firm types and sub-sectors, it promotes knowledge spillovers and encourages the uptake of best practices from adjacent industries. This capability cross-fertilisation stimulates innovation, supports adaptive learning, and fosters experimentation-essential attributes for navigating technological disruption and market volatility.

In addition, the matrix aids firms in discovering diversification pathways, helping them recognise untapped synergies across markets and product categories. This insight is especially valuable for SMEs seeking to expand operational scope, enter new markets, or build strategic alliances. The resulting increase in flexibility contributes to greater organisational resilience and enhances long-term competitiveness.

From a supply chain perspective, the matrix offers tools to improve traceability, boost certification compliance, and upgrade quality assurance-essential for building trust with consumers and meeting increasingly complex regulatory requirements. By supporting logistics optimisation and collaborative distribution strategies, it also contributes to the design of more agile and resilient supply chains networks. Also, the matrix offers strategic guidance for investors by highlighting capability strengths, innovation potential, and growth-ready segments across the agri-food value chain-enabling more targeted investment aligned with regional development goals.

Finally, the matrix holds value at the policy level. Aggregated insights can inform targeted public interventions aimed at capability upgrading, cluster development, and innovation ecosystem strengthening. By linking firm-level competencies with regional development strategies, the matrix reinforces the dual goals of sectoral excellence and global competitiveness.

Originality of the paper. *This paper contributes to the literature by developing an innovative capabilities matrix grounded in an original dataset compiled from firms across the agri-food sector in Piemonte. Unlike traditional frameworks that examine firm-level competencies in isolation, our approach aggregates and synthesises insights from a broad spectrum of stakeholders-including primary producers, processors, service providers, logistics firms, and distributors. This wide-ranging scope enables the matrix to capture the full complexity and interdependence of capabilities across the agri-food supply chain.*

The integration of firm-level data with regional ecosystem analysis provides a unique empirical basis for diagnosing both individual strengths and systemic challenges. By applying the matrix across ten interrelated capability dimensions, the study offers a comprehensive view of how traditional resources-such as artisanal know-how, certification systems, and geographic identity-interact with contemporary strategic drivers like digital technology adoption, sustainability practices, and adaptive logistics. By embedding the matrix within the resource-based and dynamic capabilities paradigms, the paper also offers a theoretically robust model that can be replicated in other regional or sectoral contexts. This methodological and conceptual integration advances academic understanding of capability development in geographically embedded, innovation-driven industries.

Overall, the paper adds to the body of knowledge on supply chain innovation, regional development, and strategic management in the agri-food industry and beyond by offering a thorough and flexible tool that supports both academic research and real-world strategy.

Key words: *Agri-food supply chain, Capability matrix, Firms' competences, Competency mapping*

Optimizing transportation management through product feature forecasting: a design science approach

ALESSANDRO RIZZOTTI[1] IVAN RUSSO[2] JAN HOLMSTRÖM[3]

Abstract

The apparel industry is characterized by a diverse range of products, each with a variety of unique features, resulting in a complex mix that makes accurate volume estimation challenging. Inaccuracies in volume predictions can affect decision-making in logistics and transport planning, leading to increased costs and reduced performance. While existing literature has explored transport planning based on historical order sizes, estimated pallet counts, and routing decisions, few studies focus on volume estimation or three-dimensional inbound freight transportation. Additionally, emerging research on Artificial Intelligence (AI) applications in forecasting, logistics optimization, and real-time tracking can affect how such decisions are made. Design Science (DS) offers a framework to address complex managerial problems, benefitting both academics and practitioners. This study compares various well-known machine learning (ML) algorithms as alternative approaches to the current calculation methods used by a global fashion retailer. This research offers valuable contributions, particularly in transportation management and logistics distribution, by addressing procedures, metrics, and model selection. Moreover, it introduces a new forecasting category-"Forecasting Based on Product Features"-which contrasts with the traditional "Sales Forecasting" based on demand.

Framing of the research. *The apparel industry presents a highly intricate context, with a broad range of products and diverse product features - such as varying designs, styles, fabrics, sewing methods, and folding techniques - all within short product life cycles dictated by a high number of collections produced every year, especially in fast fashion. These complexities pose significant logistical challenges, particularly in accurately estimating freight volume, a critical factor that directly impacts transportation costs (Mehrjoo et al., 2014; Wen et al., 2019). Misjudging freight volume can lead to costly resource misallocations such as inefficient load planning, higher shipping expenses, and broader disruptions in supply chain operations. Implications extend beyond logistics, affecting transportation cost calculations, working capital management, return on assets, and overall supply chain performance (Rogerson and Sallnäs, 2017; Feizabadi, 2022; Culot et al., 2024).*

To navigate these challenges, companies are increasingly turning to data-driven strategies which can help optimize freight rates (McKinsey, 2023). To improve freight volume estimations, both traditional statistical models and Artificial Intelligence (AI) techniques have been explored. AI's ability to detect hidden patterns and approximate complex relationships has made it a valuable tool for predictive supply chain management applications. Recent research underscores the need for empirical studies examining AI's role in supply chain management from managerial, strategic, and operational perspectives (Richey et al., 2023; Ronchini et al., 2024). This growing academic interest highlights the importance of integrating technological advancements with practical logistics solutions.

Purpose of the paper. *Existing literature on forecasting highlights the difficulty of working with three-dimensional (length by width by height) measurements of fashion items, particularly when dealing with fabrics. This challenge arises due to the complexity of reconciling incongruent information caused by material properties (Ravasi and Stigliani, 2012; Abecassis-Moedas, 2006). While existing literature has explored transport planning based on historical order sizes, estimated pallet counts, and routing decisions, few studies focus on volume estimation or three-dimensional inbound freight transportation.*

Cannas et al. (2023) shed light on the applications of AI Supply Chain Management (SCM) such as inventory management, demand forecasting and detecting the volume of the parcels during in the return process. This study underline the common goals of applying AI in SCM in the which are reducing the time required for decision support, reducing human resources for repetitive tasks, and increasing capacity utilization. However, predicting volumes is still underexploring.

Hendriksen (2023) and Wamba et al. (2023) illustrate AI's potential to revolutionize supply chain management through innovative applications in forecasting, logistics optimization, and real-time tracking and tracing, thereby assisting managers in making aware decisions. In addition, AI technologies, such as machine learning techniques, open

new pathways for efficiently managing complex calculations, enabling more accurate forecasts of merchandise dimensions (Richey et al., 2023). The apparel industry has undergone significant transformation with the introduction of new technologies, such as AI. AI influences fashion retail supply chain processes by enhancing demand forecasting accuracy (An et al., 2024), improving production processes by incorporating product features (Mohiuddin et al., 2024). However, limited empirical research has explored the application of AI technology as a forecasting technique to predict freight volumes for apparel products.

Accordingly, this paper addresses the following research question: How can AI technology enhance the shipping process in the apparel industry by introducing advanced estimation techniques for freight volume?

To answer this research question, which has practical and theoretical aims, we intend to move beyond problem-solving into theory building based on pattern detection and metrics to evaluate alternative models, using an abductive reasoning contribution, following suggestions by Chou et al. (2023).

Methodology. *As introduced by Holmström et al. (2009), to effectively integrate real-world managerial challenges with academic research and to provide valuable insights for both scholars and practitioners, this study adopts a Design Science (DS) approach. DS bridges theoretical advancements and practical applications and this research design was based on the recommendations of Bagni et al. (2024) and Gupta et al., (2024) and Naim and Gosling (2023). This research follows a structured DS approach, progressing through the key phases outlined in Table 1, with the following detailed steps:*

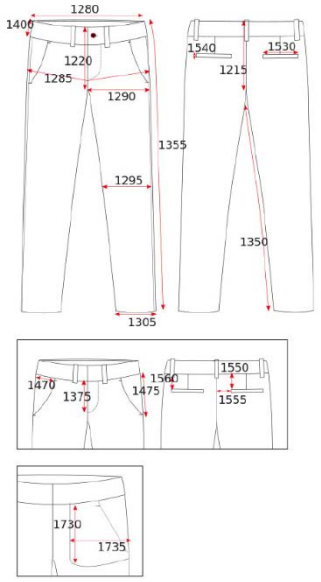
1. *Solution Incubation - In this initial phase, we employ the "Thinking Process" tool proposed by Groop et al. (2017). This phase involves problem structuring, hypothesis formulation, and iterative refinement of potential approaches, with the aim of conceptualizing and developing preliminary solutions.*
2. *Solution Refinement - To enhance the robustness of the proposed preliminary solution, we followed the recommendations of Chou et al. (2023) to ensure a systematic assessment of causal relationships, enabling data-driven adjustments and optimizations*
3. *Examination and Evaluation - We conduct a rigorous comparative analysis in the final phase by benchmarking various established statistical models and machine learning (ML) algorithms. Specifically, we assess Ordinary Least Squares (OLS) regression, XGBoost, and Random Forest (RF) and compare them with the current computational methods employed by a leading global fashion retailer. This evaluation aims to determine the proposed approach's effectiveness, accuracy, and scalability in real-world applications.*

By systematically implementing these phases, this study ensures a scientifically rigorous yet practically relevant approach to addressing contemporary managerial challenges.

Table 1 - Phases of the Design Science approach (Adapted from Holmström et al., 2009)

Research Type	**Exploration (Design Science)**		**Explanation (Theoretical Science)**	
Research Phase	Solution Incubation	Solution Refinement	Explanation I Examination and evaluation	Explanation II Formal Theory
Objective	What exactly is the problem?	What is the initial solution to solve it?	Substantive theory	Formal theory; generalizability
Methodology	- Initial meeting and Interviews with company employ - Thinking process of Theory of constraints(Goldratt 1990)	Thinking process of Theory of constraints(Goldratt 1990) A tool for effect detection and inference	Based on mutability artefacts we are going to identify theory in the literature in order to employ an abductive approach.	

For this study, the first phase "Solution Incubation" started by selecting a case company that will be referred to as "Fashion" for the purpose of anonymity. "Fashion" is a global fashion retail brand handling over 6,000 Twenty-Foot Equivalent Units (TEU) annually and managing approximately 100 million product units. Despite its operational scale, the company's prediction accuracy for high-volume items remains below 80%, underscoring the need for a more effective forecasting approach. However to better underline the practical relevance of this study, we have conducted a one-way sensitivity analysis using MS Excel which is "one-way sensitivity analysis is the simplest type of analysis and it consists of systematically varying one of the network's parameter probabilities while keeping all other parameters fixed" Borgonovo (2017). A one-way sensitivity analysis is essentially a graphical tool, and we can gain insights from the one-way sensitivity function graphs. This preliminary analysis consider how the profit can varies with changes in



transportation costs. This calculation helps to determine how changes in these parameters can impact profitability in the model.

As suggested by Öhman et al., 2021 we started with preliminary meetings with managers of the case company which helped to better align the empirical research in logistics and supply chain management and the DS approach. The assessment meetings with company managers helped also to gain a comprehensive understanding of the managerial issue. During these sessions, we: a) documented discussions and compiled detailed notes; b) mapped the current estimation process to pinpoint inefficiencies; c) examined shared data to analyze the characteristics of products used in the retailer's forecasting model.

As per Öhman et al. (2021), based on these discussions, a Current Reality Tree (CRT) diagram was created, a well-established method used by several scholars (Groop et al., 2017; Kaipia et al., 2017; Tanskanen et al., 2015) This method is based on Thinking Processes (TP) tools, which are part of the Theory of Constraints (TOC) framework (Goldratt, 1990). The idea is to collect and analyze data from a system to fully understand it.

These meetings helped us also to deeply understand the role of the product feature to detect the volume of the product. Therefore, we gathered quantitative data from the retailer's master dataset, encompassing key product feature such as dimensions, seasonality, seeewing technique, and measurement point as reported in the example of product features in Figure

Figure 1 - Example of measurement point of features of an apparel product adpated from Li et al. (2017)

ID	Measurement point
1190	HIP POSITION FROM TOP WAIST
1195	KNEE POSITION
1215	BACK RISE
1220	FRONT RISE
1280	HALF WAIST
1285	HALF HIP
1290	HALF THIGH
1295	HALF KNEE
1305	HALF BOTTOM
1310	BOTTOM SIDE FORWARD (BOTTOM PART)
1350	INSEAM
1355	SIDE TOTAL LENGTH
1375	FLY OPENING
1380	FLY STITCHING WIDTH

1475	FRONT POCKET HEIGHT
1530	BACK POCKET WIDTH
1540	BACK POCKET HEIGHT
1550	BACK POCKET DISTANCE on top
1555	BACK POCKET DISTANCE on c back
1730	FRONT INNER POCKET BAG LENGTH
1735	FRONT INNER POCKET BAG WIDTH
1780	FABRIC ELASTICITY % IN WIDTH
1785	FABRIC ELASTICITY % IN LENGTH

Specifically, we collected a dataset with 887 observations of single fashion product such as (Pants, T-shirt, Jacket) with their 41 product features. These product features represent the independent variables in our statistical models, while the dependent variable is represented by the effective product volume (calculated by multiplying the length by width by height as suggested by Abecassis-Moedas, 2006). Table 2 summarizes the variables, reporting also the descriptive statistics and their description. We conducted graphical analyses, including scatter plots and correlation matrices, to investigate the relationship between the dependent variable and independent variables.

Table 2 - Descriptive statistics and feature descriptions

Product feature name (Indipendent Variable)	Variable description	Data Type	Obs	Mean	Stil	Min	Max	Dropped
Back_Across	This refers to the horizontal measurement across the back of a garment, from one shoulder seam to the other. It is taken at the back and typically measured at a point across the shoulder blades. This measurement ensures the garment fits properly across the upper back without being too tight or loose.	Continuous	887	39,20	9,28	0,00	90,40	
Back_Yoke_Height	The back yoke is the horizontal panel of fabric at the upper back of a garment (typically seen in shirts or jackets). The Back Yoke Height measures the vertical distance from the top of the garment (usually at the neck seam or collar seam) down to the bottom seam of the yoke. This helps in determining the proportion of the upper back section.	Continuous	887	4,60	7,36	0,00	50,50	
Center_Back_Collar_Height	Refers to the vertical measurement taken from the point where the collar joins the body of the garment (typically at the center back neck seam) to the top edge of the collar. This measurement is used to determine the height or thickness of the collar at the back, ensuring proper fit and comfort, especially for shirts, jackets, or coats.	Continuous	887	3,13	4,31	0,00	20,00	
Center_Back_Length	The measurement from the center of the back neckline (at the collar seam) down to the bottom hem of the garment. This determines the overall length of the garment at the back.	Continuous	887	62,20	17,36	26,80	122,70	Yes
Flap_Height	The vertical measurement of a flap (such as a pocket flap) from its top edge to its bottom edge.	Continuous	887	1,65	2,92	0,00	26,00	
Flap_Width	The horizontal measurement of a flap across its widest part.	Continuous	887	2,78	5,92	0,00	36,00	
Front_Across	This refers to the horizontal measurement across the front of the garment, from one side seam to the other, usually measured just above the bust or chest area	Continuous	887	34,13	11,85	0,00	67,70	
Front_Length_From_Shoulder_Point	The vertical measurement from the top of the shoulder (where it meets the neckline) down to the front hem of the garment.	Continuous	887	65,04	17,12	30,00	127,60	Yes
Front_Zipper_Length	The measurement of the zipper placed on the front of the garment, from the top of the zipper to the bottom of it.	Continuous	887	39,29	34,93	0,00	665,00	
Half sleev	= 1 if the item has Half sleeve, = 0 otherwise	Continuous	887	56,13	13,99	0,00	76,00	
Half_Bottom	The measurement of the garment at the bottom hem, taken from one side seam to the other. "Half" refers to only measuring the front or back width, not the full circumference.	Continuous	887	48,41	10,91	0,00	96,00	
Half_Chest	The horizontal measurement across the chest, from one side seam to the other, typically taken just below the armpits. This is half of the full chest circumference	Continuous	887	50,72	9,06	31,50	84,00	Yes
Half_Collar_Length	The horizontal measurement from the center back seam to the front edge of the collar, typically half of the full collar length.	Continuous	887	13,94	12,03	0,00	45,00	
Half_Elbow	The horizontal measurement across the elbow area of the sleeve, typically taken at the midpoint of the sleeve's length.	Continuous	887	15,62	3,62	0,00	26,70	
Half_Muscle	The horizontal measurement across the widest part of the upper arm (bicep area) when the sleeve is laid flat.	Continuous	887	18,53	4,34	0,00	47,00	
Half_Neckline	The horizontal measurement of the neckline across the front or back of the garment. It can refer to the width of the neck opening when measured flat.	Continuous	887	23,32	5,38	0,00	51,50	
Half_Shoulder	The measurement from the base of the neckline (where the shoulder seam starts) to the end of the shoulder seam, typically half of the total shoulder widt	Continuous	887	12,32	5,45	0,00	105,00	
Half_Waist	The horizontal measurement across the waist area, from one side seam to the other. This is half of the full waist circumference.	Continuous	887	43,44	16,16	0,00	65,00	
Hood	= 1 if the item has hood, = 0 otherwise	Continuous	887	21,05	23,45	0,00	59,50	
Hood_Circumference	The total circumference of the hood opening, measured around the edge where the face would be.	Continuous	887	21,04	23,43	0,00	59,50	Yes
Hood_Width	The horizontal measurement of the hood from one edge to the other, measured across the top or back of the head when the hood is laid flat.	Continuous	887	11,56	12,90	0,00	37,00	Yes
length	This measure indicated the length of the item	Continuous	887	65,04	17,13	30,00	130,00	
Man	= 1 if the item belongs to the Man collection, = 0 otherwise	Binary	887	0,51	0,50	0,00	1,00	Yes
Padding	= 1 if the item has padding, = 0 otherwise	Binary	887	0,41	0,49	0,00	1,00	
Pocket_Distance_On_Bottom	The vertical distance from the bottom hem of the garment to the bottom edge of the pocket.	Continuous	887	21,93	18,74	0,00	65,00	
Pocket_Distance_On_Top	The vertical distance from the top edge of the pocket to a reference point, such as a seam or the neckline.	Continuous	887	22,95	14,13	0,00	52,00	
Pocket_Opening	The horizontal measurement of the opening of the pocket (the space where the hand enters).	Continuous	887	12,48	5,53	0,00	28,50	
Pocket_Position_From_Bottom	The vertical distance from the bottom hem of the garment to the point where the pocket begins.	Continuous	887	10,03	10,47	0,00	58,00	
Season	= 1 if the item belongs to the Spring Summer season = 0 otherwise	Binary	887	0,37	0,48	0,00	1,00	
Shoulder_Forward	This refers to the placement of the shoulder seam being slightly forward of the traditional shoulder line, often done for design or fit purposes. It indicates how much the shoulder seam is moved forward.	Continuous	887	1,92	1,57	0,00	15,00	
Shoulder_Width	The horizontal measurement from one shoulder seam to the other, taken across the back or front.	Continuous	887	41,24	9,72	0,00	97,00	
Side_Length	The vertical measurement taken from the underarm (where the side seam begins) down to the bottom hem of the garment.	Continuous	887	37,38	15,94	0,00	94,10	Yes
Sleeve_Length	The measurement from the shoulder seam (or from the center back neck in raglan sleeves) to the end of the sleeve cuff.	Continuous	887	56,20	13,86	0,00	76,00	Yes
Sleeve_Opening	The measurement of the circumference or width of the sleeve at the cuff or hem.	Continuous	887	11,11	2,74	0,00	30,00	
Total_Armhole	The total circumference measurement of the armhole, typically from where the sleeve is attached to the body of the garment.	Continuous	887	47,84	9,68	0,00	82,50	
Vacum	= 1 if the item packaging is treated by vacum, = 0 otherwise	Binary	887	0,18	0,38	0,00	1,00	
Volume_eff	This is the Dependent variable which is the volume (length x width x height)	Continuous	887	0,01	0,01	0,00	0,03	
Waist_Position	The vertical measurement from the top of the garment to the waistline, marking where the natural waist falls on the garment.	Continuous	887	27,26	15,00	0,00	62,50	
Weight	This measure indicated the weight of the item	Continuous	887	239,15	185,62	40,00	999,00	
Width	This measure indicated the width of the item	Continuous	887	50,71	9,06	31,50	84,00	
Woman	= 1 if the item belongs to the woman collection, = 0 otherwise	Binary	887	0,42	0,49	0,00	1,00	

According to Budak and Sarvari (2021), we partitioned the dataset into:

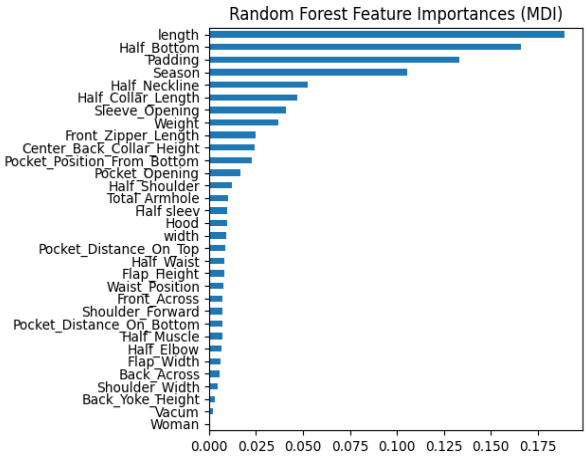
- *A Training Dataset, consisting of historical product data and their respective attributes. In our sample these data were referred to the year 2022.*
- *A Test Dataset, containing newly introduced items along with their associated features for predictive analysis. In our dataset these were concerning the year 2023.*

Results. *In this section will be presented the the second and the third phases of the DS approach, starting from the second phase "Solution Refinement "the existing literature, particularly Chou et al., 2023, suggested to follow the*

following steps 1) "Ensemble construction", 2) "Importance assessment", 3) "Pattern visualization" to present how the results were build.

The first step "Ensemble construction" started by building the training dataset using the database extraction provided by the company. Then, we performed the Pearson correlation analysis as suggested by Jonsson et al. (2023), which allowed us to select 32 variables out of 41, the dropped variables from both the training and testing datasets are listed in Table 2. In the second step, "Importance assessment" in line with Senoner et al. (2022), we employed an "Importance assessment" procedure named the "Mean Decrease Impurity" (MDi), which determines the importance of features by ranking the variables involved in the regression models using the training dataset after the feature reduction as reported in Figure 2 and 3.

Figure 2 - Feature importance with RF algorithm



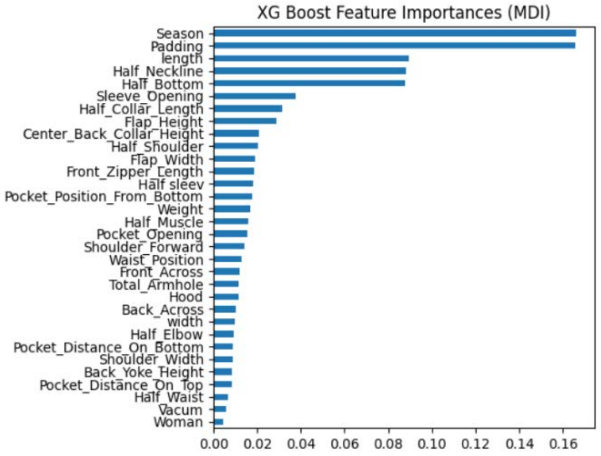


Figure 3 - Feature importance with XGB algorithm

Subsequently, we ran the regression model using the remaining feature set on the training dataset, followed by predictions on the testing dataset. This procedure resulted in different selected features, as shown in Figure 4, highlighting the selection differences between the XGB and RF models.

Figure 4 - Feature selection model-by-model

To properly select product features, we followed the approach of Chou et al. (2023), who trained models using tree-based methods and tuned hyperparameters (e.g., minimum leaf size, sampling fraction) through a model-based approach. This iterative process-propose, evaluate, and select-was found to be more effective than traditional grid or random search methods for hyperparameter optimization (Probst et al., 2019). After selecting the features for the model, we proceeded with the prediction procedure using the testing dataset.
The third step, "Pattern visualization" helps to highlight the differences between the predictions and the selected features. For brevity, only the top two important features of the RF model are shown in Figures 5 and 6, and the top two features of the XGB model are shown in Figures 7 and 8, the remaining analysis will be provided upon request.

Figure 5 - Prediction performed by Random Forest vs Length feature

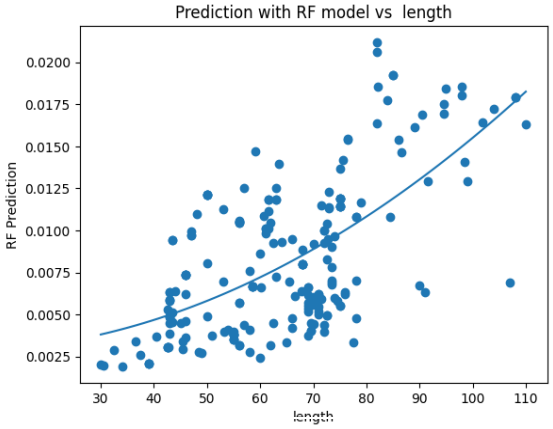

Figure 6 - Prediction performed by Random Forest vs Half_Bottom feature

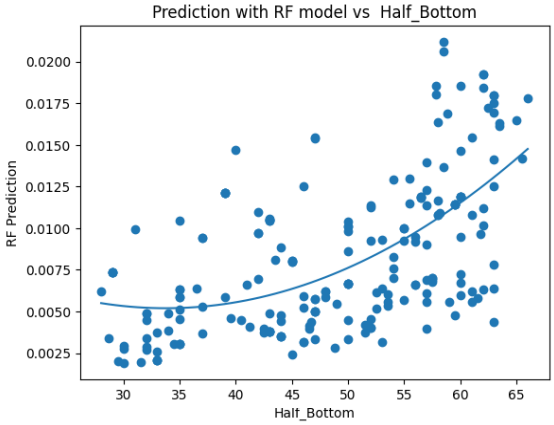

Figure 7 - Prediction performed by XGB model vs Season

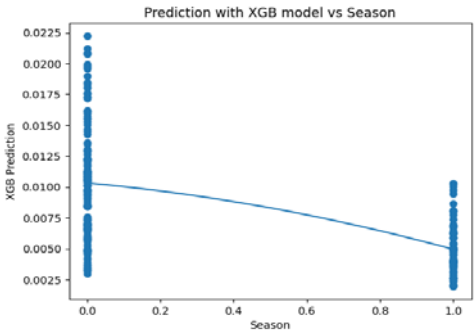

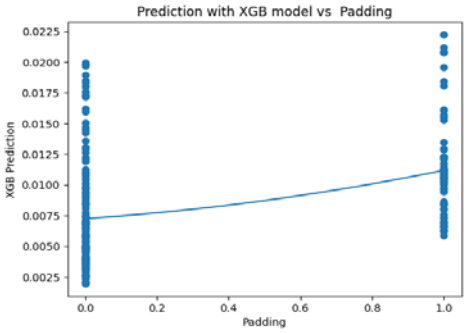

Figure 8 - Prediction performed by XGB model vs Padding

The third Phase of the DS approach called "Examination and Evaluation" reports the final step helps determining which model performs better than the others.
According to the following forecasting accuracy metrics selected:
1) "Log Accuracy Ratio" (LAR) studied by Tofallis (2015) and Jonsson et al. (2024)
2) Mean Absolute Error (MAE) used by Budak and Sarvari (2021) and Verstraete et al. (2019)
3) Bayesian Information Criterion (BIC) reported by Cameron and Trivedi (2009).

Table 3 shows that the LASSO algorithm performs best regarding variance. However, based on the MAE, the RF model performs better. Nevertheless, the hypothesis test confirmed that the prediction data of each model reject the null hypothesis of homoscedasticity, indicating that all data models are heteroskedastic, therefore, according to Tofallis (2015) LAR metrics is particurly helpful to compare model in case of heteroskedasticy presence. Indeed, the XGB model produces a lower value of 0.14565 for the LAR metric, compared to CONCA, which performs at 0.17752, and RF at 0.15669.

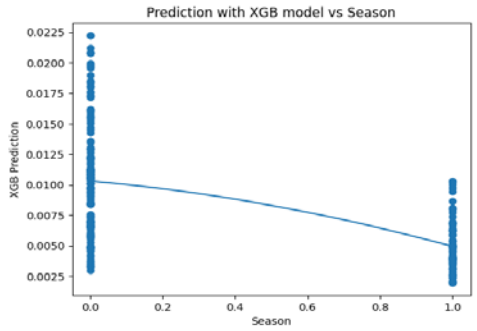
Although, MAE and BIC are lower in the RF model compare with XGB model, according to Tofallis (2015) due to the heteroscedasticity presence XGB model has to consider the best model to predict the volume of the product using product feature having also lower variability.

Table 3 - Evaluation metrics results with the selected features

Model	RF	XGB	LASSO	OLS	CONCA
Mae	0.00283	0.00286	0.00318	0.00312	0.00259
LAR	0.15669	0.14565	0.20245	0.20699	0.17752
Variance	2.02e-05	2.21e-05	1.73e-05	1.91e-05	4.07e-05
BIC	-8959.4	-9463.1	-7069.5	-7070.9	-2192.7

These results have also further supported by the probability density plot of the error distribution between the predicted and true values, as shown in Figures 9 and 10. In these plots, the XGBoost model shows error values above 150, while the CONCA model has error values equal to 150.
These results allowing concluding that using XGB model the prediction of the volume can be more accurate rather than using the actual model

Figure 9 - Probability function of predicted values residuals performed



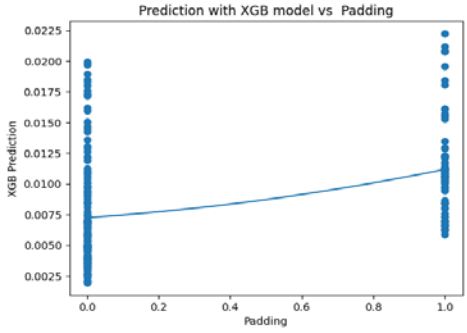


Figure 10 - Probability function of predicted values residuals performed

One of the most intriguing insights from this research is the unexpected nature of feature selection. A feature that appears insignificant in one model may prove essential in another. For example, while the RF model assigns low importance to "Padding," the XGB model identifies it as a key factor significantly enhancing performance.

Moreover, the number of selected features varies across models: the XGB model utilizes 20 features, whereas the RF model selects only 15 out of a total of 32. This indicates that incorporating a larger set of highly influential features can improve model accuracy.

Another notable finding involves the comparison of different modeling approaches. Unlike Chou et al. (2023), who did not evaluate XGB, our study highlights it as the top-performing model for predicting garment volume, outperforming both RF and LASSO regression. Additionally, our analysis accounts for model variance-an essential aspect of performance evaluation-addressing a gap left unexamined by Chou et al. (2023) and Senoner et al. (2022).

Research limitations. *This research is limited to the apparel industry, with a specific focus on a single product category and the collections from 2022 and 2023. Future studies could extend this scope by exploring other product categories and industries, applying new algorithms, and examining additional variables. Researchers may also use the same metrics to explore different contexts. However, further research could improve upon this by studying other metrics or proposing new evaluation approaches to enhance the analysis in the apparel industry. This study also Additionally, future research could assess the impact and magnitude of transportation costs on performance, either in the fashion industry or in other sectors facing similar volume-related challenges, to emphasize the importance of estimation methodologies.*

Additionally, further studies investigate different retail contexts to determine if decision-makers behave by applying ML algorithms. Future research could also adopt a Design Science (DS) approach across various retail contexts, measuring how product volumes affect profitability at downstream levels of the supply chain. Further research could implement the remaining phase by formalizing a theory to explain the factors explored in this study.

Managerial implications. *This research has several managerial contributions: First, by reducing variance of the error and from a managerial perspective, managers are able to access more accurate and reliable information. This improved information allows the transportation function to plan the container loading process better, leading to a more precise and timely estimation of transportation costs throughout the downstream levels of the supply chain. Second,*

managers dealing with fashion item volume estimations, particularly in the delivery process, this research may help them approach data without any transformation to avoid dealing with heteroskedasticy, ensuring reliable results.

Third, with a clear understanding of the model algorithm, managers can easily apply it using Python code without requiring in-depth knowledge of statistics. This accessibility simplifies the integration of advanced AI tools into managerial decision-making processes, making them more efficient and less dependent on technical expertise. Fourth, as confirmed by retailer managers, having accurate estimations can be helpful for collection planning and procurement in general, enabling better awareness in terms of performance, as confirmed by Guida et al. (2023). Fifth, the quality tool applied to evaluate the intervention can also assist managers in assessing any interventions in the delivery process by enhancing accuracy enables better planning of container loading processes, leading to more precise and timely estimates of transportation costs across downstream levels of the supply chain.

Finally, the research helps managers access more accurate and reliable information by proposing a specific pathway for integrating machine-learning algorithms with freight volume forecasting. We utilized the Design Science approach to support managers in making more rigorous and informed decisions, to enhance decision-making outcomes.

Originality of the paper. *The originality of this research lies in several key contributions. First, it introduces a new forecasting category, "Forecasting Based on Product Features," as an alternative to the traditional "Sales Forecasting" based on demand. Second, it provides a novel theoretical contribution to forecasting applications within the logistics and supply chain management research field. Third, this study offers practical benefits by guiding managers on procedures, metrics, and model selection, specifically demonstrating how to handle data variability using the Least Absolute Residual (LAR) metric. Fourth, approaching this research through the Design Science (DS) approach not only provides a structured method for problem-solving but also fosters theoretical advancements and generates economic impact across the entire supply chain, from upstream to downstream.*

Unveiling Omnichannel Strategy Dynamics through Topic Modeling Methodology and Fuzzy-TISM Analysis

FRANCESCO RUSSO[1] MARCO ROMANO[2] VIJAY PEREIRA[3]

Abstract

The omnichannel revolution is imposing a novel holistic entrepreneurial vision of customer experience that transforms firms strategy, leading organisations to provide a value proposition integrating seamlessly across all of any possible channel. The first objective of our research is to review omnichannel literature to highlight the main research areas that have emerged in recent years adopting the Structural Topic Modelling methodology. This technique leads to identify seven relevant topics. The second part of our research consists in designing a Fuzzy-TISM study which will uncover relationships and mutual influences existing among the factors, deducing interlinkages and impacts on omnichannel strategy and customer experience.

Framing of the research. *Every component of a firm's offering, including customer service, advertising, packaging, product and service features, usability, and trustworthiness, stimulates a reaction in the customers. In the attempt to maximise the value generated for the customer along the entire end-to-end customer journey, firms should nowadays consider implementing an omnichannel strategy, which imposes a novel holistic vision of customer experience, taking care of any possible channel customer may use.*

Technology and data are playing a key role in this strategic shift. Technological solutions such as Artificial Intelligence (AI), Internet of Things, Augmented Reality (AR), Virtual Reality, Mixed Reality, Virtual Assistants, Chatbots, and Robots, can create experiential value (Hoyer et al., 2020) and make customer experience increasingly seamless, pleasurable, and stress-free. One-size-fits-all experiences are no longer enough, and organisations should leverage data to deliver personalised experiences, by means of the different channels (Holmlund et al., 2020).

The omnichannel strategy is indeed at the heart of retailers' digital transformation processes (Gao et al., 2021, Gerea et al., 2021). This strategy consists in co-ordinately managing several touchpoints and channels of communication between a firm and a customer to improve the quality of the customer's experience at the various stages of the purchasing process. The omnichannel business is defined as "the synergetic management of the numerous available channels […] in such a way that the customer experience across channels and the performance over channels is optimized" (Verhoef et al., 2015).

In this perspective, omnichannel customer experience can be defined as the sum of customer evaluations of different dimensions in every stage of their seamless experiences across all the organisation's channels (Rahman et al., 2022). However, despite there is agreement on the importance of offering an omnichannel experience, organisations are still struggling to align their long-term strategic vision with omnichannel goals, sometimes overfocusing on technological innovation rather than on customer value (Briedis et al., 2021).

We argue that omnichannel strategy and omnichannel customer experience are two sides of the same coin: deeply intertwined and mutually influential.

Purpose of the paper. *To further investigate this emerging and complex topic, we first conduct a literature review based on Structural Topic Modelling that encompasses all the aspects raised by the adoption of an omnichannel strategy, both from a customer and a firm perspective.*

Our research questions are: (1) what are the aspects characterising an omnichannel business? (2) Which of them are customer-oriented factors and which are more strategic, operational and technological factors?

Structural Topic Modelling approach enables to identify seven topics that embrace the multidimensionality of the omnichannel strategies and provide a structured overview of the main research areas emerging from a corpus of 448 academic abstracts.

In the second study characterising the paper, drawing on the literature review study, we design an empirical investigation that aims to answer the following research questions: (1) What are the success factors of an omnichannel strategy, within a firm, that can generate positive outcomes for the organisation? (2) What are the causal relationships

DOI 10.7433/SRECP.SP.2025.01

between the different strategic areas in an omnichannel business, and how do they contribute to an effective customer experience? (3) How are the key factors driving omnichannel customer experience and behaviour interconnected, and what is their hierarchical structure?

This study applies the Fuzzy-TISM methodology to analyze the factors derived from the STM results. Advanced modeling enables exploration of causal relationships and hierarchical structure with respect to these factors, described in the study 2, thus deducing interlinkages and impacts on omnichannel strategy and customer experience.

The findings from these two analyses bring about an enhanced theoretical understanding and offer useful insights on entrepreneurial and strategic decisions in adopting an omnichannel business model. Omnichannel strategy is about relevant financial investment, technological and organizational changes to ensure a coherent and valuable user experience.

Study 1: Structural Topic Modeling

Methodology. *Structural Topic Modeling (STM) extends Latent Dirichlet Allocation (LDA) by allowing covariates (meta-information) that shows topic distributions based on (exogenous) factors such as publication date or author. STM is the only approach we will discuss that incorporates external variables to understand not just how topics may evolve over time, but how they might differ among classes of authors.*

We retrieved documents from the Web of Science (WoS) and Scopus databases through the relevant subject categories (Business, Management, Computer Science, Economics, etc.) by using the following search string "omnichannel" in title, abstract or keywords. The search, restricted to English-language articles, returned 948 records. We preprocess these abstracts using KNIME Analytics, removing duplicates, giving us 569 documents (Tursi and Silipo, 2018) and applying the ABS 2021 criteria further filtered it to 448 articles.

The text preprocessing process contained stop word removal, removal of rare terms and stemming (Kuhlen Stemmer). We built a bag-of-words based in monograms together with bi-grams taking 20 most frequent ones. STM was proposed then (Roberts et al., 2019) and differed from LDA in that it estimates document-specific topic distributions and enables topic correlation. The best number of topics was determined by maximization of exclusivity, semantic coherence, held-out likelihood and residual variance. After comparing alternative solutions with 6-8 topics, we settled for 7 topics for better readability and interpretability. Here, we summarize the identified topics in brief.

Results. *We categorized topics and provided topic-wise analysis for an extensive overview of omnichannel literature.*

Topic 1: Customer experience and journey

Customers engage in these interactions through the omnichannel customer experience and journey that brings together multiple channels into a unified flow (Rahman et al., 2022; Stead et al., 2022). The integration among online and offline channels enables continuity throughout consumer interactions throughout the purchasing process of pre-purchase to post-sales (Palazón et al., 2022). Performing that integration across channels is important for creating an effortless experience (Deng et al., 2022; Gao et al., 2021; Hossain et al., 2020; Cocco & Demoulin, 2022). Although literature supports the idea that channel integration has a positive impact, some studies reveal negative effects of inconsistent integration (Gasparin et al., 2022). This research also considers determinants of integration, particularly focusing on environmental and organizational dimensions researchers (Deng et al., 2022).

Topic 2: Online-offline integration models and financial strategies

In omnichannel retail, online-offline integration frameworks and financials are of importance, addressing challenges posed by the convergence of the digital and physical domains (Maier et al., 2023; Akter et al., 2021). Much research has been conducted to investigate Buy Online Pickup in Store (BOPS) strategies, considering profitability (Jain et al., 2020), pricing strategies (Gu et al., 2023), and supply chain dynamics (Wang et al., 2023; Jiang & Wu, 2022). Given how online-to-offline platforms facilitate offline sales, they do not compete with physical stores (Zhang et al., 2019).

Topic 3: Technology management

Technology management drives innovation and efficiency in omnichannel retail (Madsen, 2021). Mobile Augmented Reality (MAR), Big Data, AI, machine learning, and Blockchain are emphasized in the literature. MAR improves the physical shopping experience by using digital interaction (Alesanco-Llorente et al., 2023; Son & Oh, 2023; Zimmermann et al., 2023; El Abed & Castro-Lopez, 2024). Big Data and AI revolutionize operational efficiency and supply chains (Bag et al., 2023; Cai & Lo, 2020; Malik et al., 2023), whereas Blockchain optimizes logistics and enhances circular economy practices (Naclerio & De Giovanni, 2022; De Giovanni, 2022).

Topic 4: Business model and Market strategy

Marketing strategies bolster omnichannel customer engagement by reciprocating and unifying communication with targeted counterparts over different channels, through big data analytics technology (Bhardwaj et al., 2023; Nguyen et al., 2022; Varadarajan et al., 2022; Lopes et al., 2021). A concise and articulated strategy of extension or restructuring of channels (including digital channels) is designed to avoid channel cannibalization (Bhardwaj & Mohapatra, 2023; Lopes et al., 2021).

Topic 5: Supply chain management

When combined with inventory synchronization and integrated fulfillment processes across channels, supply chain management achieves operational efficiency, agility, and customer satisfaction (Lei et al., 2022; Lawson et al., 2018; Li & Wang, 2023). Before introducing omnichannel, some background information should be provided regarding its distinction from multichannel in the context of demand correlations between channels (Shin et al., 2022). Inventory and fulfillment challenges are addressed via strategies such as ship-from-store (SFS), ship-to-store (STS), and hybrid approaches (Das et al., 2023; Li et al., 2022; Neves-Moreira & Amorim, 2024). BOPIS and OSHDS significantly accelerate delivery speed while efficiently utilizing inventory, necessitating accurate scaling of inventory.

Topic 6: Customer relationship management

CRM is vital to omnichannel strategies and helps in building long-term relationships with customers. Integrative practices (buy-online-return-in-store (BORS) and BOPS)-which indicate channel integration-foster positive customer satisfaction and loyalty (Xie et al., 2023; Li et al., 2024). Through the combined use of omnichannel strategies and technologies, customer responses (affective, pleasure; cognitive, trust; and behavioral, purchase intention, word-of-mouth) are improved (Nawres et al., 2024; Rodríguez-Torrico et al., 2023; Lazaris et al., 2022; Pereira et al., 2023; Tran et al., 2023). It is also important that in-store mobile usage can provide personalization and further enhance customer engagement (Tyrväinen et al., 2020; Zhang et al., 2024).

Topic 7: Promotion and distribution strategies

The promotion and distribution of products are essential for omnichannel engagement and the smooth flow of products (Dhaigude & Mohan, 2023). To balance fulfillment costs and consumer satisfaction, the strategic coordination of distribution channels and promotional activities is required (Wan, 2022; Strong, 2024; Z. Li et al., 2023; Blom et al., 2021). Fundamentally, integrated marketing efforts are crucial for successful omnichannel distribution and promotion strategies (Shankar & Kushwaha, 2021).

Study 2: Fuzzy-TISM analysis on omnichannel strategy

Theoretical lens. *The theories that have been selected as theoretical lens for this analysis are: resource-based theory and Signal Theory.*

The Resource-Based View (RBV) is a key strategic management theory. Its underlying principle states that an organization's resources are essential for achieving and sustaining a competitive advantage (Barney, 1991, Wernerfelt, 1984). In this perspective, unique tangible and intangible resource allow organizations to clearly differentiate themselves from competitors and create value (Peteraf, 1993). These resources include, for example, employee know-how, physical capital, reputation, technological infrastructure, as well as cultural and natural assets (Wernerfelt, 1984).

Applying Resource based theory to the omnichannel context allows to examine how firms can enhance their competitive advantage by leveraging resources to implement an omnichannel strategy.

The Signal Theory examines how individuals and organizations communicate information in the presence of informational asymmetry (Spence, 1978). Communication is based on signals, whose effectiveness and credibility depends on their uniqueness and difficulty to be imitated.

In the context of marketing and consumer behaviour, the Signal Theory has been further developed by Erdem and Swait (2001) who argue that a brand's value is a core signal to consumers, conveying clear messages about the quality and performance of products. The brand itself is a reference point for reliability and perceived quality, thus influencing purchasing decisions.

Applying the Signal Theory to the omnichannel experience, companies aim to reduce informational asymmetry by sending consistent and credible signals across all customer touchpoints.

Methodology. *To answer the three research questions, we utilize a Fuzzy-TISM mainly to identify the relative importance of key factors of both an omnichannel business and omnichannel customer experience, based on the factors identified by previous research employing STM methodology.*

Fuzzy-TISM will also further allow to explore how these themes interact and construct a hierarchy and to better understand the dynamics between them, even in terms of cause-effect relationships, thus building a holistic view of an omnichannel strategy in terms of enablers and outcomes.

The Fuzzy-TISM methodology, proposed by Khatwani et al. (2015) allows to address problems of ambiguity and uncertainty in modelling complex systems, managing the vagueness in the relationships between factors, organizing them hierarchically based on their mutual influence. The result is the creation of a structure that highlights the extent to which the variables affect each other.

Fuzzy-TISM integrates and extends the ISM (Interpretive Structural Modelling) method with fuzzy theory, which allows to assign specific weights to the relationships between variables, capturing the uncertainty and subjectivity in decision-making processes.

Fuzzy-TISM addresses multi-factorial problems and offering a clear visualization of the results by modelling interrelations between factors in a collaborative way. It is indeed a form of enhanced group decision-making that

leverages the different opinions of various experts, enabling to effectively model these varying degrees of consensus on the topic of interest. Based on the above-described characteristics, this methodology is therefore suitable to investigate emerging and still understudied phenomena for which there is room for the development of structured models.

Following Pereira et al. (2024), the application of the Fuzzy-TISM methodology entails the following phases: factors identification, data collection, data analysis.

Factors identification.

We have identified the factors that are deemed to be relevant in explaining the phenomenon under investigation, being able to capture the multifaceted nature off omnichannel strategy. The factors have been extracted from the literature and are presented below.

1. *Alignment of a firm's omnichannel strategy with other strategies, including marketing and its overall strategy, is paramount. Description: A critical point to address is the alignment of the omnichannel strategy with the overall business strategy. This alignment is essential for ensuring the overall success of the business. Specifically, the omnichannel strategy must be coherent with the marketing strategy and the broader organizational goals. It implies the commitment of top management to the omnichannel strategy in order to guarantee the synchronization of operations across different channels (channel coordination). Furthermore, changes in the organizational structure may be required to support omnichannel operations. This strategic alignment may also take place by means of the selection of strategic partnerships (e.g. with technology providers, logistics partners, and other third parties to enhance omnichannel capabilities) as well as the ability to effectively allocate resource (staff, technology, budget) across channels and manage the costs associated with maintaining multiple channels (Maulana et al., 2023, Djofack et al., 2023, Solem et al., 2023).*
2. *Competitiveness in design, development and implementation is important. Description: it is important to examine companies' actions to make their omnichannel strategy competitive. Understanding these practices is key to identifying successful approaches in the market. Such approaches may take various forms, depending on the supply chain management strategy (as discussed in factor 5) (Solem et al., 2023, Djofack et al., 2023, Lazaris et al., 2021).*
3. *The role and selection of technology in supporting the omnichannel strategy is very important for its success. Description: This involves the role and selection of technology in supporting the omnichannel strategy. A thorough evaluation of a company's technological readiness is necessary to determine how effectively technology is leveraged in their omnichannel efforts. Key technological solutions include mobile apps, Big Data, artificial intelligence (AI), machine learning, blockchain, and augmented reality (AR). A coordinated adoption of such technologies has implications for customer experience, inventory management, and logistical efficiency (Alesanco-Llorente et al., 2023, Bag et al., 2023, Cai and Lo, 2020, De Giovanni, 2022).*
4. *A key factor for an organization is its focus on the signals communicated to customers as part of the omnichannel experience.*
   Description: It is crucial to analyse what messages or experiences, as signals, are being transmitted from both internal and external customers, and how these impact customer perception and engagement. This is important for a feedback loop and mechanism for organisations to constantly improve. This theme emphasizes the importance of integrating online and offline channels to offer a seamless and consistent customer experience throughout their interaction journey with a brand. Channel integration is crucial in enhancing customer experience quality. It indeed allows customers to interact with the firm using several touchpoints, moving from one to another in a seamless way (e.g. online research, in-store visits, and social media interactions) (Rahman et al., 2022, Stead et al., 2022). "The omnichannel customer experience implies a synergy between online and offline channels, allowing consumers to transition smoothly from one channel to another during the research, purchase, and post-sale phases" (Palazón et al., 2022). An omnichannel firm makes an effort to guarantee seamlessness across channels, a high channel integration quality by means of synergistic use of touchpoints, personalization of experiences across different channels and a proper response time in terms of both service provision and communication with customers.
5. *The integration and management of the supply chain in the context of an omnichannel strategy is important. Description: Effective supply chain integration and management plays a pivotal role in ensuring the smooth functioning of the omnichannel strategy. Effective supply chain management is essential in omnichannel strategies to ensure speed, convenience, and product availability (Lei et al., 2022). Real-time synchronization of inventory levels and order fulfilment processes across physical and digital channels is essential. Strategies such as "ship-from-store" (SFS) and dedicated fulfilment centers optimize inventory management and delivery (Das et al., 2023, Lawson et al., 2018, Shin et al., 2022).*

Specific logistics solutions can include: ship from store (SFS), Shipped from online logistics centers (SFO), Ship-to-store (STS), Hybrid SFO+SFS, SFO+STS, SFS+STS. Possible inventory solutions are Buy-online-pickup-in-store (BOPIS) or Out-of-stock-home-delivery-service (OSHDS). What is important is also the degree of synchronization between suppliers and the retailer to meet omnichannel demands.

6. *The performance measurement of the omnichannel strategy is of primary importance for its success. Description: Establishing a feedback loop is essential for continually improving products or services based on customer interactions across multiple channels. This factor refers to performance measures in a broad sense, including sales growth, improved supply chain management, competitive advantage, improvement in operations, innovation*

ambidexerity, improved reputation, improved perception by customers and employees (Asmare and Zewdie, 2022, Abadie et al., 2023, Li et al., 2023).

7. *Companies need to address how they measure customer relationships through the rich omnichannel strategy generated data. Description: This is a critical component for optimizing increasingly data-driven strategies, ensuring that insights derived from customer behavior inform future decisions. Relevant data for this purpose concern affective, cognitive, and behavioral responses, purchase patterns (buying behaviours across different channels), customer satisfaction, customer loyalty, customer retention (Lazaris et al., 2022, Li and Wang, 2023, Nawres et al., 2024, Pereira et al., 2023, Rodríguez-Torrico et al., 2023, Tran et al., 2023, Tyrväinen et al., 2020, Zhang et al., 2024).*

Data collection.

Based on these factors, data on experts' opinions are collected. This phase of data collection is still ongoing. We have identified a sample of 15 experts on the topic of omnichannel at an international level, to whom a questionnaire has been administered. The questionnaire has been developed based on the 7 identified factors.

The questionnaire consists in asking experts opinions about the existence of a relationship between all the possible pairs of variables (Yes or No) and, if yes, asking them in what way they influence each other and what is the strength of the relationship (from 0 to 1: (1= full relationship, .9= very high relationship, .7=high relationship, .5= medium relationship, .3= low relationship, .1= very low relationship and 0= no relationship).

Expected results. *Data will be analysed for the creation of a reachability matrix. Subsequently, the matrix is defuzzifyed and dependent and independent variables are identified, to be able to identify the links between them.*

Utilising the results obtained, we will proceed to create a MICMAC graph that effectively separates the variables representing the driving linkages and autonomous clusters.

In the final step, a Fuzzy-TISM digraph will be created to visually represent the study variables in levels and establish the connections between these variables based on the strength of their association.

Managerial implications. *The work has important managerial implications. A broad understanding of omnichannel phenomenon, its pillars and their mutual influence is a key input for strategic decisions concerning the implementation of omnichannel strategy, which implies managerial commitment and investments.*

Originality of the paper. *The goal of the two studies included in this paper is to shed new light on the omnichannel phenomenon. The literature review highlighst the most frequently discussed topics in omnichannel literature: Customer experience and journey, Online-offline integration models and financial strategies, Technology management, Market strategy, Supply chain management, Customer relationship management and Promotion and distribution strategies. Some of the topics can be considered as belonging to a customer perspective, while others are more business and strategy oriented. The Fuzzy-TISM study has instead the goal to clarify the relationships between variables, leveraging the perceptions of the surveyed managers and experts.*

Key words: *omnichannel, customer experience, Fuzzy-TISM, Entrepreneurial decision making, digital transformation.*

“Online or offline? That is the question” The wine distribution channels dilemma

FABRIZIO BALDASSARRE* SAVINO SANTOVITO†

Abstract

This paper aims, with an exploratory approach, at understanding which variables affect wine consumers when they opt for online or offline purchasing channels decisions. In order to do so, in this study authors carry out a comparative analysis between the wine preferences of Italian and Chinese consumers. The examination of the reasons behind purchasing or not purchasing wine online or via social media among Chinese and Italian consumers reveals some interesting similarities in the factors influencing their decisions.

Framing of the research. *The global wine industry is continuously expanding, with more consumers showing interest in exploring and appreciating various wine varieties from all over the world. One of the most notable emerging markets in this sector is China, a country with a long history of producing and consuming alcoholic beverages, which is now undergoing a significant transformation in the wine industry. In this context, Spanish wine has become one of the leading players in wine imports to China. According to Jimenez-Asenjo et al. (2019), the increasing globalization has encouraged both multinational corporations and smaller businesses to explore new and promising markets like China, with a particular focus on Spanish wines being exported to the region. The research on international marketing strategies of Spanish wine producers in China suggests that these companies do not take extreme approaches of either complete market adaptation or full standardization of their marketing strategies. It further points out that full standardization is primarily driven by internal factors related to business strategy, while adapting to the Chinese market is mainly influenced by external factors such as consumer behavior, distribution systems, and legal and socio-cultural environments. As a result, companies must employ both strategies simultaneously. A key challenge for businesses entering the Chinese market is gaining access to market information and distribution channels, as these are still underdeveloped. Due to the wide range of available brands, selecting and purchasing wine can be a complicated process for consumers. Therefore, it is crucial for marketers to understand what influences consumers when selecting wine and the reasons behind their purchasing decisions. Corsi, Cohen, and Lockshin (2015) expanded on Goodman’s (2009) research, which used the Best-Worst Scaling method, to examine whether the factors influencing wine choices differ based on where it is purchased or the occasion it is consumed. The study found that prior tasting experience is the most significant factor in wine selection, and the occasion of consumption has a stronger influence on wine choice than the retail channel. Later, Corsi, Cohen, and Lockshin (2017) built on these findings by using a Discrete Choice Experiment (DCE) to analyze Chinese consumers’ decisions when presented with wine bottles containing manipulated attributes. They found that factors such as the wine's origin and price were crucial in consumers’ decisions, with significant variations based on the consumption occasion. In Lockshin et al.’s (2017) study, several research methods were employed to gather data, including Check-All-That-Apply (CATA), Best-Worst Scaling (BWS), Discrete Choice Experiments (DCE), and Likert scales. These methods helped to assess consumers' knowledge of wine-producing countries, regions, and grape varieties, as well as their reasons for drinking wine. The primary motivations among Chinese consumers for drinking wine were related to health and relaxation. Best-Worst Scaling was also used to identify key attributes in wine selection depending on whether it was consumed on-site or off-site. Quality indicators and grape variety were found to be crucial in retail wine selection, while on-site consumption was more influenced by word of mouth and food pairings. An interesting finding was the growing trend of drinking wine during informal occasions, such as meals and casual evenings, highlighting a shift in wine consumption habits in China. In conclusion, the CWB provided a detailed understanding of Chinese consumers' preferences and behaviors regarding wine, showing that techniques like CATA and BWS are more effective in capturing these behaviors compared to traditional scale-based methods. This study also addressed the challenge of understanding Chinese consumers’ wine preferences, considering the cultural and linguistic differences. It investigated whether Chinese consumers preferred to use Western-standard terminology or Chinese terms to describe the aroma and taste of wine.*

Purpose of the paper. *The main objective of this analysis is to compare the obtained results with those from a similar study conducted among Chinese consumers by researchers, as well as with the theories presented in the scientific*

literature regarding Italian consumers, in order to assess whether there is a convergence between the collected empirical evidence.

Methodology. *The researchers conducted a survey with a group of Italian consumers. A key aspect of this study is to carry out a comparative analysis between the wine preferences of Italian and Chinese consumers. By exploring both the differences and similarities, this analysis will offer valuable insights into the wine preferences of two distinct cultural backgrounds, both of which have deep-rooted wine traditions, but vary in several ways. The Italian wine market is quite complex, both in terms of production and demand. The wine industry is highly fragmented, with numerous small businesses that are closely tied to regional and local winemaking traditions. Additionally, the factors influencing consumer preferences are shifting, aligning with new lifestyles, and the marketing efforts of wine producers appear to have limited impact. The purpose of the questionnaire is to perform an empirical analysis of Italian consumers' purchasing preferences. The survey will examine their buying choices across three different contexts: offline purchases, online purchases, and purchases made through social media. The data gathered from this survey will be compared to information already collected on wine purchase decisions in China. The sample consists of 150 individuals, both male (36%) and female, all Italian nationals and aged between 20 and 74 years, with an average age of 36. To better understand the key factors behind wine purchasing decisions, a variety of extrinsic and sensory attributes were considered, such as grape variety, region of origin, geographical indication, aroma/bouquet, alcohol content, color, food pairings, wine characteristics described on the label, bottle shape, brand and label appearance, and price-quality ratio. Each respondent was asked to rate the importance of each wine attribute on a 5-point scale, where 1 meant "not important at all" and 5 meant "extremely important." The authors also applied regression analysis to interpret the results.*

Results. *The current study shows that 131 participants consume or purchase wine, while the remaining 19 do not. The majority of the respondents are female. Half of the participants have an average level of education, while 45% have a university degree. The average age is 36, with ages ranging from 20 to 74. Most of the respondents are employed (52%). Additionally, when making purchase decisions, many participants rely on recommendations from a restaurant or retailer as trustworthy sources of guidance. Television programs, on the other hand, are considered unreliable by most respondents, while the internet seems to be a useful communication tool for 23% of the participants. 77% of the respondents buy wine offline, in retail stores. Consumers tend to have clear, well-defined opinions (low uncertainty) about the importance of factors such as the complexity and taste of the wine, aroma/bouquet, price-quality ratio, region of origin, and food pairings. The shape of the bottle, television advice, and online reviews are considered less important attributes. The wine characteristics were then classified into five groups:*

G1: Food pairing, aroma/bouquet, wine taste, and price-quality ratio. This cluster includes the price and a mix of sensory features that are most important to consumers.

G2: Grape variety and region of origin. The grape variety is often linked to sensory differences between wines that can be highly appreciated. Similarly, the region of origin, being closely tied to the grape varieties, tends to reinforce consumers' expectations about the quality of the wine.

G3: Label information, alcohol content, color, and overall pleasantness of the beverage. This cluster refers to packaging-related aspects that are considered important attributes. The brand is considered quite relevant, despite the large number of brands due to the significant fragmentation of the Italian wine industry, which includes around 6,000 companies.

G4: Bottle shape: considered a less significant driver.

G5: Geographical indication status. Geographical denominations are seen as very important for several reasons: they connect the wine to a specific region, which can influence quality perceptions; they are regulated by strict wine laws that ensure high-quality standards; they imply sensory differences in the wine, such as taste, aroma, and structure, which may be important for consumers seeking unique wine experiences; and they help preserve and promote local culture and native grape varieties. This can be a point of pride for Italian consumers who value the diversity and authenticity of regional wines.

Consumption occasions play a significant role in wine selection. Consumers tend to choose wines based on the context in which they will be consumed. A growing trend has been observed in consuming wine on informal occasions: 47% of respondents prefer to drink wine at home, during a dinner with friends, for an aperitif, or in a wine bar, while 38% prefer to drink wine during special occasions. Regarding the place of purchase, almost half of the participants buy wine in supermarkets or at wine bars/wine shops, while 48% buy it occasionally in person. 43% consume wine at least once a week. The most important motivations for wine purchases among this sample of respondents are "taste and pleasure" and consuming it "on special occasions with friends/family." Only 23% of participants purchase wine online; those who do prefer this channel because of the wide selection of wines, the availability of special offers and discounts, and the time-saving aspect. Most respondents who buy wine online use e-commerce sites (e.g., Amazon), and only 11% buy through social media. It can be said that consumers may be skeptical about purchasing wine online and via social media for several reasons:

Wine tasting is a multisensory experience involving sight, smell, and taste. Buyers may be concerned that online purchases do not allow them to evaluate the wine directly before purchasing.

The inability to physically inspect the wine can raise concerns about its quality, as consumers may doubt its origin, freshness, and integrity.Wine purchases require some level of knowledge and expertise. Consumers may feel uncertain about selecting wines online, especially if they are unfamiliar with the brand or grape variety.

Purchasing wine online or through social media requires sharing personal and financial information. Some consumers may be concerned about the security of their data.

Direct interaction with an expert in a physical store can be reassuring. Online shopping may lack this support and advisory dimension. Some consumers may worry about encountering dishonest sellers or counterfeit wines.

Despite these concerns, many wine buyers trust online purchasing and information from social media. Companies are attempting to address these concerns through marketing strategies, offering reviews and ratings, providing detailed product descriptions, and ensuring reliable delivery.

OFFLINE: MOST RELEVANT ATTRIBUTES

CHINESE CONSUMERS	ITALIAN CONSUMERS

OFFLINE: LESS RELEVANT ATTRIBUTES

CHINESE CONSUMERS	ITALIAN CONSUMERS
Alcohol content	*Bottle shape*
Attractive label	
Shelf information	

One key finding from our analysis is that there are both significant similarities and differences in the preferences of Chinese and Italian consumers when it comes to offline wine purchases.

On one hand, it's interesting to see that both groups share many of the same factors they consider important when deciding which wine to buy. This alignment could suggest a trend of globalized wine preferences, where consumers from different cultural backgrounds value similar qualities in wines.

On the other hand, a major difference lies in how many attributes each group deems important. While Chinese consumers focus on fewer key factors, Italian buyers tend to consider a broader range of characteristics when selecting a wine. This might reflect cultural differences or a more refined approach among Italians in assessing wines.

Moreover, it's notable that Chinese consumers assign less importance to certain attributes compared to their Italian counterparts and don't have any shared traits among those they consider less important. This could be interpreted as a result of differences in winemaking traditions, consumption habits, or even how wine is viewed as a product in each culture.

Reasons for Purchasing Online or Through Social Media

Chinese Consumers	Italian Consumers
Time savings	*Time savings*
Convenience	*Convenience*
More information	*More information*

Reasons for Not Purchasing Online or Through Social Media

Chinese Consumers	Italian Consumers
Difficulty in evaluating a product based on a photo	*Difficulty in evaluating a product based on a photo*
Security of payment card data	*Security of payment card data*
Lack of trust	*Prefer human interaction*
Cannot taste the wine	*Concerns about delivery methods*

The examination of the reasons behind purchasing or not purchasing wine online or via social media among Chinese and Italian consumers reveals some interesting similarities in the factors influencing their decisions. Both groups are driven by considerations like convenience, a wide range of choices, and access to detailed product information. However, there is a noticeable pattern of distrust towards these purchasing methods. This skepticism may stem from concerns about the security of online transactions, the potential for fraud, or doubts about the quality of the products received. This mistrust forms a major obstacle to the widespread use of online and social media wine purchases. A key point to highlight is that, despite the similar motivations, the ongoing mistrust suggests a gap between consumers' interest and their actual willingness to buy. This gap might be the result of a lack of confidence in online security or negative past experiences with online shopping. To encourage more consumers to embrace online and social media wine purchases, addressing these concerns about security and trust is essential. Tailored marketing and communication efforts that emphasize transparency, reliability, and secure transactions could help break down these barriers and improve consumer perceptions of these purchasing channels.

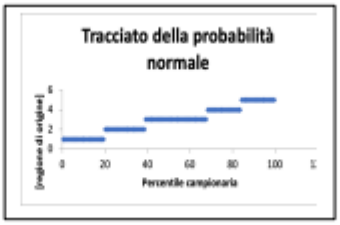
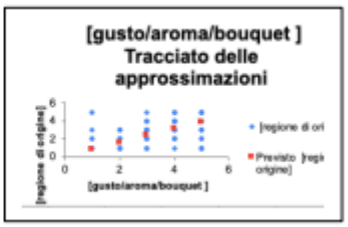
The examination of Italian consumers' preferences when buying wine has highlighted an interesting difference from what the existing literature suggests. While previous studies show that Italian consumers focus on only a few key attributes, our research found that a much wider range of factors influence their purchasing decisions. This difference could be due to a change in the wine market dynamics, where Italian consumers have become more sophisticated and now consider a broader range of attributes when choosing wine. Alternatively, it might indicate that earlier research doesn't fully reflect the current preferences and behaviors of Italian wine buyers. One important point of divergence is in the less important attributes. While the literature identifies a specific set of attributes as less significant, our study found that only one of these is shared between the two. This discrepancy could mean that the literature overlooks certain factors that are actually important to Italian consumers, or that the market is evolving, making some attributes that were once considered irrelevant now seem less important.



Regression Analysis



We conducted a further comparative analysis using regression, a statistical method that helps us understand how one variable (such as a wine attribute, for example, price) can influence another variable (such as taste). It allows us to discover whether there is a relationship or connection between the characteristics of the wine and the actual choices made by consumers.

Regression between: Region of Origin and Taste/Aroma/Bouquet

The values indicate that the regression model has a high ability to explain and predict the variation of the dependent variable (region of origin) in relation to the independent variable (taste/aroma/bouquet). A high R-squared suggests that a significant portion of the variation in the dependent variable is explained by the independent variable in the model. However, the standard error indicates that the model's predictions could deviate, on average, by about 1.33 units from the actual observed values. The analysis of variance suggests that the regression model is highly significant. Most of the variation is explained by the model, as the sum of the residual squares is relatively low compared to the total sum of squares.

Statistica della regressione

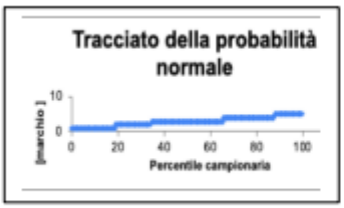
R al quadrato	0,82765
R al quadrato corretto	0,819957
Errore standard	1,327385
Osservazioni	131



Regression between: Price and Brand

The results show that the regression model is effective in explaining and predicting changes in the dependent variable (price) based on the independent variable (brand). A high R-squared value indicates that a significant portion of the variation in the dependent variable is explained by the independent variable in the model. However, the standard error suggests that the model's predictions may differ from the actual values by an average of approximately 1.42 units.

The variance analysis suggests that the regression model is statistically significant, meaning the model explains most of the variation. This is evident as the residual sum of squares is relatively low compared to the total sum of squares.

Statistica della regressione

Regression between: Taste/Aroma/Bouquet and Color

The results show that the regression model is effective in explaining and predicting changes in the dependent variable based on the independent variable. A high R-squared value indicates that a large portion of the variation in the dependent variable is accounted for by the independent variables in the model. However, the standard error suggests that the model's predictions may deviate from the actual values by an average of approximately 1.11 units. The variance analysis indicates that the regression model is statistically significant, meaning that the model explains most of the variation. This is evident as the residual sum of squares is relatively low when compared to the total sum of squares.

Research limitations. *This study is not without limitations, especially considering that it is still in its initial stages. First and foremost, the sample size is still too small to be fully representative of the Italian population. This suggests that the sample should be expanded for further development of the paper. Additionally, it is important to note that the comparison was made between the results of the questionnaire administered to the sample of Italian consumers and the data available in the literature regarding Chinese consumers.*

Managerial implications. *Based on the analyses carried out and the challenges encountered throughout this research, it's clear that understanding the preferences of Italian and Chinese consumers when buying wine is an area that is constantly evolving. Contrary to the limited insights offered by existing scientific literature, the findings from this study show a wide range of factors that Italian consumers consider important. This suggests that the wine market is undergoing significant changes, with consumers now paying more attention to details that may have been overlooked before. The difference between the attributes considered less important in the literature and those highlighted in this research raises important questions. It points to the possibility that consumer preferences are evolving or that the complexity of the Italian wine market has not been fully captured by previous studies. The way we understand consumption patterns must therefore be continuously updated to keep pace with these shifts. Moreover, the overall skepticism towards buying wine online or through social media, shared by both Chinese and Italian consumers, highlights a major obstacle in embracing these purchasing channels. Concerns over online security and product quality are key barriers that require targeted strategies from those in the wine industry. To conclude, this study suggests that understanding consumer preferences in the wine industry requires an adaptive approach that stays attuned to emerging trends in consumer behavior. The differences observed from other studies emphasize the importance of continuously reevaluating marketing*

strategies and industry practices in order to better meet the evolving needs and complex cultural and market dynamics within the wine sector.

Originality of the paper. *The originality of this research paper is the comparison between two different countries (Italy and China) for a specific product, which is wine, usually compared for other kinds of products.*

Key words: *Wine, Italy, China, Consumers, Channels, Online environments*

Assuring Supply Chain Resilience in the aeronautic industry: a Total Cost of Ownership perspective

BARBARA GAUDENZI[1] ALESSANDRA COZZOLINO[2]

Abstract

Supply chain projects in the aeronautic industry are characterized by a complex set of interrelated activities oriented toward the achievement of specific objectives, such as efficiency, responsiveness and quality (Ward, 1999; Jaafari, 2001). In nowadays complex competitive scenarios - highly characterized by uncertainty, risks, and high level of servitizations - assuring Supply Chain RESilience (SCRES) becomes vital. In the aeronautic industry, this is particularly true not only by considering the complexity of the product itself (namely, the aircraft's production and delivery) but also in the perspective of its entire life cycle, addressing all the post-sales services (da Silva et al., 2020; Mohammadi, 2020; Singh & Hong, 2020; Saputro et al., 2022). Hence, a comprehensive assessment of risks and vulnerabilities along the entire life cycle of the aircraft represents a Supply Chain Management (SCM) challenge that has been only partially explored (Camara et al., 2016). In this study, we aim to address this research gap by investigating - with a qualitative approach, based on a case study - the challenges and opportunities of Project Risk Management (PRM), Supply Chain Risk Management (SCRM) and SCRES in the aeronautic industry under the lens of Total Cost of Ownership (TCO) (Brad et al., 2018).

Framing the research. *Although the existence of a link between Project Risk Management (PRM), Supply Chain Risk Management (SCRM), and Supply Chain RESilience (SCRES) has been recognized in the literature (Sauer et al., 2022), few studies have explored, in practice, how to assess risks and vulnerabilities along the entire life cycle of an aeronautic 'product', namely an aircraft, considering the processes of Supply Chain Management (SCM) and all the services related to the of post-sales phase, within the entire life cycle of the aircraft under the perspective of the Total Cost of Ownership (TCO) (Camara et al., 2016).*

Project Risk Management (PRM), Supply Chain Risk Management (SCRM) and Supply Chain RESilience (SCRES) in the aeronautic industry

The aeronautics and defense sector includes all companies that produce, distribute and use aircraft for commercial, defense and space exploration purposes. The value chain in the aeronautics sector is fragmented and heterogeneous, and it is composed by a series of activities and services - from design to after-sales market - necessary to move from the conception of the project to the placement of the aeronautical product on the final market and its functionality along the years, so it concerns activities and services linked to assistance and after-sales services (Bolatto & Frigero, 2014). The output is a product-service composition, a complete solution, and in cases like that it became evident that selling spare parts and after-sales services conducting repairs; installing upgrades; reconditioning equipment; carrying out inspections and day-to-day maintenance; offering technical support, consulting, and training; and arranging financescould be a bountiful source of revenues and profits as well (Cohen et al., 2006).

The aeronautic sector presents complex characteristics and challenges, such as high technological level, product complexity, increasing development costs, long break-even periods and small markets, cash flow issues, high interdependencies between civil and defence markets, and most of all it is a strategic industry; these aspects have a strong influence on the organisations strategic decisions regarding the localisation of activities, the relations among supply chain actors and governments, and SCM as a while (European Commission, 2009). These aspects are strongly related to Project Risk Management (PRM) and Supply Chain Risk Management (SCRM) (Li et al., 2015; Ahn et al., 2018; Guerra et al., 2024). For this reason, the aeronautic industry represents and exemplar case to address the issues above-mentioned and to suggest potential comparisons across different sectors.

PRM is an important lens to adopt in project planning, with the potential to influence project design as well as activity-based plans on a routine basis, occasionally influencing very basic issues like the nature of the project parties and their objectives for the project. So even if it is usually associated with the development and evaluation of contingency plans

[1] University of Verona, Italia

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

supporting activity-based plans, a real effective PRM will be essential in the development of the entire project (the so-called 'base plan') and the related contingency plans[3] (Chapman, 2003).

SCRM is aimed at developing strategies for the identification, assessment, treatment, and monitoring of different risks in supply chains (Neiger et al., 2009; Tummala and Schoenherr, 2011; Ho et al., 2015). It has several definitions that all have emphasized collaboration with supply chain partners, but in particular we may refer to "an inter-organisational collaborative endeavour utilising quantitative and qualitative risk management methodologies to identify, evaluate, mitigate and monitor unexpected macro and micro level events or conditions, which might adversely impact any part of a supply chain" (Ho et al., 2015, p. 5036).

Traditionally, aeronautic manufacturers have internally managed most of the risk associated with innovation, development and production (Williams et al., 2002). However, the sector has been developing a complex evolutionary path towards a network approach based on strong long-term relationships and risk sharing mechanisms among the supply chain actors (Rose-Anderssen et al., 2008; Kamsu-Foguem, 2023).

In fact, in the aerospace supply chain risk-sharing partnerships are largely used for enhancing innovation and competitive advantage, allowing for efficiency, timeliness and financial strength that go beyond the limited capacity of a firm working alone (Raj Sinha et al., 2004; Rose-Anderssen et al., 2008; Tang et al., 2009). Despite these advantages, the network of relationships can also become a source of risk and vulnerabilities that might come from suppliers (Gupta et al., 2015; Kamsu-Foguem et al., 2023) and customers during the post-sales phases (Brad et al., 2018).

The Supply Chain RESilience (SCRES) definition typically measures the "magnitude of disturbance" the system can absorb before it changes its structure by changing the processes and variables that control behavior, comprehending both the "engineering resilience" and the "ecological resilience" perspectives (Wieland, 2020).

The SCRES literature has also largely analyzed and categorized those SCRES strategies that may contribute to ensuring resilience and better performance (Um and Han, 2020; Gaudenzi et al, 2023), underlining SCRES enablers, such as agility, information sharing, collaboration, visibility, risk sharing, risk-management culture, adaptive capability (Soni et al., 2014) to cite a few examples that are largely coherent with the key strategic challenges of the aeronautic industry.

After sales and Total Cost of Ownership (TCO) in the aeronautic industry

After-sales services are activities during warranty periods that include field technical assistance, spare parts distribution, customer care, and accessories sale; aftermarket support involves secondary market transactions for additional products (e.g. accessories and add-ons) and product recovery processes (Durugbo, 2020). An aftermarket support is a network of resources (material, people and infrastructure) for after-sales services, secondary market transactions and product recovery processes. This definition expatiates on various business-to-business interactions and relationships in the aftermarket. It attempts to conceptualise the business ecosystems of aftermarkets which include different aspects (Durugbo, 2020), such as actors, i.e. customers, Original Equipment Manufacturers (OEMs), suppliers and competitors (Wagner et al., 2018; 2012) and different aftermarket areas highlighted in the literature, such as the after-sales market (Kranenburg and Van Houtum), returns (Akturk et al., 2018), spares (Snyder, 1993), and field service (Saccani et al. 2007; Schulze et al., 2012). After-sales and also aftermarkets are significant revenue streams for most of the industrial companies (Kirkizoğlu & Karaer, 2022), also for the aeronautic one (Durugbo, 2020). Aftermarket goods and services constitute a significant source of revenue and profit for manufacturers. An awareness of the potentials of both concepts is evident by the extensive body of production and operations management (POM) publications that investigate the perspectives of both academia and practitioners, but not few in aerospace (Durugbo, 2020). In the aerospace industry, maintenance, repair and overhaul (MRO) services are normally provided during product usage. Given that an airplane is a durable product with a life span of over 30 years, opportunities abound in aviation maintenance, repair and overhaul. The profitability of the aviation industry is not just from the sale of aircrafts, but also from maintaining them for an anticipated lifespan (Zhu et al., 2012). In this industry in particular, the concept of "through-life management" involving the provision of a complex combination of products and services over extremely long life-cycles, has been widely advocated, particularly in the defence aerospace arena, meaning the life-cycle management of the products, services and activities required to deliver a fully integrated capability to the customer, while reducing the cost of ownership for the customer (Ward & Graves, 2007).

The Total Cost of Ownership (TCO) is a methodology that estimates the cost of a product or an action by going beyond the mere purchase price, and including several other purchase-related and/or service-related costs and challenges (Bhutta and Huq, 2002; Brad et al., 2018). TCO can focus on understanding the overall cost of doing business with a respective supplier or customer, and TCO of the supply chain computes the overall cost of a good or service from an entire end-to-end supply chain perspective (Ellram, 1996, 1993). This means that it includes the cost from the idea of the product/service, such as the cost of working with a supplier or customer to develop a new or improved product and service

[3] 'Base plans' are target scenarios, a portrayal of how we would like a project to go, incorporating proactive responses to uncertainty, they provide a basis for project preparation, execution, and control. 'Contingency plans' are a second level of plan, a portrayal of how we would like to respond to threats or opportunities associated with a base plan, incorporating reactive responses to uncertainty (Chapman, 2003).

(Brad et al., 2018; Heilala et al., 2006). The use of TCO as an approach for integrating PRM, SCRM and SCRES is presented by Gaudenzi et al. (2021), which analyze some costs and risk elements associated with the SCM processed, enriching the approaches for managing the risks within the pre-transaction, transaction and post-transaction phases. Through a TCO approach, the analysis of the cost components and risks reveals many additional challenges arising beyond the optimization of procurement, production and delivery processes such as for example the costs and risk related to post-transactions and post-sales phases.

Purpose of the paper. *In this exploratory study, we aim at investigating the complex and less-explored relationship between PRM, SCRM and SCRES outcomes under the perspective of TCO theory. Following an inductive approach, based on a case study in the aeronautic industry, theorizing arises from qualitative data, according to a 'bottom up' approach. The Research Questions (RQs) of the study are therefore the following:*

- *RQ1: What are the approaches/practices adopted by aeronautic industry companies towards PRM, SCRM and SCRES along the aircraft product life cycle?*
- *RQ2: How do PRM and SCRES practices influence SCRES outcomes in the different phases of the aircraft life cycle, including the after-sales phase?*

Methodology. *The unit of analysis is focused on the aeronautic industry, investigating the relationships between PRM, SCRM and SCRES along the different phases of the aircraft life cycle under the lens of TCO theory. An aeronautic manufacturer operating worldwide can offer a rich base of information (Flyvbjerg, 2006) for two main reasons. First, the themes of risk management, resilience and servitization along the product life cycle represent a key priority in the aeronautic industry that is also a key theme for global supply chains in different sectors, allowing a potential cross-industries comparision. Second, the aeronautic industry represents an interesting sector for exploring the complex balance between service management and resilience (Kamsu-Foguem et al, 2023). In the data collection process, we are involving senior supply chain managers from aeronautic industry with expertise in PRM, SCRES and SCRM.*

We aim to collect data within a first pilot test to validate the clarity of the protocol of the interview. After this phase, we aim to proceed with interviews according to robust qualitative research methodology. We are also collecting other secondary sources of data for our analysis, such as industry reports and additional information provided by the respondents, to achieve a rich base of information. All interviews will be recorded and transcribed.

Results. *A within-case analysis, which is still in progress, will allow us to identify and organize themes emerging from the transcripts. Relevant literature was incorporated at this stage to support the definition of themes and to provide an additional source of validation (Eisenhardt, 1989). We will present the results during the Conference.*

Research limitations. *In this version of the research, the main limitation arises from the adoption of a single case study methodology. Future research should develop further case studies across different industries to enrich the data and the results.*

Managerial implications. *This study will generate managerial implications on how challenges and opportunities of PRM, SCRM and SCRES may drive innovation in the aeronautic industry under the lens of Total Cost of Ownerhsip theory.*

Originality of the paper. *Due to the complexity of modern supply chains with several stages and multitudes of suppliers, each event occurring at any stage may detrimentally affect the performance and profitability of firms. This is why risk and vulnerability need to be assessed, mitigated and continuously monitored to protect the business before and after the sale of the product. However, not all the risks can be avoided, given the limited resources of companies for managing supply chain risk. Therefore a thorough assessment of project risk and supply chain risk is crucial in order to better estimate the company's risk exposure and determine the priority of potential threats to supply continuity and profitability in order to manage risk is a cost effective manner, considering the entire product life cycle, hence including the post-sales services. Even, in some cases it is useful for a company to continue to bear some risks, in order to capture opportunities that uncertainty may create. The qualitative and quantitative analytic approaches to PRM and SCRM before the sale and in the post-sale stage allow to better consider the complexity of SCRM and SCRES.*

Key words: *supply chain risk, supply chain resilience, total cost of ownership, case studies, aeronautic industry*

Implementing ESG Criteria in Italian SMEs: Regulatory Challenges and the Role of Innovative Digital Tools in the Context of the CSRD Directive

GIOVANNI SPATOLA[1] MARIO D'AVINO[2]

Abstract

This paper analyses the organizational, operational, and regulatory challenges faced by Italian Small and Medium Enterprises (SMEs) in implementing Environmental, Social, and Governance (ESG) criteria, specifically in light of the European Union's Corporate Sustainability Reporting Directive (CSRD). By adopting the Technology-Organization-Environment (TOE) framework, this research aims to better understand the determinants influencing ESG adoption processes within SMEs. Furthermore, the paper explores how innovative digital tools, particularly the AWorld smartphone app, can mitigate these challenges by streamlining ESG data management, enhancing stakeholder engagement, and supporting the internal organizational learning process. Using a qualitative methodology combining a comprehensive literature review, exploratory case analysis, and planned empirical data collection through semi-structured interviews, the study seeks to establish both theoretical insights and actionable managerial recommendations. Expected findings indicate that digital tools significantly facilitate ESG compliance and strategic integration, ultimately strengthening SMEs' competitive positioning.

Framing of the research. *Sustainability has become a critical strategic issue for businesses worldwide, with Environmental, Social, and Governance (ESG) criteria increasingly influencing corporate performance, stakeholder engagement, and long-term value creation (Ahmad et al., 2023). In line with this global trend, the European Union introduced the Corporate Sustainability Reporting Directive (CSRD), mandating comprehensive ESG disclosures and significantly expanding the regulatory framework for corporate sustainability reporting (Capasso & Lattarulo, 2023).*

Small and Medium Enterprises (SMEs), dominant in the Italian economic landscape, face unique resource constraints and organizational limitations, complicating their ESG implementation processes. SMEs often lack the financial resources, specialized skills, and structured governance frameworks required to effectively manage complex ESG reporting requirements (Barro et al., 2024). Moreover, the CSRD directive places additional pressure on SMEs, requiring sophisticated data collection and reporting methodologies that typically exceed SMEs' internal capabilities (Alsayegh et al., 2020). Digital technologies, particularly AI-informed digital platforms, offer promising solutions to overcome these compliance challenges. Platforms such as AWorld provide SMEs with intuitive solutions for managing ESG data, streamlining reporting processes, and improving stakeholder transparency and engagement (Dablander et al., 2025).

Yet, despite their potential, the practical impacts of such digital solutions within SMEs remain underexplored in the context of ESG implementation.

Purpose of the paper. *The research adopts the Technology-Organization-Environment (TOE) theoretical framework (Tornatzky & Fleischer, 1990) to explore and clarify the factors influencing ESG adoption in SMEs. Specifically, the TOE framework allows for examining the technological context (digital platforms like AWorld), organizational context (SME-specific resources, governance, and culture), and environmental context (regulatory pressures from CSRD).*

Thus, the paper addresses two main objectives:

1. *To identify the regulatory, methodological, and operational challenges faced by Italian SMEs in ESG compliance under CSRD.*
2. *To investigate the extent to which digital ESG platforms, notably AWorld, can support SMEs in overcoming these barriers and leveraging ESG for competitive differentiation.*

The research seeks to answer two main questions:

RQ1: How do technological, organizational, and environmental factors influence Italian SMEs' ability to effectively comply with ESG criteria mandated by the CSRD directive?

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

RQ2: What are the practical impacts of adopting digital platforms, such as AWorld, on SMEs' ESG reporting processes and internal sustainability practices?

Methodology. *Given the exploratory nature of this research, a qualitative approach structured in three clear phases is employed:*

1. *Literature and Regulatory Framework Review*
   The initial phase involves an extensive review of existing ESG literature, regulatory documents related to CSRD, and SMEs' sustainability practices. This literature review clarifies key regulatory requirements, organizational factors impacting SMEs, and technological opportunities provided by digital ESG platforms (Sood & Özen, 2024; Barro et al., 2024).
2. *Exploratory Case Analysis of the AWorld Digital Platform*
   This phase provides a detailed exploratory analysis of the functionalities and expected benefits of the AWorld platform. Drawing on available documentation and preliminary evidence, this analysis explores how SMEs could practically benefit from AWorld's AI-informed features, automated data management, and interactive stakeholder engagement tools (Dablander et al., 2025).
3. *Empirical Qualitative Research (Planned phase)*
   The forthcoming phase will involve semi-structured interviews with a carefully selected sample of Italian SMEs' sustainability managers, executives, and decision-makers. Interviews will gather empirical insights into SMEs' ESG implementation experiences, perceptions of digital technologies, and practical impacts of adopting ESG digital platforms.

Results

Preliminary analyses highlight several *significant challenges and opportunities:*

Regulatory and Operational Challenges

Italian SMEs typically face financial constraints, limited internal expertise, and inadequate governance structures, complicating their ability to adhere to CSRD's ESG reporting requirements. The complexity and comprehensiveness of required ESG disclosures amplify these constraints, imposing significant burdens on SMEs' limited resources (Capasso & Lattarulo, 2023).

Organizational and Managerial Factors

Organizational factors such as transformational leadership, innovative organizational culture, and sustainable human resource practices significantly influence SMEs' ESG adoption effectiveness. SMEs often lack structured governance and leadership commitment necessary for successful ESG implementation (Jin & Huang, 2023; Pellegrini et al., 2018).

Potential Impacts of the AWorld Platform

The AWorld digital platform is expected to significantly mitigate SMEs' ESG compliance challenges by:

- *Streamlining ESG data collection, reducing time and resource consumption in reporting processes.*
- *Increasing accuracy and reliability of ESG disclosures through automated data verification and analytics informed by AI.*
- *Enhancing stakeholder engagement capabilities, improving transparency, stakeholder trust, and external communication of sustainability efforts.*
- *Facilitating organizational learning processes and capability development through intuitive user interfaces, personalized recommendations, and ongoing stakeholder interactions (Dablander et al., 2025; Spatola & Zifaro, 2024).*

Research limitations. *This research, still in progress, currently relies on literature review and exploratory analysis. Empirical validation through interviews and further case studies is pending, limiting the immediate generalizability of preliminary findings.*

Managerial implications. *The study aims to provide SMEs with actionable recommendations, including:*

- *Guidance for integrating digital ESG platforms into operational workflows and strategic planning.*
- *Recommendations for internal ESG capacity-building through targeted training and employee engagement initiatives.*
- *Practical advice for effectively communicating ESG achievements externally, thus enhancing SMEs' reputational capital and competitive advantage.*

Theoretical Implications (expected)

By applying the TOE framework, findings are expected to enrich theoretical understanding of ESG adoption processes in SMEs. Specifically, this study may contribute empirical evidence on how regulatory pressures (CSRD), organizational constraints (SME-specific limitations), and technological innovations (AI-driven ESG tools) interact to shape SMEs' ESG reporting practices.

Originality of the paper. *This research uniquely explores ESG implementation within Italian SMEs, explicitly linking regulatory analysis (CSRD), digital innovation adoption (AWorld), and organizational factors (leadership, culture). The integration of the TOE framework adds theoretical depth, addressing a clear gap in current ESG literature.*

Conclusion and future directions. *Initial findings indicate that, despite substantial challenges, SMEs can significantly benefit from ESG compliance, particularly when strategically leveraging digital innovations such as the AWorld app. Future empirical research will validate these preliminary insights, providing robust theoretical contributions and actionable managerial recommendations for SMEs.*

Keywords: *ESG; sustainability; CSRD; SMEs; digital platforms; AWorld; compliance; stakeholder engagement; transformational leadership.*

Unpacking ESG performance and the relation with green innovation: the moderating role of board cultural diversity

ELISA FIORE[1] JORDANA RECH GRACIANO DOS SANTOS[2] ROBERTO URBANI[3]

Abstract

European companies, driven by increasingly stringent sustainability regulations, have committed to improving their ESG performance. What was once just a matter of compliance is now evolving into a fully integrated approach, where sustainability is embedded in corporate policies and strategic decision-making. This shift reflects the growing recognition that ESG considerations are not just regulatory requirements but key drivers of long-term value creation, risk management, and competitive advantage in the global market.

However, embedding ESG principles into corporate practices remains complex, requiring firms to embrace innovation, rethink conventional business paradigms, and redesign operational processes to align with sustainability goals. Green innovation has emerged as a critical factor in improving ESG performance by enabling companies to develop sustainable technologies, eco-efficient production processes, and environmentally responsible products. Nevertheless, the effectiveness of green innovation in driving ESG outcomes may depend on various internal governance factors.

This study explores the relationship between green innovation and ESG performance, focusing on the moderating role of board cultural diversity. Understanding how green innovation contributes to environmental, social, and governance outcomes is crucial in an era when sustainability has become a key driver of corporate success. However, the effectiveness of these innovation strategies is not solely determined by technological advancements or regulatory compliance; governance structures, particularly board diversity, play a significant role in shaping corporate sustainability efforts.

Therefore, this research focuses on the governance mechanisms that enhance ESG performance by examining how culturally diverse boards influence the adoption and implementation of green innovation. Board members from different cultural backgrounds bring diverse perspectives, values, and strategic approaches, which can foster more dynamic decision-making and a broader understanding of global sustainability challenges. Their varied experiences may lead to stronger oversight, better risk management, and a more proactive approach to integrating green initiatives into corporate strategy.

Framing of the research. *During the last few years, scientists, practitioners, and the public have shown increased interest in preserving the environment and using resources efficiently, improving human living standards, and promoting long-term economic competitiveness. The term "sustainability", encompassing environmental, social, and economic concerns, was introduced by the World Commission on Environment and Development (WCED, 1987).*

Along with the sustainability term, the organizations started to deploy Environmental, Social and Governance (ESG) plans, which refer to organizational practices aimed at promoting positive effects with the aim of forging a fairer and enduring future. This shift is reflected in the increasing integration of ESG principles into corporate decision-making, transforming sustainability from a compliance requirement into a driver of long-term value creation (Porter and Kramer, 2011). Companies are now expected to generate financial returns and shared value by addressing societal and environmental needs through responsible business practices.

However, embedding ESG principles into corporate strategies is a complex and multifaceted endeavor. It requires firms to rethink conventional business paradigms, invest in green innovation, and implement governance mechanisms that align sustainability goals with long-term corporate success (Dicuonzo et al., 2022).

Based on the stakeholder theory, an enterprise is an institutional arrangement of specialized investment in intelligence and management. The survival and development of an enterprise depend on the quality of its response to the interest requirements of various stakeholders. Companies planning green innovation will be better equipped to fulfill ESG responsibilities and accumulate reputational capital, further promoting corporate operating performance (Fatemi et al., 2018; Velte, 2017). Meeting the expectations of the government, residents, and the media, it is necessary to obtain support

from financial institutions and reduce the pressure of financing constraints. Solving financing constraints will further promote corporate green innovation, creating a virtuous cycle (Bond et al., 2005; Savignac, 2008; David et al., 2008).

Indeed, it's paramount for the board of directors (from now on, BoDs) to actively oversee ESG issues, integrating sustainability risks into strategic planning and decision-making processes. This key governance body plays a pivotal role in steering corporate responsibility efforts, fostering a positive corporate culture, ensuring alignment with strategic objectives, and endorsing robust corporate governance frameworks (Aguilera et al., 2006; Jo and Harjoto, 2011; Agyei-Mensah, 2023).

Hill and Jones (1992) attribute a fundamental role to BoDs in overseeing an organization's sustainable practices and being accountable to various interest groups. This role has strengthened, especially in recent years, when the imperative of balancing the interests of people, the planet, and profit has firmly entrenched itself in discussions within corporate boardrooms worldwide. In fact, BoDs are increasingly accountable for environmental and social impacts because of their substantial responsibility in provoking them (Elkington 2006; Kakabadse 2007).

Substantial evidence indicates that diverse board attributes can significantly influence corporate social responsibility (Webb, 2004; Dunn and Sainty, 2009; Huang, 2010). For example, Mohy-ud-Din (2024) shows that board diversity in U.S. companies fosters green innovation by driving investments in green technologies and developing eco-designed products. Also, Bazel-Shoham et al. (2024) show that more women on the board positively and significantly influence corporate decision-making on green innovation.

A characteristic that so far has had less attention is the cultural background of directors (Harjoto et al., 2019; Khatib et al., 2021). This characteristic, commonly known as board cultural diversity, encompasses the idea that board members originate from various cultural backgrounds or belong to different cultures, often referred to as cultural diffusion (Luo et al., 2021).

The significant influence of BoDs on ESG activities suggests that directors' features can substantially impact ESG and corporate responsibility outcomes (O'Neill et al., 1989). This is coherent with upper echelons theory (e.g., Hambrick and Mason, 1984; Hambrick, 2007), emphasizing the influence of BoDs' characteristics, values, knowledge, and experience on their decision-making processes. Particularly, since BoDs play a significant role in shaping the formulation of sustainability policies (Yarram and Adapa, 2021), a relevant aspect is represented by the different traits and cultures of directors, as summarized by the concept of board cultural diversity.

For example, Aliani et al. (2024) found that organizations must prioritize fostering diversity within their boards and establishing clear, well-defined structural policies to institute ESG strategies effectively. Additionally, previous studies have shown that a diverse cultural background within the board is related to higher corporate social responsibility practices and improved ESG performance (Harjoto et al., 2015, 2019; Beji et al., 2021; Ouyang et al., 2022; Cheung and Lai, 2023).

Purpose of the paper. *This paper examines the relationship between ESG pillars and green innovation, focusing on how each pillar contributes to sustainable business practices. By analyzing the effects of green innovation on environmental, social, and governance factors, both individually and compositely, the study seeks to determine whether green innovation drives them individually or functions collectively to drive sustainable development. Given the increasing relevance of green innovation strategies in corporate decision-making, understanding their role in fostering ESG performance is essential for businesses aiming to enhance their sustainability efforts. Specifically, the study investigates whether adopting green innovation impacts a company's ESG performance, assessing RQ1: Does the adoption of green innovation in a company impact its ESG performance?*

Grounded in stakeholder theory, we propose the following hypothesis:

H1: Firms with greater adoption of green innovation positively impact ESG performance, both at the individual and composite levels.

Furthermore, this research explores the moderating role of board cultural diversity in the ESG-green innovation relationship. Prior research suggests that culturally diverse boards improve social and environmental performance (Martinez-Ferrero et al., 2021). Also, a diverse board brings varied perspectives, experiences, and decision-making approaches, which can enhance the incorporation of stakeholder concerns into business strategies. Cultural diversity fosters broader discussions, eases knowledge sharing, and introduces fresh insights that drive sustainable innovation. To assess this dynamic, the study addresses RQ2: Does board cultural diversity moderate the relationship between adopting green innovation and a company's ESG performance?

Grounded in upper echelons theory and existing research on the positive influence of board cultural diversity on sustainability practices and corporate performance, we propose the following hypothesis:

H2: Firms with higher board cultural diversity are more likely to achieve positive ESG performance by adopting green innovation.

Methodology. *The dataset used in this study consists of organizations listed in the Euro Stoxx 600 index, a key financial benchmark for the Eurozone, developed by STOXX, a leading index provider under the Deutsche Börse Group. This index encompasses a diverse range of major European companies across multiple industries, making it a widely recognized representation of the region's economic landscape (Paolone et al., 2024).*

Furthermore, our study examines the period from 2014 to 2023. This timeframe is particularly relevant as, from 2014 onwards, regulatory developments and compliance requirements in the European context led companies to place greater emphasis on sustainability and its impact on all the dimensions of environment, society, and governance. To answer our

research questions, we employ the individual and the composite scores of ESG pillars as dependent variables obtained from the LSEG Workspace Refinitiv ESG database, which is widely recognized as a prominent and reputable source of data for its transparent and objective assessment of ESG (LSEG website). These pillars are frequently used as a proxy for corporate sustainability performance in academic literature (e.g., Uyar et al., 2022; Paolone et al., 2024).

In line with Fabrizi et al. (2018), the independent variable, green innovation, comes from data extracted from the OECD PATSTAT database. These patents are identified using search strategies for environment-related technologies (ENV-TECH) developed by OECD staff. This method primarily relies on the International Patent Classification (IPC) system established by the World Intellectual Property Organization. The IPC system categorizes inventions into more than 70,000 technological groups and subgroups, enabling the identification of technologies related to environmental management (such as human and ecosystem health), water-related adaptation, and climate change mitigation.

Our moderator (board cultural diversity) is defined as the percentage of board members with a cultural background different from the location of the corporate headquarters, and it is obtained from the LSEG Workspace Refinitiv ESG database.

We use a fixed-effect panel model. This model combines cross-sectional and time series data. It is well-suited for this regression analysis due to its ability to control time simultaneously, individual, and cross-sectional variations. Cross-sectional fixed effects and time-fixed effects further bolster the robustness of the analysis by accounting for differences across firms and years (Greene, 2005).

Moreover, we control specific firm characteristics like size, which is measured by the number of total assets and firm age, and other financial variables like debt on equity, profitability (measured as return on asset), and quick ratio.

Results. *With this investigation, we aim to understand how ESG can be incorporated into business strategies, as a neglected research area suggested by other studies (Makridou et al., 2023) and going beyond only financial value (Wong et al.,2020). Our preliminary results show that green innovation, measured by the adoption of green patents (Fabrizi et al., 2018) impacts a firm's ESG performance. This is consistent with the idea that companies that invest in sustainable technologies and eco-efficient production processes are better positioned to meet environmental and social expectations while improving governance structures. In addition, the cultural diversity of boards plays a moderating role in this relationship, reinforcing the positive effects of green innovation on ESG outcomes. Culturally diverse boards may contribute to more comprehensive sustainability strategies by integrating a broader range of perspectives, improving risk assessment, and fostering long-term value creation.*

Research limitations. *While this study provides insights, it is subject to certain limitations. First, our sample is restricted to European companies, which may limit the generalizability of our findings to other geographical contexts with different regulatory frameworks and corporate governance structures. Future research could extend the analysis to a broader set of countries to enhance external validity.*

Second, our analysis focuses on a specific time period, which, while justified, may not fully capture long-term trends or the evolving dynamics of corporate sustainability practices. Expanding the temporal scope in future research could offer a more comprehensive perspective on these developments. Additionally, we acknowledge that this period includes the disruptive impact of the COVID-19 pandemic. Future studies could account for this impact to better isolate its effects on the observed relationships.

Third, our measure of green innovation relies on the OECD database patents as the primary indicator of firms' environmental innovation efforts. While patents are widely used as a proxy for innovation, they may not capture all forms of sustainability-driven technological advancements, such as process improvements or non-patented innovations. Future studies could complement this approach by incorporating alternative measures of corporate sustainability innovation. Although patents have some drawbacks as indicators of technological activity (not all inventions are patented, the incentives to patent differ according to the sector and market, protection systems vary across countries, etc.), their use as a measure of output of the inventive process has become standard in the literature (Griliches, 1990; Hall et al., 1986)

Finally, our analysis of board diversity focuses only on cultural aspects, potentially overlooking other dimensions that may influence sustainability-related decision-making. Moreover, we recognize that the variable from LSEG Refinitiv may not fully consider all possible aspects of cultural diversity. Future research could adopt a more holistic approach by integrating additional board attributes that overcome this issue.

Managerial implications. *From a managerial perspective, our preliminary findings highlight key implications. Corporate leaders should embrace board cultural diversity as a governance tool to enhance ESG performance, prioritizing diverse directors for broader sustainability perspectives. Also, green innovation should be integrated into a long-term strategy, not just compliance. Aligning governance with ESG objectives fosters sustainability, financial resilience, and stakeholder trust. Policymakers can leverage these insights to promote diversity-driven governance supporting green innovation.*

This study advances our understanding of governance mechanisms for corporate sustainability. It shows how board diversity and innovation drive responsible and competitive business practices and offers valuable insights for policymakers and leaders aiming to strengthen ESG performance.

Originality of the paper. *The preliminary findings of this study and the unique combination of variables-green innovation, the individual and composite ESG pillars, and the moderating role of board cultural diversity-position it as an original contribution to the literature. Specifically, this study builds upon and extends the work of Bazel-Shoham et al. (2024) by introducing green innovation as a key driver of ESG performance and assessing how board cultural diversity moderates this relationship. Unlike previous studies that often treat ESG as a single aggregated measure, our research*

takes a more granular approach by analysing each ESG pillar (Environmental, Social, and Governance) separately. This allows for a more nuanced understanding of how green innovation influences different dimensions of sustainability and how governance structures shape these dynamics.

Moreover, we employ a characteristic of the board that has had less attention and is the cultural background of directors (Harjoto et al., 2019; Khatib et al., 2021). By incorporating board cultural diversity as a moderating factor, this study sheds light on how diverse cultural perspectives within corporate boards can shape strategic decision-making, risk assessment, and sustainability orientation. Given that cultural diversity influences cognitive perspectives, problem-solving approaches, and strategic priorities, our research offers fresh insights into facilitating or constraining green innovation's impact on ESG performance.

Keywords: *ESG performance; sustainability; green innovation; governance; board cultural diversity.*

Understanding the Interplay Between ESG Performance and ESG Controversies: A Quadrant-Based Framework

EMILIA FILIPPI[1] ALICE ALOSI[2]

Abstract

This study examines the complex relationship between Environmental, Social, and Governance (ESG) performance and ESG controversies, focusing on U.S.-based firms. It explores how companies can enhance their ESG performance while managing the reputational risks associated with ESG-related controversies. The research utilizes data from LSEG Data & Analytics to analyse the role of corporate governance (i.e., larger boards, presence of independent directors, women directors, and a CSR committee), firm size, age, profitability, and industry in shaping a company's ability to effectively navigate ESG issues. Findings shows that the characteristics of company's corporate governance, company's size, age, and profitability improve the ability to achieve high ESG performance and effectively manage ESG controversies. Instead, operating in a controversial industry does not exert an effect. The study contributes to both managerial practices and theoretical understanding of corporate sustainability, suggesting avenues for future research to further explore the single dimensions of ESG and the broader global context.

Framing of the research. *In academic literature, Corporate Social Responsibility (CSR) is often viewed as a broad framework that includes various initiatives aimed at meeting the different expectations of stakeholders, which range from environmental protection to social welfare and shareholder returns (Erhemjamts and Huang, 2019). Proactive actions aimed at environmental protection and improving society can enhance a company's reputation, thus strengthening its position among a broad range of stakeholders, including consumers, investors, and the broader community (Weston and Nnadi, 2023; Wu et al., 2023).*

Recently, the concept of Environmental, Social, and Governance (ESG) has emerged as a more concise way to represent the key aspects of CSR (Tsang et al., 2022). ESG factors have increasingly become a key focus for investors, regulators, and stakeholders in evaluating the long-term sustainability and ethical practices of companies (Duque-Grisales and Aguilera-Caracuel, 2021; Weston and Nnadi, 2023). These factors cover a wide range of issues, from environmental sustainability and reducing carbon footprints to social responsibility and ethical governance (Tsang et al., 2022). Integrating ESG practices into business strategies is often seen as a way to gain a sustainable competitive edge, enhance a company's reputation with stakeholders, and create long-term value (Wu et al., 2023; Wang et al., 2024). ESG practices encompass both tangible actions and public communication, such as ESG performance and disclosure (Wang et al., 2024). ESG performance, as a strong commitment to an ESG strategy, is positively linked to firm value (Tampakoudis and Anagnostopoulou, 2020). For instance, actions like improving information quality and fostering stakeholder engagement, while costly in the short term, can prove beneficial in the long run by reducing corporate controversies (Wang and Sarkis, 2017).

The increasing focus on ESG has led to increased ESG-related controversies (Nirino et al., 2021; Wu et al., 2023). ESG-related controversies span a broad spectrum, from environmental disasters like toxic waste spills to irresponsible social practices, such as human rights violations, and corporate governance misconduct, including accounting frauds. ESG controversies can severely damage a firm's reputation and financial performance. Financially, ESG controversies often lead to lower firm value (Wu et al., 2023), higher stock price volatility (Ilhan et al., 2023), increased costs of capital (Rau and Yu, 2023), and reduced market share (Islam et al., 2021). Non-financial impacts include a loss of consumer trust, brand devaluation (Klein and Dawar, 2004), and heightened regulatory scrutiny (Gillan et al., 2021). Additionally, such controversies can harm stakeholder relationships and hinder a firm's ability to attract and retain talent (Singh and Misra, 2021). Legal consequences and activism from stakeholders can also emerge, complicating a company's operational environment (Al-Hiyari, 2024). The visibility of a company amplifies the repercussions of ESG-related controversies, making it more vulnerable to reputational damage and loss of stakeholder trust (Aouadi and Marsat 2018). In conclusion, addressing ESG controversies is critical for firms to protect both their financial standing and long-term strategic success.

These controversies tarnish a firm's reputation and raise questions about the efficacy of ESG performance in capturing the true ethical and sustainable nature of business operations (Chatterji et al., 2016). Moreover, such

DOI 10.7433/SRECP.SP.2025.01

controversies can trigger legal repercussions and stakeholder activism, further complicating the firm's operational landscape (Freudenreich et al., 2020). The paradoxical relationship between ESG performance and ESG controversies underscores the complexity of effectively implementing ESG initiatives (Busch et al., 2016). For instance, according to Nirino et al. (2021), ESG controversies reduce firms' financial and non-financial performance while ESG performance does not have a positive moderating effect, despite being important for satisfying stakeholders' needs. Similarly, Keidann Soschinski et al. (2024) found that ESG practices are essential to meet stakeholders' needs but are not enough to mitigate the negative impact of ESG controversies. Instead, higher ESG performance and lower ESG controversies scores reduce the cost of debt capital (Hampl and Linnertová, 2024).

This complexity calls for a more nuanced understanding of how ESG issues are managed, reported, and integrated with a firm's broader strategic objectives (Chou et al., 2023).

Purpose of the paper. *Given that ESG performance enhances firm value and overall performance, while ESG controversies diminish them (Keidann Soschinski et al., 2024), we believe that companies should strive to improve their ESG performance while simultaneously reducing and managing ESG controversies. Hampl and Linnertová (2024, p. 1742) underline how "the most controversial companies with the lowest ESG controversies score can benefit an increase in ESG performance […] as ESG performance alleviates the consequences of their bad reputation". Specifically, companies should enhance ESG practices and avoid ESG controversies to benefit reduced cost of debt capital (Hampl and Linnertová, 2024). The primary objective of this study is, therefore, to understand how companies vary in their ability to enhance ESG performance and manage ESG controversies.*

The existing literature discusses how factors such as corporate governance, firm size, firm age, economic and financial conditions, and the industry in which a company operates influence its ability to achieve high ESG performance and manage ESG controversies effectively. Specifically, good governance plays a crucial role in the ESG framework, acting as a safeguard against ethical lapses that could result in ESG controversies. For instance, a diverse board is more likely to consider a wider range of stakeholder interests, thereby reducing the likelihood of ESG-related issues (Freeman et al., 2018). Firms with diverse board characteristics, such as gender diversity, independent board members, and board size, are better positioned to make quick and informed decisions, allowing them to take corrective actions swiftly (Bagh et al., 2023; Dong et al., 2023). For example, an independent board brings specialised knowledge and networks relevant to ESG issues and is more committed to addressing stakeholders' expectations, alleviating conflicts of interest among stakeholders (Endrikat et al., 2021; Abdullah et al., 2024). At the same time, an independent board is more willing to replace management or revise strategies that led to the ESG controversy, signaling to the market and stakeholders that corrective steps are being taken (Zattoni et al., 2023). The presence of women directors enhances the board of directors' awareness of ESG issues and its ability to address stakeholders' needs (Shahbaz et al., 2020; Cabral & Sasidharan, 2021). This increased awareness ensures that ESG issues are better integrated into firm strategies, while mitigating the risk of misconducts (Galbreath, 2011; Arayakarnkul et al., 2022). Women directors are more sensitive to the adverse consequences of ESG controversies (Issa and Hanaysha, 2023). Finally, the CSR committee ensures that the ESG goals outlined in the corporate strategy are met and that commitments to stakeholders are fulfilled (García-Sánchez et al., 2021; Moreno-Ureba et al., 2022). Firms with a CSR committee show fewer ESG controversies (Elmaghrabi, 2021). Previous literature also shows that larger and older firms are more likely to address ESG issues and present greater capacity for stakeholder engagement due to increased stakeholder pressure (Biswas et al., 2018; Orazalin, 2020). Firms with higher profitability present higher financial ability to invest in ESG activities (Ananzeh et al., 2022; Zhang et al., 2018). Finally, previous research indicates that companies in controversial industries may be less inclined to adopt CSR as a genuine long-term strategy and are more likely to encounter legal ESG challenges compared to those in non-controversial sectors (Eriandani and Wijaya, 2021).

Considering the discussions in the existing literature, the objective of this study is to understand how contextual factors (e.g., corporate governance, firm size, firm age, economic and financial conditions, and industry) influence a company's ability to achieve high ESG performance and effectively manage ESG controversies.

Methodology.

***Data**. This study uses data obtained from LSEG Data & Analytics, previously known as Refinitiv Eikon Datastream, a prominent database focused on social, environmental, and corporate governance. It is widely utilized by professional investors and academic researchers (Giannarakis et al., 2023). LSEG Data & Analytics provides information on over 15,500 public and private companies worldwide, covering more than 90% of global market capitalization, with data records dating back to 2002 (LSEG Data & Analytics, 2023). The database is recognized as the largest and comparable resource for CSR-related data (Uyar et al., 2020). The CSR data are sourced from publicly available materials such as CSR reports, annual reports, company websites, stock exchange filings, and media outlets (LSEG Data & Analytics, 2023), and are widely regarded as transparent, accurate, and comparable (Giannarakis et al., 2023).*

Our dataset is unbalanced, containing data from 2,874 U.S. firms, with a total of 15,992 firm-year observations covering the period from 2014 to 2023. We focused on the United States since the Refinitiv database includes listed firms from different countries and the coverage of ESG engagement and controversy data vary across countries. Therefore, following Kotzian (2024), we decided to select U.S. firms to ensure a consistent and large dataset[3].

[3] On the contrary, the analysis of the sample of Italian firms presents some limitations, mainly due to the small sample size over the considered time period; therefore, the authors decided not to focus the analysis on this country.

***Method**. To understand how contextual factors (e.g., corporate governance, firm size, firm age, economic and financial conditions, and industry) influence a company's ability to achieve high ESG performance and effectively manage ESG controversies, we performed an ordered logistic regression, a type of logistic regression where the dependent variable is categorical and ordered into more than two categories (Fullerton, 2009).*

***Variables**. In this analysis, the dependent variable "ESG profile" is a categorical variable that assesses both ESG performance and ESG controversy levels. It classifies companies into four categories based on whether their ESG performance level at time t and ESG controversy level at time t-1 are high or low. Specifically:*

- *ESG Leader, Controversy-Free. These companies stand out for their strong ESG performance, coupled with effective management of reputational risks. They implement advanced sustainability, social responsibility, and governance strategies while minimizing controversies. This profile is typical of companies considered ESG benchmarks, with a well-established and widely recognized positive impact.*
- *ESG Leader, Reputationally Challenged. This category includes companies that achieve high ESG performance levels but frequently face controversies or criticism. This may stem from the adoption of innovative yet contentious ESG strategies, operations in high-impact sectors, or challenges in balancing the interests of diverse stakeholders. These companies may be seen as both pioneers of the ESG transition and entities facing reputational risks.*
- *Controversy-Free, Low ESG Performer. Companies in this category maintain a cautious ESG profile, avoiding scandals and controversies but without implementing ambitious sustainability, governance, or social responsibility strategies. While they are perceived as reputationally stable, their contribution to ESG innovation and progress remains limited.*
- *Reputationally Challenged, Low ESG Performer. Companies in this category face a dual challenge: low ESG performance and frequent exposure to controversies related to environmental, social, or governance issues. This profile suggests inadequate ESG risk management, potentially leading to negative impacts on reputation, investor confidence, and the company's long-term sustainability.*

In this analysis, the dependent variables include "Board size", "Independent directors", "Women directors", "CSR committee", "Firm size", "Firm age", "ROA", "Leverage", "Controversial industry".

Tab. 1 provides a description of dependent and independent variables.

Tab. 1: Description of dependent and independent variables

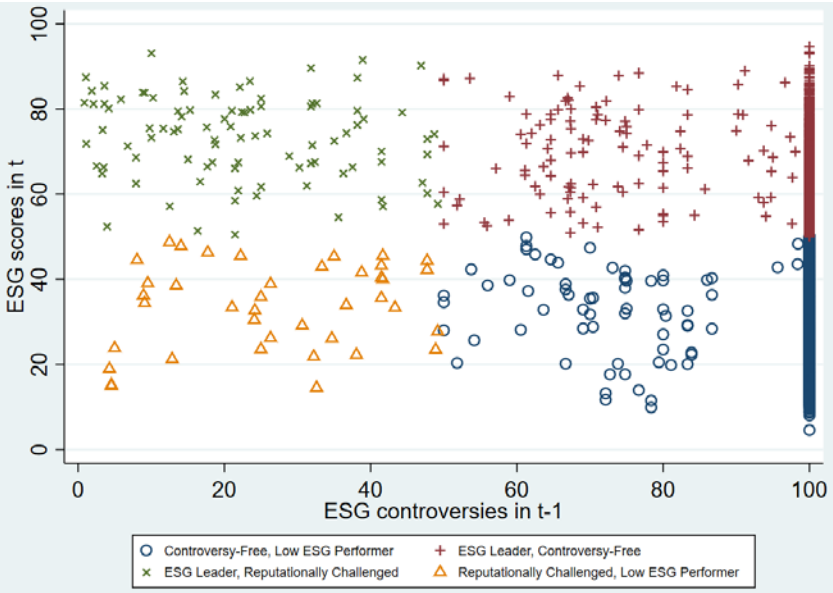
Variable	Definition	Source
Dependent variable		
ESG profile	Categorical variable that assesses both ESG performance and ESG controversy levels. It classifies companies into four categories based on whether their ESG performance and controversy levels are high or low. Specifically: 1) ESG Leader, Controversy-Free; 2) ESG Leader, Reputationally Challenged; 3) Controversy-Free, Low ESG Performer; 4) Reputationally Challenged, Low ESG Performer	Our elaboration
Independent variables		
Board size	Logarithm of the total number of directors	Refinitiv
Independent directors	Percentage of independent directors	Refinitiv
Women directors	Percentage of women directors	Refinitiv
CSR committee	Dummy variable equal to 1 if the firm has a CSR committee, and 0 otherwise	
Firm size	Logarithm of total assets	Refinitiv
Firm age	Logarithm of years since firm foundation	Refinitiv
ROA	Return on assets, defined as the ratio of net income on total assets	Refinitiv
Leverage	Ratio of debt to total assets	Refinitiv
Controversial industry	Dummy variable equal to 1 if the firm belongs to a controversial industry, and 0 otherwise	Our elaboration

Results.

***Descriptive statistics**. The descriptive statistics (Tab. 2) show that the category "Controversy-Free, Low ESG Performer" is the largest one (66.239% of companies are classified in this category), followed by the category "ESG Leader, Controversy-Free" (27.414%). Few companies are classified as "Reputationally Challenged, Low ESG Performer" (2.057%) or "ESG Leader, Controversy-Free" (27.414%).*

The correlation matrix (Tab. 3) shows acceptable correlation indexes between the variables (Greene, 2003).

Tab. 2: Descriptive statistics



Variable	Mean	Stand. dev.	Min	Max
Reputationally Challenged, Low ESG Performer	2.057%	0.142	0	1
Controversy-Free, Low ESG Performer	66.239%	0.473	0	1
ESG Leader, Reputationally Challenged	4.290%	0.203	0	1
ESG Leader, Controversy-Free	27.414%	0.446	0	1
Board size	2.211	0.270	0	4.779
Independent directors	0.780	0.120	0	1
Women directors	0.209	0.117	0	1
CSR committee	0.367	0.482	0	1

A scatterplot showing the distribution of ESG profiles (i.e., the distribution of companies based on whether their ESG performance level in 2022 and ESG controversy level in 2021) is presented in Fig. 1. In 2022, companies appear to be more evenly distributed across the various ESG profile categories compared to the distribution observed over the entire analysis period (2014-2023; see Tab. 2). This suggests a shift towards a more balanced ESG landscape, potentially driven by increased investor scrutiny or a broader corporate commitment to sustainability principles.

Fig. 1: Scatterplot showing the distribution of companies based on ESG profiles (year: 2022)

As shown in Tab. 4, the characteristics of company's corporate governance (i.e., larger boards, presence of independent directors, women directors, and a CSR committee) play a positive and significant effect in improving a company's ability to achieve high ESG performance and effectively manage ESG controversies. This result is in line with previous literature according to which firms with diverse board characteristics (e.g., gender diversity, independent board members, and board size) are better positioned to make informed EGS decisions (Bagh et al., 2023; Dong et al., 2023). Specifically, independent directors bring specialised knowledge relevant to ESG issues and are more willing to replace management or revise strategies that led to the ESG controversy (Endrikat et al., 2021; Zattoni et al., 2023; Abdullah et al., 2024). Women directors enhance awareness of ESG issues and assure that ESG issues are better integrated into firm strategies, mitigating the risk of misconducts (Arayakarnkul et al., 2022). Finally, the CSR committee ensures that the ESG goals are met and play a key role in reducing ESG controversies (Elmaghrabi, 2021; Moreno-Ureba et al., 2022).

Firm size, firm age, and firm profitability positively affect the ability to achieve high ESG performance and effectively manage ESG controversies, in line with previous literature according to which larger and older firms are more likely to address ESG issues (Biswas et al., 2018; Orazalin, 2020), while higher profitable firms present higher financial ability to invest in ESG activities (Ananzeh et al., 2022; Zhang et al., 2018).

Finally, operating in a controversial industry does not influence a company's ability to achieve high ESG performance and effectively manage ESG controversies. This result contrasts with previous literature according to which operating in a controversial industry affects ESG strategies and behaviors (Eriandani and Wijaya, 2021).

Research limitations. *The study primarily focuses on U.S.-based firms, which may limit the generalizability of the findings to companies in other regions with different regulatory environments, cultural contexts, and stakeholder expectations. Future research could expand the scope to include firms from diverse geographical areas to provide a more global perspective.*

Moreover, the study mainly addresses ESG performance and controversies, potentially overlooking specific dimensions of ESG, such as environmental, social, and governance factors (e.g., resource use, emissions, workforce conditions, and community impact). The lack of detailed data on ESG controversies prevented an in-depth exploration of these individual dimensions. Future research could replicate the analysis focusing on the single dimensions of ESG.

Additionally, the study relies on data from publicly traded firms, which may not reflect the practices of private companies or startups. These entities may approach ESG performance differently due to variations in transparency, resource availability, and external pressures. Furthermore, the visibility of public companies may amplify the repercussions of ESG-related controversies. Future research could understand if and how publicly traded firms and non-traded firms differently manage the balance between ESG performance and ESG controversies.

Managerial implications. *The findings of this study offer valuable insights for firms seeking to enhance their company's ESG performance while mitigating the risks of ESG controversies. The results emphasize the importance of implementing robust ESG strategies that align with stakeholder expectations, alongside effective mechanisms for managing reputational risks. Specifically, the study suggests that companies can benefit from integrating diverse board characteristics (e.g., larger boards, presence of independent directors, women directors, and a CSR committee) and strong corporate governance practices, which enhance decision-making and help prevent ESG controversies. Firms should focus on balancing ambitious sustainability goals with transparent communication and stakeholder engagement to avoid controversies that could undermine long-term value.*

Additionally, our results show that operating in a controversial industry does not influence a company's ability to achieve high ESG performance and effectively manage ESG controversies. This suggests that achieving strong ESG performance by minimizing ESG controversies is a desirable approach, regardless of the industry in which a company

operates or the external pressures it faces. To this end, companies should proactively integrate sustainable practices, enhance transparency, and adopt robust governance frameworks to mitigate risks and strengthen stakeholder trust.

Originality of the paper. *This paper contributes to the theoretical understanding of ESG by shedding light on the management between high ESG performance and the occurrence of ESG-related controversies. It challenges the conventional view that improving ESG performance inherently reduces reputational risks, illustrating instead the complex interplay between ESG initiatives and the potential for negative public perception. The study introduces a novel framework for categorizing firms based on their ESG profiles, which provides a deeper understanding of how companies can balance performance and controversy. Furthermore, it extends existing literature by examining the role of contextual factors, such as corporate governance (i.e., larger boards, presence of independent directors, women directors, and a CSR committee) and firm characteristics (i.e., operating in a controversial industry), in shaping the ability of firms to manage ESG challenges. These insights offer a more nuanced perspective on ESG management and contribute to the ongoing development of theories related to corporate social responsibility and sustainability.*

Key words: *ESG performance; ESG controversies; Quadrant-based framework; Board characteristics; Controversial industry; Quantitative analysis.*

Corporate purpose and sustainability: Do SDGs references in Purpose statements influence ESG performance?

LUCIA BARRA[1] ADELE PARMENTOLA[2] MICHELE COSTAGLIOLA DI FIORE[3]

Abstract

Sustainability has become a global priority, with the United Nations' Sustainable Development Goals (SDGs) providing a strategic framework to address societal grand challenges. The UN Agenda 2030 represents a "call to action" for companies that are recognized as pivotal agents for societal transformation and the achievement of sustainable development. Companies are called to embed sustainability values within their core strategies and daily operations and to disseminate a culture of sustainability among all their stakeholders. Consequently, many companies incorporate the SDGs into their purpose statements, indicating alignment with global sustainability initiatives. Nevertheless, there is a paucity of evidence to suggest that these references result in quantifiable enhancements in corporate sustainability performance. While corporate purpose is widely acknowledged for its guidance and communicative roles, empirical research linking SDG references to tangible environmental, social, and governance (ESG) performance is scarce. This study addresses this gap by empirically examining the relationship between SDG references in corporate purpose statements and their ESG performance. The findings reveal a significant and positive relationship between the presence of references to global goals in corporate manifestos and companies' higher ESG metrics, suggesting that their integration is not just a rhetorical action but a pragmatic strategy that positively affects organizational performance related to sustainability outcomes. In addition, a controversial result was found as companies in countries with higher SDG ratings reported lower ESG scores. This study advances the field of corporate sustainability and strategic management, providing practical recommendations for managers and policymakers to align business purpose with organizational performance in the context of sustainable development goals.

Framing of the research. *Since the last decade, corporate purpose has re-emerged as a strategic framework to help organizations address sustainability challenges while aligning social responsibility with financial and economic goals (Sasaki et al., 2023; Sasaki et al., 2024). While there is no agreed-upon definition, modern management scholars have generally defined corporate purpose as a firm's ultimate goal beyond profit maximization (Henderson et al., 2015; Mayer, 2021; Jimenez et al., 2021; Gartenberg, 2023). Purpose has been described as the heart of an organization, the reason for its existence, which is rooted in its authenticity and core values (George et al.,2021). It reflects the organization's long-term vision of creating value for all its stakeholders - including employees, customers, communities, and the environment - rather than narrowly focusing on shareholders' interests (Freeman, 1984., Freeman et al., 2004). The organizational purpose is the driving force behind shared value creation (Porter and Kramer 2011) which means that firms solve societal issues - like climate change and equality- through new business strategies that create both financial and social results. It plays a decisive role in shaping corporate strategy and decision-making processes, helping organizations to harmonize their operations with overall social and environmental goals. (Kaplan S.,2023). Beyond strategic alignment, corporate purpose significantly influences employee behavior by fostering a sense of responsibility and commitment to the organization's overarching mission. A well-structured corporate purpose acts as a performance driver, motivating employees to exceed expectations and contribute to long-term success (van Tuin et al., 2020). Furthermore, a clear and explicit purpose can help attract, select, and retain highly motivated employees (Delaney & Royal, 2017), strengthen stakeholder relationships, and enhance trust and long-term value creation (Henisz, 2023). As a consequence of the numerous advantages that the articulation of corporate purpose offers, it can be argued that it is more than a theoretical concept: it marks the start of the events and has extensive practical implications for the wider society and its members.*

In this context, Hollensbe et al. (2014) stated that purpose acts as an ethical and moral compass that directs strategic decisions and aligns the firm's operations with its social mission. Due to this intimate moral connotation, Gartenberg (2022) argued that corporate purpose is often explicitly prosocial and intrinsically related to business sustainability, asserting that "Purpose requires sustainability and vice-versa". The relationship between corporate purpose and

business sustainability may be mutually reinforcing, with consequences for leadership roles, behavior influence, and goal determination (Florez-Jimenez et al., 2024; Florez-Jimenez et al., 2025; Pardo-Jaramillo et al., 2025). The 2030 Agenda and the achievement of the SDGs have further strengthened the link between these two elements, making a genuine alignment between stated goals and operational strategies essential.

To effectively implement the corporate purpose in business strategy, it must be clearly articulated, explicitly communicated to all stakeholders (Gartenberg et al., 2019), and, most importantly, translated into tangible actions (Lleo et al., 2021). To encourage the adoption of responsible behaviors, it has to act as a guideline that promotes the diffusion of a culture of sustainability at every level (Jimenez et al., 2021), ensuring environmental and social commitments become part of daily operations rather than symbolic expressions. Corporate Purpose and the SDGs are closely connected, with the former defining values and direction and the latter providing measurable targets to evaluate progress in sustainable development. Thus, integrating the SDGs within the corporate purpose ensures that the company is seen as a force for good by reimagining its role in the future of sustainable workplaces and societies (Jimenez et al., 2021). While some firms are making meaningful internal changes to address the achievement of Sustainable Development Goals, others seem to exploit their commercial potential to enhance public perception (Nicolò et al., 2022). This suggests instances of sustainability-washing, where companies use sustainability narratives as a public relations tool rather than a genuine commitment to change (Mhlanga et al., 2018). As stakeholders demand greater transparency and authenticity, discrepancies between corporate rhetoric and real sustainable commitment can negatively affect reputation, investments, sales, and the working environment.

The possibility that companies integrate sustainability issues into their corporate purpose to improve their reputation and competitive advantage, has raised debates in the literature regarding the authenticity of their statements. Several scholars have explored the use in sustainability disclosure (Macellari et al., 2021, Saizarbitoria et al., 2022, Arena et al.,2023) concluding that some companies use communication tools - as mission and vision statements - only to fulfill stakeholders' expectations and not truly to implement a substantial change in corporate strategies. For instance, Van der Waal and Thijssens (2020) qualitatively analyzed the disclosure practices of the 30 organizations identified as the most comprehensive SDG reporters. Their findings revealed that these groups engaged superficially with a generic description of the goals, no concrete activities were performed, and no measurement or operationalization of the SDGs was achieved. Similarly, Macellari et al. (2021) conducted a content analysis of a sample of sustainability reports published by 28 organizations included in the UN Global Compact LEAD. These organizations are widely considered leaders in SDG issues and reporting practices; however, a discrepancy between information reported and information from external sources was found. Some other authors emphasize the employment of impression management techniques suggesting the instrumentalization of SDGs as a public relations tool. (Mhlanga et al., 2018).

Purpose of the paper. *The extent to which integrating the Sustainable Development Goals (SDGs) into corporate purpose statements represents a genuine commitment to sustainability rather than a rhetorical strategy for enhancing public image remains an open question. While some companies embed sustainability into their core strategies, others adopt only superficial measures, making it difficult to assess the true impact of SDG integration on corporate sustainability performance. Despite the increasing prevalence of SDG discourse for corporate purposes, existing research remains largely conceptual or illustrative (Mayer, 2023). While some studies acknowledge the divergence between sustainability rhetoric and actual performance, the literature lacks systematic, large-scale empirical analyses assessing whether SDG commitments translate into measurable ESG outcomes. Most prior research has focused on corporate sustainability narratives, disclosure practices, or motivations for SDG adoption, but few studies have rigorously examined whether these commitments yield tangible improvements in corporate sustainability performance. This gap is particularly critical given the rising pressure on corporations to demonstrate accountability and social impact, as well as the growing skepticism about the authenticity of corporate sustainability claims.*

To address this gap, this study examines the relationship between SDG references in corporate purpose statements and measurable sustainability performance. Specifically, it seeks to answer the following research question:

RQ: How does incorporating the Sustainable Development Goals (SDGs) into corporate purpose statements influence corporate sustainability performance?

Methodology. *To address our research question, a quantitative analysis was employed. Specifically, a weighted linear regression (WLS) on a comprehensive sample of 340 European manufacturing companies was applied using R statistics software. The manufacturing sector was chosen due to its extensive engagement in industrial operations. This industry is essential to sustainable development since it supports societal advancement, creates jobs, and boosts economic growth. Furthermore, its significant energy, water, and material consumption makes it extremely pertinent to environmental issues (Ahmad et al., 2023). To identify corporate purpose, the mission statements of the firms were analyzed, as these are widely recognized in academic literature as formalized expressions of an organization's purpose. Since mission statements are "explicit expressions of an organization's overarching purpose, goals, and core values" (Bartkus et al., 2006), they were considered a suitable proxy for evaluating corporate purpose in the context of this study (Aljebrini et al., 2025)*

To ensure a structured approach to assessing the relationship between references to the SDGs in corporate mission statements and ESG performance, in the regression model, the chosen variables were classified as follows:

***1) Independent Variable**: A quantitative content analysis was employed to assess the presence of SDGs references in companies' manifestos. Quantitative content analysis is a research method that involves the systematic categorization and recording of features within a text, to facilitate subsequent analysis. This method provides numerical descriptors of a single text or, more commonly, a corpus of texts (Coe and Scasso,2017), and it's frequently utilized in the context of analyzing mission statements (Kemp and Dwyer, 2003; Bartkus et al., 2004; 2006; Dermol, 2012). Firms' purpose statements were identified from their official websites exploring the sections: "Mission," "About us," "Our History," and "Our Philosophy". When unavailable, the information were retrieved from verified social media profiles (e.g., LinkedIn). To detect SDGs citations, it was used a collection of about 847 keywords created by the Sustainable Development Solutions Network (SDSN). This list is based on authoritative and diverse sources, including United Nations documents, targeted Google searches, and direct personal communication (SDSN Australia, New Zealand and Pacific, 2017). The employment of NVivo Software facilitated the organization, coding, and analysis of the textual data. In this context, to assess the presence or the absence of SDG goals in the corporate purpose statement, we used binary values. Specifically, the value "1" was assigned if the reference to at least one SDGs was present, while the value "0" was assigned if such SDGs were absent.*

***2) Dependent Variable:** To measure companies' commitment to sustainability the ESG (Environmental, Social, and Governance) score of Refinitiv Eikon's was selected. This score is an aggregate value that measures a company's ability to implement sustainability-oriented, providing a holistic measure of its alignment with Sustainable Development Goals. The metric system is based on a scale ranging from A to D, with values ranging from 0 to 100, to assign a company score. Companies with an A to B score, or between 50 and 100 in numerical terms, demonstrate a strong organizational commitment to sustainability issues. This includes ethical and sustainable business practices, socially responsible initiatives, and management structures that support these goals. Conversely, scores between C to D, or between 0-50 in numerical terms, are attributed to companies with little involvement in sustainable issues and, therefore, a lack of implementation of sustainability principles at the heart of organizational processes.*

***3) Control Variables:** To account for external influences, the SDG index (Sachs et al., 2019) was included as a control variable. The index was developed in 2016 by SDSN to evaluate the progress of different countries over time in achieving the Sustainable Development Goals (SDGs). It serves as a tool to guide public policies and encourage more sustainable behaviors. Moreover, it may have both direct and indirect effects on corporate sustainability performance. Additionally, company size, measured by the number of employees gathered from "the ORBIS" database, was used as a second control variable. As larger companies often have better infrastructure, advanced technology, and more financial resources to invest in sustainability projects, this metric was used to prevent the result from being biased by factors related to the companies' dimensions.*

Tab. 1: Description and operationalization of variables

Variable	Code	Variable description	Operationalization
Independent variable	***SDG_Presence***	Captures the presence of references to the Sustainable Development Goals (SDGs) in firms' mission statements.	Binary variable: "1" if SDG references are present in the mission statement, "0" if not.
Dependent Variable	***ESG_Score***	Measures corporate commitment to sustainability, focusing on environmental performance, social responsibility, and governance practices.	ESG Scores range from A to D, with A-B indicating high sustainability performance and C-D indicating marginal engagement. Numerical values between 50 and 100 were assigned to A-B companies. Numerical values between 0-50 were assigned to C-D companies.
Control Variables	***SDG_index***	Reflects the environmental, social, and governance context of the country where the company operates.	SDG_index at the country level accounts for sustainability-related regulations, policies, and cultural values. Controls for the influence of external contextual factors on firms' environmental performance.
	Num_Emp	Proxy for firm size, as larger firms often have more resources and face greater scrutiny when adopting sustainable practices.	Measured by the number of employees. Controls for the effect of operational scale on environmental performance, ensuring focus on the specific impact of SDG integration in mission statements.

Source: Authors elaboration

Results. *Our findings reveal a significant positive relationship between references to the Sustainable Development Goals (SDGs) in company purpose statements and the Environmental, Social, and Governance (ESG) scores of the firms. Specifically, for every one-unit increase in SDG mentioned in the purpose statement, the ESG score rises by 0.694 when other variables - SDG Index and Company Size - are controlled for. The statistical significance of the relationship is also underlined by the p-value associated with the coefficient of the variable SDG presence, well below the conventionally established threshold (p=0.05). This result allows us to conclude that companies incorporating SDG references in purpose statements tend to perform better in sustainability metrics. Additionally, the variable "company's size" was found to have a positive and significant impact on ESG score, suggesting that larger firms (based on employee number) tend to achieve better sustainability outcomes. Even though the effect of "size" is modest, it underscores the critical role of a firm's dimension in shaping ESG performance. An interesting result was found between the variable SDG Index and the ESG score of the analyzed companies. In particular, a significantly inverse relationship between the two variables*

was found, that means a one-unit increase in a country's SDG Index was linked to an average decline of 1.111 in company ESG scores, suggesting that a higher national SDG ranking does not necessarily translate to better corporate sustainability performance. The overall model fit is strong, with an R-squared value of 0.9949 and an adjusted R-squared of 0.9948, indicating that the included variables explain nearly 100% of the variation in ESG scores. The F-statistics (2.175e+04, p < 2.2e-16) confirms the model's overall significance and its ability to accurately explain the observed relationships. Furthermore, the residual standard error (0.999, with 336 degrees of freedom) suggests minimal deviation between observed and predicted ESG scores, further validating the model's reliability.

R statistics software

Research limitations. *Although the study contributes to advancing the research field, it has limitations. First of all, the study uses the ESG score as a primary indicator of sustainability performance. While ESG score offers a broad overview of a company's sustainability efforts, they may not fully capture the depth and scope of a company's commitment. The ESG indicator aggregates various dimensions of corporate sustainability, potentially overlooking specific initiatives or outcomes directly related to one of the three pillars. Additionally, the sample analysis is confined to European companies operating in the manufacturing sector. Due to this narrow focus, the generalizability of the findings could be affected. Future research might explore similarities across various industries or expand the study to other geographic areas. This would facilitate a more comprehensive understanding of the guidance role of corporate purpose in different sectors and would also reveal how global sustainability goals are adapted in different local contexts. Lastly, our findings indicate a negative correlation between national SDG commitments (as measured by the SDG Index) and companies' ESG scores. This raises important questions about macro-environmental factors and suggests the need for further investigation that might explore how different national policy frameworks, both regulatory and voluntary, influence corporate sustainability strategies.*

Managerial implications. *Our study offers policymakers and corporate managers practical insights that, if adopted, could potentially accomplish the achievement of Sustainable Development Goals (SDGs) and strengthen the role of firms in sustainable development.*

For corporate managers, our findings indicate that aligning corporate purpose with the 17 SDGs is not just an ethical responsibility but a strategic advantage. Companies that explicitly integrate SDGs into their mission statements tend to achieve higher Environmental, Social, and Governance (ESG) performance, strengthening their market positioning, investor confidence, and stakeholder trust. By embedding sustainability at the core of corporate strategy, firms can enhance resilience, drive long-term financial success, and gain competitive advantages in an increasingly sustainability-conscious global economy. For policymakers, the findings highlight the need for stronger regulatory frameworks that promote corporate accountability and transparency in sustainability commitments. Governments and regulatory bodies can foster authentic SDG integration by implementing stricter ESG disclosure requirements, incentivizing sustainable innovation, and developing standardized sustainability metrics. Additionally, public-private partnerships can bridge gaps between corporate initiatives and societal needs, ensuring that sustainability commitments translate into tangible progress. By creating a policy environment that encourages substantive corporate engagement with the SDGs, policymakers can drive systemic change and maximize the role of businesses in achieving sustainable development objectives.

Originality of the paper. *Current literature widely recognizes the role of corporate purpose as a critical driver of organizational behavior and strategic guide toward long-term value creation. While most studies have focused on its contribution to fostering stakeholder trust, organizational resilience, and the improvement of financial performances, less emphasis has been placed on how the explicit integration of SDGs within a company's "manifesto" can influence*

sustainability performance metrics. Our study aims to fill this gap by exploring the real effectiveness of mission statements as sustainability communication tools, and how the incorporation of the SDGs within them can shape strategic decision-making and operational priorities, leading to higher sustainability performance.

It provides empirical evidence that including references to the SDGs in companies' purpose statements can be an effective strategy for aligning business objectives with global sustainability priorities. It also reinforces the idea that purpose-driven organizations can play a central role in achieving Sustainable Development Goals by 2030.

Key words: *Corporate purpose; SDGs; ESG performance; manufacturing firms; Europe; WLS regression*

The Impact of Green Training on Workforce Behavior, Environmental Performance, and Reputation: A European Study

GIULIA ALESSANDRI[1] FABIO IANNONE[2] ANNAMARIA PESCI[3] TIBERIO DADDI[4]
FABIO IRALDO[5]

Abstract

The challenges of digitization, the green transition, and demographic trends in Europe have significantly impacted the labor market. In particular the request of green talent from the demand side has grown enormously, making mandatory to reskill and upskill the workforce to address the green skill gap. In this scenario employees' green training, a key element of Green Human Resource Management (GHRM), has become fundamental to align employers requests and employees working profile availability. This study examines the impact of green training for the existing workforce in the European business context, focusing on its influence on the green working climate and its mediating role in enhancing firms' environmental performance and green reputation, enabling organizations to anticipate green trends, driving the transition. The paper explores the role of green training through an online survey, focused on the agri-food, construction, manufacturing, wood and furniture industries, and public administration, strategic sectors within Europe. Findings indicate that green training positively contributes to fostering a green working climate within the surveyed European firms, reinforcing the importance of structured training programs in supporting sustainability-oriented business practices. Moreover the study indicates that green working climate positively impacts on firm environmental performance and green reputation.

Framing of the research. *The recent challenges imposed by digitization and green shift, as long with the European demographic trend, have impacted deeply different dimensions of society, including the labor market (Cedefop, 2024). The effect has been witnessed by drastic changes in terms of demand and offer of job opportunities, as well as the increase of the labor shortage (Innerhofer, Nasta and Zehrer, 2023) that has affected different European sectors. Moreover, the assessment of the impact of green transition on the labor market is made more difficult by the geographical distribution of workers (Vona, Marin and Consoli 2018; Dussaux, 2020), the dependence of countries 'GDP on high polluting industries, the classification used to define the concept of green jobs and the level of labor intensity of the industries majorly impacted by the transition (Causa et al., 2024). Between all these issues, what stands out is the general unalignment between employers' requests and employees working profile availability (Linkedin Report, 2023), along with the necessity to address the recurrent green skills gaps requests (Renfors, 2024) to satisfy the requirements imposed by the green transition. Moreover, the necessity to achieve the ambitious climate targets imposed by public institutions without compromise the general wellbeing and potentially expose the current workforce to vulnerability, makes mandatory to adequate the skills requests to the new policies (Borgonovi et al., 2023). Understanding the skills needed for reskilling and upskilling in low-emission economies is crucial for workforce redistribution (Draca et al., 2021). Equally important is assessing the gap between required and existing skills to determine reallocation costs (Gathmann and Schönberg, 2010; Kambourov and Manovskii, 2009). Redefining workers competences is essential for labor market resilience, reducing vulnerability to external forces and market fluctuations (Borgonovi et al., 2023). This requires considering job obsolescence, supply chain pollution levels (Vandeeplas et al., 2022), and sector-specific impacts. According to recent studies the request of green skills from the demand side has grown enormously (Nikoloski et al., 2024; Sulich and Soloducho, 2022) aligning with the policy makers objectives and following the trends imposed at European level by Agenda 2030, the Sustainable Development Goals (SDGs), the European Green Deal, the Fit for'55 directive, the Net Zero industry Act for decarbonization, and the revision of the Waste Framework Directive in 2024. Moreover, the requirements imposed by green transition will have a neutral or generally positive quantitative impact on the labor market (Business Europe 2021), even if some sectors would be dramatically impacted because of the increased*

DOI 10.7433/SRECP.SP.2025.01

sector mobility towards more "green friendly" ones. Despite this, it is difficult to define a worldwide general employment trend since labor market policies vary widely across countries (Chateau. Saint-Martin and Manfredi 2011). However, what stands out is that, despite the optimistic forecasting, there has been a significant misalignment between the demand for green skills from employers the availability of skilled workers over the last 5 years (Global Green Skills Report, 2022). Without this adjustment the gap between demand and offer of green talents is expected to grow globally even higher until the 101, 5% by 2050 (Ferrazza, 2025). Moreover, the adaptation process to the new requirements imposed by green transition is made even slower by the difficulty of the employees to acquire adequate expertise and knowledge to improve the level of sustainability of organization performances and products (Pinzone et al., 2019). For these reasons Green Human Resource Management (GHRM) plays an important role in supporting firms in the achievement of a green transition. GRHM has been analyzed, in the hospitality industry, through the lenses of Resource Based View (RBV) theory and Stakeholder theory, revealing a correlation with circular economy and consequently with green organizational culture, and internal and external resilience and witnessing its role in promoting long term firm sustainability (Elshaer et al., 2024). GHRM is associated to programs, techniques and processes that are implemented in the workforce tasks to reduce negative environmental impacts and achieve a better environmental performance (Arulrajah et al. 2015). This aim is reached thanks to the three major component of GHRM: selection and recruitment, training and development, compensation and rewards (Zihan et al., 2024). According to Jackson et. al. (2011), training and forming employees is a key component of GHRM especially in the middle of a change process, associated to green and digital transition, like the one Europe is currently facing.

Our analysis is focused on green training component based on the Human resources studies related to the AMO Framework (Marin-Garcia and Tomas, 2016), which shares a common foundation with GHRM (Vasquez Brust et. al., 2022). The AMO acronymous that stands for Ability, Motivation, Opportunity Theory originally developed by Bailey (1993), refers to the components that are considered essential to promote the high involvement and high-level performances of employees inside a firm. The first dimension, ability, is related to the owing of knowledge and skills that lead to the correct performing of a certain job. This can be enhanced by specific recruitment techniques and selection, development and formal training (Raidén et al., 2006). Green training can be defined as a type of training that is related to relevant environmental topics, which lead the staff to the integrations of firm's performance with environmental issues (Teixeira et al., 2016). It is also a process of continuous education that aims to increase employee's ability to acquire environmental sustainability knowledge and develop a spontaneous green behavior over time (Liu et al., 2020). The correlation between GHRM and firm environmental performances has already been deeply explored in academic South Asian literature (Ren et al. 2018). Wu et al., (2020) have highlighted that organization that adopt an Environmental management system obtain significant economic benefits. The ability to create an internal culture based on skilled and engaged people completely committed to the environmental cause and aligned with firms' main goals inevitably leads to an elevated environmental performance trough the promotion of shared green behavior (Sarfo et al., 2024).

Purpose of the paper. *The present study explores the impact of green training that involves current workforce, inside European business context, on green working climate (GWC) and the mediating role of this dimension in promoting better firms' environmental performances and better firms' green reputation addressing the needs imposed by green transition. The paper aims to assess the efficacy of green training in promoting the resilience of firms and help organization achieve better performance by anticipating the green trends and assuming a pivotal role in the promotion of the transition. The research focuses in particular on agri-food, construction, manufacturing, wood and furniture industries and Public administration, that are strategic sectors of the variegate European business tissue and that are targeted inside the survey used to gather data. Despite the evident necessity of green skills to perform a long-term transition and adaptation of traditional business both public institutions (OECD/CEDEFOP, 2024) and academic researches (Xie et al. 2020) have portraited a specific scenario of misalignment between demand and offer on the labor market that can be potentially fulfilled by green training. From an institutional perspective and considering existing research gaps, this paper examines whether green training, a key component of Green Human Resource Management (GHRM), enhances firm resilience by directly shaping the internal climate. As the primary beneficiaries of this process, employees contribute to a GWC, which serves as a mediating factor for firm performance and reputation. According to our hypothesis the paper aims to address the following questions:*

RQ1: How much green training influence firm's internal working climate fostering workforce green behavior?
RQ2: How much green working climate mediates the impact of green training on environmental performance of firms?
RQ3: How much green working climate mediates the impact of green training on green reputation of firms?

The research questions correspond to three major hypothesis, following detailed. The implementation of clean environmental strategy must be supported by an adequate green human resource management and consequently an important training system that can create an internal GWC and engagement (Cherian and Jacob, 2012). For this reason, the first hypothesis is: H1 Green training positive influences GWC.

A recent study (Sarfo et al., 2024) has shown a significant correlation between the adoption of GHRM practices and firm environmental performances. What stands out is that the acquirement of new knowledge and specific competences related to environmental sustainability topics can lead to an enchanted and higher competitiveness of the organization (Obaid, 2015). The ability to create an internal culture based on skilled and engaged people completely committed to the environmental cause and aligned with firms' main goals inevitably leads to an elevated environmental performance

through the promotion of shared green behavior (Sarfo et al., 2024). For this reason, the second hypothesis is: H2 GWC positive influences firms' environmental performance.

Practicing substantial environmental sustainability can lead to perform in a less impactful way on the environment but also acquire good reputation between different types of stakeholders and investors (Ervin et al., 2013) who care for the same values (Cable and Turban, 2003; Brammer and Pavellin, 2006; Yoo, 2021). The propensity of working for a company that follows the environmental sustainability principles and the support received by companies that adopt sustainable behaviors throughout the supply chain has been also confirmed by Merlin and Chen (2022) and by Marrucci, Daddi, and Iraldo, (2021), Daddi et. al (2019). An internal climate that is compatible with sustainability principles and a strong engagement and commitment of workforce to environmental sustainability leads to the perception of an external positive public esteem. Businesses' managers can make employers an active and proactive part in the external promotion of a sustainable behavior trough the idea of the green employers external branding (Sulich, 2021). The success in the implementation of green strategies depends on the internalization of the green principles by the employees who, if adequately involved, can assume a proactive behavior in the external promotion of the firm. These considerations provide the base for our third hypothesis: H3 GWC positive influences firms reputation

Methodology. *The data have been collected from a sample of European firms located in Bulgaria, Italy, Belgium, UK, Spain, Finland, coming from different strategic sectors (majorly manufacturing, construction, agri-food, wood and furniture, public administration). To achieve the maximum diffusion of the survey the selection of the respondents has been performed trough a non-probability sampling methodology, convenience sampling (Galloway, 2005), useful since the population is extremely big and really complex to be defined and reached (Etikan et al., 2016). The responses have been collected between May and August 2024. The items used in the survey have been measured with a 5-point Likert scale, ranging from 5=strongly agree to 1= strongly disagree. Two items have been also used to measure firms' green performance (S., Hadi et. al. 2023), focusing on environmental performance that are related to material use and waste management and that for this reason can be adapted to different industries, while four items have been used to assess firms' green reputation with different types of stakeholders throughout the entire value chain (Marrucci, Daddi, and Iraldo, 2021; Daddi et. al 2019). The explanatory variable is the dichotomic variable Green Training (GT) that ranges between 1, if the organizations are already performing green training activities and 0 if they are not doing them. To assess the presence of possible differences of GT effect, countries and industries have been also adopt as control variable. GWC acts both as a dependent variable when the relation with GT is assessed and also as a mediating variable for the relation with GP and GR. This study adopts it as the mediating variable since the direct impact that green training has on it and its ability to vehicle the indirect effect on GT on firm environmental performance's and reputation. The analysis has been performed trough the application of regression analysis, to measure the level and strength of the correlation between the application of green training programs inside the organizations and the results obtained in terms of green internal climate and then its moderating effect on performance and reputation. All the analysis as been performed using STATA software.*

Results. *The first hypothesis, that aim to verify if green training positive influence working climate, is verified. This result is particularly important since despite the numerous study that attribute a general positive influence of green training on employees' behavior, some studied have identified a possible negative impact due to the pressure created by the added overload created by the learning activity (Pinzone et al., 2019; Oppenauer and Van De Voorde, 2018; Topcic et al., 2015). The second and third hypothesis that aim to assess the mediating role of GWC - so if it can vehicle the positive effect of green training, associated majorly to personal behavior, to the organizational dimension trough the impact on environmental and reputational performance - are both verified. The extremely high value of R2 demonstrate an important representativeness of the models and of the analysis used. From the tests performed it is noticeable that green training is not only a key variable from an institutional of view (CEDEFOP, 2023; Business Europe, 2022) but represents also an important leverage spendable in the field of long-life learning to promote a readaptation of the working profile to the needs of the green transition. The implementation of a well-structured training program that addresses skill gaps at the European level will equip employees with the necessary abilities, knowledge, and competencies (Fernando et al., 2019), fostering personal development (Xie et al., 2020) and encouraging proactive behavior (Gusmerotti et al., 2023). This approach not only aligns with environmental trends but also promotes a mindset of eco-innovation, leading to what can be termed a "new green empowerment", which serves as a foundation for enhancing firms' green performance and reputation. The present paper aims at confirming the efficacy of green training in promoting and environmentally friendly working climate and define how it can represent an antecedent for organizational performance, justifying the efforts made by firm to invest in it and help build resilience overtime. According to the previous inferences it is possible to state that green training has a positive impact on the green working climate inside the sample of European firms who took part to the survey. This means that a lifelong learning process as stated by European Union (Council of EU union, 2022), is significant to address the green transition issue and guarantee sectors resilience and adaptability to the new market needs. What seems to be even more important from the analysis conducted is the mediating role assumed by GWC respect to Green performance of the organizations and their green reputation. Both the relationships are statistically significant, showing a great reliability of the results and a strong correlation. Our results reveal that the role of a mediating variable like GWC is extremely important for multiple reasons. First, our work has evaluated the effect that green training has directly on the "personal" component of the organization, that is workforce and then used the internalization of the behavior acquired by the employees to test the effect on organizational variables like the effective*

green performances of the firm and the perception that external stakeholders have of the overmentioned behavior. This confirms and extends what literature (Ren et al., 2018; Pinzone et al., 2016) has already claimed. The adoption of effective actions, like green training, suited to sustainability create a better internal working climate and avoid the risks of green washing effect and formal or superficial adoption of environmental friendly behavior (Boiral, 2007) and this is reflected substantially by a better environmental performances of the organization (as reflect by the relation between GWC and GP) but also by the image that it is given outside (as reflected by the relation between GWC and GR). The contraposition between the personal dimension of the effect of green training, also according to the AMO framework introduced in the initial section of the study, that directly affect the behavior of the learners makes necessary to introduce GWC has a mediating variable. Moreover, the present study gives the opportunity to observe the relations between the variables on a large scale comparing different European countries and different contexts. The adding of the control variables has indicated that GT produces positive effect on the organization internal climate despite the geographical or sectorial collocation of the organization which instead has a consistent weight when it come come to green performance and reputation.

Research limitations. *This study has some limitations, though they do not diminish its relevance. First, the use of convenience sampling ensures a large sample, but results are not evenly distributed across countries. Second, while the link between green working climate (GWC) and green training is statistically significant, the low R2 value indicates limited predictability. This is expected, as green training mainly affects the ability component of the AMO framework, while other factors were not considered. GWC is shaped by multiple influences, including external pressures (Duan et al., 2020), firm-specific factors (Flagstad et al., 2022), and incentives (Arhavbarien et al., 2024). Nonetheless, the study confirms the significant positive impact of green training on the internal organizational climate, reinforcing its key role in the green labor market transition. The present research aims to raise the attention on the role of training and its impact on GWC as an important leverage of firm capacity to adapt to the challenges imposed by climatic pressure and policymakers' requests, maintaining and possibly gaining competitive advantage over time. Possible research paths could be related to the exploration of the role of green training focusing on further specific dimension and distinction (for example different training modalities) or perform longitudinal case study focusing on a specific country or a specific industry or even making comparison related to the moderating role of GWC between two specific countries other then European context.*

Managerial implications. *The paper highlights the power of green training in address the challenges of the green transition without leaving anyone behind, directly, influencing the firm's workforce and indirectly on firm's performance and reputation, helping building resilience overtime. Companies should constantly monitor and assess the level of preparation of their internal workforce and set a specific training program that impose to maintain the workers constantly updated according to market trends and policy requirements, building an internal culture that promotes resilience and consent to scale up and capitalize new knowledge, performing a smooth green transition aligned with sustainability principles.*

Originality of the paper. *The paper aims to explore the role of GHRM in supporting green transition by focusing on one of its components, green training and its role in aligning labor market demand and offer according to green transition need. Moreover, the paper analyses the role of GWC as a mediating variable for green performance and reputational and their overall impact on firm resilience inside a multisectoral business context.*

Key words: *Green Human Resource Management, Green Training, Green Skills, Green transition, Firm resilience*

Control Points Perspective in Environmental Business Strategies: Corporate Roles in Shaping Sustainable Markets

VITTORIO MARIA GARIBBO[1] RENE' BOHNSACK[2] FRANCESCO RIZZI[3]
ELEONORA ANNUNZIATA[4] MARCO FREY[5]

Abstract

The climate crisis necessitates a shift in production and consumption patterns, requiring a reconfiguration of traditional markets to align with sustainability principles. This transformation introduces unique challenges for companies operating in sustainability-oriented markets including technological disruption, regulatory shifts, unpredictable customer behavior, financial constraints, and strategic inertia such as waiting games. While the literature on market shaping identifies firms as pivotal agents in the formation of new markets it is less clear whether firms can truly act as catalysts for sustainability-oriented markets. The additional complexities inherent in these markets raise questions about whether and how firms can effectively navigate these challenges to drive the formation of new market models without compromising their competitive positioning. To address this gap, we use a control point perspective to analyze key positions within the value network where firms can generate systemic value while ensuring future value capture. Our case study of nine key firms in the emerging green hydrogen market in Italy reveals how market-shaping roles - Market Drivers, Market Supporters, and Market Missionaries - navigate challenges of value creation and capture by exploiting different configurations of control points. Additionally, we identify specific positioning mechanisms that provide deeper insights into the agentic role of actors driving the transition to sustainable markets.

Framing of the research.

- ***Introduction:***

Strategic marketing and management studies emphasize the importance of market-shaping mechanisms in the evolution of industries (Helfat, 2021; Nenonen et al., 2020). Assuming the market as a dynamic, plastic, multi-actor system (Nenonen et al., 2014; Storbacka, 2019), this perspective acknowledges how such systems can be shaped by the actions of their constituent actors (Mele, Pels, & Storbacka, 2015; Nenonen et al., 2014).

Consequently, the recognition of the pivotal role of firms in shaping new markets (Nenonen, Storbacka, & Windahl, 2019) has prompted an increasing number of scholars to question the role of business agency in sustainability transitions (Novalia et al., 2018; Werbeloff et al., 2016), emphasizing the need to investigate the role of businesses as potential catalysts for the transition towards sustainability-oriented markets (Mintrom & Rogers, 2022; Schaltegger et al., 2022; Koistinen & Teerikangas, 2021).

However, while shaping new markets subject to traditional market dynamics, is already an inherently demanding endeavour for any firm, a company's role as a catalyst for a sustainability-oriented market constitutes an exceptionally complex and strategically significant challenge.

Pinkse et al., (2023), categorize the unique constraints that companies operating in emerging markets focused on sustainability face as follows: (i) limited availability of low-carbon substitutes, (ii) the need for new infrastructures, (iii) difficulties in using existing production facilities with low-carbon inputs, and (iv) challenges in delivering the same quality or quantity of output at a comparable price when using low-carbon inputs.

A review of the literature on market shaping for sustainability revealed a paucity of studies that do not provide a comprehensive description of the phenomenon. The few exceptions mainly explore how the incumbent actors prepare the market for the replacement of existing technologies with more sustainable ones (Doganova & Karnøe, 2015; Keranen et

al., 2023; Werner et al., 2022) or how market systems are collectively shaped in order to promote social change in an emerging economy (Kullak et al. 2022).

In light of this, recent research has underscored the need to extend the conceptual scope of market shaping beyond a traditional focus on economic improvement to encompass sustainability (Koistinen & Teerikangas, 2021; Sheth & Parvatiyar, 2021), highlighting the need for further research to balance the business and sustainability objectives of shaping strategies (Werbeloff et al., 2016; Köhler et al., 2019; Stathakopoulos et al., 2022).

We posit that the control point perspective provides an excellent lens through which to explore this phenomenon. This perspective enables to consider simultaneously the positions in the value network that companies need to manage to create and capture values.

By integrating this perspective in the process of formation of new sustainable market, it becomes possible to understand how firms can foster harmonious value creation aligned with sustainability objectives, while strategically managing ecosystem positions that hold the potential for long-term profitability.

This paper thus addresses the following research question:

(i) What control points are adopted by shaping companies to overcome sustainable market constraints and capture value?

(ii) What mechanisms do shaping companies use to position such control points within emerging sustainability-oriented markets?

To our scope, we conducted a multiple case study involving several actors engaged in developing the emerging green hydrogen market in Italy. Using a qualitative approach, our study identifies the roles of companies in market-shaping and how they shape a sustainability-oriented market.

Our study contributes to the literature by extending market-shaping research with empirical evidence in sustainability, uncovering patterns in control point development and management, and offering insights into the roles and dynamics of actors driving the transition to sustainable markets.

Purpose of the paper.

- ***Theroretical Background***

Market shaping and companies' roles:

The agentic effort of companies is nowadays considered as a significant driving force in strategic management, as it influences the evolution of an operating environment (Helfat, 2021) and highlights the potential role of a focal company in shaping a new market (Nenonen and Storbacka, 2021). Recognizing the firm not as a passive actor within the market system, subject to external and deterministic forces, but as a proactive entity capable of deliberately driving market change (Nenonen and Storbacka, 2021), highlights the critical role firms might have in the creation of new market models oriented toward sustainability. The market-shaping literature thus offers a valid lens to study the formation of a sustainable market, and specifically focuses on the agency of different actors (Ottosson et al., 2020).

Different players participating in the shaping process use different approaches and levels of engagement in creating a new market system (Nenonen, Storbacka, and Windahl 2019). The engagement of a focal company in creating a new market and its ability to involve as many market actors as possible has been used to cluster different market shaping roles (Fehrer et al., 2020).

Recent findings (Flaig and Ottosson, 2022) shown that roles are determined by the actions of a focal actor and the responses of the other actors involved (Nystrom et al., 2014). Such actions determine what resources are accessed and utilized, which actors to collaborate with, and which networking objectives to be pursued to engage a broad number of players (Nystrom et al., 2014). Flaig and Ottosson (2022) identified the roles involved in market shaping domain based on the different levels of engagement exerted by the actors. These roles are:

- *Market Drivers who outline a market vision and allocate significantly more resources than other actors to realise this vision. These actors steer market-shaping process driven by the possibility of reaching a leading position in the new emerging ecosystem. These players have a profound commitment to the creation of the new market.*
- *Market Supporters are companies who endorse this vision and do not interfere with the Market Drivers' shaping efforts. These companies facilitate the education of the market regarding the advantages of the nascent ecosystem, thereby enabling the positioning of their products and services within a novel market segment. Compared to the Drivers, Supporters have limited resources, and thus they leverage opportunistic partnerships to drive sales growth.*
- *Market Missionaries are crucial in developing market networks and promoting the market vision to a broader audience. Often funded by industry or government, they act as proxies for other actors' market-shaping efforts, extending these ambitions in line with the focal vision (cf. Mountford, 2019).*

However, a thorough understanding of how these roles operate within a sustainable market is lacking. A deeper investigation of the roles' underlying actions to achieve economic and environmental equilibrium in sustainable market-building would contribute to overcoming the current fragmented literature on shaping sustainable markets (Nenonen & Storbacka, 2021).

Control point perspective:

Control points are defined as abstract positions of greatest value and control within a given business ecosystem, thereby inherently introducing a "systemic dimension" to these positions (Pagani, 2013). Such positions are not

necessarily within the firm boundaries but are placed between layers on the layered architecture of a value network (Yoo et al., 2010). According to this approach, companies first identify the assets, technologies, or industry-level value systems that could create market value. Subsequently, they develop and occupy these positions to exert dynamic control, ensuring future value capture dynamics (Baldwin & Woodard, 2007; Baldwin, 2015; Hannah & Eisenhardt, 2018).

Control points can be technical, above all identifying the potential value creation in the various layers of an ecosystem, and strategic, by determining the value capture potential (van Dyck et al., 2021). Technical control points refer to technical solutions that enable access to a company's market, while strategic control points encompass sociological and institutional aspects which help the company to benefit from the ecosystem.

As with the value creation dynamic, control points are therefore useful for understanding how firms guide the evolution of the value network, creating value at a systemic level (Hannah and Eisenhardt, 2018; Helfat and Raubitschek, 2018). With respect to the potential for value capture, establishing control points within an emerging business ecosystem involves the identification and occupation of strategic positions in advance to gain control of the ecosystem with the goal of capturing value (Dattè, 2018).

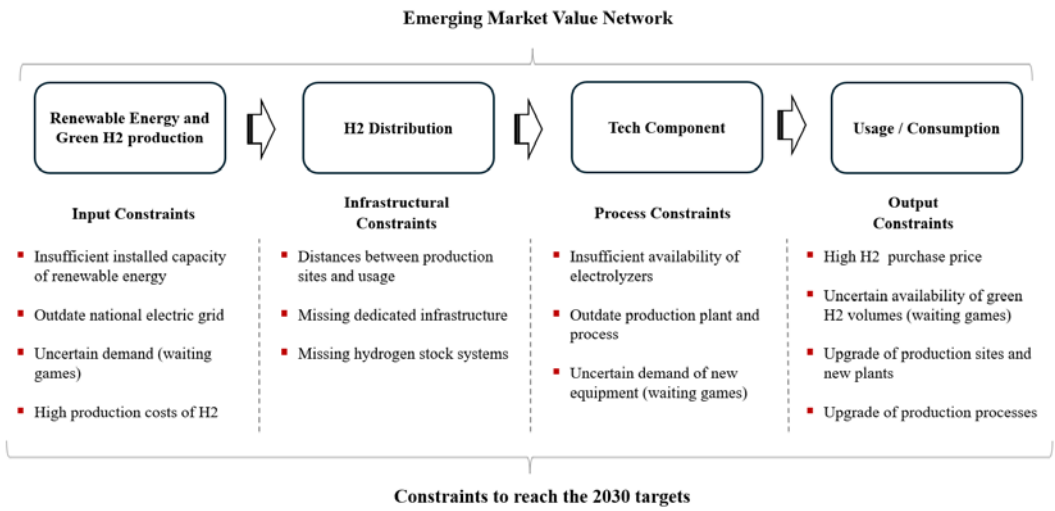
Purpose and objective of the study:

The control point perspective provides a valuable lens for understanding how companies balance sustainable markets shaping actions (value creation) with enhancing competitive advantage (value capture). Therefore, this study aims to integrate the control point perspective into the phenomenon of shaping sustainable market, seeking to extend the market-shaping literature by highlighting differences among actors and identifying recurring patterns that reveal the unique characteristics of each role in shaping sustainable markets.

Methodology.

- ***Setting:***

The burgeoning green hydrogen market in Italy is an optimal setting for analysing the shaping of an emerging sustainability-oriented market.



The development of the green hydrogen market is hindered by several issues (IRENA, 2022; IEA, 2022) tied to input, process, and output constraints, which are common to emerging sustainable markets (Pinkse et al., 2024).

These constraints include limited large-scale hydrogen production to ensure competitive supply, the absence of high-capacity transport infrastructure like pipelines, and the need for new or upgraded equipment to integrate hydrogen into industrial processes. Additionally, hydrogen's higher costs compared to fossil alternatives and its impact on maintaining quality in certain production processes pose significant challenges (IPCC, 2022, Nunez-Jimenez et al., 2022).

Despite the numerous complexities associated with this emerging market, many corporate actors are currently dedicating significant resources and efforts to building it.

All things considered, this setting is particularly suitable for investigating the actions taken by companies entering a distinctive and promising emerging market and their efforts to shape it. ***Figure 1*** *shows the value network layers used to achieve the 2030 target, highlighting the main constraints companies will have to face.*

Fig. 1: Green hydrogen value network's layers and associated constraints

- ***Data collection:***

To identify the firms that are active in this emerging market, we began with the IEA dataset, which catalogs the hydrogen projects launched since 2000 and the respective companies leading them. We supplemented this with a list of companies affiliated with associations such as the European Hydrogen Alliance and H2IT, and we also attended the

Hydrogen Energy Summit & Expo in Bologna (October 2022), which is the key industry event in Italy attended by major stakeholders.

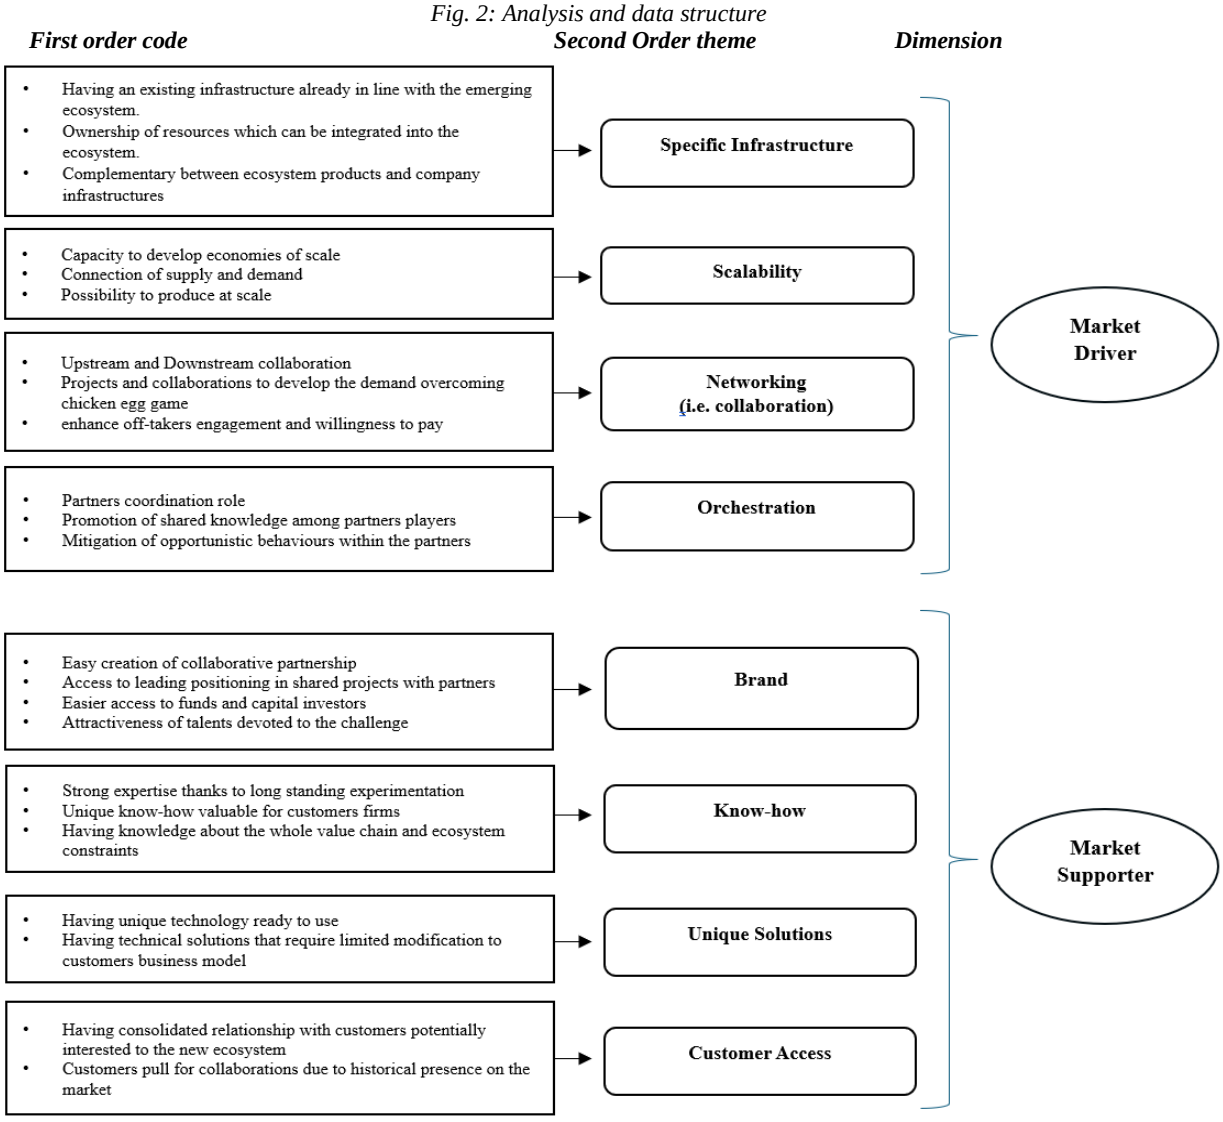
*To determine the companies most committed to shaping this market, we applied criteria including declared investments in the emerging market, ongoing projects impacting the national supply chain, and public statements to shareholders. This approach identified nine companies extensively engaged in large-scale industrial initiatives to advance green hydrogen development, with investments totaling several million euros. These actors are recognized as key actors in this emerging market, given their potential to revolutionize the entire Italian hydrogen supply chain (e.g., Osservatorio H2IT). We contacted these companies, requesting interviews with representatives who were extensively involved in hydrogen projects, as well as senior executives responsible for the company's strategic direction. Between October 2022 and September 2023, we conducted interviews via Teams with a total of 22 interviewees (see **table 1**).*

Tab. 1: Overview of the interviewees and their company activities

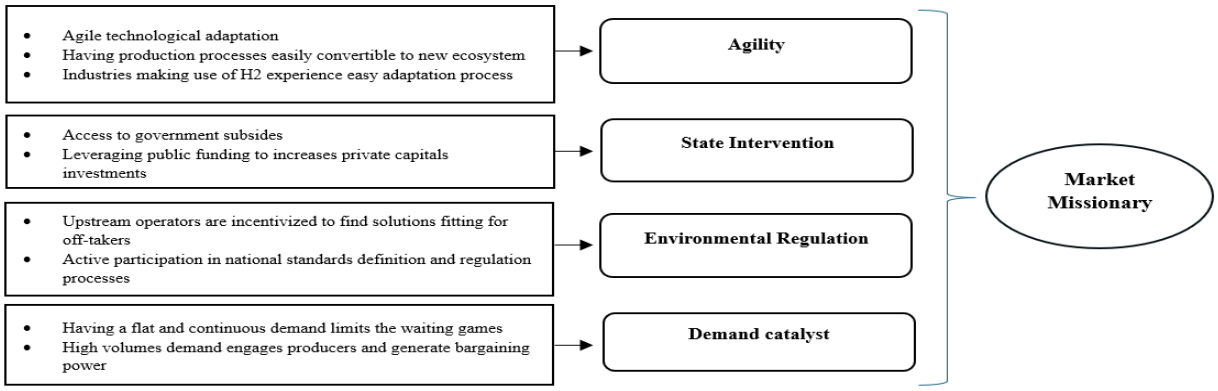
Company Profile / Pseudonym	**Interviewees**	**Market shaping initiatives**
Energy Hubs Developer	COO; Head of strategy; Head of market development	- Coordination of an industrial district for the use of green hydrogen - Development and management of renewable energy hubs dedicated to H2 production and direct interconnection with off-takers.
Energy Company A	Head of H2 BU; Head of special projects; Project manager	- Development of hydrogen valleys - Coordination of H2 mobility initiatives and H2 refuelling stations development - Collaboration to develop H2 supply and usage in hard-to-abate sectors (ceramic, steel, glass etc)
Energy Company B	Head of Strategy; 2 Project Managers	- Development of renewable power plants dedicated to H2 production - Orchestration of multiple H2 pilot projects in collaboration with hard-to-abate (e.g., refinery, chemical) - Development of a national platform to test new H2 technologies to involve startups, and industrial off-takers and create networking
Gas Distributor	Head of H2 BU; Head of decarbonization BU; H2 Project Leader	- Upgrade and replacement of gas pipelines to enable national H2 supply - Launch of a new company in collaboration with electrochemistry partner to develop an electrolysers gigafactory - Coordination of a multiparter project to develop H2 rail mobility - Collaboration with hard-to-abate players (steel and refinery) to test H2 integration into production cycle
EPC Contractor A	CEO; Business model developer	- Development of new H2-based technologies for steel making - R&D collaboration with steel producers - Development of an in-house lab to test new technologies with potential clients
EPC Contractor B	Coo; Head of engineering	- Development of new H2-based technologies for metal heating - Technical support for pilot projects aimed at decarbonizing ceramic and metallurgical industries.
EPC Contractor C	Head of strategy; Project Manager	- Development of new H2-based technologies - Partnerships with H2 valley developers to test new hydrogen storage models - R&D collaboration with city councils to develop hydrogen mobility projects.
Steelworks Company	President and Coo	- Multi-partners alliance to decarbonize production cycle integrating H2 (DRI technology) - Dissemination of ongoing results internationally to position the initiative as an industrial alternative in the steel sector. - Interactions with policymakers to guide regulatory development and establish a supportive framework for H2 usage initiatives.
Refinery Company	Head of strategy; Project Manager	- Multi-partner alliance to manage the production, distribution, and direct use of green H2 in crude oil processing. - Lobbying in Italy and the EU to unlock funding for industry decarbonization. - Committed to buy and use large volume of hydrogen on a long-term horizon, thereby enabling large-scale H2 production in the reference industrial district.

- ***Data Analysis:***

*First, we followed Gioia et al. (2013) for inductive reasoning, deriving first-order codes that closely represented our raw data (Gioia et al., 2010). Our raw data comprised approximately 280 pages of interview transcripts, which were analysed using the qualitative data analysis software NVivo. The analysis of interview transcripts was an iterative process that led to the identification of 32 first-order themes relevant to the subsequent identification and description of **control points**.*



In the second step, we used deductive reasoning to assign the first-order codes to pre-defined second-order themes (Weber et al., 2019); these themes represent control points previously discussed in the literature (Bohnsack et al. 2024).



In a third step, the 12 second-order themes (control points) were aggregated into three overarching dimensions representing the market shaping roles: Market Drivers, Market Supporters, and Market Missionaries. This deduction was based on the characteristics of market shaping roles developed in prior studies (Flaig and Ottosson, 2022) and consistently aligned with previous role conceptualisations in the ecosystem and market strategy literature (e.g., Adner, 2017; Nenonen & Storbacka, 2020). ***Figure 2*** *represents the data structure that emerged from analysing control points within market shaping roles.*

Finally, based on interviews, the rich amount of secondary data, and in line with the distinctive characteristics of the market-shaping roles (Flaig and Ottosson, 2022; Adner, 2017), we associated the nine companies in our sample with three shaping roles: Market Driver, Supporter, and Missionary. To do this, we counted the number of first-order codes belonging to each individual firm that converge on each of the three shaping roles. This provided us with a comprehensive representation of the control points and the related market shaping role adopted by each company within our sample.

We then analysed the actions that each group of companies undertakes to establish and position control points within the market. Based on interpretive approach (Rynes and Gephart 2004) we identified recurring mechanisms adopted by each group of market-shaping roles. These mechanisms reflect the business, relational, or commercial initiatives developed by companies to take control of specific control points and exert influence over the emerging market. These mechanisms are infrastructural upgrade, branching-out, collaborative r&d programs, and sustainability-oriented symbiosis. This examination provided a deeper understanding of the systematic logic behind control point positioning across different shaping roles, highlighting the inherent differences and unique characteristics of each role.

Fig. 2: Analysis and data structure

Results.

- ***Control points underpinning market-shaping roles***

Market Drivers:

The role of the Market Driver is characterised by a targeted vision of the emerging ecosystem, as a result of this role, companies commit significant resources to develop the market, defining its boundaries, and engaging with multiple actors. Energy companies A and B, Gas distributor and Energy Hubs Developer are the four companies of our sample acting as market driver.

Companies approaching the emerging market with this role first position themselves in the market segments where they can create great value for the whole system. To this end, ***Specific Infrastructure*** *and* ***Scalability*** *are key control points for these companies, as they facilitate the scale-up of production and distribution. These companies are therefore investing in converting or adapting existing assets and resources, aimed at establishing a foundation for the emerging market.*

However, Market-Driver companies face great uncertainty regarding demand evolution, and it is essential for them to promote the harmonious growth of the entire system by securing the engagement of other actors and synchronizing their actions toward market creation (Fehrer et al., 2020; Kleinaltenkamp, et al., 2021). ***Orchestration*** *and, most importantly,* ***Network Engagement*** *are control points purposively developed to build market boundaries, develop demand, and capture future value by becoming the selling reference for other actors. Through these latest 2 control points these companies launch new initiatives across the value network, involving the participation of actors throughout the value chain, thereby creating the bones of the new market. By orchestrating projects and other companies' efforts, they seek to build a coherent value network that strengthens their bargaining power and enhances value capture.*

Market Supporters:

Market Supporters view market shaping as an opportunity to increase sales without significantly diverging from their core business. EPC contractors A, B, and C are technological providers responsible for the Engineering, Procurement, and Construction phases of a project and they are exploring the potential of this emerging market with this market shaping role.

This role suits market actors that are more cautious about the shaping process (Nenonen & Storbacka, 2020). They recognise that the new market can provide opportunities, but they take a more conservative approach. These firms therefore pursue activities that enable them to maintain flexibility and enable experimentation to improve their knowledge (Rindova and Courtney; 2018).

As for their contribution to the system value creation, they leverage control points, such as deep technological ***Know-How****, to develop* ***Unique Solutions****. These control points address the process constraints (Pinkse 2024) that companies transitioning to green hydrogen will have to face.*

*Our findings suggest that organisations that adopt this role proactively try to leverage their established name in the industry (****Brand****) and the direct interface with end-users (i.e.,* ***Customer Access****), by steering the process toward intangible control points. In fact, end-users embarking on transition paths are inclined to seek out well-known and experienced technology partners. Market Supporters are deeply intertwined with the industry sector. They therefore exploit these control pints to position themselves as the primary point of contact for new users in the emerging market. These companies thus establish their presence in the emerging market by conducting experimental projects with customers and by leveraging their brand as a symbol of reliability. This strategic use of control points is crucial for capturing value as the demand for new technologies grows.*

Market Missionaries:

The aim of Market Missionaries is to meet challenging environmental goals, with the emerging market serving as the means. Despite being in hard-to-abate sectors, the Steelworks Company and the Refinery Company are committed to reaching net-zero emissions by 2040 and they are approaching this market with a market missionary posture.

They support the envisioned market as far as their resources permit (Flaig & Ottosson 2022), given the significant technical and economic challenges they face (i.e., input, process, and output constraints). However, they play a key role in the market-shaping, as their ability to realize the vision of the new market often leads Market Drivers and Market Supporters' actions to converge on them (Flaig & Ottosson, 2022; Mountford, 2019).

To enter this market, these actors leverage their potential to generate a stable and consistent demand for hydrogen. This reduces the uncertainty for producers regarding the presence of off-takers, thereby mitigating the risk of waiting games (Robinson et al., 2012). We refer to this control point as the ***Demand Catalyst****. In addition, Market Missionaries capitalize on their ability to quickly adapt, making them highly attractive players for collaboration and exploratory projects (****Agility****). In an industrial context, this refers to a company's ability to adapt its production processes to the needs of the new market, while minimizing disruptions (Liljenberg 2022).*

Finally, it is important to stress that business objectives are deeply intertwined with environmental goals in shaping sustainable markets. Market Missionaries, experience the most significant benefits in emission reductions and can leverage this advantage. The generic control points determined at the institutional level, such as ***State Intervention*** *and* ***Environmental Regulation****, are exploited mainly by Market Missionaries. These companies are the first players entitled to apply for government grants and participate in regulatory discussions to address key constraints and systemic challenges in evolving regulations.*

The privileged position of Market Missionaries makes them an appealing partner for all the other players (particularly Marked Drivers) who are seeking deeper connections with policymakers to influence new developing regulations. This control point is leveraged by Market Missionaries to hook companies that seek to establish a voice at the institutional level and to forge new collaborative relationships that are instrumental in supporting their transition projects.

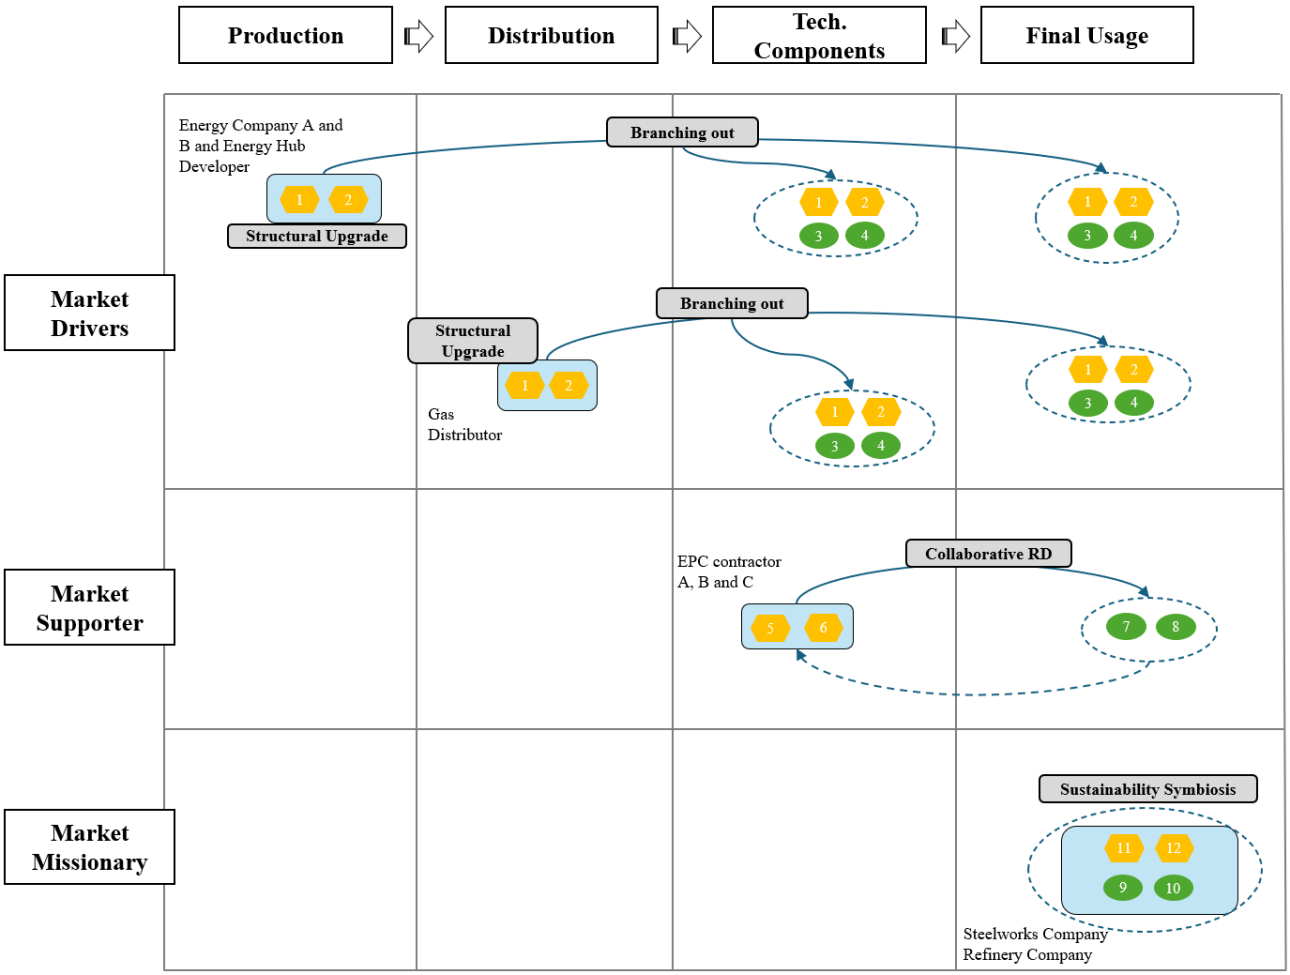
- ***Mechanisms of control point positioning in sustainability-oriented market***

This section examines the recurring mechanisms employed by different market shapers to position control points, highlighting the strategic actions undertaken and the distinct roles played by various actors.

Structural Upgrades *are mechanism that involves investments in essential infrastructure and assets to establish the foundational framework of the emerging market. By defining market boundaries that align with their organizational structure, firms create the necessary conditions for systemic value creation. This approach is predominantly adopted by Market Drivers, who integrate existing resources into the ecosystem to develop key infrastructures, such as renewable energy plants for hydrogen production or expanded distribution networks. Through these investments, they secure a strategic position that enhances market scalability and long-term competitiveness.*

Branching out *entails the creation of separate business divisions in different segments of the value network, rather than integrating core assets into the emerging market. This mechanism is commonly used by* ***Market Drivers*** *to ensure the balanced development of the entire value chain, mitigate supply bottlenecks, and secure future value capture. Companies engage in underdeveloped areas of the market to coordinate the participation of other stakeholders and promote ecosystem growth. For instance, firms may invest in hydrogen refueling stations or electrolyzer production to facilitate market formation. This dual-purpose strategy fosters both value creation and value capture by expanding market reach and ensuring readiness for future demand.*

Collaborative R&D Programs *are Primarily employed by* ***Market Supporters*** *and involve partnerships with industrial stakeholders to conduct research and test innovative solutions tailored to the emerging market. These initiatives serve as a means to acquire market knowledge, develop new technological competencies, and position firms as key suppliers for future clients. Although these programs often do not generate immediate financial returns, they allow firms to establish early-stage relationships with potential customers and gain credibility in the nascent market. For example, engineering and procurement contractors (EPCs) may provide consultancy for pilot projects in hydrogen mobility or industrial decarbonization, reinforcing their role as strategic partners in the transition process.*



Sustainability Symbiosis *are employed by Market Missionaries, and foster interdependent collaborations between firms seeking to decarbonize their production processes and stakeholders capable of supplying low-carbon alternatives. Through these partnerships, firms share financial and operational resources to overcome transition barriers while securing stable demand for emerging technologies. Market Missionaries enhance the visibility of their projects, often positioning them as pioneering national or international initiatives, which in turn attracts external funding and partnerships. By leveraging their role as demand catalysts, they create favorable conditions for broader market engagement, strengthening their influence within the value network and becoming key partners for other market-shaping actors.*

Figure 3 *presents a matrix that illustrates the dynamics of control point positioning across four key stages of the emerging market: production, distribution, technological development, and final use. This structure facilitates the*

identification of each player's entry point into the value network and the strategic pathway through which they position control points to capture value effectively.

***Table 2** shows the clear association between roles, mechanisms, control points, and, ultimately, the market constraints that hinder the development of new sustainable markets. These results highlight both the distinct contributions of various actors to market development and the specific positioning dynamics that foster value capture mechanisms and competitive equilibrium.*

Fig. 3: Market shaping mechanisms and the positioning of control points within the value network

Control Points	N
Specific Infrastructures	1
Scalability	2
Networking (i.e. collaboration)	3
Orchestration	4
Know-how	5
Unique Solutions	6
Brand	7
Customer Access	8
State intervention	9
Environmental Regulation	10
Agility	11
Demand catalyst	12

Tab. 2: Systematization of the intersection between the impact of control points on firm value dynamics and their role in overcoming market constraints

Market Shaping Role	Shaping Mechanisms	Control Points	Dynamic	Market constraints tackled
Market Driver	Infrastructural Upgrade	• Specific Infrastructure • Scalability	Value Creation	Limited availability of low-carbon substitute High production costs Lack of distribution system Harmonious growth of the whole value network
	Branching out	• Networking • Orchestration	Value Capture	
Market Supporter	Collaborative R&D	• Unique solution • Know-how	Value Creation	Need for new technological components Need for replacement of facilities
		• Brand • Customer Access	Value Capture	
Market Missionary	Sustainability Symbiosis	• Agility • Demand Catalyst	Value Creation	Uncertain demand and waiting games Higher output price point Lack of a clear regulation
		• Environmental Regulation • State intervention	Value Capture	

- ***Contribution***

This study highlights critical ecosystem points that are essential for the evolution of new value networks and the mechanisms of value capture-key conditions for firms to drive transition processes while maintaining competitive equilibrium.

Secondly, our study offers a more detailed understanding of the functioning and unique characteristics of various market-shaping roles in building sustainable markets. We identified the propensity of Market Drivers to operate across the entire value network, the cautious approach of Market Supporters focused on limited initiatives in value networks' layers further from their core business and the Market Missionaries' strategy, which entails a strong anchoring to the value network segments closest to their business domain. These findings build on the categories provided by Flaig and Ottosson (2022) to broad the different market-shaping roles in forming new sustainable markets.

In so doing our results contribute to the literature providing the disentanglement of the composite process of market shaping and thus fill the gap highlighted by recent research (Storbacka et al., 2022; Nenonen & Storbacka, 2021) on the limited applicability of the market-shaping literature within the sustainability context.

Research limitations. *Like any study, ours has its limitations. These include the qualitative nature of our findings, which are based on nine case studies. Future research should investigate the control points and positioning mechanisms in other sustainable emerging markets. Furthermore, our analysis did not address the roles of firms that resist or actively hinder change to preserve the status quo. Further studies could explore how such firms operate, the control points they leverage, and how their positioning strategies either interact with or oppose the market-shaping roles examined in this study.*

Managerial implications. *The implications of this study are useful to foster firms engagement into emerging sustainability-oriented ecosystem. Companies seeking to engage in market-shaping initiatives can leverage our framework to strategically evaluate resources, identify value-generating opportunities, and navigate control points to secure sustainable competitive advantage. By integrating the control points lens within sustainable market shaping, the framework offers a new perspective that encourages firms to explore market positions beyond their traditional core activities, and to thus reveal opportunities for substantial long-term value creation and capture.*

Originality of the paper. *To the best of our knowledge, this is one of the first studies to conduct an in-depth analysis of market shaping for sustainability, specifically by examining market shaping roles within sustainable markets. To this end, we integrate the control point perspective with the market shaping approach, leveraging their combined insights to better understand how companies position themselves and strategize to create and capture value. This study offers a*

promising framework for unraveling the complex processes that firms engaged in shaping sustainable markets must navigate to balance value creation and capture-that is, to foster sustainable ecosystems while profiting from it.

Trusting Green Energy: How Social and Emotional Value Drive Peer-to-Peer Energy Adoption

DOMENICO DE FANO[1] ROSAMARTINA SCHENA[2] ANGELOANTONIO RUSSO[3]

Abstract

Despite increasing interest in green energy, little is known about the factors that influence consumer adoption of peer-to-peer (P2P) green energy networks. These systems enable individuals to trade renewable energy directly, providing an alternative to traditional centralized energy providers. The advent of P2P energy networks marks a transformative shift in energy consumption paradigms, integrating green energy innovations into the daily lives of consumers. Despite their potential, the adoption rates of P2P energy systems are impeded by various consumer-based barriers, particularly trust and value perception. This study investigates the role of social and emotional value in shaping trust and adoption behavior in P2P energy trading. Two empirical studies examine how these perceived values impact consumer trust and adoption intentions. The findings suggest that social and emotional value significantly influence trust, which in turn mediates adoption decisions. This research contributes to the discourse on consumer behavior in energy markets, emphasizing the importance of psychological and social factors in fostering trust and sustainable energy adoption.

Framing of the research. *There are several business models under green energy innovation. This article focuses on peer-to-peer (P2P) energy provider (Benoit et al., 2017; Perren & Kozinets, 2018; Ruotsalainen, Karjalainen, Child, & Heinonen, 2017). P2P type exchange has gained popularity across various service sectors (Eckhardt et al., 2019). Such as transportation (e.g., Uber) to clothing (e.g., Rent the Runway) and short-term rentals (e.g., Airbnb). P2P activities are classified into; pure collaboration, where consumers interact without a digital platform (2) facilitated collaboration in the presence of intermediaries (C2C), and (3) mediated collaboration (Ertz et al., 2019; Benoit et al., 2017).*

P2P energy community differs from other forms of sharing, as it is classified into (1) coordinated market (e.g., Lüth et al., 2018; Papadaskalopoulos & Strbac, 2013), (2) decentralized market (e.g., Tushar et a., 2019), and (3) community market (Moret & Pinson, 2018). In a community market, the exchange is facilitated by a community manager (Esmat et al., 2021), whereas in a decentralized market, peers can directly communicate and interact with each other within "the connected community" (Esmat et al., 2021).

The growing interest in sustainable energy has led to innovative business models that decentralize energy markets, allowing individuals to trade renewable energy through peer-to-peer (P2P) platforms (Neves et al., 2020; Klein et al., 2020). The European Union has encouraged such initiatives through its Clean Energy for All Europeans directive (European Union, 2018), highlighting the potential of decentralized energy to enhance energy security and sustainability.

Despite the advantages of P2P energy networks, adoption rates remain low due to trust-related concerns (Jogunola et al., 2019). Trust is a crucial element in sharing economy models (Hawlitschek et al., 2018; Möhlmann, 2015), and in the energy sector, consumer hesitation is often linked to the lack of established regulatory frameworks and perceived risks associated with decentralized transactions (Hackbarth & Löbbe, 2020). While economic benefits are commonly cited as adoption drivers (Ecker et al., 2018; Li et al., 2021), recent studies suggest that social and emotional values may be equally or more important in influencing trust and adoption behavior (Bhowmik et al., 2018; Biswas & Roy, 2015).

This research addresses these gaps by examining how social and emotional value impact consumer trust in P2P energy trading and, consequently, adoption intentions. Research examining consumer adoption in the P2P innovation context still in an infancy stage. Therefore, broadens the literature on the psychological and social variables that predict trust and P2P energy adoption is worthwhile. Our theoretical framework is guided by the theory of consumption value, "green perceived value" (e.g., Khan & Mohsin, 2017) due to its applicability in the green energy consumption context (Sangroya & Nayak, 2017).

Purpose of the paper. *The primary aim of this research is to investigate the factors that drive consumer adoption of P2P green energy networks. Specifically, the study examines the extent to which social, emotional, and functional values influence consumer trust in P2P energy providers and how trust mediates adoption intentions. In doing so, this research*

contributes to the literature on sustainable consumption and the collaborative economy by identifying the psychological mechanisms that underlie green energy adoption.

The importance of social value is widely regarded in green consumption context (Gilg et al., 2005), and renewable energy (Akella, Saini, & Sharma, 2009), sometimes it refers to social groups "family and friends" (Social influence-; Johnstone & Hooper, 2016) or self-image and social status (e.g., Yang, Lu, Zhu, & Su, 2015). However, some studies suggest that green energy's social value does not impact consumers' behavioural intentions (Sangroya & Nayak, 2017). Other studies noted that focusing on social value is relevant in green energy consumption (e.g., Arroyo & Carrete, 2019; Hartmann & Apaolaza-Ibáñez, 2012). as it provides social approval (Biswas & Roy, 2015; Tanner & Wölfing Kast, 2003), a sense of responsibility (Biswas & Roy, 2015), and improves the social status (e.g., Elliott, 2013).

Drawing from past research, there are several reasons why social value is relevant in the P2P energy context. First, prior work has shed substantial light on the benefits of social value in the P2P context. In particular "hospitality" (e.g., Lu, Cai, & King, 2020; Tussyadiah & Pesonen, 2016). Social value plays an important role in P2P markets (e.g., Bollinger & Gillingham, 2012; Chen, Ghosh, Liu, & Zhao, 2019). P2P business model allows individuals to create new forms of social connection "social value" (e.g., Perren & Kozinets, 2018). In P2P markets, there are situations in which sharing, and social interaction, such as sharing a ride, trading energy in the closer social context, can create a sense of communal belonging or communal norms (Huurne, Ronteltap, & Buskens, 2020).

In P2P context, social and community intrinsic motivations are viewed as an essential ingredient in this type of exchange (Botsman & Rogers, 2010). Prior work shows that social value is a major driver towards P2P adoption (Benoit et al., 2017). As it provides a stronger sense of community belonging (e.g., Minami, Ramos, & Bortoluzzo,2021), and has the the potential for creating and developing social connections with others (Tussyadiah & Penson, 2016). Therefore, this work theorizes that social value plays a vital role in improving consumers' trust and adoptions towards P2P energy networks. This idea supports the interpersonal relationship literature (Chiu, Huang, & Yen, 2010) and social exchange theory (Mitchell, Cropanzano, & Quisenberry, 2012). Consumers gain several benefits from social interaction (Stollery & Jun, 2017), engaging in P2P activities enables connections to foster social connection and establish relationships (Tussyadiah & Pesonen, 2016; Davlembayeva et al., 2020; Tussyadiah, 2016), increase social ties (Davlembayeva et al., 2020), which ultimately build trust (Lu et al., 2020). Following this rationale, it is suggested that social value impact consumers' trust and adoption.

Emotional value refers to the capacity to arouse curiosity, provide novelty, and satisfy a desire for knowledge (Sheth, Newman, & Gross, 1991). Prior knowledge suggests that emotional value is the product's ability to elicits feelings or affective states (Sheth et al., 1991). Emotional value plays a vital role in consumers buying green products (Khan & Mohsin, 2017); indeed, some studies suggest that consumers are emotionally attached to green products (e.g., Koller et al., 2016). For example, Chang (2011) found that consumers felt greater about themselves when they bought green products (Chang, 2011) because such actions provide a sense of social responsibility (e.g., "fighting climate change" Odou & Schill, 2020), or "feeling is for doing" (e.g., Zeelenberg, Nelissen, Breugelmans, & Pieters, 2008; Odou & Schill, 2020). For example, recent work by Odou and Schill (2020) that anticipated emotions affect behavioural intentions to fight climate change. Emotional value has received recent attention in the P2P literature (e.g., Zhang & Jahromi, 2019). P2P activities enable both peers to develop stronger social bonds (Tussyadiah & Pesonen, 2016), emotional value (Zhang & Jahromi, 2019). However, most studies were discussed outside the energy domain. Thus far, this literature demonstrates that emotional values drive repurchasing decisions (Zhang & Jahromi, 2019). Furthermore, climate change research suggests that strengthening the emotional rewards by increasing the intensity of positive emotions-related content in the message can positively affect prosocial behaviour in the fight against global warming (Odou & Schill, 2020).

Extending the paradigm into a P2P energy network, it is declared that emotional value is relevant in predicting adoption behaviour. This perspective is aligned with recent studies that associate emotional benefits and consumer acceptance of new technologies (e.g., Kim, Oh, Park, & Joo, 2018; Li et al., 2017). For example, Li et al. (2017) found the emotional experiences such as joy or pleasure of new technologies impact consumers' adoption of battery electric vehicles. Following this reasoning, it is expected that in P2P energy trading, emotional value plays an essential role in establishing trust and adoption.

Finally, prior studies have highlighted the importance of trust in P2P platforms such as Airbnb and Uber, where decentralized exchange structures necessitate confidence in service providers (Ert et al., 2016; Möhlmann, 2015). In the case of P2P energy trading, where transactions involve essential resources and high perceived risk, trust may play an even greater role in shaping consumer behavior (Hackbarth & Löbbe, 2020). This research builds on existing work by applying the concept of green perceived value (Sangroya & Jogendra, 2017) to the energy-sharing context, examining its influence on trust and adoption behavior.

Methodology. *This research comprises two empirical studies designed to test the proposed framework. Study 1 shows that consumers exhibit a lower level of trust towards P2P (vs company) energy providers. Study 2 tests the full model using PLS-SEM to test and reveal that emotional and social value are the most critical factors in predicting consumers' trust and adoption intentions.*

Study 1 - Trust in the P2P energy context

This experiment was explicitly designed to examine whether consumers exhibit higher trust in P2P (vs conventional) energy providers. To do so, a scenario-based experiment is used to test this prediction. The study provides preliminary evidence on consumers' trust in P2P energy systems.

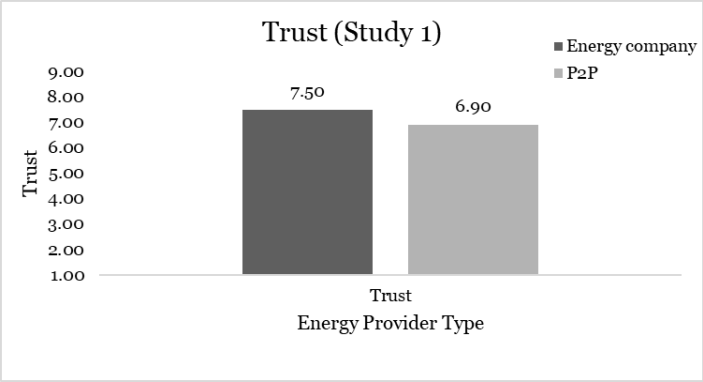
Eighty European consumers were recruited via Prolific online panel (48% females, Mage = 35.34 SD = 12.88) to exchange for a nominal payment. Participants were randomly assigned to a peer energy provider (N =39) or an energy company (N = 41). Ten participants were excluded from the analysis as they failed the attention checks. The final sample size was (N=70).

Participants were instructed to read a scenario: "Imagine that you are looking for a new energy provider, and you came across this post about a new energy provider: Marin P2P Energy. "P2P energy is a new concept of buying and selling between individuals. They can produce clean energy and sell at a reasonable price. For example, using Marine service, you can buy energy from your neighbour (solar panels)". [Marine is a new energy company that provides clean energy. It sells energy at a reasonable price. Using Marine energy service, you can buy energy from the company's power station (solar energy)]. Then, the participants answer to our key measures.

On a nine-point Likert scale of 1(strongly disagree) and nine (strongly agree), it is measured trust using the items of study 1 (α =.80). For manipulation checks, it is asked participants to identify if "the energy was provider by peer service provider", "by a company", it was a national energy supplier or a peer".

The manipulations worked as intended. In the peer energy provider condition, respondents indicated that a peer provider provided the service rather than a company (Mpeer =5.85 vs Mcompanu =3.31; t(68) =1.98, p < .05). Further, participants perceived the company as a national energy distributor (Mpeer =4.48 vs Unconventional = 5.71; t(68) =1.98, p < .03).

Study 2 - Testing the full Model



Two hundred and forty US energy consumers were recruited via online panel Amazon Mechanical Turk (MTurk) in exchange for a nominal payment. MTurk is a valuable source for data analysis and has been widely used in behavioural and social science research, and is considered a good source for data collection (e.g., Raimi & Carrico, 2015; Schwartz et al., 2015). Ten participants were excluded from the analysis for failing attention checks, which resulted in our final sample of 230 participants (Females = 42.7%, Mage = 34.33, SD = 12.3).

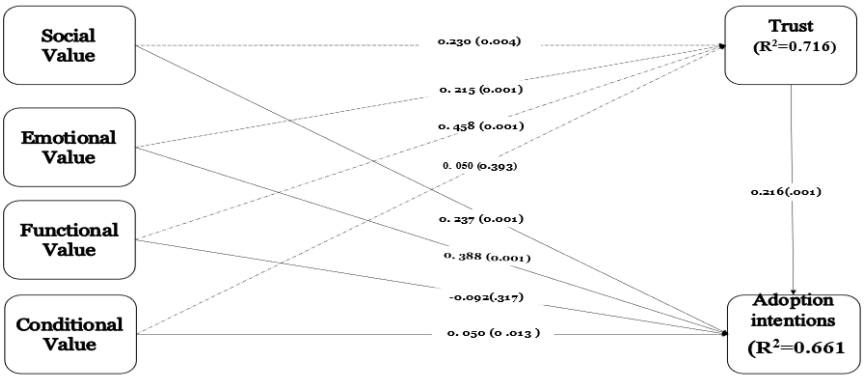
First, participants were asked to read the scenario regarding peer-to-peer energy systems based on peer-to-peer energy exchange. Then, participants responded to our measures on a scale from 1(strongly disagree) to 9 (strongly agree); social value was measured by adapting items from Sangroya and Nayak (2017), i.e., "Using green peer-to-peer energy network would help me to feel accepted by others", "improve the way I am perceived by others" (α = .94), and four items for functional value by adapting α = .88). Behavioural intentions towards P2P energy were detected by using three items from Washizu et al. (2019) ("I plan to use peer to peer energy network, intend to use peer-to-peer services, "I intend to use peer-to-peer energy network" and "I predict that I will use peer-to-peer services as long as I have access to It" α = .93). Additionally, trust was evaluated by adopting five items from Chai et al. (2012) and Bhattacherjee (2002), e.g., "The other users of peer-to-peer energy network are truthful in dealing with one another " α = .92). See Appendix 1 for all measurement items.

The research hypotheses are tested by employing Partial Least Squares Structural Equations Modelling (PLS-SEM), using SMART-PLS 3 (Ringle, Wende, & Becker, 2015). This statistical technique estimates causative relations by combining statistical data and qualitative causal hypotheses (Dijkstra & Henseler, 2015). For this analysis, the partial least squares have been adopted - a variance-based technique - because it does not require a large sample and has no restriction on a normal distribution.

Results. *In Study 1, participants reported significantly higher levels of trust towards traditional energy companies (M = 7.53, SD =1.64) as opposed to the peer providers (M = 6.85, SD = 1.27; t(68) = 2.460, p < .001). Thus, Study 1 shows that participants hold more trust concerns towards this type of green energy innovation.*

Tab. 1: Trust based on the provider

It is shown that consumer trust is a crucial barrier towards P2P adoption. When faced with two types of energy providers, participants reported higher trust towards conventional (vs P2P) companies.



In Study 2, the research hypotheses are tested by employing Partial Least Squares Structural Equations Modelling (PLS-SEM), using SMART-PLS 3 (Ringle, Wende, & Becker, 2015). The data analysis is executed by adopting a two-step development. First, the measurement model is examined to ensure the research instrument's reliability and validity, and then the structural model is analyzed to test the hypotheses.

The measurement model was assessed for convergent and discriminant validity and construct indicator reliability (Hair, Hult, Ringle, and Sarstedt, 2016). The internal consistency values (Cronbach's Alpha) and the Composite Reliability values are adequately and are considered fitting in exploratory studies (Hair et al., 2014), as well as all the AVEs are more significant than 0.5 (Fornell & Larcker, 1981).

The structural model results were assessed through path coefficients (β), applying a bootstrapping technique with 1,000 iterations to calculate the t-statistic and the strength of the relationships among all constructs.

Our research model supports H1, and the social value positively impacts adoption intentions (β=-.237, p<0.01). Thus, H1a has been accepted, and social value has a positive impact on trust (β=-.230, p<0.01), confirming (H2b) and emotional value impacts consumers' adoption of the P2P energy system (β=.388, p<0.01), accepting H2a(β=.237, p<0.01). To test H3b, it has been found a significant effect of functional value on trust (β=.458, p<0.01), however, there was not a significant effect of functional value on adoption intentions (β=-0.092, p=.340), thus rejecting (H3a) and accepting (H3b). Finally, it was not revealed a significant impact of conditional value on trust (β=0. 50, p=.391) or consumers' adoption intentions' (β=0.050, p<0.013).

Tab. 2: Research model results

Thus, Study 2 reveals that the social and emotional dimensions of the green perceived model are the most important predictor in the P2P energy trust and adoption. More specifically, they both play a vital role in influencing adoption. However, functional value does not influence adoption.

Research limitations. *This research has limitations that may be future research opportunities. All our studies using survey and scenario-based experiments will need future research examining actual customer data to collaborate our findings. Moreover, The P2P green energy system is in early phases; thus, we lack clarity over boundaries of the concept of collaborative green energy (Biresselioglu et al., 2018). Future research could improve the original conceptual model provided, using other variables such as economic factors and social interaction.*

Our model focused on four dimensions of green perceived value, and future studies need to explore the role of epistemic and environmental dimensions (e.g., Biswas & Roy, 2015). Furthermore, one of the critical issues that might affect trust in P2P energy is privacy concerns. Growing privacy concerns associated with the consumers' data. Therefore, future research needs to explore consumers' privacy concerns in the P2P energy context.

Finally, this study focuses mainly on trust and adoption. However, other psychological and social factors might affect consumers' responses to energy communities, i.e., relationship norms communal and exchange (e.g., Aggarwal, 2004), or money and social market (see- Heyman & Ariely, 2004), thus understanding these communal and exchange norms might affect consumers' reactions to P2P platforms and providers.

Managerial implications. *First, given the strong influence of social and emotional value on trust and adoption, P2P energy platforms should emphasize community-building and shared environmental responsibility in their marketing strategies. Our findings can help both P2P platforms and peer single providers find practical strategies that impact consumers' adoption as our findings suggest that social value is the critical predictor towards adoption (e.g., Kowalska-Pyzalska, 2018). Thus, focusing on social aspects can be effective for P2P energy providers. Indeed, many emerging peer platforms seem to have a social focus in their positioning and branding strategies. Therefore, we encourage P2P energy platforms to focus on social value. This is beneficial for increasing adoption and plays an essential role in establishing trust in P2P platforms (e.g., Lu et al., 2020).*

Second, platform developers should implement trust-enhancing mechanisms, such as transparent user reviews, certification systems, and secure transaction processes, to address consumer concerns about reliability and risk. Previous

research suggests that trust-building features can significantly impact engagement in sharing economy platforms (Ter Huurne et al., 2017).

Third, policymakers should support regulatory frameworks that facilitate trust in P2P energy trading. Standardizing consumer protection measures and providing financial incentives for early adopters may accelerate adoption and contribute to broader sustainability goals.

Originality of the paper. *This research makes a novel contribution by integrating the concept of green perceived value with the study of trust and adoption in P2P energy trading. Unlike previous work that focuses on functional and economic factors, this study highlights the primacy of social and emotional drivers in shaping consumer behavior. By demonstrating the mediating role of trust, the findings extend the theoretical understanding of P2P energy adoption and offer practical guidance for promoting decentralized energy exchange.*

Key words: *Green energy adoption, social value, emotional value, peer-to-peer energy, sustainability.*

On a mission to get funds: the demand for venture capital of impact oriented ventures

VALENTINA LO MELE[1] ANITA QUAS[2] STEFANO ROMITO[3] CLODIA VURRO[4]

Abstract

This working paper examines the demand side of impact oriented ventures' financing for two key sources of equity: Traditional (TVC) and Social Impact Venture Capital (SIVC). Because of their dual mission to generate social or environmental impact alongside financial returns, we posit that impact-oriented ventures have stronger need for external financing. However, they might refrain to associate with investors who do not share their intention to generate impact, such as TVC, fearing mission drift. Instead, that impact-oriented ventures might prefer investors who also share impact objectives, such as SIVC. To test our hypotheses, we conduct a survey on European start-ups, collecting valid responses from 946 ventures—35.1% of which are impact oriented. Preliminary results indicate that impact oriented ventures exhibit higher overall needs for external finance compared to their commercial counterparts, and they have a strong preference for SIVC rather than TVC financing. Our results shed new light on the results of previous studies that found that impact-oriented ventures are less likely to secure TVC: it is not only because of a lower attractivity of these companies towards TVCs, but also because of a lower demand.

Framing of the research. *The objective of creating social or environmental impact, often aligning with the achievement of the United Nation Sustainable Development Goals (SDGs), has become increasingly relevant for many entrepreneurial ventures, especially in Europe (Austin et al., 2006; Battilana & Lee, 2014). Until recently, social or environmental impact-driven missions were typically the domain of non-profit activities, which mostly rely on donor communities to finance their operations (Shepherd et al., 2019; Schätzlein et al., 2023; Bonfanti et al., 2024). Impact oriented ventures are instead for-profit businesses, with a mission of generating social or environmental impact alongside financial returns. Impact oriented ventures have distinctive entrepreneurial practices, also with respect to the collection of financial resources (Battilana & Lee, 2014; Doherty et al., 2014). While philanthropic finance continues to be relevant (Lall & Park, 2022), it is not sufficient to ensure the scale-up of the venture. The objective of this paper is to investigate the demand for external finance of impact oriented ventures, with as focus on different types of Venture Capital (VC) funds.*

Impact oriented ventures, operating at the intersection of social and commercial objectives, have unique financial needs that are often overlooked (Doherty et al., 2014). Traditional VC (TVC), which is fundamental source of finance for promising entrepreneurial ventures, are often reluctant to associate with impact oriented ventures because of their impact goals, which might be perceived by TVCs as potentially compromising financial performance. Impact oriented ventures require hybrid financial instruments that align with their dual objectives, and specialized social investment funds and programs have emerged to fill this gap (Hehenberger et al., 2019). Literature shows that these companies are more likely to get funding from niche VC investors, including social impact venture capital (SIVC) funds (Lo Mele et al., 2024).

Yet, existing literature has mostly focused on the supply side of the financing of impact oriented ventures (Barber et al., 2021; Lo Mele et al., 2024), taking the point of view of investors, rather than the ventures themselves. The nuanced demand for finance of impact ventures, in terms of their preferences and access barriers, remain underexplored, highlighting a critical area for research and policy development (for an exception related to repayable finance, see Lyon & Owen, 2019).

Purpose of the paper. *To fill this gap, in this paper we focus on impact oriented needs for external equity, and on the demand for two prominent providers of entrepreneurial finance: TVCs and SIVCs. We theorize that, given their focus on creating impact alongside profit, impact oriented ventures may require larger and more patient capital, perceiving a greater need for external equity compared to other ventures. At the same time, the agency costs associated with engaging with external investors may make companies reluctant to seek funds from TVCs, fearing that the investors might not perceive, value or protect their impact orientation. Concerned of being forced to drift away from their mission when*

associating with TVCs, impact oriented ventures might seek funds from SIVCs, who also value and prioritize social and environmental impact.

Furthermore, we tackle the heterogeneity of impact oriented ventures, distinguishing those with a more substantial impact orientation (Truong et al., 2021). Specifically, we expect that ventures that adopt more sustainable managerial practices and those with a stronger intention to scale-up their impact will be more in need of external finance because of the higher investments needed to pursue their mission. At the same time, they will also perceive a stronger risk of mission drift (Battilana et al., 2022), which will further reduce the demand for TVC financing and increase the demand for SIVC.

We test our hypotheses using survey-based data retrieved in early 2024 from a European sample of start-ups, 35.1% of which are impact oriented. Results confirm our hypotheses that these ventures have higher needs for finance. Conditional on needing resources, impact oriented venture are less likely than other ventures to seek TVC, and more likely to seek SIVC. These results partially explain the evidence on a less likely association between impact oriented ventures and TVC, demonstrating that it is not only an issue of supply of finance, but also a consequence of the impact oriented ventures reluctance to associate with TVCs, for fear that the investor might require a mission drift.

Literature review and hypothesis development:

Financial need refers to the gap between a venture's available internal resources (such as cash flow, retained earnings, or founder contributions) and the capital required to sustain and expand its operations, fulfil strategic objectives, and achieve long-term viability (Patzelt et al., 2008; Bottazzi et al., 2014). Entrepreneurs typically address these financial needs by seeking external sources of financing. Importantly, the degree of financial need can influence entrepreneurial decision-making, not only with respect to financial strategies but also regarding non-financial, value-adding decisions (Riepe & Uhl, 2020).

While prior research has explored the general financing challenges faced by new ventures, direct studies on the specific financial needs of impact oriented ventures remain scarce. In this research, we posit that impact oriented ventures require more capital than their purely commercial counterparts. For commercial ventures, external financing is primarily used to pursue essential business activities, such as establishing the company, developing products, and scaling operations (Plambeck, 2012; Villanueva et al., 2012). In contrast, impact oriented ventures require funding for a dual purpose: in addition to covering core operational needs, external resources are crucial to creating positive social or environmental impact (Austin et al., 2006). This dual-purpose mission often translates into the adoption of less profit-oriented business models or the implementation of additional mission-driven activities (Hietschold et al., 2023), both of which heighten their financial needs.

Impact oriented ventures frequently adopt business models that, particularly in their early stages, are less profitable or less efficient than those of commercial ventures. For example, ventures targeting lower-income communities may offer products or services at reduced prices to ensure accessibility (Bloom, 2009). While such strategies, commonly aimed at bottom-of-the-pyramid populations, may yield long-term benefits through high sales volumes (Dentchev et al., 2022), they often result in reduced margins during initial phases. Similarly, firms employing socially disadvantaged workers might prioritize social impact over operational efficiency, further increasing their reliance on external financial resources (Narayanan & Terris, 2020). These factors collectively heighten the financial needs of such ventures.

Beyond business model constraints, impact oriented ventures frequently invest in mission-aligned activities that add substantial operational costs. For instance, ventures working directly with beneficiaries often provide additional training, education, or employment programs to fulfil their social missions (Hietschold et al., 2023). In addition to direct beneficiary engagement, these organizations often undertake activities aimed at other stakeholders, such as customers or industry peers. Environmental entrepreneurs, for example, may simultaneously reduce environmental degradation and capture economic value by educating consumers about the environmental attributes of their products or services (Dean & McMullen, 2007).

Recent research has also highlighted advocacy as a critical activity for social enterprises (Mair & Rathert, 2024) a specific type of impact oriented venture. Advocacy efforts are designed to address systemic social problems by influencing public policy, legislation, norms, attitudes, and behaviors. Unlike lobbying, which primarily seeks to advance the interests of specific groups or organizations, advocacy aligns with the broader missions of these ventures, aiming to tackle the root causes of societal issues. However, while advocacy is mission-aligned, it often lacks a direct positive impact on profitability. Consequently, these initiatives generate additional costs, further exacerbating the financial constraints faced by impact oriented ventures.

Taken together these arguments suggest that impact oriented ventures may face heightened financial constraints, making them more dependent on external funding. Therefore, we hypothesize:

Hypothesis 1: Impact oriented ventures are more likely to need external funding.

VC is a prominent provider of finance for entrepreneurial ventures, better able to cope with severe information opacity and lack of collateral than traditional commercial banks (Kaplan & Strömberg, 2001; Carpenter & Petersen, 2002). Yet not all companies are likely to seek this specific financing opportunity. Previous literature shows that the ventures' demand for external equity depends on a number of factors, including the availability of internal sources of finance such as cash flows (Mina et al., (2013), the growth orientation of the company (Cosh et al., 2009; Eckhardt et al., 2006; Mina et al., 2013; Riding et al., 2012), the industry (Eckhardt et al., 2006; Cosh et al., 2006) the level of education and experience of the founders (Bertoni et al., 2017; Colombo et al., 2017; Cosh et al., 2009) and the local availability of VC (Colombo et al., 2019).

Recent advancements in the supply side of VC financing have emphasized the heterogeneity within the VC ecosystem, which alongside Traditional VC includes, among others, Social Impact (SIVC), Governmental, and Corporate VC (Lo Mele et al., 2024). These diverse investor profiles exhibit distinct preferences and investment strategies (Cole et al. 2022; Shankar et al., 2024), leading to significant variation in the characteristics of the ventures they include in their portfolios. Importantly, the process of venture selection is not unidirectional; it represents a mutual matching process between investors and investees (Bengtsson & Hsu, 2015). This dynamic suggests that the preferences of the investees themselves—shaped by the attributes of potential investors—play a crucial role in determining the outcomes of VC engagement.

Building on this premise, we argue that the demand for VC financing among impact oriented ventures will vary based on the type of VC considered. Specifically, we posit that impact oriented ventures are more likely to prefer SIVCs while avoiding TVCs. Our argument is based on the perceived tradeoff faced by impact entrepreneurs when seeking external funding. While the inclusion of new shareholders offers the opportunity to secure additional capital, it also introduces the risk of mission drift: external investors may pressure the venture to alter its business model to achieve greater profitability (Gerasymenko et al., 2015), and in the case of impact oriented ventures this might come at the expense of the venture's social or environmental mission (Cetindamar & Ozkazanc-Pan, 2017). Such perceived risks can significantly influence the decision-making process of impact oriented entrepreneurs, who prioritize maintaining their mission integrity.

The perceived risk of mission drift, however, is not uniform across investor types. When engaging with TVC, these tensions are likely to be heightened due to the fundamental misalignment between the profit-maximization objectives of TVC and the dual-purpose mission of impact oriented ventures (Shatzlain et al., 2022). This misalignment exacerbates principal-agent costs and increases the likelihood of conflicts arising from differing strategic priorities. Consequently, impact oriented ventures may actively avoid seeking funding from TVC to mitigate these risks. Conversely, these perceived risks are significantly lower when dealing with SIVC. Impact investors and impact oriented ventures share a dual mission to achieve both financial returns and measurable social or environmental outcomes (Cetindamar & Ozkazanc-Pan, 2017). Moreover, SIVC management teams often have professional backgrounds in NGOs, social enterprises, or other mission-driven organizations (Scarlata et al., 2017), fostering a shared understanding of impact oriented goals. This alignment in objectives and values helps establish a common "impact language, " reduces the potential for conflict, and enhances trust. As a result, SIVC are seen as more supportive of maintaining the venture's mission while providing the necessary financial resources. Based on these arguments, we hypothesize:

Hypothesis 2: Impact oriented ventures are less likely to search TVC (a) and more likely to search SIVC (b) than other ventures

While we have acknowledged the heterogeneity of investor types, we have so far considered impact oriented ventures as a homogenous group. However, prior literature underscores the significant diversity among such ventures in terms of their characteristics, objectives, and capabilities (Saebi et al., 2019).

One important source of heterogeneity lies in the extent to which these ventures adopt managerial practices aimed at setting, monitoring, integrating, and communicating impact goals (Rawhouser et al., 2019). For some ventures, adopting these practices comprehensively is perceived as disruptive due to ambiguous indicators or the complexity and time-intensive nature of their application (Schlütter et al., 2024). This challenge is partly due to the absence of standardized measurement approaches and partly to the perception that these activities represent an additional burden for organizations. As a result, some ventures prefer more immediate and intuitive ways of communicating results, such as storytelling or qualitative evaluations of social criteria (Hehenberger et al., 2019).

We posit that this heterogeneity in the adoption of sustainability-related managerial practices influences not only the financial needs of these ventures but also their preferences for specific types of investors. Ventures that implement these practices comprehensively are likely to incur higher financial burdens because such processes often require significant internal resources, including specialized personnel, dedicated time, and the development of systems for data collection, analysis, and reporting (Truong et al., 2021). These costs add to the overall operational expenses of the venture, heightening its financial constraints and increasing its reliance on external funding sources. Therefore, we hypothesize:

Hypothesis 3: Impact oriented ventures that incorporate managerial practices related to their impact mission are more likely to need external funding.

Furthermore, the degree of adoption of these practices has implications for the ventures' preferences regarding investors. Ventures with robust managerial practices are more likely to prioritize consistency with their mission, which increases their sensitivity to potential misalignments with investors. The process of systematically defining, monitoring, and communicating impact goals reinforces a venture's commitment to its mission (Ebrahim et al, 2014) and amplifies the perceived risks of engaging with investors who prioritize financial returns over social or environmental outcomes. For such ventures, the possibility of mission drift—where external pressures lead to a deviation from core impact objectives—becomes a significant deterrent to approaching non-aligned investors, such as TVC.

Conversely, these ventures are more inclined to engage with SIVC, whose dual-purpose objectives align with their own commitment to achieving both financial and impact outcomes (Lo Mele et al, 2024). The shared values and understanding between ventures and SIVC foster trust and reduce potential conflicts, making SIVC a preferred financing option for ventures with strong sustainability-related managerial practices. Additionally, ventures that adopt these

practices are often growth-oriented and seek to scale their impact in a way that aligns with their mission, further discouraging engagement with investors whose priorities diverge from their own (Schätzlein et al., 2023).

Hypothesis 4: Impact oriented ventures that incorporate managerial practices related to their impact mission are less likely to seek TVC and more likely to seek SIVC compared to other impact oriented ventures

Methodology.

Data on the need or demand for external finance of ventures is generally not available from proprietary databases. We therefore decided to collect information on the demand for external finance of European impact oriented and commercial ventures through a survey. We designed the survey in Spring 2023, based on academic literature and on previous relevant surveys, and submitted to companies retrieved from Dealroom in July 2023. The list of ventures was supplemented by Innovative start-ups registered in the special section of the Italian Chambers of Commerce registry[5].

After data cleaning, the final list of prospective survey recipients included 102, 931 European ventures founded since 2015. The official survey was first distributed on the 6th of February 2024 in 7 languages. Four reminders followed till the end of March. Only a portion (53, 776) of our emails was successfully received[6] and opened by recipients. Eventually, 1, 583 responses were collected, for a response rate of 2.94%[7]. Response rates greatly varied across countries. Moreover, older companies were less likely to participate in our survey: the response rate is as high as 64% for companies born in 2023 and as low as 2% for companies founded in 2015. The average age of ventures in 2023 was 4.54 years.

In our models, we use 946 answers for which we have full information on variables of interest. In order to avoid sample selection bias to influence our results, we adopted post-stratification techniques based on stratified weights (Cochran, 1977; Deville et al., 1993). and used those weights to run weighted regressions.

Our model specifications analyse the need and the search for VC funding of our respondents. We first asked our ventures whether they ever searched VC, defining a dummy variable need as equal to 0 if the companies didn't search because of a lack of need, and 1 in all other cases. 836 (88.4%) out of 946 companies, perceived the need for external financing. Companies that had sought VC were then asked to indicate the type of investor they first approached during their lifetime, namely TVC, SIVC.

The main independent variable captures whether a venture is impact oriented. We considered as impact oriented ventures who declared that impact orientation is the venture's top priority or among the top priorities, excluding those companies whose impact orientation has changed over time. Eventually, we consider as impact ventures 332 companies (35, 1% of total). To identify "substantial" impact oriented ventures, we asked respondents to indicate whether they adopted any sustainable managerial practices among 12 different practices provided. We use this information to build two alternative variables capturing the use of sustainable managerial practices: Sustainable practices count and Sustainable practices factor (obtained through a factor analysis). (See Table 1 for statistics and correlation matrix)

Table 1: Descriptive statistics and correlation matrix.

		N	Mean	SD	Min	Max	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
(1)	Need	946	0.884	0.321	0.000	1.000	1.000							
(2)	Impact Venture	946	0.351	0.478	0.000	1.000	0.087	1.000						
(3)	Search of TVC	946	0.391	0.488	0.000	1.000	0.291	0.001	1.000					
(4)	Search of SIVC	946	0.146	0.353	0.000	1.000	0.150	0.198	0.086	1.000				
(5)	Age	946	4.542	2.074	0.000	8.000	-0.052	-0.126	-0.070	-0.068	1.000			
(6)	Growth Intention	946	3.962	1.213	1.000	5.000	0.087	0.034	0.172	0.043	-0.118	1.000

(8)	Sustainable Practices Factor	946	.000	.504	1.945	.646	0.014	.000	0.008	.054	0.003	.075	.401	.000

Notes. This table presents the descriptive statistics and correlation matrix of the variables used in the analysis.

We use probit regressions to test the hypotheses H1 and H3, using need as dependent variable (Table 2). We then restrict the analysis to companies in need for external finance and resort to bivariate probit regressions to test hypotheses H2 and H4, on the search for TVC and SIVC, respectively (Table 3). We also control for growth intention, foundation year, industry sector thanks to the NACE codes, and the country where the venture is located.

Results. *Our results related to hypotheses 1 and 3 are reported in Table 2. Considering the dichotomous nature of the dependent variable need, we employed a Probit model with robust standard errors and probability weights to integrate post-stratification techniques and limit sample selection bias.*

Column I shows some support to hypothesis 1, showing a stronger need of external finance for impact oriented ventures (p-value<10%). However, neither of our measures capturing the adoption of sustainable managerial practices in Columns II and III are significant. They do not influence the financial need of impact ventures, thus rejecting hypothesis 3. Instead, the need for finance is mostly driven by the ventures growth intention (p-value<5%).

5 https://startup.registroimprese.it/isin/static/startup/index.html?slideJump=32

6 For GDPR compliance we decided to use generic company email (info@company.com) for the distribution.

7 The low response rate is arguably the outcome of different circumstances: use of generic email addresses, the survey distributor service, recipients' language.

Table 2: Probit models on the need of external finance for impact ventures and further explored for impact ventures adopting sustainable practices.

Dependent variable: Need	I	II	III
Impact Venture	0.292*	0.400	0.341*
	(0.171)	(0.258)	(0.154)

Notes. Significance: * $p < 0.10$; ** $p < 0.05$; *** $p < 0.01$.

Results on the search for TVC and SIVC are shown in Table 3. In column I, we find that impact ventures are less likely to seek TVC (p-value<5%) and more likely to seek SIVC (p-value<1%), consistently with our Hypothesis 2.

In Column II, we find that this effect is further amplified when these ventures adopted more sustainable managerial practices, as Sustainable Managerial practices score has a significant negative effect on TVC (p-value<10%) and positive on SIVC (p-value <5%). This supports hypothesis 4.

In Column III, when we use our alternative measure of Sustainable Practices Score, we do not find a significant effect on the search for TVC, but we find a strong positive effect on the search for SIVC (p-value<5%), further supporting Hypothesis 4.

Moreover, growth orientation loads positively on the chances to look for TVC (p-value <1%), while it has no effect on the search for SIVC.

Research limitations. *The major limitations of our study lie in four key aspects. First, the relatively small dataset may affect the generalizability of our findings, as a larger sample could provide a more comprehensive representation of the phenomenon under investigation. Second, the survey distribution methods may have introduced selection bias, potentially influencing the composition of respondents and, consequently, the results. Third, entrepreneurial financing encompasses a variety of mechanisms, and it is possible that different funding models would yield distinct outcomes, limiting the extent to which our conclusions can be applied across different contexts. Finally, our data offers only a snapshot in time; longitudinal data collection at multiple intervals could provide a more nuanced and dynamic understanding of how these patterns evolve over time.*

Future research could enhance our findings by exploring and comparing the investment outcome of the VC search, also including Governmental Venture Capital (GVC) among investors. Future studies could also investigate how the behaviour of impact oriented ventures vary based on entrepreneurs' backgrounds and organizational structures.

Managerial implications. *Our findings contribute to the literature on impact oriented ventures by shifting the perspective to their unique needs and preferences in securing VC financing. Specifically, our findings demonstrate the much urgent need of equity financing for impact oriented ventures and suggest a hierarchy in the preference of VC form, with a clear tendency for these ventures to prioritize financing from investors who share and support their ideals and mission.*

These insights inform VC investors about potential funding preferences of ventures who typically may not search traditional form of investments, and instead prefer more impact oriented forms, especially if their mission is more substantially oriented to impact creation. From the perspective of the venture, these results also suggest how impact oriented ventures should approach managerial practices from a financing perspective.

Originality of the paper. *By inspecting the funding need of impact oriented ventures and their search for VC, with a special focus on the TVC and SIVC investors, our study contributes to the literature on the demand of impact oriented ventures. Findings show that impact orientation somehow increases the need of external financing, but at the same time discourages ventures from approaching traditional finance provides for start-ups, i.e., TVC. Instead, these ventures are more likely to seek funds from investors who align with their mission, i.e., SIVC. Further analysis highlights that this behaviour is especially prevalent among impact oriented ventures who integrate more sustainable managerial practices in their business model.*

Key words: *Impact oriented venture; Social Impact Venture Capital; Demand side*

Understanding Paradoxical Thinking in Corporate Sustainability: Antecedents, Processes, and Outcomes

GIOVANNI GESIOT[1] ALICE ALOSI[2] FRANCESCO RIZZI[3] ELEONORA ANNUNZIATA[4]
MARCO FREY[5]

Abstract

Complex challenges, such as those related to Corporate Sustainability, require complex solutions and complex minds to develop them. In this Systematic Literature Review (SLR) of 82 papers, we structure and organize the existing knowledge related to cognitive frames using paradox theory as a theoretical lens and corporate sustainability as context. The goal is to examine the antecedents that foster the cognitive complexity of paradoxical thinkers, to identify the distinctive cognitive processes they employ, and exploring the outcomes that result from these processes.

The literature underlined that cognitive frames are flexible structures that are influenced by personal features and contextual factors and evolve as the individual gains new knowledge. Moreover, individuals with paradoxical cognition, thanks to their cognitive complexity, are well equipped to face tensions in Corporate Sustainability: they are able to gather all the relevant information on the issue, interpret them, accept the inconsistencies inherent to the subject, and eventually adopt a positive stance toward the issue.

In conclusion, individuals with paradoxical cognition act seeking synergies or compromises while trying to influence the cognitive frameworks of those around them through discursive and motivational practices.

Framing of the research. *To organize and interpret ambiguous informational signals, such as those related to the three dimensions of Corporate Sustainability (CS), individuals rely on cognitive frames, which serve as "mental templates that individuals impose on an information environment to give it form and meaning" (Walsh, 1995, p. 281).*

The literature identifies various types of cognitive frames. Hahn et al. (2014) limit their research to two main cognitive frames ideal-types: the business-case and the paradoxical cognitive frame. The business-case cognitive frame avoids inconsistencies and ambiguities by applying a unified logic, resolving sustainability tensions by prioritizing economic goals; however, following an instrumental logic, if pursuing social and environmental goals allows to obtain economic benefits they engage with it. The paradoxical cognitive frame accepts that tensions cannot be entirely eliminated and instead accommodates and embraces the inconsistencies arising from the simultaneous pursuit of the three dimensions.

More recently, scholars have proposed a third cognitive frame. Defined as the "unidimensional frame" by Preuss & Fearne (2022), "grow first" (Giuliani et al., 2020) or the "business frame" by Sharma & Jaiswal (2018), this frame focuses exclusively on economic aspects, disregarding environmental and social considerations entirely.

Each cognitive frame addresses environmental and social challenges through distinct logic. The process through which individuals interpret such signals is known as sensemaking, which Hahn et al. (2014) describe as having three main components: scanning, consisting of information gathering, interpreting, which involves carving out meaning from information and responding, entailing the formation of an attitude toward the issue.

Although comparing the three cognitive frames is worthwhile, a focus solely on the paradoxical cognitive frame and the associated sensemaking process is a nuance perspective. This focus is due to the potential of paradoxical cognition to integrate the three dimensions of corporate sustainability effectively. By advancing research on this cognitive frame, we can gain insights into developing practical tools to tackle complex sustainability challenges.

The literature suggests the existence of other cognitive processes besides sensemaking (Maitlis & Christianson, 2014). Between these, there are sensebreaking (Pratt, 200) and sensegiving (Gioia & Chittipeddi, 1991).

Cognitive frames are not stable structures; they evolve as the individual gains experience (Gröschl et al., 2019). This process is facilitated by sensebreaking, which involves the disruption of existing cognitive frames, spurring individuals

DOI 10.7433/SRECP.SP.2025.01

to question established assumptions and search for new interpretations of complex issues (Pratt, 2000; Kaffka et al., 2021). In the context of sustainability, sensebreaking can challenge dominant business logics, fostering openness to paradoxical perspectives and the accommodation of competing goals (Menon, 2022).

On the other hand, once the void has been created, organizational actors can influence individuals' cognitive frames by using sensegiving processes, through which individuals actively shape others' interpretations of ambiguous or complex issues, utilizing narratives, symbols, and other communicative tools to align organizational understanding and action (Gioia & Chittipeddi, 1991; Sharma & Good, 2013). In corporate sustainability, sensegiving plays a pivotal role in promoting shared values and motivating collective efforts to address paradoxical tensions (Hoppmann et al., 2023).

Purpose of the paper. *Since Hahn et al. (2014) conceptual work, empirical and theoretical studies have advanced understanding of how paradoxical cognitive framing functions in corporate sustainability, especially as it relates to decision-making and strategy (Boijca & del Rio, 2023; Sharma & Jaiswal, 2018; Schulte & Paris, 2024). This Systematic Literature Review (SLR) focuses on the paradoxical cognitive frame as it pertains to sustainability because this approach shows significant potential for accommodating the three dimensions of corporate sustainability, ensuring the long-term survival and success of businesses while addressing pressing global challenges (Hahn et al., 2014; Sharma & Jaiswal, 2018; Boijca & Martínez-Del-Río, 2023).*

This study is grounded in the growing body of literature on paradoxical cognitive frames in corporate sustainability which has reached a significant production. However, the contributions remain heterogeneous in their findings, highlighting the need for a cross-referenced analysis. Such an approach is essential to identify underlying themes and establish a coherent foundation for future developments in the field. Accordingly, this SLR aims to address the following research questions:

- *What are the antecedents to the development of a paradoxical cognitive frame concerning corporate sustainability?*
- *Which cognitive processes do individuals holding a paradoxical cognition use to make sense of paradoxical tensions related to corporate sustainability?*
- *What are the consequences of paradoxical sensemaking related to corporate sustainability?*

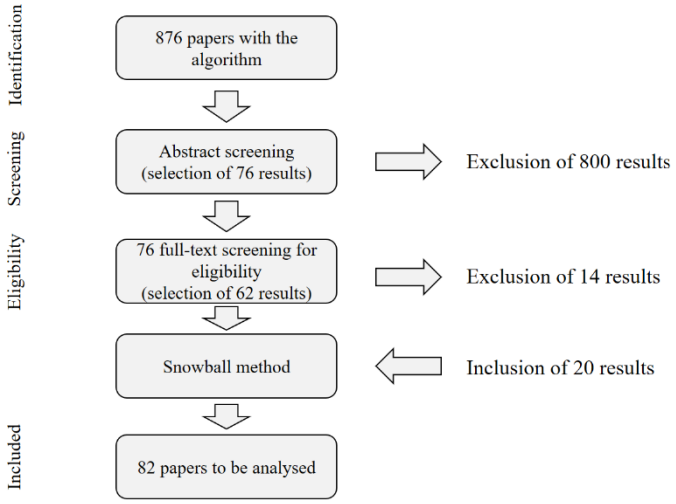
Methodology. *To respond to the three research questions, we decided to adopt the method of systematic literature review (Tranfield et al., 2003), with the following research design decisions.*

The research was conducted in Scopus database, including peer-review papers, therefore excluding books and books chapters, published in English between January 2014 and September 2024. This timeframe was chosen to capture studies published after Hahn et al.'s (2014) conceptual paper on paradoxical cognition and sensemaking, which spurred interest in paradoxical cognition as a critical aspect of decision-making in corporate sustainability contexts.

To develop our search strategy, we conducted multiple tests to optimize the search string. The final search string was as follows: (TITLE-ABS-KEY (sustainab OR csr OR "corporate sustainab*" OR cs* OR hybrid) AND TITLE-ABS-KEY ("cognitive frame*" OR "mindset" OR sensemaking OR micro* OR leader* OR manage* OR entrepreneur* OR consumer* OR customer* OR employee* OR individ* OR persona*) AND ALL (paradoxical)).*

This search string allowed us to identify articles examining how various categories of individuals face paradoxical situations in sustainability-related decisions. Our pool encompassed both for-profit and hybrid organizations, ensuring a broad perspective on corporate sustainability challenges.

The search algorithm yielded 876 results in the Scopus database, which were screened using the following inclusion criteria (Figure 1).



To ensure the inclusion exclusively of high-quality papers, we included only articles from journals listed in the ABS ranking. We then proceeded to eliminate all the contributions that did not refer to at least two of the three dimensions of sustainability to justify the presence of paradoxical tensions. We included only the papers that had a focus on the individual level, therefore excluding all the paper with an organizational or systemic focus. An initial abstract screening yielded 76 articles, which were further screened in an interactive process by all the authors via text. We retained papers that contributed to at least one of the following research areas: factors facilitating the development of paradoxical cognition, cognitive processes involved in making sense of ambiguous sustainability cues, and outcomes of these processes. After full-text screening, we retained 62 articles that met our criteria, which we integrated using the forward and backward snowballing process (Wohlin, 2014), including 20 other results. This process resulted in a final set of 82 articles for analysis.

Finally, we used an Excel data extraction sheet (Rashman et al., 2009; Calabrò et al., 2019) to identify recurrent patterns, shifts, and trends (Saunders et al., 2009).

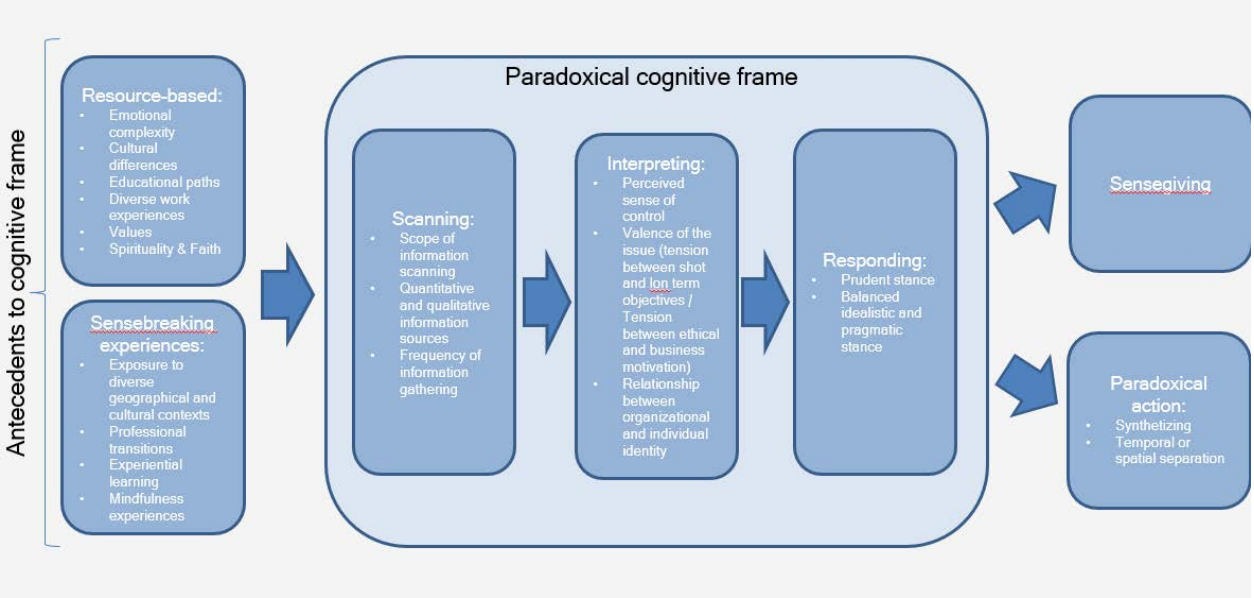
Results. *Episodic antecedents are specific, time-limited events that prompt the development of paradoxical cognition. These events include sensebreaking episodes, which disrupt existing mental frameworks and prompt individuals to seek alternative interpretations and understandings. Examples of episodic antecedents highlighted in the literature are exposure to diverse geographical and cultural contexts, professional transitions, experiential educational opportunities, and mindfulness experiences (Gröschl et al., 2019; Menon, 2022). Immersive intercultural experiences, such as living or studying abroad, challenge existing cognitive schemas by exposing individuals to diverse values and perspectives, thus encouraging the adoption of a more complex cognitive frames (Mafico et al., 2021). Similarly, professional transitions introduce new cognitive challenges that prompt individuals to develop more integrative cognitive frames to manage paradoxical tensions effectively (Preuss & Fearne, 2022). Experiential learning, such as pedagogical activities designed to immerse students in real-world scenarios emphasizing sustainability tensions, fosters cognitive complexity by requiring students to manage conflicting sustainability dimensions actively (Smith et al., 2012; Al Taji & Bengo, 2019). Mindfulness*

experiences further contribute by enhancing individuals' self-reflection, critical thinking, and adaptability, enabling deeper engagement with paradoxical sustainability tensions (Sajjad et al., 2024).

Figure 1:PRISMA flow diagram

Resource-based antecedents, by contrast, are enduring personal traits or stratified experiences that support the ability to think paradoxically. These include emotional complexity, cultural background, values, educational and working background, and spirituality. Emotional complexity, defined as the ability to simultaneously process and integrate both positive and negative emotions, supports paradoxical thinkers by enabling them to cope with the emotional strain associated with sustainability challenges (Sharma & Good, 2013). Cultural background significantly influences the development of paradoxical cognition, with research suggesting that indigenous managers or managers from Latin American contexts often exhibit enhanced capabilities for managing sustainability paradoxes due to cultural norms emphasizing interconnections between social, economic, and environmental goals (Angulo-Ruiz & Muralidharan, 2023). Values play a critical role, with individuals who strongly endorse self-transcendence and universalism being better equipped to embrace paradoxical tensions in sustainability (Moura-Romero et al., 2024). Educational and working backgrounds also shape cognitive complexity. Diverse professional experiences across sectors increase the capacity to manage sustainability paradoxes, while educational backgrounds in non-business disciplines tend to foster paradoxical thinking more readily than business-oriented education (Carollo & Guerci, 2018). Finally, spirituality and philosophical inquiry enhance cognitive complexity by motivating individuals to critically reflect on existential questions, thereby fostering a nuanced understanding of sustainability tensions (Gröschl et al., 2019).

The sensemaking process itself is structured into three distinct phases: scanning, interpreting, and responding, as described by Hahn et al. (2014) and Walsh (1995).



Scanning involves gathering information perceived as relevant based on an individual's cognitive content and structure. It is influenced by emotional complexity, which allows paradoxical thinkers to navigate ambiguity without experiencing overwhelming emotional distress (Sharma & Good, 2013). Paradoxical thinkers balance breadth and depth, gathering information broadly across economic, environmental, and social domains, while still conducting detailed searches when required (Corbett et al., 2018; Busch et al., 2020). Their integrative learning capacity fosters a continuous search for new knowledge, enhancing the complexity and richness of their interpretations (Vallaster et al., 2019).

Interpreting involves extracting meaning from information gathered during scanning. Paradoxical thinkers often experience ambivalent interpretations due to balancing competing sustainability attributes across temporal dimensions-short-term economic objectives and long-term ethical, social, and environmental considerations (Sasse-Werhahn et al., 2020; Guerci & Carollo, 2018). Despite earlier suggestions by Hahn et al. (2014) regarding paradoxical thinkers' moderate sense of control, recent studies suggest a higher perceived control due to their cognitive complexity and proactive nature (Busch et al., 2020; Boijca & Martínez-Del-Río, 2023). This ambivalence in valence often emerges from balancing economic motivations with ethical drivers, resulting in nuanced evaluations of sustainability issues that incorporate both positive opportunities and challenging trade-offs (Dhanesh, 2020; Sasse-Werhahn et al., 2020).

Responding, the final sensemaking phase, encompasses the mental stance toward sustainability issues that predisposes individuals toward certain actions. Paradoxical thinkers typically adopt prudent or balanced stances, consciously navigating between idealistic aspirations and pragmatic considerations (Ashforth & Reingen, 2014; Gopakumar & Gupta, 2023). This balanced approach allows them to set ambitious sustainability goals while ensuring practical feasibility.

Finally, the outcomes of sensemaking manifest in sensegiving and concrete actions. Sensegiving, a political and communicative process, involves influencing how others interpret sustainability issues, shaping collective cognitive frames through narratives, symbols, and motivational tactics (Poon & Law, 2022; Sharma & Good, 2013). Paradoxical action typically includes synthesizing, integrating economic, social, and environmental dimensions simultaneously, or splitting strategies, addressing these dimensions separately, either temporally or spatially (Xiao et al., 2019; Epstein et al., 2015). These strategic actions reflect the cognitive complexity inherent in paradoxical cognition and allow for effective management of sustainability paradoxes.

Figure 2: Paradoxical thinkers processes, antecedents and consequences

Research limitations. *First, the research exclusively examines paradoxical thinking within corporate sustainability due to inherent tensions across economic, social, and environmental dimensions, but external validity beyond sustainability contexts hasn't been tested.*

Second, cognitive frames were analyzed as static structures, not accounting for how these evolve dynamically. This limitation arises from a scarcity of longitudinal studies exploring the development of paradoxical cognition over time.

Third, cognitive antecedents and structures were studied without exploring contextual influences like industry-specific characteristics or cultural settings. The absence of detailed exploration of these contextual elements represents a further limitation.

Managerial implications. *First, we highlight the importance of experiential learning, suggesting that organizations can use sensebreaking experiences (Menon, 2022), through redirecting, reframing and questioning strategies (Kaffka et al., 2021), to promote sustainability practices and foster paradoxical cognition among employees at different organizational levels.*

Second, this review offers valuable insights for human resource practices, helping managers identify and select individuals with the cognitive characteristics and personal resources necessary to proactively address sustainability tensions.

Originality of the paper. *This paper uniquely synthesizes episodic and resource-based antecedents influencing paradoxical thinking. Examining episodic antecedents, sensebreaking, originally defined by Pratt (2000) as the disruption of one's existing meaning structures, is pivotal in developing paradoxical cognition. Recent expansions by Kaffka et al. (2021) identify socially situated sensebreaking, where external feedback unintentionally challenges managers' mental frameworks. Three core mechanisms-redirecting, reframing, and questioning underlying assumptions-characterize this process (Vlaar et al., 2008; Kaffka et al., 2021).*

Furthermore, the study extends and identify inconsistencies between Hahn et al.'s (2014) sensemaking conceptual model by incorporating recent empirical findings, offering a more nuanced understanding of how paradoxical thinkers navigate tensions between economic, social, and environmental sustainability dimensions.

Outcomes of paradoxical sensemaking include sensegiving and action strategies. Sensegiving, occurring both top-down and bottom-up (Hahn & Aragón-Correa, 2015), involves influencing peers through discursive and motivational practices. Paradoxical thinkers primarily adopt synthesizing strategies to integrate sustainability dimensions, though separating strategies, involving temporal or spatial separation, are also prevalent (Epstein et al., 2015; Xiao et al., 2019).

Assessing costs and benefits of a Nature-based Solution through a triple bottom line and participatory approach

GIORGIA CONDOMITTI[1] MARIA ROSA DE GIACOMO[2] SARA TESSITORE[3] MARCO FREY[4]

Abstract

The increasing frequency and intensity of climate-related disasters have underscored the need for effective risk management strategies that enhance resilience while mitigating socio-economic and environmental impacts. Nature-based Solutions (NBS) have emerged as a promising approach, offering multiple co-benefits across ecological, social, and economic dimensions. However, existing assessments often fail to account for the complex trade-offs and synergies associated with NBS implementation. Additionally, they rarely take into account the impacts on the whole platea of stakeholders affected. This study seeks to address these gaps by adopting a participatory approach to evaluate stakeholders' awareness of the costs and benefits linked to NBS.

Focusing on a coastal restoration project in the Tuscany region developed within the Horizon-funded Regions4Climate initiative, our research is grounded on a qualitative methodology. We first conduct a literature review to categorize NBS' costs and benefits within the Triple Bottom Line (TBL) framework. Subsequently, we integrate stakeholder perspectives through interviews and participatory workshops, aiming to explore synergies and trade-offs among economic, social, and environmental dimensions. By involving diverse stakeholder groups - including policymakers, private enterprises, civil society organizations, and scientific experts - this study aims to provide a more comprehensive understanding of how NBS impacts are perceived.

The anticipated outcomes of this research include a preliminary version of an analytical framework that systematically maps NBS costs and benefits against stakeholder awareness, highlighting potential conflicts, synergies, and areas of consensus. This study contributes to the literature on assessment frameworks of NBS adopting a participatory approach. On a practical perspective, the participatory assessment of trade-offs and synergies can help decision makers in identifying critical areas and potential conflicting objectives for management, as well as opportunities for strengthening synergies.

Framing of the research. *The increasing frequency and intensity of climate-related disasters underscore the urgent need for effective risk management strategies capable of mitigating their socio-economic and environmental consequences. In response, integrated ecosystem-based approaches, such as Nature-based Solutions (NBS), have gained prominence as viable alternatives probing to be effective in mitigating risks by leveraging natural features and enhancing climate resilience (Van Slobbe et al., 2013; Temmerman et al., 2013; Ferrario et al., 2014; Spalding et al., 2014).*

NBS represent an evolution of ecosystem-based approaches by integrating ecological processes with human interventions to enhance adaptation and mitigation efforts, conserve biodiversity, and improve human well-being (Cohen-Shacham et al., 2016). Although their conceptualization remains subject to ongoing debate, NBS are widely regarded as an "umbrella concept" encompassing diverse ecological, social, and technological interventions (Nesshöver et al., 2017; Pauleit et al., 2017). A unifying characteristic of NBS is their multifunctionality-their ability to generate co-benefits across environmental, social, and economic domains (Kabisch et al., 2016; Albert et al., 2017). These include biodiversity conservation, pollution mitigation, climate adaptation, improved public health, job creation, cost-effectiveness and adaptability (Cohen-Shacham et al., 2016; Raymond et al., 2017a; Keesstra et al., 2018). Nonetheless, alongside these benefits, NBS can also produce ecosystem disservices, which should be considered as co-costs (Calliari et al., 2019).
Recognizing the complexity of NBS highlights the need for a comprehensive assessment of their impacts, which should incorporate diverse stakeholder perspectives. Multiple stakeholder engagement, in fact, has been shown to enhance environmental decision-making, particularly when built on principles of empowerment, trust, and social learning (Young et al., 2007; Reed, 2008; Pistorius & Reinecke, 2013).

DOI 10.7433/SRECP.SP.2025.01

However, participation occurs along a spectrum, ranging from passive information dissemination to active co-creation and transformative engagement (Arnstein, 1969; Pretty, 1995; Farrington, 2014). While higher levels of engagement are often encouraged, recent studies suggest that the most appropriate level of participation depends on the specific context, stakeholders' capacity to influence outcomes, and project objectives (Richards et al., 2004; Tippett et al., 2007).

Purpose of the paper. *A comprehensive evaluation of NBS requires a rigorous assessment of both benefits and costs, taking into account trade-offs across different challenge areas and recognizing potential synergies. In this regard, while existing literature provides a solid foundation for understanding the various impacts of NBS, it tends to adopt a compartmentalized perspective. Thus, a much clear understanding of the interface between environmental, economic and social dimensions of NBS is still lacking. This limitation has been noted in multiple studies, which highlight the need for a more holistic perspective in assessing NBS trade-offs (Liquete et al., 2016a; Narayan et al., 2017; Raymond et al., 2017a, b; Calliari et al., 2019; Viti et al., 2022).*

Moreover, the involvement of multiple stakeholders, each with distinct interests and problem framings, further complicates this assessment, as different values coexist - sometimes in conflict.

Existing research has primarily relied on the ecosystem services framework to quantify the biophysical and economic value of NBS, particularly in urban areas (Baró et al., 2015; Liquete et al., 2015; Green et al., 2016). However, many of these studies focus on isolated indicators or challenge areas, such as ecosystem service valuation (Maes, 2013; Mouchet et al., 2017), climate mitigation co-benefits (Bain et al., 2015; Rao et al., 2016), environmental drivers of change (Díaz et al., 2015), and cost-benefit analyses (Ürge-Vorsatz et al., 2014). While valuable, these approaches fail to capture the multidimensional nature of NBS, which requires integrated evaluation frameworks that assess interdependencies across multiple domains. Additionally, NBS impact assessments often draw upon expert knowledge, while there are a range of other types of knowledge (e.g., indigenous, local, tacit) which require consideration in NBS impact assessments (Raymond et al., 2017a).

Few attempts have been made towards the investigation on the interplay between costs and benefits. For instance, synergies have been observed in areas such as water management and temperature control, while conflicts often relate to the allocation of limited physical space (Eftec, 2013). These synergies can extend beyond economic gains-such as reduced management and investment costs or economies of scale-to encompass social benefits, including community interaction in public green spaces and educational opportunities, as well as environmental advantages like enhanced biodiversity. Conversely, challenges may arise from nature conservation measures themselves, particularly where competition over land or other resources exists. Conflicts may also stem from incompatible human uses or environmental degradation, alongside socio-political tensions resulting from the unequal distribution of costs and benefits (Eftec, 2013; Piwowarczyk et al., 2013).

All this considered, we identify two main gaps relating to the impact assessment of NBS. First, previous works provide a quite comprehensive picture of costs and benefits individually considered, but there is less clarity on the potential synergies and trade-offs stemming from them. In this regard, the nature of the relationship between the various impacts of NBS requires further investigation, as both trade-offs and synergies may emerge. For instance, how NBS contribute to social justice, social capital and social cohesion, is still unclear (Raymond et al., 2017a).

Second, although there is broad consensus that robust assessments of NBS should be grounded in participatory approaches that engage all relevant stakeholder groups, there remains a notable lack of structured guidance on how stakeholder engagement can be operationalized in practice. Existing methodologies for evaluating socio-economic and ecological benefits still require refinement in order to effectively capture the diverse perspectives, experiences, and forms of knowledge held by different stakeholder groups (Ruangpan et al., 2019). In this regard, the interaction between different types and systems of knowledge constitutes a further gap in both academic research and practical application.

This study aims to address these limitations by adopting a multidimensional and participatory approach to explore the relationships between the impacts of NBS implementation. Accordingly, the purpose of this paper is twofold.

First, we seek to develop a more comprehensive framework for assessing the impacts of NBS by explicitly accounting for synergies and trade-offs among economic, social, and environmental dimensions. To this end, we address the following research question:

RQ1: What economic, social, and environmental benefits and costs do stakeholders identify in the implementation of NBS for coastal restoration? What synergies and trade-offs emerge from the identified co-benefits and co-costs across different stakeholder groups?

Second, we aim to contribute to the ongoing call for empirical studies that integrate participatory approaches into NBS impact assessment. In particular, we focus on the cognitive dimension of stakeholder engagement by examining the types of understanding and knowledge that different groups of stakeholders hold regarding NBS impacts. In doing so, we seek to answer the following research question:

RQ2: What types of knowledge do different stakeholder groups possess in relation to NBS impact assessment?

This paper represents a work in progress and builds upon a previous version presented last year (Condomitti et al., 2024), incorporating significant refinements to the research design. The study's focus has shifted from stakeholder classification to a more in-depth analysis of how the participatory approach contributes to the assessment of NBS' impacts in terms of costs and benefits. To achieve this, the empirical analysis has been expanded to include an iterative process of interviews and workshops, ensuring continuous stakeholder engagement throughout the entire implementation period.

Additionally, the literature review on the identification of NBS costs and benefits has been updated to reflect the latest advancements in the field.

Methodology. *To address these research questions, we conduct a case study in the Tuscany region of Italy as part of the Horizon project Regions4Climate. The project aims to tackle coastal erosion and enhance adaptation strategies through the implementation of a NBS consisting in the restoration of the dune ecosystem in that area.*

Our work is grounded on a qualitative methodology, combining desk study and empirical observations with key actors. First, we conducted a literature review to identify costs and benefits. This analysis included both academic and grey articles. The findings were categorized using the Triple Bottom Line (TBL) framework, classifying costs and benefits under economic, social, and environmental dimensions. Second, we will conduct empirical research through a series of interviews with selected stakeholders in order to triangulate the data and validate the results stemming from the literature review. These interviews will be followed by workshops aimed to deeper investigate the positive (synergies) or negative (trade-offs) relationships between costs and benefits. During this step we will as well investigate the level of understanding and the type of engagement of multiple stakeholders' group.

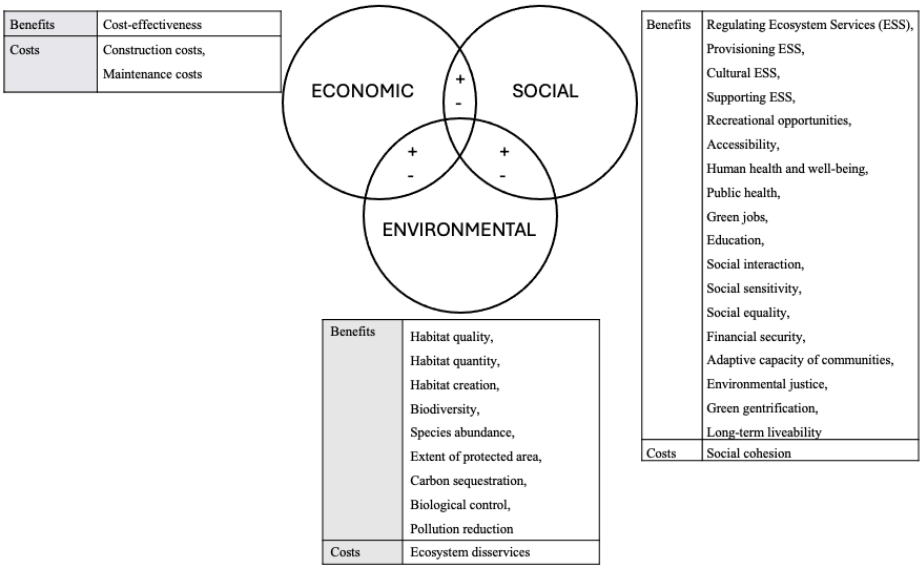
In order to do so, our first step consisted in the stakeholders' mapping and selection. This step played a critical role in ensuring a comprehensive and unbiased assessment of the NBS implementation process. Given the inherent diversity of perspectives, interests, and levels of influence, particular attention was paid to minimizing selection bias and avoiding stakeholder marginalization (Ananda & Herath, 2003; Reed et al., 2009). The identification process followed a two-stage approach. Initially, project partners compiled a preliminary list of local stakeholders, which was subsequently validated through data triangulation, drawing on previous academic studies. A key reference in this phase was Sarabi et al. (2019), who propose a four-level classification of actors relevant to NBS development, distinguishing between micro, meso, macro, and transboundary stakeholders.

Micro-level actors include citizens, landowners, business owners, entrepreneurs, and representatives of civil society organizations such as NGOs. Meso-level actors, operating at the local level, encompass municipal and provincial decision-makers responsible for public management and policy implementation (Guan et al., 2022; Liquete et al., 2016a). At a broader scale, macro-level actors engage at regional, national, and international levels, including governmental agencies and intergovernmental institutions that shape regulatory frameworks and funding mechanisms. Lastly, transboundary actors transcend geographical and institutional boundaries, serving as knowledge brokers who facilitate collaboration and knowledge exchange. This category comprises scientific and technical experts, educational institutions, and intergovernmental bodies that contribute to the diffusion and operationalization of NBS within multi-stakeholder networks (Guan et al., 2022; Liquete et al., 2016a).

Results. *This paper is work-in-progress and presents preliminary findings on the multidimensional impact assessment of NBS (RQ1). To answer to the first research question, we developed a robust methodology to assess costs and benefits consisting in two steps. The first step consisted of a literature review, aimed at identifying the costs and benefits of NBS implementation. The results were classified applying the Triple Bottom Line (TBL) framework that incorporates economic, social, and environmental dimensions (Fig 1).*

From an economic standpoint, NBS proved to be cost-effective (EC, 2015; Liquete et al., 2016; Keesstra et al., 2018). However, Calliari et al. (2019) find that construction and maintenance costs of NBS may reach levels similar to that of traditional engineering options, while Liquete et al. (2016) find that they can slightly exceed those of a traditional grey infrastructure.

Considering the social dimension, benefits of implementing a NBA include a broad list on ecosystem services, such as regulating, provisioning, cultural and supporting services (Liquete et al., 2016). They also contribute to ameliorating human health and wellbeing (Mitchell et al., 2015; Cohen-Shacham et al., 2016). Other benefits include improving recreational opportunities (Chang et al., 2017), accessibility (López-Mosquera and Sánchez, 2011) and long-term livability of the areas interested by the NBS. They also create the opportunity to foster the creation of green jobs (Van der Jagt, 2017) and they can help in building adaptive capacity of communities (Seddon et al., 2020). Additionally, they can enhance social interaction, social sensitivity (Valenzuela et al., 2020) and social equality by improving environmental conditions for people living in deprived communities (Mitchell et al., 2015). Finally, they can improve environmental justice (REF). On the other side, they can create social costs in terms of loss of social cohesion (Raymond et al., 2017).



On the cross-roads between economic and social dimension, NBS can be beneficial since they can provide financial security (Ahammad et al., 2013; Waldron et al., 2017).

Considering the environmental dimension, NBS can benefit the habitat quality, quantity and habitat creation (Dushkova & Haase, 2020), as well as biological control, biodiversity and species abundance (Thompson et al., 2018). They can also help in extending the dimension of protected areas and reduce the vulnerability of the social-ecological system (Seddon et al., 2020). Finally, they contribute to pollution reduction and carbon sequestration (Chang et al., 2017). Environmental costs can involve ecosystem disservices (Calliari et al., 2019).

In order to validate the findings from the literature review and identify synergies and trade-offs among these impacts, a second step for the assessment of costs and benefits will be conducted through an empirical examination by engaging directly with stakeholders. The empirical phase of the research is structured into two main steps. Initially, a series of interviews will be conducted with consortium partners, focusing on specific areas of impact analysis, particularly within the economic domain. This phase will also serve to expand the list of costs and benefits, leveraging the technical expertise and practical experience of these actors.

Building on these insights, a second phase will involve participatory workshops designed to foster stakeholder interaction. These workshops will bring together representatives from different stakeholder categories, including private enterprises, academic and scientific communities, policymakers, civil society organizations, and industry associations. This phase aims to stimulate dialogue and exchange of perspectives, particularly on the synergies and trade-offs that emerge from NBS implementation. The interactive nature of these discussions will allow for a more nuanced characterization of costs and benefits, clarifying their interdependencies (RQ2).

Fig. 1: Economic, social and environmental costs and benefits identified through the literature review

Research limitations. *One key limitation is the restricted generalizability of our findings. The case study methodology provides valuable insights into a specific context, but its applicability to different settings remains constrained. To enhance generalizability, future research should consider replicating this study across diverse geographical and socio-economic contexts, enabling comparative analyses that could identify common patterns and context-specific variations.*

Another limitation pertains to stakeholder sampling. Despite our efforts to ensure a balanced representation of different stakeholder categories through triangulation with classifications established in the literature, potential biases may have influenced the identification of costs and benefits. The perspectives captured in this study are inherently shaped by the composition of the participant group, which may not fully reflect the diversity of viewpoints within the broader stakeholder ecosystem. Future research could address this limitation by adopting more extensive sampling strategies, incorporating a larger and more heterogeneous pool of stakeholders.

Additionally, this study provides a qualitative assessment of NBS benefits and costs. While this approach allows for a nuanced exploration of perceptions, trade-offs, and synergies, the lack of quantitative measurement limits the precision of impact evaluation. Future research could complement these findings by incorporating quantitative methodologies, such as cost-benefit analysis or multi-criteria decision analysis, to systematically assess the magnitude of benefits and costs, as well as the intensity of synergies and trade-offs identified. Integrating qualitative and quantitative approaches would strengthen the robustness of the evaluation and provide a more comprehensive understanding of NBS impacts.

Finally, while the scope of our study involves the impact assessment stage of NBS, it is critical to extend the stakeholder engagement approach to the entire life cycle of the NBS - from its design to its evaluation and potential replication. Future research should investigate how to effectively define engagement strategies for each and every phase of NBS implementation.

Managerial implications. *The practical implications of this study primarily target public managers and decision-makers. Our analysis concerning benefits, costs, synergies, and trade-offs aids in identifying critical areas and potential conflicting objectives for management, as well as opportunities for strengthening synergies. Thus, the study aims to furnish best practices and solutions for minimizing conflicts and maximizing benefits.*

Originality of the paper. *This research makes original contributions to both theoretical and practical domains.*

Theoretically, it enriches the literature on stakeholders' awareness related to NBS impact assessment by exploring the interrelationships between costs and benefits. While previous literature has focused on identifying costs and benefits, limited efforts have been made to capture potential synergies and trade-offs among them. Moreover, grounding our research on a participatory approach that requires the engagement of multiple categories of stakeholders, we broaden the scope of traditional impact assessment by investigating the level of engagement and the different forms of understanding of multiple stakeholders.

Practically, we provide valuable results for policy and decision-makers about the state of the art of stakeholders' awareness and engagement about NBS impact. These insights can be helpful in order to design programs aimed at improving literacy about NBS at the local scale, as well as to motivate local actors' involvement in NBS implementation.

Exploring Customer-Centric Sustainability and Brand Relationships in Fast Fashion: Evidence from Indian Consumers

MANJITHA MATHEW[1] POORNIMA VIJAYKUMAR[2] LUCA PERSICO[3] RICCARDO SPINELLI[4]

Abstract

This work-in-progress (WIP) study investigates how Customer-Centric Sustainability (CCS) strategies influence consumer-brand relationships in the fast fashion industry. While fast fashion brands are often criticised for their unsustainable practices, many are now adopting consumer-facing sustainability initiatives that address economic, environmental, and social concerns. Grounded in the CCS framework proposed by Sheth et al. (2011), this research examines the impact of each sustainability dimension on brand trust, affective brand commitment, and brand loyalty intentions. It further explores how individual differences in sustainability knowledge and concern moderate these relationships.

Data are being collected through an online survey of Indian consumers with recent fast fashion purchase experience. Preliminary analysis will be followed by exploratory and confirmatory factor analysis, and structural equation modeling to test the proposed hypotheses. The study contributes to literature by integrating sustainability marketing with brand relationship theory and provides practical insights for managers seeking to strengthen loyalty through authentic sustainability efforts.

Framing of the research. *The global fast fashion industry (FFI) has transformed the way consumers engage with fashion, offering affordable, trend-driven clothing with rapid turnover. Fast fashion brands have built business models centred around speed and accessibility, driving mass consumption and fuelling a culture of disposable fashion (Barnes & Lea-Greenwood, 2006). This model relies on shortened production cycles, low-cost manufacturing, and frequent new collections that encourage impulsive buying behaviour (Joy et al., 2021). The Quick Response strategy, which coordinates the supply chain to minimise time-to-market, helps these brands stay ahead of trends and stimulate continuous purchasing (Golobovante et al., 2018).*

While economically successful, this model poses profound sustainability challenges across the fashion supply chain. In the production phase, it contributes to environmental degradation through resource-intensive manufacturing, excessive water use, and hazardous chemicals that harm ecosystems (Niinimäki et al., 2020; Zhang et al., 2021). Socially, the pressure to reduce costs often results in poor labour practices, such as low wages and unsafe working conditions in garment factories (Turker & Altuntas, 2014). Sustainability concerns also extend to the distribution and consumption phases, as global logistics generate high carbon emissions and packaging waste, while consumers discard clothing quickly due to its poor durability and planned obsolescence (Niinimäki et al., 2020; Park et al., 2017).

In response to these issues, the fashion industry has seen a growing emphasis on sustainable practices. Public awareness and consumer demand for ethical fashion have prompted major fast fashion brands to introduce eco-conscious collections-such as Zara's Join Life, Mango's Committed Collection, and H&M's Conscious line (Vedeikyte & Lechmanova, 2019). These efforts aim to align with ethical consumerism trends (Hill & Lee, 2015), but they are often criticised as superficial or tokenistic, as they continue to encourage excessive consumption (Vedeikyte & Lechmanova, 2019).

Despite rising awareness of fast fashion's environmental and social impacts, many consumers continue to purchase from these brands. This reveals a well-documented paradox: ethical concerns do not always translate into sustainable purchasing behaviour (Joy et al., 2012; McNeill & Moore, 2015). In light of this, and in an effort to align with shifting consumer expectations, fast fashion brands are increasingly adopting strategies that position sustainability as a consumer-facing value. Customer-Centric Sustainability (CCS) is one such approach that integrates environmental, social, and economic sustainability into marketing and brand-consumer interactions (Sheth et al., 2011). traditional CSR, which focuses on firm-level responsibility, CCS places the consumer at the core, highlighting how sustainable practices can enhance customer experience, build trust, and deepen brand engagement (Park & Kim, 2016a).

Existing research on fast fashion and sustainability has primarily focused on environmental impact, ethical sourcing, and corporate sustainability initiatives (Turker & Altuntas, 2014; Niinimäki et al., 2020). However, limited studies have examined the effectiveness of CCS in shaping brand trust, brand loyalty, and brand commitment. This work-in-progress study aims to address this gap by investigating the influence of CCS dimensions (economic, environmental, and social) on brand trust, affective brand commitment, and brand loyalty intentions among Indian fast fashion consumers. It also explores the moderating role of sustainability knowledge and concern. By doing so, this research contributes to both academic theory and managerial practice. The study extends CCS literature by linking sustainability to brand relationship theories and sustainability marketing while providing empirical evidence on how sustainability awareness and concern shapes consumer responses. From a managerial perspective, the findings will offer insights for fast fashion brands on how to align sustainability efforts with evolving consumer values and expectations. Ultimately, this study aims to provide a deeper understanding of how fast fashion brands can build trust-based, long-term relationships with consumers through authentic and transparent sustainability efforts.

The following sections provide an overview of the three CCS dimensions, followed by a discussion of how they may influence brand trust, affective brand commitment, and brand loyalty intentions in the context of fast fashion.

Customer-centric sustainability (CCS)

The CCS stems from the stakeholder perspective wherein firms integrate stakeholder expectations into their business actions and thereby resolve different perspectives on sustainability issues and outcomes (Kozlowski et al. 2012). The lack of consumer involvement in the Triple Bottom Line (TBL) approach paved way for a new approach, known as the customer-centric sustainability approach, which places customers at the core of the framework. This approach was proposed by Sheth et al. 2011, who defined CCS as the consumption-mediated impact of marketing actions on environmental, personal and economic well-being of the consumer. They argued that sustainability outcomes must result from consumer-directed business actions, if companies plan to make sustainability an integral part of their business strategies and operations. Thus, CCS outcomes are a joint product of marketing action and consumer behaviour (Sheth et al. 2011).

<u>CCS: Economic dimension</u>

The economic dimension of sustainability is often perceived as focusing solely on financial profitability, as highlighted in traditional interpretations like the "planet, people, profit" framework (Slaper and Hall 2011). However, in line with Elkington's TBL approach, which emphasises firms' economic performance and profitability, the CCS framework proposed by Sheth et al. (2011) offers a more comprehensive perspective. This approach expands the economic dimension to include not only the financial performance of firms but also the economic interests of external stakeholders, particularly consumers, through broad-based improvements in economic well-being and standards of living.

In the CCS framework, sustainability is viewed as a shared outcome of firm and consumer actions-a form of business-consumer reciprocity. Brands are expected not only to produce responsibly but also to enable consumers to make financially sustainable choices. One of the most tangible ways to support this is by offering high-quality, durable products that reduce the need for frequent repurchase and thus relieve economic pressure (Park & Kim, 2016a).

Consumption is a key indicator of economic welfare, with higher levels of consumption typically associated with a better quality of life. However, it is the quality of consumption-rather than quantity-that plays a more critical role in promoting sustainability and consumer well-being (McNeill & Moore, 2015). For economically sustainable firms, addressing the economic well-being of consumers is essential, with a particular focus on product quality. Quality is, in fact, one of the main features that consumers most associate with sustainability, which is directly related to their perceptions that buying the highest quality available is the same as buying more sustainable products (Nogueira et al. 2023). Therefore, when fashion brands offer quality products, they not only support sustainable consumption but also demonstrate a commitment to the broader economic system beyond their financial gains (Fulton and Lee 2013).

Fast fashion products are often criticised for being made with poor-quality materials and construction (Joy et al. 2012). Quality, durability, and comfort are key indicators valued by consumers, and investing in these attributes signals a brand's concern for the economic well-being of its customers, as they do not need to repurchase products as frequently. Thus, the CCS framework positions the economic dimension of sustainability as a dual responsibility: ensuring financial profitability while simultaneously enhancing consumer economic well-being through high-quality, durable products.

<u>CCS: Environmental dimension</u>

The environmental dimension of CCS relates to impact of consumption on environmental well-being, that is, health and human well-being consequences of environmental change ensuing from consumption (Sheth et al. 2011). Unlike traditional CSR approaches that focus on firm-level emissions or waste, CCS emphasises how marketing actions and consumption choices affect human and environmental health.

The FFI is widely regarded as one of the most environmentally damaging sectors, contributing to excessive water usage, toxic chemical discharge, greenhouse gas emissions, and large volumes of textile waste (Zhang et al., 2021;

Niinimäki et al., 2020). The industry's rapid production cycles and culture of disposability have normalised overconsumption and short garment lifespans (Joy et al., 2021), leading to widespread environmental degradation.

In response to mounting sustainability concerns, fast fashion brands have launched initiatives such as organic cotton lines, recycling programs, and carbon reduction strategies (Park & Kim, 2016a; Vedeikyte & Lechmanova, 2019). Notable examples include H&M's Conscious Collection and Zara's Join Life, which promote the use of recycled materials and encourage clothing take-back schemes. While these efforts aim to appeal to ethically minded consumers, they are often criticised as reactive, limited in scope, and primarily driven by branding motives rather than a genuine commitment to systemic change (Park & Kim, 2016a). Research also points to a disconnect between brand messaging and actual environmental performance, particularly when outsourced suppliers do not adhere to sustainability standards (Nogueira et al., 2023). Despite this, CCS offers a framework to engage consumers in shared environmental responsibility, encouraging sustainable behaviours through transparent communication and product design (Sheth et al., 2011).

CCS: Social dimension

The social dimension of CCS framework relates to the impact of production and consumption on the personal well-being and quality of life of the consumers on a micro level and the associated welfare of the community on a macro level (Sheth et al. 2011, Park and Kim, 2016a). The social aspect of sustainability adds a sense of community to sustainable development by emphasizing concern for others in ways such as fair wages, access to health and education, and fair labour conditions, not only for employers but also for the communities who are exposed to the business throughout the supply chain (Waage et al. 2005). The social aspects of CCS in the FFI are connected to fair wages for factory workers, the working conditions of the workers, consumer preferences for locally made products, and perceptions of how fast-fashion companies contribute to the communities where they operate. Unfortunately, the FFI has its fair share of socially irresponsible practices, such as using sweatshops, paying poor salaries to workers, or overall poor working conditions. The pressure to cut costs often results in poor working conditions and exploitation of labour in garment factories, reflecting the social dimension of unsustainability.

Brand Relationships and CCS

CCS extends beyond traditional corporate sustainability efforts by focusing on how sustainability initiatives enhance consumer experience, trust, and engagement (Park & Kim, 2016a). Unlike standard CSR approaches that emphasise corporate responsibility at a strategic level, CCS positions sustainability as a consumer-driven value proposition, aiming to strengthen brand trust, brand loyalty, and brand commitment (Nogueira et al., 2023).

Brand Trust and CCS

Brand trust is broadly defined as the consumer's confidence in a brand's reliability, integrity, and ability to fulfil its promises (Erdem & Swait, 2004; Park & Kim, 2016a). From a sustainability perspective, trust develops when consumers believe that a brand is authentic in its ethical claims, consistent in its messaging, and committed to long-term values beyond profit (Neumann et al., 2021; Nogueira et al., 2023). However, scepticism remains high due to greenwashing concerns-when companies exaggerate or falsely claim sustainable practices (McNeill & Moore, 2015).

In the CCS framework, brand trust is reinforced when sustainability efforts are perceived as transparent, credible, and consumer centric. Erdem and Swait (2004) conceptualise trust as a key component of brand credibility, emphasising the brand's willingness (trustworthiness) and ability (expertise) to consistently deliver what it promises. Similarly, Park and Kim (2016a) measure brand trust through statements such as "this brand delivers what it promises" and "this brand has a name you can trust," which reflect consumer perceptions of honesty and reliability.

Affective Brand Commitment and CCS

Affective brand commitment refers to the emotional bond or attachment a consumer feels toward a brand, characterised by identification with the brand's values and a desire to maintain the relationship over time (Fullerton, 2005). Unlike continuance commitment (based on switching costs), affective commitment arises from genuine liking and emotional connection, often strengthened by shared ethical or sustainability values.

In sustainable branding, affective commitment may emerge when consumers see a brand as aligned with their personal values related to environmental protection, ethical labour, or social justice. Such commitment deepens consumer engagement, leading to brand advocacy and loyalty even in competitive markets (Fullerton, 2005; Nogueira et al., 2023). However, when sustainability is seen as a marketing tool rather than a core business principle, commitment declines (McNeill & Moore, 2015).

Brand Loyalty Intentions and CCS

Brand loyalty is typically defined as the intention to continue purchasing from or supporting a brand, often accompanied by positive word-of-mouth and advocacy behaviours (Zeithaml et al., 1996). Loyalty intentions are more than repeat behaviour - they reflect a psychological attachment that leads consumers to recommend, repurchase, and prioritise the brand over competitors.

Zeithaml et al. (1996) identify loyalty intentions as part of a broader framework of behavioural intentions, including recommending the brand, saying positive things about it, and repurchasing. In the context of fast fashion and sustainability, loyalty may stem from perceptions that a brand is genuinely committed to customer well-being and responsible consumption (Park & Kim, 2016a). Importantly, Fullerton (2005) distinguishes between loyalty driven by affective commitment versus continuance (habitual or constrained) loyalty, finding that emotional attachment is a stronger and more positive predictor of long-term brand support and advocacy.

Research suggests that consumers who trust a brand's sustainability efforts exhibit stronger loyalty (Algesheimer et al., 2005). However, in the fast fashion sector, loyalty is often transactional, driven by factors such as price and trend availability rather than sustainability commitment (Joy et al., 2012). While CCS initiatives may improve perceived brand authenticity, their direct influence on loyalty remains inconsistent (Neumann et al., 2021).

Drawing upon the CCS framework (Sheth et al., 2011) and previous empirical research (Park & Kim, 2016; Nogueira et al., 2023), this study proposes that each dimension of customer-centric sustainability-economic, environmental, and social-influences key brand relationship outcomes: brand trust, affective brand commitment, and brand loyalty intentions. As discussed, CCS emphasises consumer-facing sustainability efforts, where marketing actions, product quality, and ethical practices shape consumer perceptions and strengthen brand relationships.

Empirical evidence suggests that economic sustainability, when focused on offering durable, high-quality products and reducing financial burdens on consumers, can enhance consumer confidence, foster emotional attachment, and increase loyalty intentions (McNeill & Moore, 2015; Nogueira et al., 2023). Similarly, social sustainability, by addressing fair labour practices and community well-being, strengthens affective ties and trust in brand ethics (Park & Kim, 2016a). While environmental sustainability may appeal to ethically motivated consumers, its effects on brand relationships in fast fashion are often more limited or inconsistent, potentially due to perceptions of greenwashing or tokenism (Neumann et al., 2021).

Moderating Role of Sustainability Knowledge and Concern

Consumer responses to sustainability initiatives are not uniform; they are significantly shaped by individual differences in sustainability knowledge and sustainability concern. These two constructs-while interrelated-represent distinct dimensions of consumer awareness and engagement. Sustainability knowledge reflects the cognitive understanding of ethical and environmental issues in the fashion industry (Zhang et al., 2021; Papasolomou et al., 2023), while sustainability concern captures the emotional or moral importance placed on these issues (Shen et al., 2012).

Research has shown that sustainability knowledge enhances consumer ability to critically evaluate a brand's sustainability efforts (Park & Kim(b)). For instance, individuals with greater knowledge of global labour conditions, sustainable materials, and environmental impacts are more likely to form favourable attitudes toward ethically responsible brands (Pookulangara & Shephard, 2013). Shen et al. (2012) found that awareness of sweatshop practices and eco-fashion positively influenced consumer support for both socially and environmentally responsible apparel brands. In the context of CCS, knowledgeable consumers may be better equipped to assess the authenticity of a brand's sustainability claims across its economic, environmental, and social practices. As a result, the influence of CCS on brand trust, affective brand commitment, and loyalty intentions may be stronger for consumers with higher sustainability knowledge.

However, higher knowledge may also heighten scepticism in the fast fashion context. Consumers familiar with the negative environmental and social impacts of fast fashion may become more critical of greenwashing or tokenistic sustainability messaging. Thus, when CCS efforts lack perceived authenticity, sustainability knowledge may dampen the positive brand relationship outcomes.

In contrast, sustainability concern reflects a consumer's emotional investment and personal values related to ethical and responsible consumption. Shen et al. (2012) emphasised that concern for issues such as sweatshop labour and environmental degradation significantly shapes consumers' positive attitudes toward socially and environmentally responsible brands. Notably, their findings suggest that sustainability concern can be a more influential predictor of ethical purchasing behaviour than sustainability knowledge, as it taps into consumers' values and moral alignment with brand practices.

Building on this, recent research by Viet et al. (2023) further confirms that consumers with higher levels of sustainability concern are more responsive to sustainability-related information, particularly when the nature of the sustainability effort (social or environmental) aligns with their specific concern. This alignment strengthens favourable consumer evaluations, suggesting that concern serves as an important psychological amplifier of perceived sustainability initiatives. Even in cases where sustainable choices come at a personal cost such as higher costs, inconvenience etc., highly concerned consumers are more likely to make such trade-offs in favour of sustainability. When CCS initiatives are perceived as authentic, transparent, and aligned with consumer values, sustainability concern can enhance brand trust, deepen affective commitment, and strengthen brand loyalty intentions. Therefore, in this study, sustainability concern is expected to positively moderate the relationship between CCS dimensions and brand relationship outcomes.

Purpose of the paper. *The purpose of this research is to explore the impact of CCS dimensions on key brand relationship metrics within the FFI. This study aims to provide insights into how CCS initiatives can influence consumer*

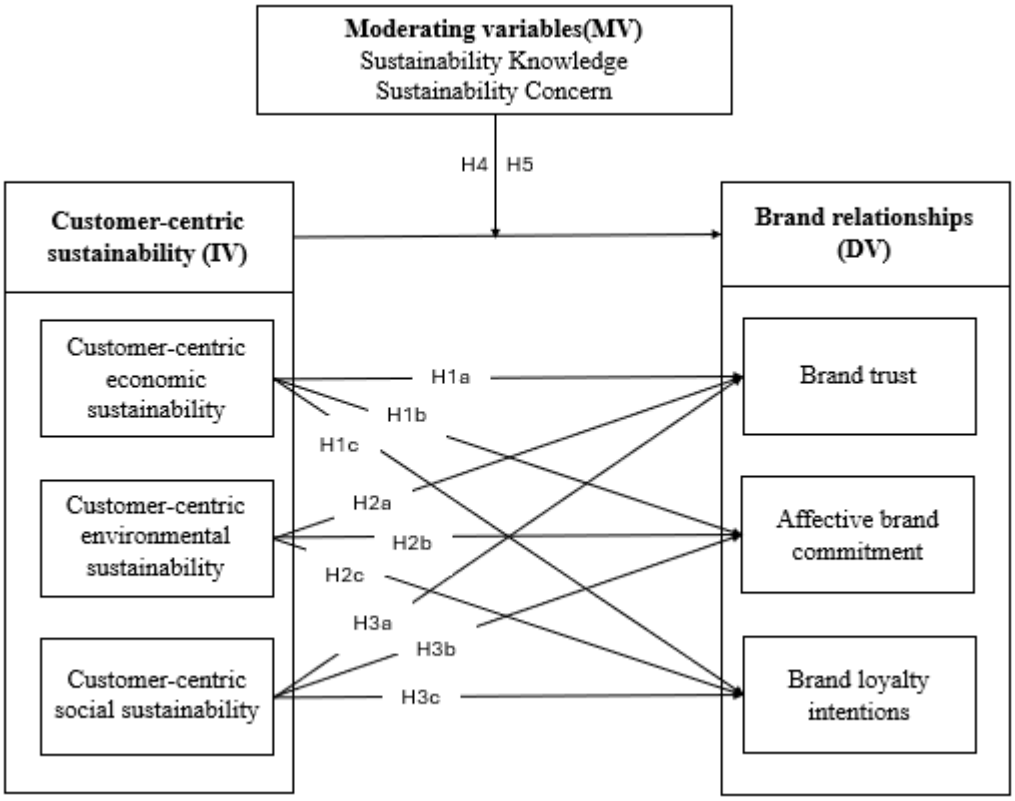
behaviour and perceptions, contributing to more sustainable business practices. The conceptual framework for this research is illustrated in Fig. 1

Objectives

- *To examine the impact of customer-centric sustainability dimensions on brand trust, brand loyalty, and brand commitment in the fast fashion industry.*
- *To assess the moderating role of sustainability knowledge and concern on the relationship between CCS and brand outcomes.*

Based on this literature, the following hypotheses are proposed:

H1: Customer-centric economic sustainability positively influences: (a) brand trust, (b) affective brand commitment, and (c) brand loyalty intentions.



H2: Customer-centric environmental sustainability positively influences: (a) brand trust, (b) affective brand commitment, and (c) brand loyalty intentions.

H3: Customer-centric social sustainability positively influences: (a) brand trust, (b) affective brand commitment, and (c) brand loyalty intentions.

H4: Consumer sustainability knowledge strengthens the relationship between CCS dimensions (economic, environmental, and social) and brand relationship outcomes (brand trust, affective brand commitment, and loyalty intentions).

H5: Consumer sustainability concern strengthens the relationship between CCS dimensions (economic, environmental, and social) and brand relationship outcomes (brand trust, affective brand commitment, and loyalty intentions).

Fig. 1: Conceptual framework and hypothesis

Methodology.

Instrument Development

The survey instrument was designed to measure the key constructs of this study: the three dimensions of Customer-Centric Sustainability (CCS)-economic, environmental, and social-along with brand trust, affective brand commitment, brand loyalty intentions, and the moderating variables: sustainability knowledge and sustainability concern.

Respondents were required to answer 43 questions and were asked to rate the degree of their agreement. All constructs were measured using previously validated multi-item scales on a five-point Likert scale ranging from 1 ("strongly disagree") to 5 ("strongly agree"). Items for CCS dimensions were adapted from Jagel et al. (2012), Lichtenstein et al. (2004), and Shen et al. (2012). The economic dimension captured product durability, comfort, style, and material quality (Jagel et al., 2012). The environmental dimension focused on the brand's use of sustainable materials and eco-friendly production practices (Jagel et al., 2012). The social dimension assessed fair wages, safe working conditions, local sourcing, and community engagement (Jagel et al., 2012; Lichtenstein et al., 2004).

The dependent variables were measured using well-consolidated and validated scales such as brand trust (Erdem and Swait, 2004), affective brand commitment (Fullerton, 2005) and brand loyalty intentions (Algesheimer et al., 2005).

The moderating variables were sustainability knowledge, using items from Shen et al. (2012) and sustainability concern, adapted from Viet et al. (2023).

Each CCS dimension and sustainability construct also included a confidence item to gauge perceived ability or awareness related to that specific area.

Tab. 1: Survey Constructs and Sources

Construct	No. of items	Source(s)
CCS economic dimension	4	Jagel et al., 2012
CCS environmental dimension	4	Jagel et al. (2012); Shen et al. (2012)
CCS social dimension	4	Jagel et al. (2012); Lichtenstein et al. (2004)
Brand trust	5	Erdem and Swait, 2004
Affective brand commitment	3	(Fullerton, 2005)
Brand loyalty intentions	3	(Algesheimer et al., 2005).
Sustainability knowledge	6	Shen et al. (2012)
Sustainability concern	6	Viet et al. (2023).

Sampling and data collection

Data are being collected through an online structured questionnaire administered via Google Forms. The survey is being distributed using a snowball sampling technique through social media platforms, university networks, and professional contacts. Participation is voluntary, and all responses are anonymous and confidential.

A brand selection filter at the beginning of the questionnaire ensures that respondents answer the items based on their most recent purchase from one of the fast fashion brands listed (e.g., H&M, Zara, Uniqlo, Zudio etc.). The target population comprises Indian fast fashion consumers aged 18 and above, primarily from the Bangalore metropolitan area, who have purchased from at least one of these brands. The survey also captures demographic details such as age, gender, and income.

Data Analysis

Data analysis will be carried out in a structured, multi-stage process to ensure methodological rigor and validity. First, Exploratory Factor Analysis (EFA) will be performed to identify the latent factor structure and evaluate item loadings, using appropriate extraction and rotation methods to optimise interpretability. Subsequently, Confirmatory Factor Analysis (CFA) will be conducted to rigorously test the measurement model, ensuring construct validity, reliability and goodness-of-fit. Finally, Structural Equation Modeling (SEM) will be implemented to empirically assess the hypothesised relationships between CCS dimensions and brand relationship variables, as well as to assess the moderating effects of sustainability knowledge and concern.

Expected outcomes. *This study expects to find that consumer perceptions of CCS-across economic, environmental, and social dimensions-positively influence brand trust, affective brand commitment, and loyalty toward fast fashion brands. It is anticipated that among these, economic and social sustainability will have a particularly strong impact on brand relationships due to their direct relevance to consumer value and ethical considerations. Environmental sustainability may have a more nuanced effect, especially where consumers question the authenticity of brand efforts. These findings would be consistent with prior research, such as Nogueira et al. (2023), which found that economic and social dimensions significantly predicted affective brand commitment and trust in fast fashion consumers.*

Moreover, consumers who are more informed about sustainability issues or who express strong concern for environmental and social well-being are expected to respond more favourably to genuine CCS efforts. These individual differences are likely to amplify the effect of sustainability perceptions on brand trust, affective commitment, and loyalty intentions.

Research limitations. *As a work-in-progress, the study is currently limited to the Indian market, which may affect generalisability to other cultural or economic contexts. While the sample is diverse in age and income, it is limited to consumers who actively shop at fast fashion brands, potentially excluding highly sustainability-conscious non-users. The reliance on self-reported data may also introduce social desirability bias, especially concerning sustainability attitudes. Additionally, while the proposed SEM approach allows for robust model testing, longitudinal data would be better suited to assess causal relationships over time. A future phase of this research could include a cross-cultural comparative analysis (e.g., India vs. a developed market like Italy) to enrich the findings.*

Managerial implications. *This study offers fast fashion managers strategic guidance on leveraging sustainability to strengthen consumer-brand relationships. By adopting a CCS approach, brands can move beyond surface-level claims and better align their efforts with consumer expectations around transparency, product quality, and ethical responsibility. The findings are expected to help managers identify which dimensions of CCS-economic, environmental, or social-*

resonate most with their target audience. Additionally, authentic sustainability practices can foster deeper emotional engagement and brand trust, particularly among consumers with higher sustainability awareness. Tailoring sustainability communications to reflect these concerns can further enhance relevance and credibility. Ultimately, CCS-driven strategies can help brands build long-term consumer loyalty that extends beyond price sensitivity and trend-driven purchasing.

Originality of the paper. *This paper contributes to the growing intersection of sustainability marketing and brand relationship literature by applying the CCS framework to the FFI-a sector often criticised for its unsustainable practices. Unlike traditional CSR research, which centres on corporate responsibility, this study shifts the lens to how consumers perceive and respond to sustainability practices. It further adds novelty by examining the moderating roles of sustainability knowledge and concern-two increasingly important factors in consumer behaviour research. By focusing on India, the study provides insights from a complex and rapidly evolving consumer market where affordability often drives purchase decisions. Moreover, India represents a context that disproportionately bears the environmental and social costs of fast fashion production, making its inclusion particularly salient in global sustainability conversations. As such, the study not only advances theoretical understanding but also offers culturally and economically relevant implications for practice.*

Towards a sustainable present: strategies and innovation for food sustainability

ANTONIO CAPASSO[1] MAXIMILIAN BROGLIO[2]

Abstract

Sustainability is a very overused topic nowadays: however, it is undeniable how it is an essential concept to allow a correct green transition in the awareness of having a correct approach to managing the planet, a management that is able to account for all relevant issues in a holistic way.

Starting from the assumption of considering environmental, economic and social issues at the same time, it must be immediately clarified that the Food sector is one of the most impactful both in terms of direct impacts -that in a life cycle perspective it is able to cause- but also in indirect terms as it is intimately connected to the lifestyles and diets of each of us: all this considered, this sector must permeate with innovative strategies in terms of sustainability that allow it to escape from the negative spiral and be able to represent a point of reference for other sectors.

Solutions such as more efficient cultivation techniques, water saving strategies, enhancement of less impactful products, development of agroecological infrastructures, green packaging, sustainability labelling, sustainable supply chains are essential to allow a radical change in a sector that is strongly in need of change.

Framing of the research. *The framing of the research is based on a holistic approach, considering all stages of the food product's life cycle - from production to distribution, from consumption to disposal - and analyzing the most advanced solutions in terms of green innovation. Key elements such as more efficient cultivation techniques, water-saving strategies, enhancement of low-impact products, agroecological infrastructures, sustainable packaging, eco-labeling, and responsible supply chains will be studied to identify best practices and the most effective models.*

The objective of the research is therefore to outline a clear and detailed framework of the strategies currently available and their future potential, identifying replicable and scalable solutions that can serve as a benchmark for the entire food sector, thus contributing to a concrete and effective sustainable transition.

The food sector is currently at the center of a transformation aimed at combining innovation, efficiency, and sustainability. To ensure a green transition and a resilient food system, a comprehensive regulatory framework has been implemented both at the European and Italian levels, covering the entire supply chain: from production to consumption, from resource management to waste reduction.

The principle of healthy and proper nutrition is related to seven of the seventeen Sustainable Development Goals (SDGs) of the United Nations' 2030 Agenda. Summarizing the concept, the possible contributions of sustainable nutrition to the SDGs essentially concern two main areas: individual and collective health and well-being on one hand, and environmental sustainability on the other. A recent report by The European House Ambrosetti[3] highlights that malnutrition affects 821 million people, while nearly 2 billion people are overweight or obese. Deaths caused by obesity amount to approximately 30 million per year, while those due to malnutrition are around 35 million. These issues are closely linked, as various studies[4], particularly in developing countries, show that childhood malnutrition can be a

[3] "The (R)evolution of Sustainability in the Italian Agri-Food Supply Chain" is the title of the report by The European House Ambrosetti and Ambrosetti Club, two of the leading think tanks specializing in business analysis and consultancy in Italy. Presented at the Food & Beverage Forum in June 2023, the research focuses on the sustainable and circular transition of the Italian agri-food supply chain. According to the Ambrosetti report, the cornerstone of the path toward sustainability must be the United Nations' 2030 Agenda: as many as 11 out of the 17 Sustainable Development Goals (SDGs) involve the agri-food sector. This includes key issues such as the right to access healthy food, as well as the fight against hunger, malnutrition, and undernourishment. At the European level, the main reference points are the Farm to Fork and Biodiversity strategies, which help set concrete and measurable objectives. These include, for example, reducing pesticide use by 50% and fertilizer use by 20% by 2050, as well as ensuring that 25% of cultivated land is dedicated to organic farming-a goal in which Italy is already making significant progress.

[4] Joint press released by EU/FAO/IFAD/UNHCR/UNICEF/WB/WFP. As reported in the latest Global Report on Food Crises (GRFC), approximately 282 million people across 59 countries and territories suffered from acute hunger in 2023-marking a global increase of 24 million compared to the previous year. This rise is attributed to the expansion of crisis-affected areas analyzed in the report and the severe deterioration of food security, particularly in Gaza Strip and Sudan. For the fourth consecutive year, the percentage of people experiencing acute food insecurity has remained alarmingly high-around 22 percent-far exceeding pre-COVID levels. As the report highlights, children and women are at the forefront of food crises, with over 36 million children under

Conference Proceedings

DOI 10.7433/SRECP.SP.2025.01

predictive factor for obesity in adulthood. Moreover, the number of malnourished people has been rising again since 2015, despite the continuous increase in global food production-clear evidence of the dramatic scale of food waste.

In its strategy for food sustainability, the European Union has set the goal of protecting the environment and ensuring healthy nutrition for all while supporting producers. This is based on the recognition that the food system-from production to consumption and waste-has a significant impact on the environment, health, and food security.

On May 20, 2020, the European Commission presented the "Farm to Fork" strategy[5]*, aiming to build a sustainable food system to safeguard food security and protect both European citizens and nature.*

Essentially, this strategy serves as a regulatory framework for a series of laws that the European Commission will propose across various areas, including the revision of pesticide legislation, new animal welfare regulations, measures against food waste and food labeling fraud, and the reform of the EU agricultural system.

The key targets of the strategy for 2030 include reducing the use and risk of chemical pesticides by 50%, cutting fertilizer use by at least 20%, decreasing antimicrobial sales for livestock and aquaculture by 50%, and allocating at least 25% of agricultural land to organic farming.

Compared to achievements so far, Europe's agricultural sector is the only one in the world to have reduced greenhouse gas emissions, achieving a 20% drop compared to 1990 levels. However, as noted in a European Parliament statement, "the sector still accounts for about 10% of emissions, with 70% of these caused by livestock farming. The production, processing, packaging, and transportation of food products remain major contributors to climate change."

The strategy is part of the European Green Deal and aligns with the new EU Biodiversity Strategy for 2030 and the reform of the Common Agricultural Policy (CAP). The ultimate goal of the "Farm to Fork" strategy is to achieve climate neutrality in the EU by 2050.

Regarding Italy, the 2024 edition of the Istat Report on Sustainable Development Goals[6] *provides an overview of Italy's relationship with food sustainability, which is closely linked to SDG 2 (Zero Hunger) and SDG 12 (Responsible Consumption and Production). The report highlights significant progress in reducing food waste, thanks to awareness campaigns and food recovery initiatives. The adoption of sustainable agricultural practices, such as organic farming and precision technologies to reduce pesticide and fertilizer use, is also increasing. Additionally, there is growing awareness and adoption of sustainable diets, with a rise in the consumption of low-impact foods such as fruits, vegetables, and legumes. However, significant regional disparities persist in access to sustainable agricultural practices and food waste reduction. Some agricultural sectors remain resistant to adopting new technologies and sustainable practices, slowing overall progress. Finally, climate change continues to pose a challenge, negatively impacting agricultural production and food security.*

Purpose of the paper. *The 'work-in-progress' research project aims to carry out a detailed and precise review of innovative strategies in the Food & Beverage sector that can represent a real driving force for the sustainable transition in this sector.*

The idea is to investigate green innovations in all phases of the life cycle of the food product by evaluating approaches, purposes and results obtained (or expected) in the sphere of sustainability (therefore also from a social perspective, for example, environmental).

---

the age of five suffering from acute malnutrition in 32 countries. In 2023, acute malnutrition worsened, especially among people displaced due to armed conflicts and natural disasters. The Global Network Against Food Crises (GNAFC) calls for an urgent transformative approach that integrates peacebuilding, prevention, and development interventions with large-scale emergency efforts to break the cycle of acute hunger, which remains persistently and unacceptably high. "This crisis demands immediate action: it is essential to use the report's data to transform food systems and address the root causes of food insecurity and malnutrition", said António Guterres, Secretary-General of the United Nations.

[5] The Farm to Fork Strategy is at the heart of the European Green Deal aiming to make food systems fair, healthy and environmentally-friendly. Food systems cannot be resilient to crises such as the COVID-19 pandemic if they are not sustainable. We need to redesign our food systems which today account for nearly one-third of global GHG emissions, consume large amounts of natural resources, result in biodiversity loss and negative health impacts (due to both under- and over-nutrition) and do not allow fair economic returns and livelihoods for all actors, in particular for primary producers. Putting our food systems on a sustainable path also brings new opportunities for operators in the food value chain. New technologies and scientific discoveries, combined with increasing public awareness and demand for sustainable food, will benefit all stakeholders. The Farm to Fork Strategy aims to accelerate our transition to a sustainable food system that should: have a neutral or positive environmental impact, help to mitigate climate change and adapt to its impacts, reverse the loss of biodiversity, ensure food security, nutrition and public health, making sure that everyone has access to sufficient, safe, nutritious, sustainable food. The strategy sets out both regulatory and non-regulatory initiatives, with the common agricultural and fisheries policies as key tools to support a just transition. A proposal for a legislative framework for sustainable food systems will be put forward to support implementation of the strategy and development of sustainable food policy. Taking stock of learning from the COVID-19 pandemic, the Commission will also develop a contingency plan for ensuring food supply and food security. The EU will support the global transition to sustainable agri-food systems through its trade policies and international cooperation instruments.

[6] On July 4, 2024, Istat presented the seventh edition of the Report on the Sustainable Development Goals (SDGs), adopted with the 2030 Agenda by the United Nations General Assembly. The 17 goals and their respective targets balance the three dimensions of sustainable development, extending the 2030 Agenda from the social pillar to the economic and environmental ones, with the addition of the institutional dimension. In the SDGs 2024 Report, 373 statistical measures are provided for 139 indicators proposed by the United Nations Inter-Agency Expert Group on SDG Indicators (UN IAEG-SDGs).

The study of these new solutions can act as a driving force for other activities and other sectors and can lead other players to adopt or improve them with a view to continuous improvement. When we talk about analysis of techniques from a cradle to grave perspective, we are referring to an approach where all the strategic innovations are considered from the field (and/or the farm) to the treatment of food waste and its possible packaging, starting from the awareness that it is important to act in every phase where it is possible to obtain an improvement: in this sense efficient cultivation techniques, water saving strategies, enhancement of less impactful products, development of agroecological infrastructures, green packaging, sustainability labelling, sustainable supply chain amongst the others will be evaluated.

Methodology. *From a methodological point of view, a qualitative approach was chosen: in fact, it was decided to undertake a review of the existing literature in the technical-scientific field that includes the most recent and innovative sustainability strategies in the Food & Beverage sector: specifically, a recent time limit allows to only count the newest solutions that logically can be more or less tested depending on the level of technical maturity that characterizes them.*

Another point to be remarked is surely that one of research perimeter: the techniques under the lens are those ones that characterize all the phase of the life cycle of a food product in a 'from cradle to grave' perspective' not focusing for example only on packaging or cultivation techniques but taking into account also other considerations as labelling, supply chains etc.

Results. *As for the expected results, what is expected is the highlighting of innovative techniques and strategies that can take on the role of best practices in the Food sector, giving rise to a real sustainable revolution in this area which, as mentioned, is one of the most impactful in this sense.*

The innovations will have to concern numerous aspects, following all the phases characterizing the life of the food product, starting from how the product is born (cultivation or breeding) to move on to packaging, its transport and its use, to its disposal. As anticipated, the idea is to create a compendium containing the best in terms of sustainable innovation that becomes a point of reference from which to draw inspiration in terms of imitation or a basis from which to develop new ideas.

Research limitations. *The scope of the research includes the various innovative strategies capable of increasing the level of sustainability within the agri-food sector by considering the various hypothetical phases of a product's life cycle in a holistic perspective from the cradle to the grave (production phase, processing phase, transport and distribution, use, packaging and end of life) focusing on the last years of strategic development.*

It should be clarified that the research does not aim to review all the innovations on the market but places the emphasis on those of greatest interest, most successful, most tested and most capable of having an impact on the sustainability of the sector; this will naturally lead to excluding strategies that may prove noteworthy in the future and that will certainly be taken into consideration in a future update.

Managerial implications. *The following research project is closely connected to several managerial implications: specifically, reviewing in great detail the technical solutions capable of increasing the level of sustainability of the agri-food sector can bring out positive trends capable of representing a path to follow for other players who will be able to exploit the innovations to adapt and consequently increase their level of sustainability; furthermore, sharing innovative practices can stimulate technological creativity by triggering processes of continuous improvement of the same strategies.*

Ultimately, the logic of the project provides a strong link between sharing ideas, imitation mechanisms and improvement, all with the ultimate goal of environmental, economic and social sustainability.

Originality of the paper. *The paper tries to find out and underline innovative strategies in the Food & Beverage sector that can represent the compass to follow for the sustainable transition in this sector.*

The strong point is the fact that the investigation related to green innovations concerns all phases of the life cycle of the food product and it develops by analyzing approaches, purposes and results obtained (or expected) in the holistic sphere of sustainability (economic, environmental, social, governance).

The study of these new sustainable solutions can act as a driving force for other activities and also for other sectors and can lead other players to adopt or ameliorate them with a view to continuous improvement.

Key words: *food; sustainability; innovation; sustainable transition; green strategies; sustainable development*

Analysis of three sustainability labels in the Food&Beverage sector

MAXIMILIAN BROGLIO[1]

Abstract

In a global context increasingly characterized by the overcoming of numerous planetary boundaries, humanity has reached the tipping point for numerous areas of interest, just think of climate change (the United Nations intergovernmental panel on climate change IPCC has already warned[2] that the food industry alone already contributes up to 37% of global greenhouse gases and that, without intervention, these are likely to increase by another 30% by 2050, due to the growing demand resulting from population growth), the impressive rates of extinction of numerous species[3] or biogeochemical pollution of anthropogenic origin; furthermore, the senseless and indiscriminate use of non-renewable resources and the unsustainable use of renewable ones (i.e. without waiting for natural regeneration rates) are necessarily moving various sectors to change course, aware that the time factor will be fundamental to counteract the overshoots mentioned above.

The food industry is a key player for sustainable development and for containing the overshooting of planetary limits, which is why various solutions have been created and are being developed to make it less impactful: one with great potential is certainly that of "ecoscores", i.e. science-based sustainability scores applied by means of a label to the final product in order to allow consumers to make informed and sustainable choices.

The ongoing research project ("work-in-progress") will provide an overview of some of the most tested "ecoscores" (Eco-score® by ADEME[4] which since December 2024 has been renamed Green-score®, Planet-score® by ITAB[5], Eco impact® by Foundation Earth[6]) highlighting their characteristics, peculiarities, gaps and differences (through a comparative analysis) and carrying out analyses on how they are perceived by both consumers and experts.

Framing of the research. *The research tries to give an in-depth and complete overview in a field that is currently fragmented and poorly harmonized (there is a clear research gap in literature), aware of the potential impact that this tool has to offer especially when a single and harmonized label will be actually achieved.*

The primary objective of the project is precisely that of clarifying, explaining and investigating food sustainability starting from the assumption that the real fundamental player is the consumer: making him aware, informing him in a clear and transparent manner is the only way to take the path of food sustainability; in fact, by being able to choose sustainable foods, the consumer indirectly forces producers and all players in the food supply chain to align themselves with the most sustainable competitors, under penalty of inevitable exclusion from the market.

This project is fundamental given the growing "ESG awareness" of the average consumer who increasingly demands products that are sustainable from an ethical, social and environmental point of view and this fits perfectly into the tracks of the European "Farm to Fork" strategy and the recent theme «Towards a framework for sustainability labelling of food products that enables consumers to make sustainable food choices».

As anticipated in order to guarantee a scientific approach all the labels considered are science-based and in particular they refer to the Life Cycle Assessment methodology: «an objective process of assessing the environmental burdens associated with a product, process or activity, conducted through the identification and quantification of energy and materials used and waste released into the environment, to assess the impact of these uses of energy and materials and releases into the environment, and to assess and implement opportunities for environmental improvement»[7].

Purpose of the paper. *The research question naturally arises from a gap in the literature and falls within the phase of defining cognitive objectives; it can be framed by the statement "Exploring the world of sustainability labels (Ecoscores) in the Food sector in Europe" from which sub-questions depend in a cascade such as "What are the most convincing sustainability labels in the UE Food sector?", "What are the points of contact and the differences between the various labels?, "What are the reasons behind their creation?", "How are they perceived by consumers?", "How*

are they perceived by producers?", "How are they perceived by a panel of experts? "How are they framed at policy level?"

The research question therefore develops in the identification of the most convincing European sustainability labels in the Food sector, in their comparative analysis and in the evaluation of their impact on different targets such as consumers, producers and experts without neglecting a dutiful reference to their framing at policy level.

A fundamental concept related to the final aim of this research project is harmonization: different labels born in different contexts and with different technical-methodological backgrounds are certainly resources for the heterogeneity of ideas but can lead to problems in terms of confusion for the end user or the consumer who is the true driving force for sustainable change in the agri-food system; the hope is for a single and harmonized label at European level that is able to capture the best (without excluding any issue such as pesticides, biodiversity, farming methods, social side, etc.) from the various experiences born so far and in which any differences in alignment with the reality of environmental modeling of impacts are not influential in a context that has as its objective the highlighting of differences at a relative level.

Tab.1 : Sustainability labels under analysis for the Food&Beverage sector

Green-score® (ex Eco-score®)	
Planet-score®	
Eco impact®	

Source: author's elaboration

Methodology. *From a methodological point of view, the approach used is both qualitative and quantitative.*

The first part of the project is based on a combination of a systematic review of the literature on "ecoscores" in the Food & Beverage sector and an in-depth and comparative analysis of the technical and methodological material provided by the label owners, setting the European territory as the reference perimeter.

The next analyses will instead be based on a more quantitative approach, using different types of statistical surveys to analyze the impact of the labels on the different players involved and specifically focus group and online surveys will be exploited for the consumer perception analysis while Delphi methodology will be linked to the collection of experts perception.

Results. *So far two activities have been completed: the review of the technical material provided by label owners and of the literature related to sustainability labels in the Food sector that led indeed to the identification and analysis of the three most convincing and tested labels in the European territory already mentioned with the creation of a sort of compendium containing all the technical material; then the detailed comparative analysis of the various labels with identification of points of contact, and gaps with the ultimate goal of extrapolating the best of the various experiences with a view to harmonization: thanks to the detailed comparative analysis of the various labels, similarities, differences, gaps were highlighted, creating an interesting information pool for future choices in the field of policy (especially with a view to a single harmonized label at European level).*

At present, it is believed that the work carried out by Planet-score® is the most complete in terms of coverage of environmental issues updated with the problems related to overcoming planetary limits; it should also be added that

labels too aligned with the PEF[8] are consequently entangled in the gaps and critical issues of the system and also recently reiterated by the European Union, in the Green Claims directive, where it was decided not to make the PEF the sole methodological framework of reference for food products due to its inability to take into account some particularities of food production, such as positive externalities on the environment or reproduction conditions.

In general, it is concluded by asserting that sustainability labels in the food sector can be truly powerful tools in the hands of policy makers and producers but that the real levers of change will be correctly informed and aware consumers.

For future research it will be interesting evaluate the direct opinion of different targets faced with the comparison of these different labels.

Research limitations. *LCA is the basis of the three labels analyzed.: the labels, however, do not stop at an analysis simply based on LCA but intervene by adding complementary indicators capable of accounting for issues that LCA in the agri-food sector, due to its current immaturity, is not able to consider. In some cases, the impact derived from LCA is paradoxically greater for the most sustainable methods (for example organic eggs) and instead is lower for the less sustainable ones (for example eggs from caged hens) demonstrating how the LCA studies specific to agri-food are still too unreliable making them difficult to use for any information and awareness-raising activity. This is easily explained by the dichotomy between "intensification" and "extensivation": as regards agri-food products, the LCA score (of French database Agribalyse for example) essentially measures the degree of intensification of practices without accounting for fundamental factors to guarantee sustainability in a holistic sense. What is clear is that the LCA without corrections (carried out by all three labels although in different ways) tends, in spite of itself, to favor intensive agriculture (characterized by better yields) and penalizes extensive or organic systems, all without accounting for negative environmental impacts such as those related to pesticides and antibiotics, problems linked to the collapse of biodiversity, impacts on soil quality, positive externalities provided by some production systems (agro-ecological infrastructures, biodiversity, carbon storage, etc.), effects of thresholds and saturation at local scales.*

To seal the issue of the inadequacy of LCA in the food sector, the Green Claims Directive published by the European Commission on 22 March 2023 and voted by the EU Parliament on 12 March 2024, also recognizes the impossibility of imposing a single reference method, in particular due to the numerous blind spots in the LCA method, especially for agriculture, fisheries and textiles: specifically, the EU has given up on making PEF (a tool largely based on LCA) the single methodological reference framework for food products, due to its inability to take into account some particularities of food production, such as positive externalities on the environment or on reproduction conditions, for example (with the paradoxical risk of causing inconsistencies with public policies in favor of the ecological transition of agriculture as well as communicating something profoundly incorrect).

Another issue to reflect on is certainly the general lack of the social side in labels: sustainability, as has been repeatedly reiterated, must be conceived in all its components and the social sphere cannot be excluded; Planet-score® with its full version by inserting the evaluation of the fair remuneration of producers on the label has taken a first step but this side of sustainability certainly deserves more space.

The last limitation is linked to the research perimeter: the analysis focused only on the European perimeter but it will be compelling to extend the analysis worldwide.

Managerial implications. *The results of the research project could induce a chain reaction with the ultimate goal of achieving the goal of food sustainability: in detail, the work could represent a systematized starting point so that policy makers can reach the definition of an optimized and above all harmonized, credible and science-based tool that can allow the final consumer, the real decisive player to actually achieve sustainability, to make conscious, reasoned and sustainable choices, also forcing the less virtuous producers to align themselves with the more sustainable competitors.*

Originality of the paper. *The work represents an important opportunity to compare three sustainability labels in the food sector in the awareness of their great potential both for policy makers and final consumers.*

The work is interesting and particular because it focuses both on a detailed comparative analysis of the three labels but also on the extended evaluation of how they are perceived by various targets with the final aim of providing valuable information to consumers and policy makers.

Key words: *Sustainability score; front-of-pack labels; Food&Beverage; ecoscore; sustainable development*

Shaping Circular Economy Ecosystems: Foundations for a Framework

MONIA MELIA[1] MARIA CRISTINA DARDANO[2] MARIA COLURCIO[3]

Abstract.

The Circular Economy (CE) reconfigures business systems to integrate economic, environmental, and social objectives through multi-stakeholder collaboration (Sönnichsen et al., 2024; Geissdoerfer et al., 2017). Although Circular Business Models (CBMs) embed these principles at the firm level, their broader impact is curtailed, with circular practices comprising just 8.7% of global economic activity (Fehrer et al., 2024). This limitation arises from an overemphasis on isolated firm strategies rather than interdependent ecosystem dynamics. Circular Economy Ecosystems (CEEs) offer a systemic lens, uniting actors-businesses, policymakers, academia and communities-to co-produce value (Pietrulla, 2022; Kanda et al., 2021). Yet, the social dimension of CEEs remains underexplored, limiting insight into their societal potential. This qualitative study, blending a systematic literature review with a case analysis of Manteco-a leader in circular textiles-proposes a multidimensional framework synthesizing environmental, economic and social facets of CEEs. Results reveal governance structures, stakeholder interactions and social value mechanisms, providing theoretical clarity and managerial strategies for advancing circularity.

Framing of the research. *The concept of the Circular Economy (CE) has gained increasing attention among scholars, industry practitioners and policymakers (Zucchella & Previtali, 2019; Pietrulla, 2022; Kanda et al., 2021; Pieroni et al., 2019). Recognized as a key enabler of sustainability, CE seeks to harmonize economic activities with environmental and social imperatives (Fehrer et al., 2024; Boldrini & Antheaume, 2021; Geissdoerfer et al., 2017). It is defined as "a regenerative economic system that requires a paradigm shift to replace the 'end-of-life' concept with the reduction, alternative reuse, recycling and recovery of materials throughout the supply chain, with the aim of promoting value preservation and sustainable development, enabled by an alliance of stakeholders as industry, consumers, policymakers, and academia" (Sönnichsen et al., 2024). This paradigm shifts challenges traditional business models and supply chain dynamics, requiring systemic transformation.*

At the firm level, Circular Business Models (CBMs) represent a key mechanism for embedding circular principles into corporate strategies. CBMs integrate economic, environmental and social dimensions into their value proposition (Boons & Lüdeke-Freund, 2013), enhancing resource efficiency, minimizing waste and ensuring value retention (Guldmann & Huulgaard, 2020; Geissdoerfer et al., 2020, 2023; Bocken & Ritala, 2021). However, despite the increasing adoption of CBMs, their overall impact remains constrained, with only 8.7% of the global economy currently operating under circular principles (Fehrer et al., 2024). The persistence of firm-centric perspectives, which focus narrowly on individual business operations rather than systemic interactions, restricts the scalability of circular initiatives. Given that firms operate within complex, multi-stakeholder networks spanning industries, supply chains and regulatory environments (Kanda et al., 2021), the transition to circularity necessitates a shift toward an ecosystemic perspective (Fehrer et al., 2024; Konietzko et al., 2020; Tabas et al., 2024; Trevisan et al., 2022).

Recent scholars have increasingly explored the intersection of CE and business ecosystems (BE), leading to the conceptualization of Circular Economy Ecosystems (CEEs) as a framework for understanding stakeholder interdependencies in resource circularity. CEEs are defined as "multi-actor entities in which interdependent actors play complementary roles, including companies, industry representatives, public and government agencies, ministries, universities, non-profit organizations, and citizen-consumers" (Pietrulla, 2022). This approach marks a shift from isolated corporate strategies to dynamic, interconnected ecosystems in which actors collaboratively create economic, environmental and social value (Kanda et al., 2021; Trevisan et al., 2022; Fehrer et al., 2024).

CEEs integrate several key dimensions, including governance, value creation, actor interactions, data and material flows and circular strategies (Asgari & Asgari, 2021). Among these, governance plays a pivotal role in ensuring coordination, strategic alignment and transparency (Pietrulla, 2022). Governance models within CEEs exhibit significant variation, ranging from centralized structures, where a dominant focal actor orchestrates collaboration, to decentralized

models relying on third-party coordination. The heterogeneity of governance arrangements underscores the need for adaptive frameworks that reflect the specific characteristics of each CEE (Pietrulla, 2022).

The role of the orchestrator is particularly critical in managing the complexity of CEEs. Orchestrators facilitate knowledge management, set operational standards and develop contractual frameworks that optimize resource circularity (Zucchella & Previtali, 2019; Pietrulla, 2022). Beyond these technical functions, they foster collaboration, encourage resource-sharing practices and enable service co-creation, balancing individual firm objectives with broader ecosystemic goals (Zucchella & Previtali, 2019). Moreover, orchestrators continuously assess ecosystem evolution, identifying new entrants, redefining stakeholder roles and recalibrating governance structures to enhance circular outcomes (Trevisan et al., 2022). Through these mechanisms, orchestrators leverage resources to strengthen CEEs, foster innovation and facilitate stakeholder cooperation, thereby advancing large-scale circular transitions (Fehrer et al., 2024; Pietrulla, 2022; Zucchella & Previtali, 2019).

While the literature increasingly acknowledges the strategic role of CEEs in fostering circularity (Aminoff et al., 2017; Hsieh et al., 2017; Parida & Wincent, 2019), there is a lack of conceptual clarity regarding the defining characteristics of CEEs and their unique attributes. Existing definitions (Aminoff et al., 2017; Wurster et al., 2020) recognize the co-evolutionary nature of these ecosystems but fail to explicitly connect ecosystem outputs with circular value propositions. Furthermore, the indiscriminate use of the term 'ecosystem' without a precise delineation of its constitutive elements constrains both theoretical advancements and managerial applications.

Trevisan et al. (2022) contribute to addressing these gaps by introducing an integrative framework that synthesizes five foundational dimensions of CEEs: (1) value creation and appropriation, (2) actor configuration and interrelations, (3) data, materials, and resource flows, (4) circular strategies and activities, and (5) governance structures. This framework offers a first theoretical foundation for analyzing the multifaceted nature of CEEs and their role in enabling systemic circularity. Authors highlight the need to investigate the social aspects of a circular ecosystem as well as the environmental and economic ones.

Purpose of the paper. *Despite the expanding literature on Circular Economy Ecosystems (CEEs), their social dimensions remain insufficiently examined. Current research provides only partial perspectives on how CEEs generate social value, leaving a critical gap in understanding their broader societal contributions. Staicu (2019) underscores the significance of social entrepreneurship in CEEs, proposing that scaling circular business models can amplify their social impact. Likewise, Parida et al. (2019) argue that circular economy scholarship must extend beyond its predominant focus on environmental and economic outcomes to encompass social benefits, such as community well-being and resilience. A thorough investigation into the social dynamics of CEEs is imperative, particularly given their capacity to stimulate community participation, generate employment, and strengthen social cohesion.*

Addressing the research agenda outlined by Trevisan et al. (2022), this study develops a holistic framework that synthesizes the environmental and economic pillars of CEEs with their underexplored social dimension. By integrating these elements, the proposed framework offers robust theoretical contributions and actionable insights for academics and practitioners advancing circular economy initiatives.

Methodology. *This study employs a qualitative methodology, integrating a single case study with a systematic literature review to investigate the structure and social dynamics of Circular Economy Ecosystems (CEEs). The systematic literature review, conducted per Tranfield et al. (2003), synthesized existing CEE scholarship (e.g., Trevisan et al., 2022; Pietrulla, 2022; Staicu, 2019) to establish a theoretical foundation and identify research gaps, particularly the underexplored social dimension. This review shaped the case study's focus by deriving key areas for inquiry-namely, stakeholder roles, governance mechanisms, and social value creation-which informed the design of interview questions and the selection of focal points for data collection.*

A single case study approach was selected for its suitability in exploring novel, complex phenomena within their real-world contexts (Yin, 2009; Eisenhardt, 1989), offering depth into Manteco, a globally recognized leader in sustainable textiles based in Prato, Italy. Manteco's pioneering role in circular wool recycling since 1943 and its ecosystem engagement made it an exemplary case for examining CEE dynamics. Data collection unfolded in two phases. Initially, secondary data from sustainability reports, news articles, and Manteco's website provided a contextual baseline of its circular practices and stakeholder interactions. Subsequently, primary data were gathered through semi-structured interviews with Dr. Giuseppe Picerno, Head of Innovation and Sustainability, and Dr. Luca Querci, Special Project Manager. These interviews, guided by literature-derived themes, probed stakeholder contributions, governance structures, and social impact mechanisms, such as the Manteco Academy's role in community engagement.

Data analysis utilized an inductive thematic coding process, following Gioia et al. (2013), to distill patterns and mechanisms from both secondary and primary sources, ensuring findings were empirically grounded and aligned with the literature's conceptual framework

Results: *Manteco's CEE.*

According to Trevisan et al. (2022), Manteco's CEE is based on the integration of the five core elements.

***Value**: Manteco's value proposition revolves mainly around its commitment to sustainability, circularity, and the creation of high-quality fabrics. Over the years, Manteco has positioned itself as a leader in sustainable fashion, crafting luxury fabrics from recycled wool. The company's value proposition is anchored in four key pillars: Circularity, Durability, Made in Italy, and Recyclability. This value proposition appeals to various stakeholders, including customers, suppliers, and institutions, who share in the collective value creation within Manteco's ecosystem.*

Manteco places a strong emphasis on value co-creation, particularly through its collaborative relationships with suppliers and customers. The company operates a recycling supply chain where partners work together to recycle textile fibers, helping close the loop on material use. The company's continuous efforts to refine its circular economy model include increased transparency and communication around the environmental benefits of its practices. However, Manteco acknowledges the need for further development of textile fiber recycling systems to fully realize the potential for value co-creation within the ecosystem.

Manteco actively co-creates social value, with the Manteco Academy, established in 2018, representing its flagship initiative in this endeavor. The Academy was designed to educate and engage students worldwide on topics related to circular economy, sustainability, and eco-designed fabrics. Its mission is to provide the next generation of designers and fashion professionals with the necessary tools to create sustainable, circular products. Through guided visits, lectures, webinars and an informative company blog, the Manteco Academy empowers students to integrate sustainability principles into their future design practices.

In addition to educational initiatives, Manteco actively fosters creativity and innovation in sustainable fashion through collaborations with academic institutions and fashion schools. The company offers its materials for fashion competitions and hosts the Manteco Sustainability Award, a competition aimed at students who wish to develop capsule collections that adhere to the company's eco-design principles. This initiative allows students to apply their knowledge of circular economy and sustainability in a real-world context, fostering practical skill-building and innovation.

Through these initiatives, Manteco has established collaborations with approximately 40 partners, including fashion schools and universities, reinforcing the company's role as a key enabler in the education and development of sustainable practices within the fashion industry. Furthermore, Manteco's engagement extends beyond education, leveraging social media platforms to raise awareness among end users about sustainability issues and circular economy principles. By using these platforms, the company promotes its sustainable initiatives and encourages greater participation in circular practices among consumers.

The Manteco Academy represents a dual approach to social value creation: both as an educational platform and as a means to actively engage the broader community in circular economy principles. As Dr. Luca Querci, Special Project Manager at Manteco, states, "The fundamental pillars of Manteco Academy are both educational and competitive. The company organizes guided visits, seminars at schools and universities to discuss products and sustainability projects, and has introduced the Manteco Sustainability Award." Through these efforts, Manteco demonstrates its commitment to fostering a more sustainable and socially responsible future in the fashion industry.

***Actors:** Manteco's ecosystem consists of a connected set of actors, each fulfilling a critical function in value creation and circular operations. The company establishes long-term relationships with key suppliers, ensuring a stable procurement process in which a significant proportion of costs is allocated to reliable partners. Subcontractors contribute to production continuity, while customers play an active role in the co-development of products and services, facilitating customization and market adaptability.*

Beyond its direct supply chain, Manteco engages with a network of institutions, including universities, research centers, NGOs and industry associations. Notable collaborations include participation in working groups within the Ellen MacArthur Foundation and strategic partnerships with institutions such as SDA Bocconi in the field of circular fashion. These alliances serve as drivers of innovation and enable stakeholder alignment, ensuring that all actors within the ecosystem adhere to Manteco's sustainability principles.

Additionally, the Manteco System, a network of affiliated companies, operates under a shared Values Charter, reinforcing collective adherence to circular and responsible business practices. Through this structured network, Manteco facilitates coordinated action, which is essential for scaling circular models and advancing innovation in textile recycling.

***Data, Materials and Flows**: In Manteco's circular economy ecosystem, resource integration plays a fundamental role in ensuring sustainability. The company incorporates recycled wool and other sustainable materials into its production processes, embedding material flows at the core of its business model. A key focus is the exchange and recirculation of resources among various actors, including suppliers and customers, to maximize the repurposing and reuse of materials and minimize waste generation.*

Data integration is equally critical in optimizing material flows and enhancing process efficiency. By leveraging advanced technologies, Manteco increases supply chain transparency, enabling real-time monitoring of material movements. The company is also expanding its use of digital tools to facilitate data exchange and improve the coordination of actors within the ecosystem. This approach enhances resource circulation, reduces dependency on virgin materials, and supports the broader transition to a circular economy.

Circular Activities and Strategies: Manteco's circular initiatives are primarily centered on the recycling of wool and other textile materials, as well as the design of durable and sustainable fabrics. These activities align with the company's overarching circular strategies, which aim to minimize waste, maximize material reuse, and enhance product longevity.

The company operates within a closed-loop model, wherein textile waste-including post-consumer garments-is transformed into high-quality recycled wool. This approach not only reduces the environmental impact of textile production but also optimizes resource efficiency. Beyond its operational processes, Manteco actively engages in stakeholder education on circular practices, both through internal initiatives and strategic collaborations with academic institutions and industry partners.

Manteco's commitment to circularity extends beyond recycling to encompass the entire product lifecycle, including design, material sourcing, and end-of-life management.

Governance: To ensure the effective functioning of its circular economy ecosystem, Manteco employs different governance mechanisms. These include the Values Charter, which aligns all ecosystem participants with the company's sustainability and circularity objectives. Serving as a foundational framework, the Values Charter establishes shared principles and operational standards for all partners within Manteco's ecosystem.

In addition, the company relies on its Code of Conduct and Sustainability Report to enforce accountability and transparency across its operations. These governance instruments facilitate the monitoring of performance and the reinforcement of Manteco's commitment to its core values and strategic objectives. By documenting its achievements and setting forth future targets in the Sustainability Report, Manteco ensures both high transparency and continuous progress.

Furthermore, when there is a misalignment between the values and vision of ecosystem actors, Manteco fosters cultural alignment through the provision of customized training programs tailored to the specific needs of the stakeholders involved.

Manteco's governance structures are integral to ensuring stakeholder engagement, fostering trust, and minimizing potential conflicts. Structured initiatives, such as Project 43, are designed to align the values of various stakeholders, thereby facilitating collaboration and ensuring that all participants in the ecosystem are working towards shared sustainability goals.

Framework Development: An exploratory framework for Circular Economy Ecosystems

We propose an exploratory multidimensional framework for Circular Economy Ecosystems (CEEs), grounded in the qualitative analysis of the Manteco case study. Building on Trevisan et al.'s (2022) five foundational dimensions-value creation and appropriation, actor configuration and interrelations, data, materials, and resource flows, circular strategies and activities, and governance structures-this framework integrates environmental, economic, and social facets of CEEs, with findings anchored in Manteco's practices as revealed through systematic literature review and case study data (see Table 1). The framework's emergence from Manteco's ecosystem underscores its empirical basis, offering a structured lens to understand how CEEs balance sustainability objectives in a real-world context.

The framework's environmental dimension reflects Manteco's commitment to minimizing ecological impact, evident in its mechanical wool recycling processes that transform discarded garments into high-quality fabrics, reducing waste and virgin material use. Economically, it captures Manteco's approach to sustaining profitability through durable, recyclable products and an efficient closed-loop supply chain, aligning with market demands for sustainable textiles. Socially, the framework highlights Manteco's role in fostering societal benefits, particularly through the Manteco Academy, established in 2018, which educates students and engages communities worldwide on circular principles via lectures, webinars, and the Manteco Sustainability Award. Analysis of interviews with Dr. Giuseppe Picerno and Dr. Luca Querci, alongside secondary data, revealed these initiatives as pivotal to co-creating social value with 40+ academic and industry partners.

Manteco's ecosystem further informs the framework's dimensions. Actor configuration emerges from its network of suppliers, subcontractors, customers, and institutions (e.g., Ellen MacArthur Foundation), coordinated through long-term relationships and the Manteco System's Values Charter. Resource flows are optimized by integrating recycled wool and transparent data systems, a practice identified in sustainability reports and reinforced by interview insights on stakeholder collaboration. Circular strategies, such as durable fabric design and textile recycling, align with Manteco's operational model, while governance mechanisms-including the Values Charter, Code of Conduct, and tailored training (e.g., Project 43)-ensure alignment across actors, as evidenced by the company's emphasis on trust and accountability. "The framework, derived from Manteco's case analysis, models CEEs as dynamic systems where environmental, economic, and social roles interplay through core processes (Table 1). For instance, co-creation ties Manteco's recycling to profitability and education, while governance alignment unifies actors via the Values Charter, offering a replicable structure for CEEs beyond textiles

Tab. 1: An Explorative framework for Circular Economy Ecosystems (CEEs)

Dimension	***Environmental Role***	***Economic Role***	***Social Role***	***Core Process (Manteco-Derived)***
Value Creation & Appropriation	*Reduces ecological footprint via efficient resource use.*	*Secures revenue through durable, circular outputs.*	*Strengthens societal impact via stakeholder engagement.*	*Co-creation links recycling (environmental) to profitability (economic) and education (social, e.g., Academy).*
Actor Configuration & Interrelations	*Connects partners for sustainable material cycles.*	*Aligns stakeholders for market scalability.*	*Builds collaborative networks for societal benefit.*	*Orchestration integrates suppliers, firms, and institutions (e.g., 40+ partners) across goals.*
Data, Materials, & Resource Flows	*Enhances circularity through recycled resources.*	*Optimizes costs via streamlined flows.*	*Shares knowledge to enhance community capacity.*	*Resource integration ties material reuse (e.g., wool) to efficiency and awareness (e.g., data transparency).*
Circular Strategies & Activities	*Lowers impact with eco-focused recycling.*	*Sustains viability via scalable circular models.*	*Promotes circular practices through education.*	*Strategy alignment blends recycling (environmental) with business models (economic) and learning (social, e.g., Award).*
Governance Structures	*Sets sustainability standards for ecosystem actors.*	*Ensures economic coordination across partners.*	*Fosters trust and inclusion via shared objectives.*	*Governance alignment uses charters (e.g., Values Charter) to unify triple-bottom-line aims.*

Research limitations. *This study's reliance on a single case (Manteco) limits generalizability across industries, despite its depth. Qualitative data from interviews and company reports may reflect self-representation biases, lacking external stakeholder perspectives (e.g., communities, NGOs). Additionally, the social dimension's scope-focused on education and awareness-overlooks broader impacts like labor conditions or equity, warranting future longitudinal or multi-case research.*

Theoretical and Managerial implications. *This study contributes to the emerging stream of research on Circular Economy Ecosystems (CEEs) by incorporating the often-overlooked social dimension. While previous studies have predominantly focused on the economic and environmental aspects of CEEs, this paper advances the literature by examining how CEEs can generate social value through collaboration, education, and stakeholder engagement. Furthermore, it addresses the lack of empirical research in the field, as highlighted by Trevisan et al. (2022).*

From a managerial perspective, this research provides useful insights for practitioners seeking to develop and implement CEEs that not only prioritize environmental sustainability but also yield positive social outcomes. Manteco's initiatives, such as the Manteco Academy and the Manteco Sustainability Award, serve as exemplary models of how companies can embed circularity into their business strategies while fostering social learning, reinforcing local partnerships and promoting a culture of sustainability.

Managers can gain valuable lessons from Manteco's engagement with a wide range of stakeholders, including universities, customers, suppliers, and local communities, to co-create value and establish a shared vision for circularity. The study emphasizes the importance of collaborative governance, trust-building and inclusive practices in ensuring long-term sustainability and resilience within circular ecosystems.

Moreover, this research provides guidance on how companies can develop circular business models that are not only economically viable and environmentally responsible but also socially impactful. By adopting strategies that integrate educational initiatives, sustainability awards, and cross-sector collaborations, managers can contribute to broader societal goals such as social equity, community engagement, and capacity building. In doing so, businesses can align their strategies with the global sustainability agenda, advancing both corporate and societal well-being.

Originality of the paper. *This paper pioneers a CEE framework uniting environmental, economic, and social dimensions, leveraging Manteco's case to empirically foreground social value, a novel contribution to circularity scholarship.*

Key words: *Circular Economy (CE), Circular Economy Ecosystems (CEEs), Comprehensive framework, social value*

An exploratory study on consumer sustainable responses to nature-inspired VR brand experiences

SARA BOCCALINI[1] MICHELA PATRIZI[2] MARIA VERNUCCIO[3] ALBERTO PASTORE[4]

Abstract

As the demand for sustainability is reshaping the branding landscape, purpose-driven brands are leveraging emerging technologies, such as virtual reality (VR), to create brand experiences that encourage sustainable consumer responses. While nature-based experiences have been shown to enhance awe, connectedness with nature, and environmental consciousness for sustainable consumption, little is known about how these responses manifest in VR-based natural environments. Given Gen Z's strong commitment to sustainability, this study investigates their sustainable responses to VR nature-based brand experiences using a cluster analysis approach. Based on 321 questionnaires, the findings identify three distinct Gen Z consumer clusters based on their perceptions of connectedness with nature, awe, and environmental consciousness for sustainable consumption. Each cluster exhibits different perceptions of the VR brand experience and sustainability-related personal characteristics. This research contributes to the brand-purpose literature by offering insights into consumer sustainable responses in virtual environments and providing managerial implications for enhancing brands' impact on sustainability.

Keywords: *brand experience, virtual reality, nature, consciousness for sustainable consumption, awe, connectedness with nature, cluster analysis*

Framing of the research. *The growing emphasis on sustainability is transforming the branding landscape. No longer confined to their traditional commercial roles, brands are increasingly recognized as agents of social change (Swaminathan et al., 2020). Within this context, purpose-driven branding aims to reshape consumer practices, expanding the social role of brands and deepening their impact on consumers (Hajdas & Kłeczek, 2021; Gray et al., 2024).*

Among marketing strategies designed to influence consumer behavior positively, Bahl et al. (2016) highlight the importance of experiences that foster deeper reflection on the human conditions of existence, which are intrinsically tied to the natural life cycles. Psychological research has long emphasized the significance of nature-based experiences in enhancing self-reflection and psychological well-being (Naor & Mayseless, 2020). Moreover, interactions with nature-whether in remote landscapes such as forests or in urban settings like parks and gardens-have been linked to emotional and cognitive benefits that encourage sustainable consumption behaviors (Rosa & Collado, 2019). Nature experiences have been found to evoke positive consumer responses, including awe (a self-transcendent emotion characterized by a sense of vastness and a need for cognitive accommodation), connectedness with nature (a deep emotional bond with the natural environment), and environmental consciousness for sustainable consumption (a heightened intention to adopt environmentally responsible consumption practices) (Agu et al., 2022; Liu et al., 2023). These cognitive and emotional responses play a crucial role in fostering sustainable consumption behaviors (Arruda et al., 2017; Dong et al., 2020; Jaiswal & Bihari, 2020; Keltner, 2025).

Despite these benefits, evidence suggests that direct experiences with nature are declining, contributing to a range of behavioral concerns (WiseSociety, 2021). Advances in digital technology, however, offer alternative ways to engage with the natural world through digital media, virtual environments, and video games (Truong & Clayton, 2020). In this regard, virtual reality (VR) has emerged as a key technology, enabling the creation of immersive, multisensory virtual environments that replicate real-world nature experiences (Bonetti et al., 2018).

With purpose-driven brands increasingly investing in sustainability initiatives, VR presents a promising tool for developing nature-based brand experiences that enhance consumer sustainable responses. Several brands have already harnessed VR to deliver nature-inspired experiences, such as National Geographic's virtual expeditions to the Arctic and

Peru and The North Face's 360° exploration of Mont Blanc (MetaStore, 2019; Sport Press, 2021). However, little is known about how consumers respond to VR nature-based brand experiences in terms of connectedness with nature, awe, and environmental consciousness for sustainable consumption. As Gen Z is projected to become the dominant global consumer group in the coming years (Jeong & Kim, 2024) and demonstrates a strong commitment to sustainable consumption (Jiang et al., 2024), this study aims to explore how Gen Z consumers respond to VR-based nature brand experiences concerning awe, connectedness with nature, and consciousness for sustainable consumption, using a cluster analysis approach.

VR brand experiences elicit consumers' internal responses across social, sensory, intellectual, behavioral, and affective dimensions (Lee & Cho, 2023). However, research remains limited on how these dimensions characterize distinct clusters of Gen Z consumers based on their sustainable responses. Additionally, prior research emphasizes the role of personal factors in shaping sustainable consumer behavior, such as perceived responsibility for environmental damage and environmental cause knowledge. Therefore, this study seeks to describe Gen Z consumer clusters based on sustainable responses by considering different VR brand experience perceptions (i.e., social, sensory, intellectual, behavioral, and affective) alongside key sustainability-related personal characteristics (perceived responsibility for environmental damage and environmental cause knowledge).

Theoretical Background

Awe. *Awe is an epistemic emotion characterized by surprise, doubt, admiration, and reverence. It is defined by two core appraisals: perceived vastness and the need for accommodation (Keltner & Haidt, 2003). As Keltner and Haidt (2003) observed, awe-inducing events can serve as powerful catalysts for personal transformation and growth (p. 312). Indeed, awe has been extensively studied as an emotion that promotes sustainable and pro-environmental behaviors (Kaplan et al., 2024; Su et al., 2025). In a recent study, Keltner (2025) identifies eight categories of awe-inducing experiences: moral beauty, nature, collective effervescence, visual design, music, spirituality, big ideas, and the life cycle. Among these, nature's ability to inspire awe has been particularly recognized (Ivanhoe, 1997; Craig et al., 2018).*

With the advancement of new technologies, awe-inspiring experiences have become increasingly accessible to consumers. VR technology has been leveraged to create immersive nature-based experiences, providing highly realistic environments that evoke profound emotional responses (Quesnel & Riecke, 2018; Chirico et al., 2023; Menkhaus, 2024).

Previous research highlights that consumers' experiences of awe in nature are shaped by various factors, including personal characteristics (e.g., feelings of smallness, spirituality, and perceptions of environmental repairability; Kaplan et al., 2024) and, in the context of VR, by the setting of the VR-based experience itself (e.g., personal and social engagement during the experience; Chirico et al., 2023).

In marketing literature, awe has primarily been explored as a precursor to pro-environmental behavior, particularly in the context of tourism experiences (Su et al., 2025). However, there is limited understanding of how awe manifests within nature-based VR brand experiences.

Connectedness with nature. *Connectedness with nature is defined as an individual's emotional and experiential bond with the natural world (Mayer & Frantz, 2004). This connection has been found to improve the interest in environmental protection (Perkins, 2010) and more sustainable consumption behaviors (Dong et al., 2020). Growing evidence suggests that nature connectedness can be influenced by specific activities or circumstances, such as experiences in natural settings (Louv, 2008).*

VR technology offers highly realistic natural experiences that can foster a sense of nature connectedness (Brambilla et al., 2024). Research indicates that consumers' connectedness with nature in VR-based experiences is shaped by various factors, including personal attributes (e.g., nature affinity; Leung et al., 2022) and experiential elements (e.g., multisensory engagement, interactivity, visual realism; Brambilla et al., 2024).

In marketing literature, connectedness with nature has primarily been explored as a predictor of green purchase behavior (e.g., Dong et al., 2020). However, there is limited research on how this perception emerges within VR-based brand experiences.

Environmental consciousness for sustainable consumption. *Environmental consciousness for sustainable consumption refers to a consumer's concern about the environmental impact of products, including whether they are made from recycled materials, can be disposed of in an environmentally friendly manner, are sustainably packaged, and are produced using environmentally responsible practices (Balderjahn et al., 2013). This form of environmental consciousness has been shown to positively influence sustainable consumption behavior (Sun et al., 2024).*

Previous literature has paid little attention to the role of marketing experiences in shaping environmental consciousness for sustainable consumption. However, research suggests that exposure to nature can enhance this awareness (Nisbet et al., 2009), and studies have highlighted the potential of VR as a tool for fostering environmental concern through nature-based experiences (Nelson et al., 2020).

In this context, research indicates that consumers' environmental consciousness for sustainable consumption is influenced by personal characteristics such as pro-environmental self-identity, social norms, environmental awareness, education, and income (Balderjahn et al., 2013; Sun et al., 2024). However, less is known about the experiential dimensions that shape this consciousness, particularly within VR-based marketing contexts.

Notably, no studies have explored how environmental consciousness for sustainable consumption arises during a nature-based brand experience in VR.

Considering the significant role of Gen Z in both sustainable purchasing behavior (Jeong & Kim, 2024; Jiang et al., 2024) and their affinity for VR technology (Statista, 2023), it is essential to understand their sustainable responses when experiencing a VR brand in a natural setting. Therefore, the first objective of this study is:

***Objective** 1 - To identify Gen Z clusters based on sustainable consumer responses (i.e., awe, connectedness with nature, and environmental consciousness for sustainable consumption) during a VR brand experience in a natural setting.*

***VR brand experience.** Virtual reality (VR) brand experience is defined as "consumers' subjective, internal, and behavioral responses that are evoked by specific brand-related attributes" within VR-based environments (Lee & Cho, 2023). The authors identify five key dimensions through which consumers engage with a brand in VR experiences: social, sensory, intellectual, behavioral, and affective.*

Existing research on VR brand experiences suggests that the sensory dimension of the VR experience can positively influence sustainable consumer responses (Laukkanen et al., 2022), such as awe through music (Pilgrim et al., 2017) and connectedness with nature through visual embodiment of a tree or an animal (Spangenberg et al., 2022). Additionally, some studies have focused on the affective dimension of VR brand experiences to explore its role in shaping sustainable consumer behavioral responses (Deng et al., 2024; Khanal, 2024).

However, an integrated perspective on the multisensory nature of VR brand experiences is lacking. It is still unclear how the different dimensions of VR brand experience (social, sensory, intellectual, behavioral, and affective) characterize consumers' experiences based on their sustainable responses-such as awe, connectedness with nature, and environmental consciousness for sustainable consumption-during nature-based VR brand encounters.

***Perceived responsibility for environmental damage and Environmental cause knowledge.** Perceived responsibility for environmental damage refers to the extent to which an individual believes they are directly or indirectly responsible for harming the environment (Schwartz, 1968). Research indicates that individuals who feel responsible for environmental damage, compared to those who do not, are more likely to engage in self-regulation, thereby enhancing their environmentally sustainable perceptions (Wu & Yang, 2018). For example, perceived responsibility for environmental damage has been shown to influence green consumption behaviors (Wu & Yang, 2018).*

Environmental cause knowledge refers to consumers' perceived understanding of environmental issues, and it has been found to significantly shape sustainable consumer responses (Liefländer et al., 2013; Hill & Lee, 2015). For instance, connectedness with nature is influenced by environmental cause knowledge (Liefländer et al., 2013).

Despite the importance of these variables in shaping sustainable responses, no studies have yet explored how they characterize consumers' experiences based on their sustainable responses (i.e., awe, connectedness with nature, and environmental consciousness for sustainable consumption) during a nature-based VR brand experience.

Given the limited insight into how dimensions of VR brand experiences and sustainability-related personal characteristics describe the consumers' experiences based on different sustainable responses, the second objective of this study is:

***Objective 2** - To describe clusters of Gen Z consumers based on their sustainable responses (i.e., awe, connectedness with nature, and environmental consciousness for sustainable consumption) by considering VR brand experience dimensions (social, sensory, intellectual, behavioral, and affective) alongside sustainability-related personal characteristics (i.e., perceived responsibility for environmental damage and environmental cause knowledge).*

Methodology. *To achieve the research objectives, we conducted an empirical survey targeting Gen Z users (ages 18-28) in Italy, as this group represents the most active demographic in VR-based experiences (ADC Group Data Center, 2022; McKinsey et al., 2022). Participants were recruited via email, and a total of 333 questionnaires were collected. After excluding 12 responses due to attention check failures or incomplete answers, we obtained 321 valid responses. The final sample was gender-balanced (57.6% women, 42.1% men, 0.3% non-binary) with an average age of 21.67 years (SD = 2.01). Regarding education, 68.8% of participants held a high school diploma, 22.4% had a bachelor's degree, 1.2% held a first-level master's degree, and 7.5% had a master's degree.*

To gather rich responses, each participant was invited to engage in a VR-based metaverse experience centered around a natural environment (i.e., The North Face) available in the Oculus store, using the highly immersive Meta Quest 2 headset. This experience was chosen because the brand is recognized as gender-inclusive, and the immersive environment enables users to navigate a natural setting, exploring the winding trails of Mont Blanc, the highest mountain in Europe. A designated room within the research department was set up for participants to join the immersive experience and complete the questionnaire.

The questionnaire was administered via SurveyMonkey® and comprised closed-ended questions divided into four sections. The first section included measurement scales for awe, connectedness with nature, and environmental consciousness for sustainable consumption. The second section focused on the five dimensions of the VR experience. The third section gathered descriptors related to sustainability-related personal characteristics for cluster analysis, such as perceived responsibility for environmental damage and environmental cause knowledge. Finally, the last section collected sociodemographic data, including age, gender, and education.

We adapted the seven-item, 7-point Likert scale from Chirico et al. (2017) concerning awe. Besides, we measured connectedness with nature by adapting the 14-item, 7-point Likert scale from Mayer and Frantz (2004), and environmental consciousness for sustainable consumption using the four-item, 7-point Likert scale from Balderjahn et al. (2013). Considering the VR experience, we adopted the 26-item, 7-point Likert multidimensional scale proposed by Lee and Cho (2023). Specifically, we assessed the following dimensions: social, sensory, intellectual, behavioral, and affective. Regarding the descriptive variables related to personal characteristics, we measured perceived responsibility for environmental damage by adopting the six-item, 7-point Likert scale proposed by Wu and Yang (2018), and environmental cause knowledge using Hill and Lee's (2015) four-item, 7-point Likert scale.

Results. *We initially conducted a confirmatory factor analysis (CFA) to evaluate the reliability and validity of the measurement model using LISREL software (Jöreskog & Sörbom, 2006). Specifically, we focused on the measurement model for the three variables used to identify the clusters: awe, connectedness with nature, and environmental consciousness for sustainable consumption. The results indicated a good model fit: $\chi 2(272) = 464.373$, root mean square error of approximation (RMSEA) = 0.045, standardized root mean square residual (SRMR) = 0.07, confirmatory fit index (CFI) = 0.96, and non-normed fit index (NNFI) = 0.98. Standardized factor loadings were all above 0.60, and each standardized item loading was significant ($p < 0.01$). The average variance extracted (AVE) for each variable exceeded 0.50 ($AVE_{AWE} = 0.51$; $AVE_{CONN} = 0.52$; $AVE_{ECSC} = 0.74$), and the composite reliability (CR) was above 0.70 ($CR_{AWE} = 0.88$; $CR_{CONN} = 0.94$; $CRE_{CSC} = 0.92$). Furthermore, Cronbach's alpha values were all greater than 0.70 ($\alpha_{AWE} = 0.88$; $\alpha_{CONN} = 0.94$; $\alpha_{ECSC} = 0.92$). The shared variance between factor pairs was always lower than the corresponding AVE, confirming discriminant validity (Fornell & Larcker, 1981). Overall, these results support the reliability and validity of the hypothesized measurement model (Bagozzi & Yi, 1988).*

To identify distinct groups of respondents, we conducted a nonhierarchical k-means clustering procedure (Ward's method), which was based on the respondents' standardized mean scores related to (1) awe, (2) connectedness with nature, and (3) environmental consciousness for sustainable consumption. The clustering procedure yielded a three-cluster solution, the generalizability of which to the entire population was confirmed by an adequate Rand index (.76) (Rand, 1971). We labeled the final groups of users according to the three clustering factors: ecological awakening minds, disconnected observers, ephemeral thrill-seekers (Table 1).

Tab. 1: K-means Cluster Analysis Results

	F-statistic	**Cluster**		
		1. Ecological awakening minds	2. Disconnected observers	3. Ephemeral thrill-seekers
Awe	169.945*	0.511	-1.137	0.208
Connectedness with nature	97.207*	0.486	-0.287	-1.175
Environmental consciousness for sustainable consumption	167.477*	0.469	-0.039	-1.548
N	321	179	90	52
% of sample	100%	55.76%	28.04%	16.20%

*Notes: *p<0.001.*

Ecological Awakening Minds (55.76%): Users in this group report the most pronounced feelings of environmental consciousness for sustainable consumption (0.469), a strong sense of connectedness with nature (0.486), and heightened awe (0.511). These findings suggest that this group exhibits the most profound interaction with environmental themes within the VR experience.

Disconnected Observers (28.04%): This group shows negligible awe, with the lowest score recorded among all clusters (-1.137). Furthermore, they display minimal feelings of environmental consciousness for sustainable consumption (-0.039) and a weak sense of connectedness with nature (-0.287).

Ephemeral Thrill-Seekers (16.20%): Users in this cluster experienced markedly the lowest connectedness scorewith nature and environmental consciousness for sustainable consumption (-1.175 for connectedness with nature and -1.548 for environmental consciousness for sustainable consumption). Interestingly, they showed a mild level of awe, with a score slightly above average (0.208).

The analysis used one-way ANOVAs to assess the differences among the three clusters based on their VR experience and sustainability-related personal characteristics. The independent variable in this analysis was cluster membership, while the dependent variables included the five dimensions of the VR experience (social, sensory, intellectual, behavioral, and affective) and two personal characteristics (perceived responsibility for environmental damage and environmental cause knowledge). The results in Table 2 indicate significant differences across all descriptive variables except for perceived responsibility for environmental damage. While the clusters differ in how they experience the VR content and their levels of environmental cause knowledge, their perceived responsibility for environmental damage is similar across all groups. Note that the variable scores have been standardized.

The findings highlight that the "Ecological Awakening Minds" cluster outperforms the other two clusters across all five dimensions of the VR experience. In terms of environmental cause knowledge, the "Ecological Awakening Minds" cluster stands out from the "Ephemeral Thrill-Seekers", indicating a stronger understanding or interest in environmental issues, whereas no significant difference was observed with the "Disconnected Observers". Notably, as shown in Table

3, no significant differences emerged across the three clusters regarding perceived responsibility for environmental damage. This suggests that, despite differences in VR experience perceptions, participants across all groups perceive themselves similarly in terms of environmental responsibility.

Table 2: One-way ANOVA, Cluster Means, and Significance Levels

	Cluster Mean			Test Statistic	P Value
Dependent Variables	1. Ecological awakening minds	2. Disconnected observers	3. Ephemeral thrill-seekers		
Social VR experience dimension	0.83	-0.13	-0.81	30,619	$p < 0.001$
Sensory VR experience dimension	0.32	-0.15	-0.85	35.966	$p < 0.001$
Intellectual VR experience dimension	0.29	-0.09	-0.86	32,443	$p < 0.001$
Behavioral VR experience dimension	0.28	-0.12	-0.75	25.469	$p < 0.001$
Affective VR experience dimension	0.31	-0.23	-0.67	26.565	$p < 0.001$
Perceived responsibility for environmental damage	0.06	-0.01	-0.17	4.678	$p = 0.010$
Environmental cause knowledge	0.14	-0.09	-0.32	1.075	$p = 0.343^{NS}$

Tab. 3: Multiple comparisons

Key Dependent Variables	Cluster		Mean Difference	P Value
Social VR experience dimension	1	2	0.432	*p<0.001*
		3	1,109	*p<0.001*
Sensory VR experience dimension	1	2	0.471	*p<0.001*
		3	1.182	*p<0.001*
Intellectual VR experience dimension	1	2	0.377	*p=0.005*
		3	1.151	*p<0.001*

		3	0.985	*p<0.001*
Perceived responsibility for environmental damage	1	2	0.067	$p=1.000^{NS}$
		3	0.230	$p=0.435^{NS}$
Environmental cause knowledge	1	2	0.220	$P=0.257^{NS}$
		3	0.452	*p=0.012*

Originality of the paper. *This study shows how Gen Z consumers exhibit varying sustainable responses regarding awe, connectedness with nature, and environmental consciousness for sustainable consumption (Obj 1). The Ecological Awakening Minds experience sustainability comprehensively and profoundly, while the Disconnected Observers show apathetic responses. In contrast, the Ephemeral Thrill-Seekers display a strong emotional reaction (i.e., awe); however, this does not include environmental perceptions (i.e., connectedness with nature and environmental consciousness for sustainable consumption). Moreover, our findings reveal that the Ecological Awakening Minds perceive all five dimensions of the VR experience more intensely than the Disconnected Observers and Ephemeral Thrill-Seekers. Furthermore, this first cluster demonstrates greater environmental cause knowledge than the Ephemeral Thrill-Seekers, who show a lower level of awareness regarding environmental issues (Obj 2). This knowledge gap may explain the limited consumer responses related to nature, including connectedness with nature and environmental consciousness for sustainable consumption, despite the positive emotional response regarding awe.*

These findings contribute to the academic literature in several ways. First, it highlights a new opportunity for purpose-driven brands to foster sustainable consumer responses (i.e., connectedness with nature, awe, and consciousness for sustainable consumption) through nature-based brand experiences in VR. Second, it is the first study to identify variations in sustainable consumer responses to VR-based metaverse experiences among Gen Z user groups, shedding light on distinct response patterns within a generational cohort widely recognized as the most sensitive to sustainability issues (Jeong & Kim, 2024; Jiang et al., 2024). Finally, this research advances the literature on VR brand experience dimensions and sustainability-related personal characteristics (i.e., perceived responsibility for environmental damage and environmental cause knowledge) by revealing differences among Gen Z groups based on their sustainable consumer responses (Liefländer et al., 2013; Hill & Lee, 2015; Pilgrim et al., 2017; Laukkanen et al., 2022; Spangenberg et al., 2022; Deng et al., 2024; Khanal, 2024).

Managerial implications. *From a managerial perspective, this study highlights the potential of nature-based VR brand experiences to elicit diverse sustainable consumer responses, including connectedness with nature, awe, and consciousness for sustainable consumption. Moreover, our findings reveal that different Gen Z clusters exhibit distinct perceptions of the VR brand experience as well as varying personal characteristics. Based on these insights, we recommend that brands tailor their strategies to align with the specific consumer responses identified in this study. First, for the Ecological Awakening Minds cluster, which demonstrates strong sustainable consumer responses and a highly positive VR brand experience across social, sensory, intellectual, behavioral, and affective dimensions, brands should further invest in conveying nature-based experiences, as this may deepen their commitment to sustainability. Second, to mitigate disengagement in the Disconnected Observers cluster, managers should investigate the underlying reasons for*

their passive responses and refine engagement strategies accordingly. Making sustainability-related content more relevant and emotionally compelling could foster stronger consumer-sustainable responses. Third, to effectively engage the Ephemeral Thrill-Seekers cluster, which responds emotionally to the experience but does not fully recognize its environmental implications, brands should seamlessly integrate educational content related to sustainability into the VR experience.

Research limitations. *This study is not without limitations, which offer opportunities for future research. First, the analysis was purely exploratory; future studies should examine causal relationships between different dimensions of the VR brand experience, personal characteristics related to sustainability, and sustainable consumer responses (i.e., connectedness with nature, awe, and consciousness for sustainable consumption). Second, this study focused exclusively on Italian Gen Z consumers who engaged in a nature-based brand experience (i.e., The North Face) without an embodied avatar and realistic interactions. Future research should expand the sample to include participants from different countries and generational groups (e.g., Millennials) and explore fully immersive environments (e.g., first-person perspective through an embodied avatar, realistic interactions) to assess sustainable consumer responses in a more lifelike setting. Third, this study does not provide sufficient descriptive information on the Disconnected Observers; therefore, future research could adopt an exploratory qualitative approach to identify additional factors contributing to this cluster's apathetic disengagement from the experience.*

Beyond Good Intentions: Unpacking the Paradoxes of Responsible Consumption Across Sectors

CECILIA GRIECO[1] ALESSIO DI LEO[2] ALBERTO MATTIACCI[3]

Abstract

As global anxieties surrounding environmental degradation and social inequalities escalate, consumers increasingly seek to align their consumption choices with their values, prioritizing environmentally and socially responsible products and services. However, transforming this heightened awareness into consistent and impactful behavioral change is complex and often fraught with contradictions.

This investigation seeks to delineate the theoretical distinctions and interconnections between two key paradigms in responsible consumption. Recognizing that these concepts manifest differently across industries, this research adopts a comparative lens, examining their practical implications within the food, and fashion sectors. By employing a mixed-methods approach, integrating qualitative analysis of social media discourse with quantitative data from a consumer survey, this study investigates how sustainable and socially responsible consumption behaviors are uniquely exhibited within each sector, the specific factors influencing their adoption, and the emergence of paradoxical outcomes. Through this multifaceted exploration, the study aims to contribute an understanding of responsible consumption paradoxes, offering valuable theoretical and practical insights for academics, businesses, and policymakers.

Framing of the research. *As global awareness of environmental degradation and resource depletion intensifies, consumers are increasingly aligning their purchasing decisions with environmental and social well-being. However, the relationship between this heightened environmental awareness and actual consumer behavior is complex and often paradoxical, necessitating further investigation.*

Sustainable consumption, as defined by Kautish and Sharma (2019), provides a framework for understanding this complex relationship. It emphasizes the use of goods and services that meet basic needs and improve quality of life while minimizing resource depletion, waste, and pollution throughout a product's life cycle. This approach, therefore, aims to ensure that the needs of future generations are not compromised (Holden et al., 2014). A comprehensive investigation of the inherent contradictions and multifaceted dynamics within this theoretical framework is essential for elucidating the discrepancy between environmental consciousness and actual consumer decision-making patterns.

Environmental concerns thus play a pivotal role in defining these consumption patterns. Yet, as the concept of sustainability gets to cover both social, economic, and environmental dimensions, responsible practices that could be adopted by consumers range within a larger span of behaviors that go beyond environmentally friendly and green practices. In this sense, the wider concept of socially responsible consumer and, consistently, socially responsible consumer behavior have emerged to indicate individuals that are driven in their consumption patterns by the desire to minimize or eliminate any harmful effects, while maximizing the long-term beneficial impact on society through the acquisition, usage and disposition of products (Mohr et al. 2001). A recent study from Sharma et al. (2025) provides an interesting systematization of socially responsible consumption, focusing on the ways it overlaps with related concepts. According to the authors socially responsible consumption differs from ethical consumption, green consumption, socially conscious consumption, and sustainable consumption under five main dimensions, i.e., human, social, environmental, economic, and perceived sense of responsibility. In the authors' view, socially responsible consumption is the only construct that involves all the five dimensions, with the other four being a combination of some of those (Sharma et al., 2025). In this sense it differs from sustainable consumption as the latter lacks consumer's perceived sense of responsibility, as individuals might buy sustainable products regardless of motivation (Falcão and Roseira 2022).

Consistently with the concept of consumer social responsibility (Zabel et al., 2023), this sense of responsibility depends upon individuals' moral principles and standards. Further elements of distinction might come from extant literature about the barriers to sustainable consumption. For example, Ramayah et al. (2010) state that habits play a pivotal role in influencing the purchasing behavior of sustainable products, as consumers are not persistent enough in practicing a new behavior until it becomes a habit. This could have an impact on both sustainable and socially responsible consumption

practices which might be hampered or fostered by individuals' habits. A further element are subjective norms, which have been investigated concerning green products as a strong source of influence on individuals' intention to act (Paladino and Ng, 2013).

Vermeir and Verbeke (2006) studied the green purchasing behavior of young consumers and found that friends and family are usually not very convinced that the consumer should purchase green products. However, social pressure exerted by peers is an explanatory variable of the intention to purchase green products (Vermeir & Verbeke, 2006). Taking this into account and the fact that Generation Y is mainly loyal to its closest circle (Hume, 2010), subjective norm is likely to positively influence the young consumer's attitude-behavior relationship.

In addition to individual identity, social or group identity influences sustainable behavior. People's attitudes, beliefs, and behaviors are influenced by the social groups to which they belong (Tajfel, 1982), sometimes even more than their personal identity (Onorato and Turner, 2004). People tend to imitate behaviors that reinforce their group identity and their in-group ties. Attitudes and behaviors are strongly influenced by other trusted individuals who share their in-group membership (people who share their social identity).

Other aspects that might be relevant in determining sustainable or socially responsible consumptions include consumers' perceived effectiveness and perceived importance. In the case of sustainable consumption considerations, high levels of perceived product effectiveness are essential for consumers to translate positive attitudes towards the environment into sustainable purchasing behavior (Vermeir and Verbeke, 2006). Vermeir and Verbeke (2006) suggest that to change their behavior, consumers must believe that purchasing a sustainable product has a positive impact on the environment.

The level of personal involvement with the environment determines the number of sustainable purchases made by consumers. Vermeir and Verbeke (2006) point out that consumers may have a very positive attitude towards sustainability, but they do not believe that environmental conservation is their responsibility and do not actually experience the consequences of, for example, environmental pollution. Consumers with low levels of perceived personal importance instead consider environmental issues as the direct responsibility of the state or businesses.

Self-defensive behaviors may also lead consumers to intentionally ignore information about ethical attributes of products to avoid negative emotions when making their purchase decisions (Ehrich and Irwin, 2005). For example, in their initial study, Ehrich and Irwin (2005) showed that consumers who reported being concerned about the environment and protecting rainforest wood were the least likely to request and use information about environmental attributes in their purchase decisions. By avoiding information about ethical attributes altogether, those who were most concerned about the environmental issue were able to justify purchasing an unsustainable option by defensively claiming their ignorance.

Thus, while partially overlapping, the concepts of sustainable consumption and socially responsible consumption imply the adoption of specific behaviors and, consequently, different effects at micro and macro levels (Sharma et al., 2025). Among the effects of these behaviors, extant research has identified several key paradoxes that highlight the complexities involved. As for sustainable behavior for example, a prominent paradox is the "green consumption paradox" (Peattie and Collins, 2009), where consumers' purchase of green products does not necessarily lead to a reduction in overall consumption or environmental impact.

Another critical paradox is the "knowledge-action gap" or "value-action gap" (Kollmuss and Agyeman, 2002), where high levels of environmental knowledge and positive attitudes towards sustainability do not always translate into sustainable behaviors. Barth et al. (2012) extensively reviewed this gap, pinpointing various psychological, social, and structural barriers that prevent consumers from acting on their pro-environmental intentions. These barriers include habits, perceived lack of efficacy, financial constraints, and the social norms that prioritize convenience and consumption.

These contradictions could be explained by adopting a genealogical-narrative framework (Altuna et al., 2017) that delineate the evolutionary trajectory of sustainability values through two interdependent phases: the Generation Phase and the Institutionalization Phase. This lens reveals how the ascent of sustainability from grassroots movements to institutional norms engenders systemic paradoxes, wherein the commodification of ethical imperatives subverts their transformative potential. The Generation Phase encapsulates the socio-cultural processes through which novel sustainability paradigms are conceived within radical circles-informal collectives of activists, ethical entrepreneurs, and visionary networks that challenge hegemonic consumerist ideologies (Verganti, 2009). These actors reimagine sustainability as a meaning-driven innovation, embedding it in practices such as agroecology, circular design, and fair trade (Altuna et al., 2017). For instance, Italy's Slow Food movement (1989-present) redefined gastronomy as a vehicle for biodiversity preservation and social justice, formalizing its ethos through manifestos that critique industrial agriculture (Slow Food International, 2023). Such movements generate emancipatory meanings but remain peripheral to mainstream institutional structures, deriving legitimacy from niche communities and subcultural validation.

The Institutionalization Phase signifies the transformation of sustainability values from marginal propositions into codified norms, operationalized through regulatory frameworks (e.g., the EU Green Deal), corporate social responsibility (CSR) initiatives, and consumer certification regimes (e.g., Fair Trade, B Corp). This phase involves the strategic appropriation of grassroots terminology-such as "circular economy" or "net-zero"-by institutional actors, a process that often dilutes radical intent to align with growth-oriented imperatives (Stern, 2000). For example, the discourse of sustainable development, initially advanced by environmental NGOs, now underpins multinational corporate strategies that prioritize incremental efficiency gains over systemic transformation (Banerjee, 2008).

The interplay between Generation and Institutionalization activates sustainability paradoxes, which arise from three interrelated mechanisms:

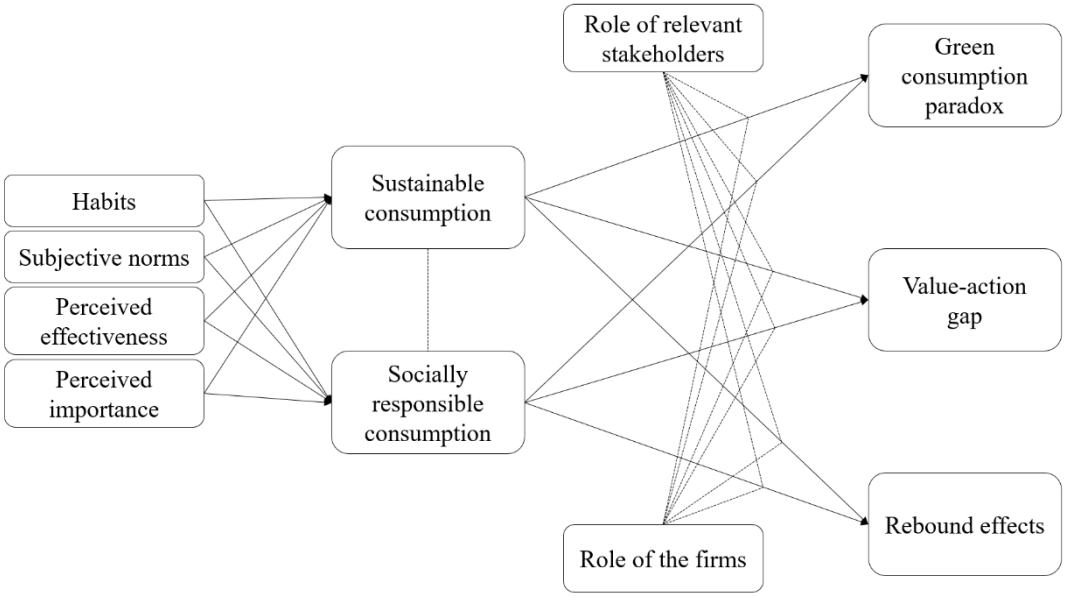
1. *Reinterpretation Asymmetry: Institutionalized norms reinterpret radical frameworks to fit existing power structures. For instance, green consumerism, born of anti-industrial activism, now sustains hyperconsumption under the guise of eco-labeling.*
2. *Decoupling of Means and Ends: Practices such as carbon offsetting, while institutionalized as "sustainable," often perpetuate socio ecological harm (e.g., land dispossession in Global South regions) (Lohmann, 2011).*
3. *Cultural Commodification: Grassroots symbols (e.g., indigenous ecological knowledge) are commercialized into marketable aesthetics, devoid of their emancipatory essence (e.g., "boho-chic" ethical fashion campaigns).*

Altuna et al. (2017) posit that such paradoxes stem from unequal power dynamics during Institutionalization, wherein radical innovators (cultural interpreters) cede discursive control to institutional elites who reframe sustainability within hegemonic economic paradigms. This mirrors Verganti's (2009) theory of design-driven innovation, where dominant actors orchestrate value-system shifts without addressing structural contradictions.

Purpose of the paper. *The purpose of this paper is to investigate the differences between sustainable consumption and socially responsible consumption when concretely adopted within two specific industries: food and fashion industries. In particular, the research aims to answer three research questions:*

RQ1. How do sustainable behavior and socially responsible behavior come about within specific industries?

RQ2. Which are the elements that drive individuals towards each of them?



RQ3. How do these behaviors determine the emergence of behavioral paradoxes?

In this sense the goal is to identify the differentiating elements among these concepts focusing on consumers, firms, and relevant stakeholders which might act as influencers in the purchasing process. In fact, to answer RQ1 and RQ2, consumers' perspective allows to identify the adopted behaviors; firms' perspective sheds light on the role of communication initiatives in orienting and promoting these behaviors; relevant stakeholders' perspective supports the identification of further source of influences that might play a role towards these consumers behaviors. The analysis will focus on two different industries that are particularly suited for the purpose of the research: food and fashion industries. The food industry serves as an ideal research context due to its dual role as a: (i) high-impact sector: agriculture, food production, and distribution account for 26% of global greenhouse gas emissions, 70% of freshwater use, and 50% of habitable land degradation (Poore & Nemecek, 2018); (ii) moral and cultural nexus: food choices are deeply tied to identity, ethics, and societal norms (e.g., veganism, fair trade), making it fertile ground for analyzing tensions between values and behaviors; (iii) pioneer in sustainability movements: from Slow Food (Altuna et al., 2017) to regenerative agriculture, the sector has incubated radical ideas that later became mainstream, offering a rich case for studying institutionalization and contradictions. Similarly, fashion industry presents: (i) high environmental impact: responsible for 10% of global carbon emissions, 20% of wastewater, and massive microplastic pollution (Ellen MacArthur Foundation, 2017); (ii) moral contradictions: "slow fashion" movements coexist with fast fashion's exponential growth (e.g., Shein's $100B valuation despite labor and ecological violations); (iii) radical circles: grassroots movements like Fashion Revolution and designers advocating for circular economy models (e.g., Patagonia's Worn Wear program).

The identification of behavioural practices will be useful to understand the relation between sustainable consumption and socially responsible consumption and the paradoxical behaviours that emerged from the literature analysis, to answer RQ3. Through this investigation, the research aims to contribute to the existing body of knowledge by providing nuanced insights into the paradoxes of responsible consumption, also offering valuable guidance for policymakers, businesses, and educators in devising strategies that effectively promote these consumption patterns.

The proposed integrated framework (Fig. 1) captures the complex interplay between individual behaviors, organizational factors, and systemic outcomes in sustainable consumption patterns, providing a theoretical foundation for analyzing the gap between environmental intentions and actual consumer behavior.

Fig. 1: A proposed model for empirical research

Methodology. *This research investigates the evolution of sustainability discourse through a three-pronged analytical framework examining Generation, Institutionalization, and Development phases, addressing how sustainability narratives emerge, gain societal traction, and generate internal contradictions through two complementary studies. Quality assurance is maintained through systematic content verification, standardized processing procedures, and regular peer review, ensuring scholarly rigor throughout the research process.*

Study 1: Social Media Analysis

The first study examines the evolution of sustainability discourse through social media platforms, aiming to identify concrete behaviors within specific industries (RQ1) and differentiate between sustainable consumption and socially responsible consumption (RQ2). Data collection will be based on data scraping using public APIs (Trezza, 2023), focuses on Facebook, X and Instagram platforms, analyzing sustainability-related content from 2020-2025.

The data collection framework encompasses specific inclusion criteria: posts explicitly addressing sustainability and ethical consumption, geographically diverse sources (including translated non-English content), and content demonstrating authentic engagement with sustainability issues. Content excluded from analysis includes spam, advertisements, bot-generated content, and irrelevant or duplicate posts, ensuring data quality through both LLM-based (Gan et al., 2023) and manual verification processes.

Through narrative analysis, we examine how sustainability stories evolve across the three phases, while qualitative content analysis employs a theoretically grounded coding framework to track thematic patterns (Weber et al., 2012). Frame analysis investigates the transformation of sustainability frames (Cornelissen & Werner, 2014), with particular attention to sentiment-action dissonance and semantic incongruence between sustainability claims and actual behaviors.

Data preprocessing involves systematic noise removal, tokenization, and standardization procedures to ensure consistent analysis across multilingual content. This process includes the removal of technical elements (URLs, emojis), text standardization through lemmatization, and professional translation of non-English content (Nesca et al., 2022).

Study 2: Survey Research

Building on insights from Study 1, a comprehensive survey will be administered to a population of consumers from diverse socioeconomic backgrounds. This quantitative phase examines how individuals engage with sustainability narratives at different stages of institutionalization and how this engagement relates to paradoxical behaviors. The survey instrument incorporates measures derived from the three-phase analysis of the qualitative data. Data collection will employ stratified random sampling to ensure representation across different age groups, income levels, and educational backgrounds. The survey will be administered online through professional survey platforms, with built-in quality control measures including attention checks and response time monitoring. To enhance response quality, the questionnaire will undergo pilot testing with a smaller sample (n=30) to refine question wording, survey flow, and completion time. The goal of this phase will be to investigate the relationship between sustainable consumption and socially responsible consumption with the emergence of paradoxical behaviours, to identify those elements that have a larger impact on determining them (RQ3).

Data analysis
Study 1
The analysis of social media data follows a systematic approach to examine the evolution of sustainability narratives and identify emergent paradoxes in sustainability discourse.
The thematic evolution analysis examines how sustainability narratives emerge and transform over time. Through topic modeling techniques based on BERTopic (Najmani et al., 2023), we will identify dominant themes characterizing each phase of narrative development. This enables us to track how sustainability discussions initially emerge, gain mainstream acceptance, and eventually develop complexities and contradictions. Temporal analysis further allows us to identify significant shifts in discourse, particularly around key events that may have influenced sustainability narratives.
To examine paradoxes within sustainability discourse, we employ a two-step analytical approach. First, we analyze intention-behavioral gap by identifying instances where positive sustainability attitudes coexist with contradictory behaviors in social media communication (Sukumaran & Majhi, 2024). Second, we examine semantic incongruence between sustainability claims and contextual evidence, with particular attention to potential greenwashing rhetoric and its relationship to actual environmental practices.
Quality assurance measures are implemented throughout the analytical process. These include systematic comparison of automated and human-coded samples to ensure reliability, with maintenance of inter-coder reliability (Cohen's $\kappa \geq 0.8$). Regular peer review sessions validate the identified themes and patterns, ensuring robust interpretation of the data.

Study 2
Correlation analyses will examine relationships between sustainability knowledge, attitudes, and behaviors. Multiple regression analyses identify key predictors of sustainable behavior and paradoxical patterns. Structural equation modeling tests the hypothesized relationships while controlling for demographic variables

Research limitations. *This research presents several notable limitations. First, the focus on two specific industries (food and fashion) may not fully represent the broader landscape of sustainable consumption patterns across different sectors. The study's methodology, particularly relying on social media analysis and surveys, introduces potential biases as consumers often report more positive sustainable behaviors than they practice.*

Managerial implications. *The findings offer valuable insights for business practitioners and policymakers. Organizations must develop integrated strategies that bridge the gap between consumers' environmental awareness and actual purchasing behaviors. This requires transparent communication about sustainability initiatives and their measurable impacts.*

Managers should recognize that different consumer segments require tailored approaches to sustainability messaging and engagement. Companies need to invest in technologies and processes that facilitate sustainable consumption while maintaining commercial viability.

Originality of the paper. *The purpose of this paper is to investigate the differences between sustainable consumption and socially responsible consumption within specific industries and the effects these might generate in terms of paradoxical behaviours. In this sense the research presents several aspects of originality compared to extant contributions. First, it aims to consider and compare different forms of responsible behaviour, differentiating the effects each of these can have on the emerged paradoxes. This is particularly relevant as most contributions focus on sustainable or green consumption, without really disentangling the different meaning these constructs might have in terms of actual behaviours. Also, other forms such as socially responsible consumption have so far been overlooked or included in the concept of sustainable consumption, disregarding the specificities these might have. A second aspect concerns the attention to paradoxical consumption, that will shift the attention on actual behavioural practices. In fact, there has been a great attention towards motivation and attitude to responsible consumption with the goal to explain why individuals are inclined to adopt these behaviours. Yet the focus is often on the antecedents, leaving considerations about the actual behaviour scantly covered. Third, the research aims to explore these behaviours within specific industries, filling a gap of investigations which might offer valuable insights for future research.*

Corporate Green Commitment: Exploring international exposure and value chain decarbonization

ALBA MARINO[1] GIOVANNA TERRIZZI[2]
DANIELA BAGLIERI[3] MARIA CRISTINA CINICI[4]

Abstract

As the transition to a low-carbon economy accelerates, firms are under increasing pressure to demonstrate meaningful commitments to decarbonization and circularity. Nonetheless, the influence of internationalization on corporate sustainability initiatives remains mainly unexamined and somewhat unclear. This paper delves into how the varied international exposure of firms affects their dedication to decarbonization and the implementation of emission reduction strategies, with a special focus on Scope 3 and upstream emissions. By incorporating perspectives from sustainable innovation and international business, we investigate whether internationalization serves as a facilitator or a barrier to achieving carbon neutrality. We evaluate 117 Italian-listed companies that engage in sustainability reporting and assess how different internationalization modes-including ownership structures, market diversification, and managerial diversity-influence their sustainability commitments. Our results indicate that while a greater degree of internationalization (DOI) is positively associated with sustainability disclosures, ownership internationalization alone does not guarantee enhanced environmental responsibility. Furthermore, we differentiate between declared commitments to decarbonization and actual reductions in emissions, revealing potential discrepancies between corporate promises and real sustainability results. These findings enhance the understanding of how internationalization, circularity, and systemic innovation converge in the journey toward net zero, providing theoretical frameworks and managerial insights for companies navigating the complexities of global sustainability.

Keywords*: Net-zero transition; internationalization; decarbonization; circular economy; multinational enterprises; sustainability innovation*

Framing of the research. *Transitioning to a low-carbon economy has emerged as a key challenge for the global community (Krieger & Zipperer, 2022). Governments, investors and consumers increasingly require companies to demonstrate their commitment to green business practices. In line with the European Union's ambitious target of net-zero greenhouse gas (GHG) emissions by 2050, organizations are called upon to take leadership roles in driving the shift toward carbon neutrality (Karim et al., 2021). In this context, internationalization emerges as a critical yet underexplored enabler-or constraint-of firms' decarbonization efforts. The heterogeneity in firms' international exposure may significantly shape how they perceive regulatory pressures, engage in sustainable practices, and commit to carbon neutrality (Kolk & Pinkse, 2008).*

Existing literature on sustainability has a strong emphasis on the firm, focusing on what drives and impedes firm efforts in making their processes and products more sustainable (Dangelico, 2016). Whilst acknowledging the role of regulatory forces, the industrial landscape, and a need to collaborate with a diverse range of stakeholders, this literature frequently isolates the notion of sustainable innovation to the boundaries of the firm and overlooks the systemic nature of the required innovation (Adams et al., 2016). However, achieving the decarbonization goals set by the Paris Agreement demands systemic innovation - coordinated transformations that cut across industries, geographies, and value chains. Recent discourse on net-zero transition has evolved beyond traditional energy switching and efficiency improvements. In fact, addressing global sustainability challenges requires a collaborative approach that extends beyond the boundaries of individual firms to embrace a more holistic perspective that integrates circularity into rethinking production processes, materials flow, and the very design of value chains (Pinkse et al., 2023). In line with ongoing research exploring low-carbon innovations, such as the deployment of green hydrogen across industrial value chains (Baglieri, 2024), this study underscores the relevance of systemic approaches to decarbonization in internationally exposed firms. Environmental

transitions demand systemic innovation that no single organization or sector can accomplish independently. Consequently, supply and value chain integration enables multiple stakeholders to pool resources, expertise, and infrastructure, fostering innovation across industries (Iacovidou et al., 2020) while balancing significant financial and operational risks, especially in resource-intensive processes (De Marchi, 2012; Wesseling et al., 2017). These attributes make the circular economy a potent contributor to achieving zero-carbon prosperity, as circularity specifically builds upon three principles:

a) Design out waste and pollution to reduce GHG emissions across the value chain.
b) Keep products and materials in use to retain the embodied energy in products and materials.
c) Regenerate natural systems to sequester carbon in products and soil.

A recent theoretical framework shows that the input, process, and output constraints that incumbent firms face in the net-zero transition can be tackled through four firm-level innovation levers - i.e. recombinative, collaborative, integrative, and socio-cognitive capabilities - which, in concert, act as enablers for firms to address these net-zero constraints (Pinkse et al., 2024). In this paper, we build on this framework by addressing internationalization as a transversal enabling strategy to break path dependency and lock-in processes related to net-zero innovation.

Although the link between internationalization and environmental commitment has been widely discussed, empirical findings remain ambiguous and sometimes contradictory (Singhania & Saini, 2021). This relationship appears to depend on several factors, including firm size, industry sector, environmental policies, stakeholders' pressures, and the international market structure (e.g., Zhang et al., 2024). Some studies argue that international trade encourages decarbonization efforts and the adoption of circular practices (Ding et al., 2022; Huang & Liu, 2021). This is because companies operate within a broader social framework that drives them to adopt appropriate behaviour to mitigate external pressures and secure social approval and legitimacy within foreign markets (Yu et al., 2017). Furthermore, exporting firms often exhibit characteristics that enhance their environmental commitment; they are generally larger, more productive, more knowledge- and capital-intensive, making them more likely to invest in pollution-reducing technologies (Galani et al., 2012;Qi et al., 2021). Additionally, exporting exposes firms to the best international practices, facilitating green technology and environmental management systems transfer, further reinforcing their sustainability efforts. At the same time, increasing international competition forces firms to develop competitive strategies to sustain their market position (Sorroche-del-Rey et al., 2022). Among organizations, multinational enterprises (MNEs) might appear particularly committed to tackling climate change due to their exposure to growing pressure from multiple stakeholders worldwide, heightened media scrutiny, skepticism in host communities, and spillover effects among affiliates (Mithani, 2017; Wang & Li, 2019). These factors drive them to enhance their environmental sustainability efforts by leveraging their ability to build complementary green competencies and reconfigure embedded organizational resources to maintain a competitive advantage in a complex environment (Maksimov et al., 2022). Moreover, in many sectors - such as textiles -, firms must comply with the environmental regulations of potential markets (Macchion et al., 2016).

Conversely, other scholars caution that internationalization may hinder decarbonization efforts (Shen et al., 2019). From this perspective, large-scale industrial production leads to increased gas emissions and increased consumption of energy and resources, ultimately exacerbating environmental degradation (Li et al., 2018). Furthermore, research has often shown that enterprises symbolically adhere to regulations and stakeholder pressures without necessarily making a concrete commitment to green practices (Haque & Ntim, 2018). Multinationals often relocate pollution-intensive activities to countries with more lenient environmental regulations (Copeland et al., 2021). Seeking to reconcile these contrasting viewpoints, some studies have proposed an inverted U-shaped relationship between firms' internationalization level and sustainability efforts (Sorroche-del-Rey et al., 2022). According to this perspective, environmental degradation tends to rise in the early stages of business expansion, as sustainability is not initially prioritized. Thereafter, increasing revenues and mounting international pressure place greater emphasis on environmental protection, thus leading to adopting green practices and emission monitoring systems (Tisdell, 2001; Vincent, 1997).

Purpose of the paper. *The paper explores the relationship between "commitment to decarbonization" beyond the firms' boundaries and the dynamics of internationalization. Given the potential impact of circularity on decarbonization efforts, it is increasingly important to address their challenges holistically. This aligns with prior research emphasizing how fostering orchestrated exploration across complex ecosystems is essential for enabling innovation-led transformation (Baglieri et al., 2012). From a circularity perspective, this means designing processes that minimize waste and energy consumption from the outset, using advanced technologies and sustainable inputs to reduce the carbon footprint of production. Closed-loop supply chains, a cornerstone of the circular economy, often require global sourcing and integration of advanced technologies and capabilities, highlighting the role of coordinated activities in creating competitive advantage. Similarly, integrating supply and value chains is pivotal in driving the environmental transition, particularly in facilitating systemic innovation and decarbonization. Even more than in other emission reduction initiatives, it is then important to foster innovative problem-solving and adaptation to global challenges (Fleming & Sorenson, 2001; Marino & Quatraro, 2023; Orsatti et al., 2020) through the cross-pollination of ideas and expertise as well (Barbieri et al., 2020; Zeppini & van Den Bergh, 2011).*

Specifically, we are interested in which internationalization modes might characterize emission reduction initiatives more significantly. Following the Corporate Value Chain Accounting and Reporting Standard, we refer to:

a) *Scope 3 emissions: all indirect emissions that occur in the value chain of the reporting company, such as the production of purchased products, transportation of purchased products, or use of sold products, excluding the use of purchased energy sources);*
b) *Upstream Scope 3 emissions: those indirect emissions that refer to the company's upstream activities;*
c) *Circularity-related categories: those Scope 3 activities that map into the circular economy principles for reducing GHG emissions (see Table 1).*

Methodology. *To build our research design, we collect information on listed private active Italian companies that are engaging in sustainability reporting. This approach limits potential selection bias related to non-financial reporting as it focuses on those companies affected by the Non-Financial Reporting Directive - NFRD (2014/98/EU). The regulation requires large public-interest entities - such as listed companies, banks, and insurance companies with their headquarters in the EU - to disclose in their management report relevant and material information and relevant non-financial key performance indicators concerning environmental aspects, social and employee-related matters, respect for human rights, anti-corruption and bribery issues, and diversity on the boards of directors.*

We derive ESG-related and financial company information from Refinitiv Eikon, one of the most comprehensive commercial databases. Refinitiv Eikon collects data from publicly available sources, including company websites, annual reports, and corporate social responsibility reports or contributed by firms. The database also elaborates on ESG Scores, designed to transparently and objectively measure a company's relative ESG performance, commitment, and effectiveness across different themes (emissions, environmental product innovation, human rights, shareholders, and so on). Then, we cross-reference this sample with Moody's AIDA databases to reconstruct information on the structure of the corporate groups, ownership linkages, and information on C-level management members. Our final sample contains 117 companies spanning different sectors and active between 2012 and 2024.

We explore the effects of international dynamics modes over different dimensions of commitment to decarbonize companies' value chains, thus operationalizing the value-chain emission reduction initiatives through multiple dependent variables (Tab. 3). In detail, we build a set of indicators that takes a value of 1 if the company discloses its emissions in the category and zero otherwise. As reporting of any Scope 3 activity is still voluntary and hard to monitor, we argue that firms that these variables proxy for a more substantial commitment to climate change (Albitar et al., 2023). On the other hand, internationalization represents an articulate phenomenon with layers of components that vary with contexts, and over time, it needs to be explored at different levels and across different streams (Antràs, 2020). Thus, we decline the extent of cross-border activities through either a) scale-based indicators - quantifying the magnitude of such activities - b) scope-based indicators - capturing qualitative aspects of the phenomena - and c) attitudinal and experiential indicators connected to top management. These indicators contribute to a comprehensive view of internationalization, revealing its extent and operational complexity, examining the extent and depth of internationalization, the distribution of markets, and the cultural and physical distances between markets.

For our empirical exercise, we specify our main regression models as linear regression with multiple fixed effects at the year and industry level (Correia, 2017).[1] *All cross-sectorial variation is absorbed by the constant term and the use of robust standard errors also accounts for the fact that error terms might differ across industries. To mitigate concerns about reverse causality and enable comparison across dimensions, we use a 1-year lag of normalized control variables that could affect the commitment to decarbonization: total value of assets, return on equity, and leverage ratio, because larger firms with low growth potential, more financial slack, more profit, and higher revenues tend to commit more resources to improve corporate environmental performance (see, for example, (Maksimov et al., 2019). We summarize the detailed variables, their operationalization, and related data sources in Table 4.*

Results. *Descriptive statistics and correlation among the main explanatory variables are in Table 5, while Table 6 shows the main results of our regression model. Firstly, we tested the effect of different internationalization dynamics on "commitment to decarbonize". Regarding the ownership structure, all dimensions show a lower probability of committing to decarbonization than independent domestic companies with different magnitudes and levels of significance for different dependent variables. This suggests that ownership internationalization alone does not necessarily create incentives for sustainability and may instead reflect divergent governance priorities, less sensitivity to host-country norms, or reduced pressure from local institutions.*

On the contrary, the Degree of Internationalization (DOI) manifests a positive relationship in almost all model specifications. At the same time, the C-level managers' cultural diversity has a positive significant relation only when considering the commitment to reporting Scope 3 emissions. Similarly, engagement in outward FDI - measured either as depth or breadth - only shows a significant correlation for the Scope 3 categories.

We further explore whether heterogeneity in internationalization modes relates differently to the probability of companies registering any reduction in GHG emissions: results in Table 7 do not reveal any significant relationship. Finally, we explore potential heterogeneity relating to the industry in which companies act. In fact, internationalization modes may have different impacts on firm's decarbonization commitment depending on whether they operate in service sector or manufacturing industries, where emissions are tied directly to operations, regulatory pressures, and supply chain dynamics. For service firms, emissions reduction strategies (e.g., switching to renewable electricity, reducing air

[1] As a robustness check, we also conducted a Poisson pseudo-likelihood regression for the dichotomous dependent variables. Results are consistent with the linear specification and available upon request.

travel) are easier to scale globally and less dependent on relationships to international dynamics, while manufacturing firms are more exposed to complex trade-offs between emissions reductions, cost competitiveness, and regulatory compliance. According to our expectations, we identify our main results as being driven by companies in the service sector.

Research limitations. *Current limitations refer to the limited universe of companies included in the analysis, mainly due to data availability limitations. First, we include only listed companies subjected to compulsory non-financial reporting to limit selection bias and lift the computational burden for accessing the harmonized dataset. For many companies, we have only had information on ESG reporting for a few years. Furthermore, we restricted our analysis to the Italian companies because of limited access to Moody's AIDA database to reconstruct detailed information on ownership and management members. Consequently, the sample size also limits our ability to address the potential heterogeneity across sectors, specifically to idiosyncrasies related to more fine-grained analysis in differentials within and between service industries and hard-to-abate manufacturing sectors. Overall, the main limitations stem from the inherent nature of sustainability reporting and the voluntary disclosure of Scope 3 emissions. The Corporate Sustainability Reporting Directive (CSRD) - which takes effect in the 2024 financial year - will expand the audience required to disclose non-financial information and facilitate broader comparisons.*

On another note, we disclose that information about the ownership structure and senior management pertains to the most current data available. Nevertheless, we are confident that these phenomena typically demonstrate gradual changes over time, and our timeframe is limited to the past ten years. Further implementation may involve reconstructing the careers of current and former managers to enhance the understanding of socio-cognitive capabilities, such as attitudes and experiences. Finally, GVC participation is a phenomenon that is particularly relevant to the aspect of firm behavior in sustainability transition choices. As the globalization of markets has significantly expanded international trade, it has fostered the integration of supply chains across nations and enabled companies to optimize production processes based on cost efficiencies and resource availability. Key conceptual aspects underline the relevance of firm-level foreign trade data and the flows of intermediate goods to analyze global value chains.

Managerial implications. *The literature has widely explored that international exposure - whether as independent domestic companies, foreign subsidiaries, or via diverse internationalization modes - can affect the commitment and implementation of net-zero initiatives. However, the results in scientific literature seem inconsistent and sometimes counterintuitive. We argue that these calls for tailored analyses of decarbonization strategies that address the challenges and opportunities of each type of international engagement. In doing so, we also call for differentiating between companies' stated commitment to decarbonization and the actual reduction in GHG emissions. The disconnection might not necessarily be seen as a greenwashing initiative, but it might represent different stages of net-zero transitions. In this regard, identifying and bridging this gap might be important by linking strategic pledges with concrete operational changes and continuous performance. Finally, we highlight the importance of rich and diverse human capital and talent for the net-zero transition commitment. A multicultural executive team can bring varied perspectives that might support innovative and effective decarbonization strategies. The intrinsic nature of net-zero transition - complex, systemic, urgent, and directional (Pinske et al., 2024) - calls for original and flexible solutions for tackling the issue.*

Originality of the paper. *A recent theoretical framework suggests incumbent firms can overcome the input, process, and output challenges encountered during the net-zero transition using four key innovation levers: recombinative, collaborative, integrative, and socio-cognitive capabilities. Together, these capabilities enable firms to effectively tackle the constraints related to achieving net-zero goals (Pinkse et al., 2024). In this paper, we build on this framework by addressing internationalization as a transversal enabling strategy to break path dependency and lock-in processes related to net-zero innovation. This study advances the understanding of internationalization and corporate sustainability by integrating multiple dimensions of foreign exposure with firms' commitment to decarbonization and circularity. Unlike prior research that often focuses on a single measure of internationalization (e.g., foreign sales ratio or number of subsidiaries), we take a holistic approach, examining the extent and depth of internationalization, the distribution of markets, and the cultural and physical distances between them. By doing so, we provide a more nuanced view of how internationalization might shape sustainability efforts. Our approach is exploratory rather than prescriptive: rather than pre-selecting specific dimensions of internationalization, we analyze their differentiated effects on key corporate outcomes, including performance, participation in international value chains, formal ownership structures, and attitudinal shifts. This comprehensive perspective allows us to capture the operational complexity of internationalization and its implications for sustainability, offering new insights into how firms navigate global challenges while advancing environmental commitments. We further contribute by highlighting the difference between commitments to decarbonization and the actual outcomes achieved. Although many companies publicly announce their sustainability goals and set ambitious targets, a significant gap often exists between these commitments and the real reductions in GHG emissions. Our paper aims to explore this disconnection by analyzing both the strategic indicators of decarbonization commitment and the practical challenges of applying circularity and low-carbon innovations. This examination is crucial, indicating that firm decarbonization pledges do not necessarily lead to measurable environmental performance.*

Sustainability in Retail:
A framework, review and future research agenda

GENNI PERLANGELI[1]

This study was funded by the European Union - NextGenerationEU, Mission 4, Component 2, in the framework of the GRINS -Growing Resilient, INclusive and Sustainable project (GRINS PE00000018 - CUP B43C22000760006). The views and opinions expressed are solely those of the authors and do not necessarily reflect those of the European Union, nor can the European Union be held responsible for them."

Abstract

This research aims to review the extant literature on sustainability and to conduct a comprehensive analysis of research in this emerging field.

Accordingly, this paper synthesizes the literature in terms of theories, contexts, characteristics, and methodology to analyze sustainability research development over time. The literature review is an important part of any research project and shows that sustainability has transitioned from different highlights.

Specifically, this paper analyzes the overview of literature related to a keyword/ title/abstract/ theory/ method using by a four-step technique: 1) the dominant definitions of sustainability (and related concepts) and its evolution over time, 2) the characteristics of sustainability elements after searching for academic publications in the database (Scopus) and selecting publications based on their relevance for the stated aims, 214 studies have been included in the review; 3)selected studies with the dominant definition as corporate social responsibility (CSR) and as green;4) studies selected and identified in the differences between the sustainability approaches (consumer approach and analytical approach).

Results show that the definition of sustainability has changed over time and in different approaches according to the growing relevance of the retail system. This study allows a classification and schematization of recent articles. It provides a synthesis of the body of knowledge so far produced in the field of sustainability; as such, it has important implications for managers, scholars, and students.

Keywords: sustainability, review, retail.

Framing of the research. *This paper is based on a literature review (Fink, 1998; Thorpe et al., 2005, Tranfield et al., 2003) and evaluates the extent to which the process can be applied to the sustainability field to produce a reliable knowledge stock and enhanced practice by developing context-sensitive research.*

The paper highlights the challenges in developing an analysis with an appropriate methodology about the role of sustainability in this literature overview and is related to a keyword/ title/abstract/ theory/ method prior studies to strengthen the foundation of knowledge.

Sustainability includes a variety of interrelated issues. Some articles investigate how far sustainable practices and circular economy concepts have been implemented in retail return systems (Frei, Jack & Krzyzaniak, 2020). Sustainability has become a pillar of the company's strategy, with almost all major companies now having a senior executive, including a vice president with the word "sustainability" in his title. Most large companies now have explicit public statements on sustainability policy and are required to apply a "triple bottom line" that considers the financial, environmental, and social benefits firm (Elkington, 1998). In many circles, "corporate sustainability" has become synonymous with "Corporate social responsibility" and sustainability. Companies that include sustainability aspects in their strategies can become even more competitive (Christmann, 2000; McGee, 1998).

Others instead examine through prior studies the opportunities and solutions through conservation of value, tracking of goods, processing time, internal and external fraud, customer brand perception, corporate social responsibility (CSR), and sustainability. There is an important correlation between corporate responsibility and retail decisions on both social and environmental dimensions, in a key role in the overall performance of CSR (Carbone, Moatti, & Vinzi, 2012). Sustainability has a holistic vision (Hall,2002), it has different dimensions, environmental and social, and is, therefore, very close to aspects that are combined with it, such as, in other words: green, CSR, supply chain, AI, and best practices.

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

Purpose of the paper. *The term sustainable development was first coined at the United Nations Conference on the Human Environment in 1972 (Hall et al.,2010) and the opportunities to study sustainability received wide attention with the Brundtland report in 1987. Sustainability has become a major issue in recent years, and its impact extends to many areas: environmental, social, and economic (Kemper et al., 2019). There has been a consequential growth in "green," "social," "CSR", "environment," "sustainable," "ESG (environment, society, and governance)" marketing, which has focused on the consumer approach and on an analytical approach (Dangelico Vocalelli,, 2017). For this reason, it is important to try to define the various aspects in the different years especially in retail.*

Methodology. *This paper is based on a systematic literature review (Fink, 1998; Thorpe et al., 2005) a methodology which differs from conventional reviews in that it aims at "synthesizing research in a systematic, transparent, and reproducible manner" (Tranfield et al., 2003: 207) and kept the first algorithm in the analysis. The first research was about systematic literature review between 2000 and 2025, and 214 scientific articles published in peer-reviewed academic journals were included.*

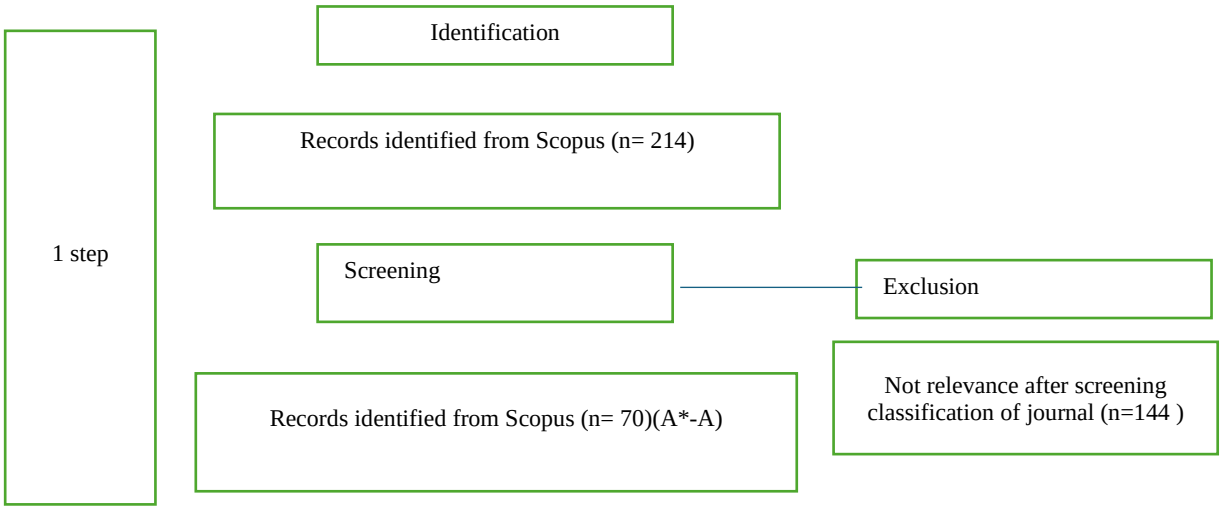
The evaluations were based on the peer review method and, for articles in the bibliometric areas indexed on the Scopus databases, on bibliometric analysis.



After emerging, the results carried out the first screening by analyzing the title, journal, and abstract of the articles and considered relevant papers with the classification about ABDC Journal Quality Guide Australian Business Deans Council, which increased rapidly over recent years (Azar and Brock 2008). ABDC was compiled using elements of the methods used in institutional lists, peer surveys, and citation studies (Morris et.al.., 2009).

Journal quality was operationalised based on the classification ABDC ranks journals based upon an A, A, B, and C classification scheme; A* in the ranking is considered "highest quality". This research, focused on the approach using Management and Marketing journals. The quality assessment of journals is carried out by panels of experts and there are internationally recognized and externally validated journal classification lists on appropriate metrics selected for citation.*

Journal quality has been an important component of performance and the evaluation of results.

After merging the results, the first screening selected all the documents reviewed, presented in Fig. 1, adapted from PRISMA flow diagram template (Page et al., 2021).

Fig. 1: Procedure for selecting (2000-2025) articles to be reviewed.

The distribution of the articles by year and journal is in Table 1. There is a period of an interesting trend, with a number of contributions concentrated in the period 2020- 2025. A total of 29 different journals are presented in A and A categories. Among studies investigating a specific topic but there are many categories inside it (food, electronic, fashion, AI).*

The marketing articles in A- A -B -C in the marketing field are a total of 52 articles in the years 2000-2025.*

Presenting the breakdown of the articles in a year is the first step. In the second step, selected research articles were published between 2020 and 2025 in A and A 35 documents. During the selection process, considering the focus of this study, non-relevant articles were identified as follows. Also, papers focused on sustainability and retailing were considered. For each study included in the systematic review, data from the full text were extracted. These data included authors, publication name, year of publication, titles, this study's research questions that have been addressed, and main results relating to this study's research question. These data were the starting point for the following analysis.*

The total of documents classified in Journal B is n. 29, selected n.23, but the articles in the years 2020-2025 are numb. 6. The total number of articles examined is 29 (A-A), and in total, n.35 (A*-A- B). Selected articles total 41 (A*-A-B) in 2020- 2025y.*

Fig.2. Procedure for selecting (2020 - 2025) articles to be reviewed

There are different areas of research about sustainability; in fact, "sustainability" has become a pillar of corporate strategy. The term " sustainability " has become synonymous with "Corporate social responsibility" (CSR).

In recent years, we have been interested in sustainability programs. The phenomenon of CSR has created a growing number of publications on the subject of sustainability and retail in specialist journals such as the Journal of Retailing and Consumer Services, the Journal of Fashion Marketing and Management, Business Strategy and the Environment, and International Journal of Retail and Distribution Management.

Based on the above, the selection is organized as follows because there are different aspects of sustainability and this contribution presents different approaches: consumer approach, company approach, and competitive advantage approach (performance).

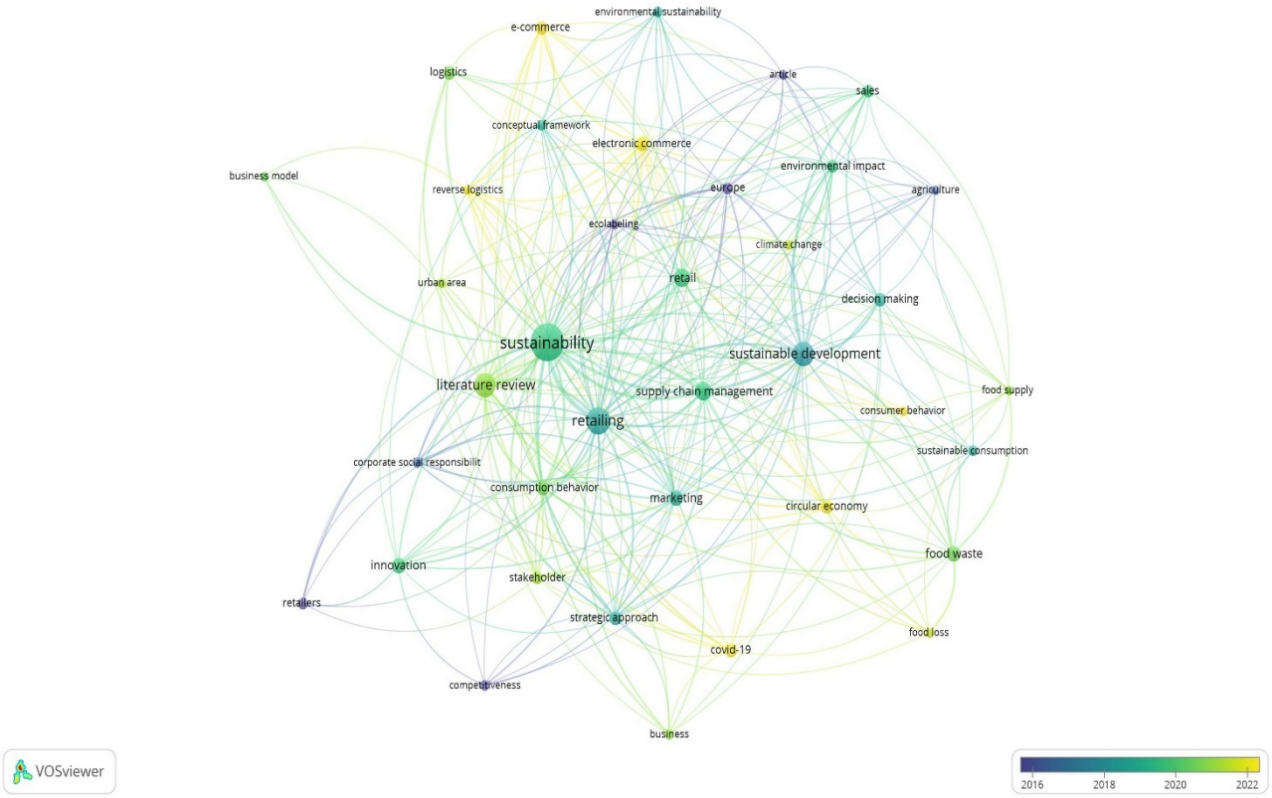
To date, most of the literature on sustainability has focused on companies, and this has somewhat affected the competitive advantage, but a careful analysis should be done on the words around sustainability. For example, we find the keyword "green" next to the word sustainability, which has a consumer approach vision; in fact, it encapsulates environmental responsibility, which determines a series of "unique opportunities to increase revenues."

The next step is to address how customers are influenced by a company's green image and then clarify the differences between customers if they are aware of performance through offering green products but not through environmental performance. This is close to a consumer approach. It is also important to see the keywords CSR and sustainability, aimed

especially at the structure of the company, and this analysis is useful in analyzing the purchasing policies of public and private retailers in different sectors. This is a closed consumer and competitive approach.

In this section, performance parameters and indicators are utilized for science mapping. These results are drawn from the entire literature extracted from the Scopus database. To begin with, the parameters utilized in this phase are derived from various visualizations that allow us to see the words used by researchers in the context of consumption phenomena. These graphs act as supplementary tools to demonstrate the significance attributed to these selected words with the specific keywords (Fig.3) and specific field (Fig.4).

Fig. 3: Science Mapping of keywords Scopus Database (2000-2025y)



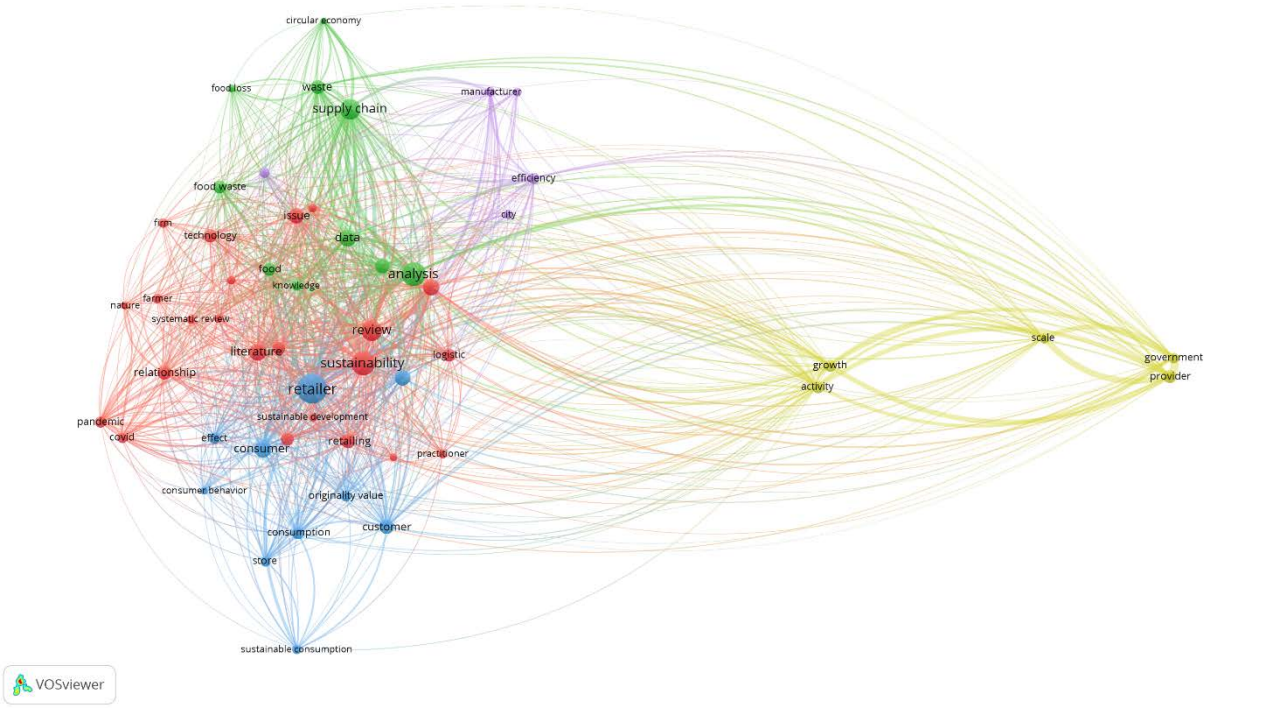


Fig.4: Science Mapping of keywords field of Journals - Scopus Database (2000-2025y)

Results. *The research on sustainability has shifted to different aspects and sectors. These have concern above all the consumers, the companies, the performances through the theme of CSR and green, in the private or public company and performance. In a perspective of sustainable development, oriented towards a triple fund (economic, environmental and social), it will be interesting to examine the performance of stores and the relationship with economic performance, but this is not at the time of this topic***.** *The green aspect (environmental sustainability) and the CSR aspect (environmental sustainability) are closely related, but they have some particularities that distinguish them. Both relate to business practices and policies that seek to respond to social, environmental, and economic challenges but do so with different focuses. The second step of analysis focuses on peer-reviewed academic journal papers written in English and published from January 2020 to March 2025, which is the period when studies on CSR are extended and explore the economic, social, and environmental concept of sustainability (Margolis & Walsh, 2003).*

Dynamic evolution of O2O strategies, underpinned by a growing emphasis on customer engagement, technological innovation, and the strategic management of online and offline synergies. The research underscores the transformative potential of O2O commerce in bridging the gap between digital and physical marketplaces, enhancing consumer experiences, and fostering sustainable business practices.	Online to Offline

Another step, has been the analysis highlighted and extrapolated the texts with CSR and sustainability in comparison (Table 3).

Tab. 3: Related (systematic) literature reviews CSR and Sustainability (A-A-B) 2000-2025*

Reference and Method	*Method*	*Perspective*	*Main Results*
Mondal J.; Chakrabarti S.,(2021)	A literature review on Brand Experience (BX) and a collection of responses from 33 domain experts led to the identification of 20 factors and the showcasing of a multilevel interpretive relational structure of the online retail environment (eRBX).	Connects sustainable development with entrepreneurship	Multi-dimensional concepts are further framed into an alternative paradigm of detailscape. This study can help practitioners to understand the insight and anatomy for creating sustainable eRBX, and prioritize marketing investments accordingly.
Frei R.; Jack L.; Krzyzaniak S.-A., (2020)	Structured Interviews- depth interviews in UK (17), 100 retailer website reviews, 3 retail community workshop	Multichannel retail and conflicts between their corporate social responsibility commitments and their returns practices.	Sustainable practices and circular economy concepts have been implemented in retail returns systems;
Jones P.; Comfort D.; Hillier D., (2007)	Literature-based review of CSR, its relationship to marketing and the rationale for growing retail interest in the topic	Analysis is conducted of CSR reports and information posted on the world wide web by the UK's top ten food retailers, followed by participant observation in their largest branch stores in one medium-sized English town.	CSR as a means of communicating with customers while they are in the store.
Du Plessis N.; Grobler A.F., (2014)	Literature review in the first phase	importance assigned to their CRS initiatives	theoretical framework against which the websites and the annual and sustainability reports of three South African retailers were analyzed
Björklund M.; Forslund H.; Persdotter Isaksson M.,(2016)	Literature review on logistics-related environmental considerations, indicators and consciousness about CSR. CSR reports from 12 of the world's largest retailers.	Indicators applied to measure the effects of these considerations and their environmental consciousness in their CSR reports.	Focused on environmentally sustainable logistics in retail chains, and even fewer address how to measure environmental sustainability.
Naidoo M.; Gasparatos A. (2018)	The literature review examines the key drivers for the adoption of CORPORATE ENVIRONMENTAL SUSTAINABILITY (CES) strategies in the retail sector.	Combined with the increasing policy traction of the Sustainable Development Goals (SDGs), and especially SDG 12 on responsible consumption and production,	Adopt different corporate environmental sustainability (CES) actions and strategies in retail system.

Suggest that this stream of research, although complementary, differs by on the CSR of a specific category of retail and their focus on sustainability.

As shown in Table 4, prior to 2000 there were only a few papers in the area of sustainability and retail. However, the situation is changing, with an increasing number of papers being published. Most of the recent ones appeared in relatively new sustainable development/environmental management journals such as International Journal of Retail and Distribution Management (which published fourteen on the topic), International Review of Management and Marketing (which published nineteen articles) and the Journal of Cleaner Production (which published twenty-two articles).

The dissemination of articles on sustainability and green has increased significantly between 2020 and 2025, above all due to the growing awareness of environmental problems and the need to adopt more sustainable practices at a global level (Paris Agreement, 2016). The interest in these issues increased in discussions on the circular economy, CSR, green finance, and sustainability in supply chains (Frei et al., 2020). Consumers have become more informed and concerned about the environmental impact of their consumer choices. This has led to an increasing demand for sustainable products and a greater focus on responsible business practices. Another interesting analysis will be the business and the best practices (White et al., 2025). Green progress, clean energy technologies and sustainable innovations increase the interest in these issues, both in the technological and economic sectors and in behavior research (Walker et al., 2015).

Consumer and Analytical Approach

The consumer approach and the analytical approach represent two distinct perspectives that can be applied in understanding and addressing issues related to sustainability and green practices. The impact of sustainability can be positive for consumers, it is associated with environmental and social sustainability (Eastman et al., 2024). The consumer approach focused on the behavior, preferences, and decisions of individual consumers (Heidenreich et al., 2015; Villagra et al, 2022). This paper aims to assess the current state of sustainability research from a consumer perspective and highlight articles with an analytical approach. Sustainability innovation required an analytical approach, especially in recent years (Yuan et al.,2024).

The next step would be to catalogue how they differ while being on the same topic. This underlines the difficulty of cataloguing sustainability and is one of the reasons why research is emphasized (Luo and Bhattacharya 2006). The aim is to fill the research gap on sustainability and improve understanding through a structured overview of the results of the two approaches underlined.

Research limitations. *This paper aims to identify 214 articles published from 2000 to 2025. Reviewed articles dealt with a variety of different approaches, contexts, methodologies and results; most of the contributions focus directly on the issue of retail, but all are linked to some degree to the topic. This article addressed an overview of sustainability in the marketing journals and the passage from CSR and green to sustainability system. This is a limitation of the research., in fact, in the first aspect, it considers only English peer-reviewed journal articles, and in the second aspect, it selects a set of keywords and builds a search algorithm, but this may have excluded other relevant non-indexed works. The period considered in this review extends from 2000 to 2025, but further relevant contributions may have been published before the conduct of this review. Has been used Scopus, thus, future research may consider other databases and journal sources, as well as different keyword combinations. Finally, the provision of a formal process of inclusion and exclusion criteria has made it possible to conduct the review process with high objectivity, but this work is only the first part of a work that includes successive analyses.*

Managerial implications. *The paper offers considerable insights, and there are vast opportunities for further research in this field where it can reveal the relationship in the sustainability framework. As discussed above, one dimension to be analysed and asked is that of the study in sustainable development helps the private and the public sector. This requires advanced and in-depth knowledge along with a range of issues related to a specific sector, the retail development.*

Second, the emergence and legitimization of sustainable development in the economy, the rules of the game are changing, which means that there will be new players, with implications for both incumbent and new actors. Another question is, to what extent, are the established organizations of retail too far removed from sustainable change and scenarios and focusing on successful past routines and skills?

Third, what are the best practices to be considered sustainable? The answers to these questions will help us move forward on the previous issue, which concerns retailers and non-sustainable or unsustainable businesses. While these and related issues require further theoretical and empirical work, the growing literature on sustainability and retail allows us to have a theoretical framework with direct and necessary observations.

Originality of the paper. *Although sustainable development continues to be defined variously and differently, results being an important channel for a more sustainable society, there is still considerable uncertainty about the nature of this role and how it will play. Recent research in the field has been outlined in this analysis. However, while the papers in this special issue provide a major step in this direction, there are still considerable opportunities for further research. Uncertainty about the nature of the role of sustainability could result from an inability to be autonomous but still dependent to other aspects of marketing. Extrapolating some questions in this research also summarized RQ1. Are there differences related to the word sustainability when combined with green or CSR in retailing? RQ 2 To what extent do consumers and practitioners focus on successful past routines and skills that are too far removed from sustainable change and the current scenario? RQ3. To what extent do approaches influence the retail world?*

Towards a conceptual framework of enabling factors for industrial symbiosis within industrial parks

MARIA COSCIA[1] ALESSANDRA DE CHIARA[2]

Abstract

This study aims to develop a conceptual framework identifying the enabling factors of industrial symbiosis (IS) within industrial parks (IPs) through the lens of the circular economy (CE). To achieve this objective, we employed a systematic literature review (SLR) methodology, analyzing scientific contributions from the Scopus and Web of Science databases. Specifically, we reviewed a collection of 166 studies that met selected criteria to uncover the key drivers facilitating the adoption of IS in IPs. The findings reveal both external and internal factors that enable IS in IPs. Among the external factors, economic conditions and the institutional context emerge as particularly significant. On the other hand, internal factors include organizational capabilities and the characteristics of entrepreneurs. Accordingly, the current research offers valuable and practical insights for policymakers and industrial park managers to what factors leverage in order to promote or enhance the application of IS principles within IPs, thereby contributing to the sustainable development of surrounding areas.

Key words: *industrial symbiosis; circular economy; industrial park; industrial symbiosis model*

Background and purpose of the paper. *The circular economy (CE) has recently gained significant attention within the discourse on sustainable development, capturing the interest of both international institutions and the academic community.*

At the macro level, the literature has emphasized the strategic importance of complex interactions among networks of stakeholders, each with distinct identities, which collectively contribute to the co-creation of ecosystem shared value (Pera et al., 2016; Bailey et al., 2019). These collaborative dynamics drive innovative solutions aimed at mitigating environmental degradation and fostering circular restorative systems in localized contexts (Suchek et al., 2021; Triguero et al., 2023).

Within this framework, scholars argue that one of the most practical applications of CE is industrial symbiosis (IS) (e.g., Guo et al., 2016). As sub-field of industrial ecology (IE), IS involves "traditionally separate industries in a collective approach to competitive advantage involving physical exchange of materials, energy, water, and/or by-products" (Chertow, 2000, p. 313). It is widely regarded as a cornerstone strategy for advancing the transition towards CE, particularly at the local level (European Commission, 2015; Baldassarre et al., 2019; Domenech et al., 2019; Lüdeke-Freund et al., 2019).

Notably, the concepts of CE and IS are closely interconnected. Indeed, the theoretical evolution of CE itself originates from the principles of IE, which have redefined perspectives on industrial development since their inception in 1989 (Heeres et al., 2004). On the other hand, IS operationalizes the principles of CE by specifically targeting the closure of pre-consumer (i.e., industrial) loops, where the by-products or residues of one entity are repurposed as inputs for another, thereby creating interconnected resource flows (Chertow 2000).

Consistent with the vision above, a growing body of research underscores the opportunities enabled by IS within local systems, particularly through the exchange of materials, energy, water, and by-products. Historically, geographic proximity has been identified as a critical driver of sustainable practices (Del Baldo, 2009; De Chiara, 2016; Moggi et al., 2022). More recently, IS has been recognized for its role in supporting circular practices, while the ecosystem perspective emphasizes the capacity of communities and their cultural frameworks to create systems of actors and infrastructures that foster locale development in terms of territorial growth and resilience (Iacobucci and Perugini, 2021; Bastian and Zucchella, 2022; Wurth et al., 2022).

Furthermore, studies (e.g., Baldassarre et al., 2019) remark that IS finds practical application in the design, implementation, and evaluation of IPs. These parks are defined as physical "communities of manufacturing and service businesses seeking enhanced environmental and economic performance through collaboration in managing environmental and resource issues, including energy, water, and materials" (Ehrenfeld, 2004; Massard et al., 2018). By

fostering such collaborations, IPs exemplify how IS principles can be operationalized to achieve both environmental sustainability and economic viability.

However, the debate appears to lack a thorough exploration of the enabling factors required to implement an IS model within local systems, particularly in the context of IPs. While the literature has addressed general aspects of IS—such as its evolution, development, and efficiency evaluations (Huang et al., 2019)—there is limited understanding of the specific enablers that support the implementation of symbiotic synergies in the context of IPs (Henriques et al., 2021).

Moreover, most of existing studies often focus on theoretical approaches or isolated case studies (e.g., Maalouf et al., 2020; Kowalski et al., 2023), without offering practical tools or frameworks for implementing IS in IPs. To address this gap, this paper seeks to identify the enabling factors for IS in IPs from the perspective of the CE through a comprehensive literature review, responding to the following research question:

RQ1: What are the enabling factors for implementing an IS model within IPs?

In addressing this research question, the study contributes to the field of IE by developing a conceptual framework that synthesises the identified enabling factors, providing a structured foundation for future empirical research. At the same time, this framework represents an initial step towards the creation of an operational model to facilitate IS adoption in industrial districts. By identifying these enabling factors, the study offers actionable insights for policymakers and industrial park managers, equipping them to overcome regulatory and operational barriers to IS implementation.

Moreover, the study underscores the potential of IS as a catalyst for sustainable development models rooted in CE principles, bridging the gap between academic research and local development policies. Accordingly, understanding the critical factors for developing an IS model within IPs represents a foundational step towards designing territorial development strategies aligned with CE principles.

Methodology. *To identify and understand the key enablers of IS implementation in IPs, we carried out a systematic literature review (SLR). According to Ginsberg and Venkatraman (1985), SLR is regarded as an essential instrument for methodically assessing a particular corpus of literature. Furthermore, SLR is a useful technique for identifying research gaps in the literature as it is thorough, organized, and analytical (Klassen et al., 1998). SLR is widely used in management and entrepreneurship research (Pittaway et al., 2004; Crossan and Apaydin, 2010; Parris and Peachey, 2013) and the broad social sciences (Tranfield et al., 2003). It has several advantages, such as the capacity to create adaptable databases of articles that are simple to update and query (Pickering and Byrne, 2014).*

With reference to databases, we draw on the Web of Science (WOS) and Elsevier Scopus databases, that have been widely adopted in prior academic research (e.g., Atanasovska et al., 2022; Mariani et al., 2023), and are considered the most comprehensive sources of studies in the social sciences (Mongeon and Paul-Hus, 2016).

In accordance with prior investigations (e.g., Arsova et al., 2022), our research process follows several stages (Table 1). First, we identified a query that included keywords referring to the concepts of CE ("circular economy" OR "CE"), IS ("industrial symbiosis" OR "IS"), and IPs. Given the numerous synonyms associated with the term "industrial park" a specific list of keywords was created through a survey conducted with a panel of experts from both academic and professional fields. In particular, to address this aspect, we employed the Delphi method, which also helped strengthen the robustness of our systematic literature review. This method involves gathering insights and achieving consensus from a panel of experts through controlled feedback. As noted by Taylor (2020, p. 12), "the Delphi method is a process for gaining consensus through controlled feedback from a panel—a group made up of experts or individuals knowledgeable on the subject."

The expert panel for this phase included both academic researchers and stakeholders (Cole et al., 2013). Among the stakeholders, we included individuals from institutional and professional backgrounds. The selection of the expert panel, a critical aspect of the Delphi method (Gordon, 1994), began with the creation of a list of potential participants. For academic experts, we conducted a literature search to identify researchers who have frequently published on topics such as CE, IS, and IPs. This initial list of 18 participants was then expanded to include representatives (9 participants) from various research centres linked to policy institutions (e.g., European Commission, ENEA, UNEP) and professional associations (4 participants). This process resulted in a final panel of 31 participants. The size of the expert panel aligns with prior studies (e.g., Oxley et al., 2024).

To ensure diversity and inclusivity, we followed the approach of several scholars (e.g., Busch and Rajwade, 2024), making a conscious effort to include participants with diverse genders, professional titles, and geographic locations. Such diversity was essential to gather a wide range of viewpoints and foster consensus among a varied group of participants. This approach is supported by prior studies, which have found that expert panels of approximately 31 members are sufficient to generate meaningful insights, as larger groups tend to produce limited additional ideas while reducing the depth of exploration (Delbeq et al., 1975). The success of this process relies on the inclusion of the right kinds of experts—individuals who understand the issues, possess relevant vision, and represent a variety of perspectives.

Following previous investigations (e.g., Ruiz-Pérez et al., 2021), the survey administered to the expert panel comprised three sections. The first section provided an overview of the project, outlining its objectives and significance. The second section presented a comprehensive list of keywords related to the concept of IPs, particularly those frequently used in studies focused on CE. In the third section, respondents were invited to share their opinions and suggestions on the selection of these keywords, ensuring alignment with the study's aims.

This structured approach allowed us to guide the experts' attention to one aspect at a time. To facilitate their participation, we allocated a 15-day response period, including a reminder sent one week after the initial invitation. In this round, the response rate was 26%, consistent with prior studies employing the same technique (e.g., Boor et al., 2011). This procedure led to the selection of the following keywords referring to the IPs' concept: ("industrial park"); ("industrial cluster*"); ("industrial district*"); ("eco-industrial park*" OR "eco-park*").*

Secondly, we ran the query to both databases, focusing on works published up to December 2024. To refine the results of our search, we applied specific inclusion criteria. First, we focused on specific types of documents, including articles, review articles, conference papers, and book chapters, as in recent studies adopting the same empirical approach (e.g., Mariani et al., 2023). Additionally, we limited the search to works published in English.

The initial search across the two databases yielded 250 studies from WOS and 315 studies from Scopus. After applying our screening criteria—filtering by document type and language—we further refined the results by removing duplicates within each database. Regarding the research areas, we focused on Environmental Science Ecology, Business Economics, and Social Science and Other Topics for WOS, while for Scopus, we considered Environmental Science, Business, Management and Accounting, Economics, Econometrics and Finance, and Social Sciences. This selection is justified by the widely recognised multidisciplinary nature of issues related to the CE and IS. Recent studies (e.g., Arsova et al., 2022; Koval et al., 2022; Okeke, 2024) highlight how these topics span multiple disciplines, including environmental science, economics, business management, engineering, social sciences, and urban planning. Following this process, the number of records was reduced to 241 contributions from WOS and 198 from Scopus.

Thirdly, the datasets were then merged, and duplicates were removed to ensure the uniqueness of the records, resulting in a final total of 192 contributions.

In the last step, we conducted a manual screening of the abstracts to evaluate the relevance of each study to our research objective. This analysis allowed us to exclude 26 records that did not align with the aim of the study. As a result, the final dataset consisted of 166 records, representing a curated collection of studies directly relevant to our investigation.

Table 1. Systematic literature review process.

Step I: Identification	***Query*** ("circular economy" OR "CE") AND ("industrial symbiosis" OR "IS") AND ("industrial park*" OR "industrial district*" OR "industrial cluster*" OR "eco-industrial park*" OR "eco-park*")			
Step II: Screening	***Document type*** Article, review article, conference paper, book chapter ***Language*** English			
	Research areas (WOS)	***Output***	***Research areas (Scopus)***	***Output***
	Environmental Science Ecology	201	Environmental science	158
	Business Economics	44	Business, Management and Accounting; Economics, Econometrics and Finance	102
	Social Science and Other Topics	5	Social sciences	55
	Tot.	250	Tot.	315
	Tot. (without duplicates)	**241**	Tot. (without duplicates)	**198**
Step III: Merging of the samples (WOS + Scopus)	***Total number of records (without duplicates): 192***			
Step IV: Manual screening based on abstract	Excluded	**26**		
	Total number of records: 166			

Results. *Although still in its preliminary stage, the findings reveal significant enablers of IS within IPs, which can be categorized into internal and external factors, as illustrated in Table 2. Internal factors include key elements such as entrepreneurs' characteristics and organizational capabilities, while external factors encompass broader influences like economic conditions and the government intervention.*

1) Entrepreneur's characteristics

The literature highlights that the attributes of entrepreneurs are crucial for promoting IS initiatives in IPs. Cervo et al. (2019) emphasize the essential significance of a dedication to sustainable development and the incorporation of IS principles into business operations. Entrepreneurs must be driven to disseminate resources and information while exhibiting reliability concerning the sustainability potential of their ventures (Mulrow et al., 2017). Moreover, cultivating a culture of trust and collaboration is crucial for enabling the efficient exchange of resources and materials (Kowalski et al., 2023). Entrepreneurial competencies, especially the capacity to interact with regulatory bodies and overcome social

obstacles, are crucial in influencing the success of IS initiatives (Ceglia et al., 2017). The present availability of organized information about business requirements and the readiness to share such information are critical elements that can facilitate or obstruct the formation of industrial networks (Giannoccaro et al., 2023). Finally, a supportive cultural environment marked by receptiveness to change and collaboration is essential for facilitating the adoption of industrial symbiosis practices (Yang et al., 2022).

2) Organizational capabilities

In the realm of organizational capabilities, Kuznetsova et al. (2016) assert that the advancement of eco-industrial parks is significantly dependent on firms' capacity to create intelligent networks for resource exchange. Efficient communication and cooperation among companies are crucial for optimizing resource distribution and improving sustainability results (Fraccascia et al., 2021). The capacity for innovation within organizations significantly impacts the success of information systems initiatives, as firms must adapt and implement new technologies and processes to facilitate efficient resource sharing (Boom-Cárcamo & Peñabaena-Niebles, 2022). The existence of proficient individuals capable of handling intricate regulatory structures and cultivating collaborations is essential (Neves et al., 2019). Moreover, an organisational culture that emphasizes sustainability and promotes proactive stakeholder engagement can augment the efficacy of IS practices (Daddi et al., 2017).

3) Government intervention

The debate has also emphasised the significant role of government intervention, which we refer to as the "institutional factor". Many scholars consider government support a crucial element that facilitates interaction among various actors in the creation of an industrial symbiosis model and its long-term sustainability.

In the literature, several key interventions are identified as essential for fostering this model. These include the establishment of favourable regulations, such as environmental policies (Belaud et al., 2019) and frameworks that promote the CE (Henriques et al., 2021). Additionally, the harmonization and coordination of policies, along with the introduction of financial incentives (Maalouf et al., 2020), play a significant role. The definition of the role of intermediaries (Henriques et al., 2021) and the establishment of collaborative governance structures (Schlüter et al., 2023) are also crucial, as they are built on a shared understanding of the functions of symbiotic networks. Furthermore, the creation of institutional coordination networks is deemed essential for promoting inter-company IS activities (Wang et al., 2017).

4) Economic conditions

The discussion also delves into several issues related to the economic factor, highlighting the needs and opportunities within the economic sphere. Studies underscore the benefits of cost reduction (Mulrow et al., 2017; Henriques et al., 2021; Giannoccaro et al., 2023), illustrating how pursuing efficiency strategies can positively impact profitability (Giannoccaro et al., 2023). Moreover, there are new business opportunities arising from the potential to leverage public and private funding for innovative projects (Henriques et al., 2021), as well as the possibility of obtaining financial (Maalouf et al., 2020) and fiscal incentives (Mulrow et al., 2017). In the design phase of industrial symbiosis models within IPs, assessing economic feasibility is critical (Cervo et al., 2019).

Table 2. Conceptual model of enabling factors of IS within Ips

Internal enabling factors of IS within IPs	
Entrepreneurs' traits	**Source**
Commitment to sustainability	Cervo et al. (2019)
Availability to share resources and information	Mulrow et al. (2017); Giannocchiaro et al. (2023)
Trusting and cooperative attitude	Kowalsi et al. (2023)
Ability to manage relations with regulatory bodies	Ceglia et al. (2017)
Openness to change	Yang et al. (2022)
Organizational capabilities	**Source**
Intelligent network creation	Kuznetsova et al. (2016)

Economic feasability	Cervo et al. (2019)

Source: Authors' elaboration

Research limitations. *This study has certain limitations that future research could address. Firstly, our analysis relies on the organization of existing literature. We suggest that researchers utilize more advanced data science techniques, including text-mining and machine learning tools like topic modeling, to identify the underlying semantic structures within the documents reviewed. Secondly, alternative sources such as Google Scholar could have been utilized to obtain additional scientific outputs that are not indexed in Scopus or the WOS. Finally, since this study is preliminary in nature, its findings will be validated through semi-structured interviews with entrepreneurs operating within an industrial park selected in the context of this research project financed by PNRR funds.*

Practical implications. *This study highlights practical implications for both managers and policy-makers. On the managerial side, firms of industrial district need to develop a greater propensity for IS by leveraging on a willingness to participate in collaborative initiatives, strengthening their capabilities through specific skills and resources, and identifying new business opportunities arising from shared resources, among the others.*

On the policy front, it is crucial to define coordination strategies and guidelines to foster the adoption of IS, accompanied by awareness-raising and training programs to raise awareness among companies. Furthermore, financial incentives can support the necessary investments, while the use of digital tools can facilitate the management and monitoring of IS initiatives, making the model more effective and replicable.

Originality of the paper. *This work offers novel insights into the fields of IE and CE by focusing on IPs. Specifically, we identify and illuminate the critical factors that facilitate the promotion of IS within these settings. The key factors identified are organized into four main categories: entrepreneurial traits, potentially drive collaboration, resource sharing, and innovation within IS initiatives. Organizational capabilities, referring to internal competencies enabling firms to engage in and sustain symbiotic relationships. Institutional context, which creates an enabling environment for IS to thrive. Economic conditions, which shape firms' willingness and ability to participate in IS.*

By identifying and structuring these factors, this work provides a guiding framework for leveraging IS opportunities within industrial districts and a practical model to assess the effectiveness of IS initiatives in IPs. Complementing the existing literature on IS, we offer actionable recommendations for practitioners to foster collaboration, facilitate resource sharing, and promote the sustainable development of local systems.

Exploring the complexity of choosing a smartphone: How do perceived sustainability tensions and paradoxical mindset influence greener consumer choices?

ROBERTA IOVINO[1] VINICIO DI IORIO[2] MICOL BATELLI[3] FRANCESCO TESTA[4]

Abstract

Refurbishing and reusing mobile devices is a key strategy to reduce the environmental impact of the smartphone sector and boost circularity. Understanding and increasing consumer proneness to buy second-hand and refurbished phones is crucial for a green and circular transition. Some studies have explored consumer attitudes and intentions towards refurbished phones. Given the complexity of consumer choices, our study aims to explore the role of perceived trade-offs/tensions between smartphone attributes (e.g., price, technical performance, aesthetics), and environmental sustainability, and how this perception influences greener purchasing decisions. We also investigate the role of environmental concern about electronic sector, perceived green value and perceived risks of used/refurbished phones. We highlight the role of a paradoxical mindset as moderator between consumers' perceptions and greener choices. Data were collected through a questionnaire administered in February 2024 to a representative sample of 2010 Italian respondents aged 18-70. We used structural equation modeling to analyze data.

Framing the research. *The consumer electronics sector, particularly the smartphone industry, is one of the most critical areas in terms of environmental impact due to high resource consumption, CO_2 emissions, and electronic waste generation (EEA, 2020). In this context, the market for refurbished and second-hand smartphones emerges as a strategic solution to extend device lifespan and mitigate the negative effects of new device production. The transition to a more sustainable consumption model, however, is a complex process that requires a transformation in consumer habits. An increasing number of studies focus on consumers' propensity to purchase more sustainable products, emphasizing the role of environmental attitudes and beliefs, perceived green value of products, and price sensitivity (Syed et al.,2024; Testa et al., 2021; Paul et al., 2016; Wang & Hazen, 2016;.Chen & Chang, 2012; Michaud & Llerena, 2011). However, despite the evident environmental and economic benefits of refurbished devices, numerous studies have highlighted persistent psychological barriers and negative perceptions that hinder their widespread adoption (Bigliardi et al., 2022; Mounesan, 2023). These obstacles include perceived risks related to product quality and reliability, a lack of trust in refurbishment processes, and unfavorable comparisons with new devices in terms of performance and aesthetics (Nasiri & Shokouhyar, 2021). Indeed, purchasing behavior in the smartphone market presents complexities. Consumers can face tensions between their desire for environmentally sustainable products and other attributes such as price, technical performance, aesthetics, and more (Luchs & Kumar, 2017). Paradox Theory could offer a useful interpretive framework for understanding how individuals approach these trade-offs and how their ability to accept and manage contradictions influences purchasing decisions (Smith & Lewis, 2022). However, the role of a paradox mindset in consumer decision-making remains a scarcely explored aspect in existing literature.(Testa et al, 2025). Paradox Theory suggests that individuals constantly face tensions between conflicting values and objectives, and their ability to navigate these contradictions significantly influences their choices (Miron-Spektor et al., 2018; Smith & Lewis, 2022). In the case of second-hand and refurbished smartphones, consumers must balance the desire for a technically advanced and aesthetically appealing device with the need to save money, concerns about durability, the intent to reduce environmental impact, and other competing factors..*

Purpose of the paper. *Our research aims to analyze the effect of several factors on the purchasing behaviour of used/refurbished smartphone including the environmental concern about the electronics sector (ECES), the awareness of green value (AGV), the perceived risks (PR) and the perceived trade-offs between smartphone attributes and*

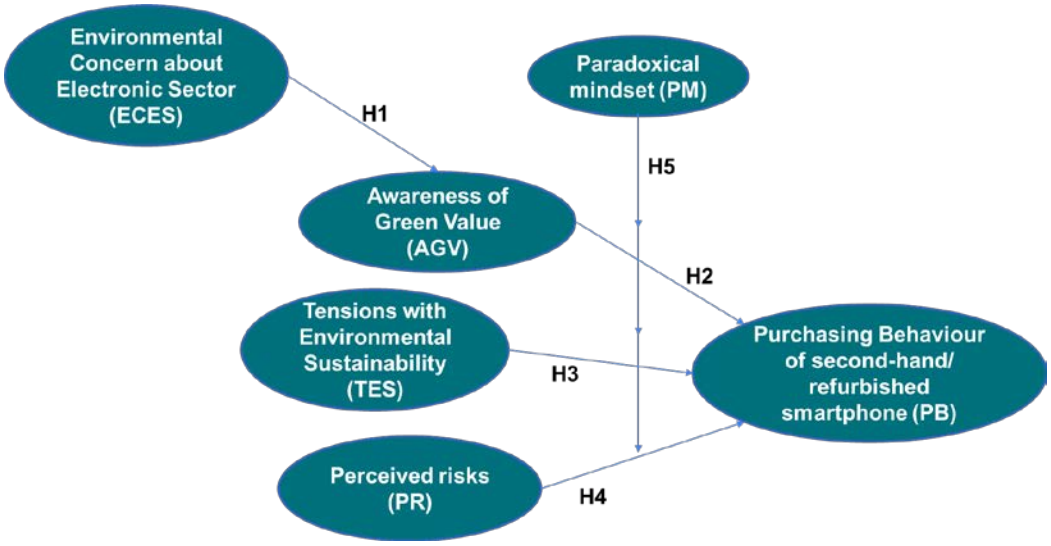
DOI 10.7433/SRECP.SP.2025.01

environmental sustainability (perceived tensions with environmental sustainability - TES). Moreover, we aim to explore the potential moderating role of a paradoxical mindset (PM) in the relationship between perceived tensions, perceived risk, green value, and purchase behavior. We make an innovative contribution to the literature on greener consumption by introducing Paradox Theory (Smith & Lewis, 2011) as an interpretative framework for analyzing purchasing behavior in the used/refurbished smartphone market. Our findings provide practical insights for policymakers and businesses professionals to encourage broader adoption of second-hand and refurbished products.

Building on previous research (Agostini et al., 2021; Hamzaoui-Essoussi & Linton, 2014; Harms & Linton, 2016; Liu & Tsaur, 2020; Testa et al., 2025) and drawing from behavioral theories (Ajzen, 1991; Festinger, 1957; Stern, 2000) as well as Paradox Theory (Smith & Lewis, 2011), we developed and tested the following hypotheses in our study:

H1: Environmental Concern about Electronic Sector (ECES) positively influences the Awareness of Green Value (AGV) of refurbished and second-hand smartphones

H2: The Awareness of Green Value (AGV) positively influences the Purchasing Behaviour of refurbished and second-hand smartphones (PB)



H3: Perceived risks (PR) negatively influence the Purchasing Behaviour of refurbished and second-hand smartphones (PB)

H4: Perceived Tensions with Environmental Sustainability (TES) positively influence the Purchasing Behaviour of refurbished and second-hand smartphones (PB)

H5: Paradox mindset (PM) moderates the relation between (a) Tensions with Environmental Sustainability/ (b) Perceived Risks/ (c) Perceived Green Value and the Purchasing Behaviour of refurbished and second-hand smartphones (PB)

Figure 1 describes our proposed model and the hypothesized relations.

Fig. 1: The proposed model

Methodology

Sample and data collection

Our study relies on data collected through a questionnaire-based survey conducted during February 2024 on a large and representative sample of the Italian population (n=2010) aged 18-70. We analysed data using structural equation modelling (SEM) and multi-group SEM.

The questionnaire was administered online through a professional survey service provider that guaranteed sample representativeness in terms of gender, age, and geographical distribution. The provider guaranteed that the mean responses of the sample represent the reference population with a confidence interval of ± 3.1%.

Our questionnaire took approximately 20 minutes to be completed and remained "in the field" for about 10 days. Only complete questionnaires, where the participants answered all the questions, were considered valid.

The demographic characteristics of the final sample and the reference population (Italians) are shown in Table 1. All the parameters of representativeness of the sample set a priori were satisfied.

Tab. 1: Sample demographics and reference population

Demographics	Values	Sample n=2010		Population 18-70 (year 2023)	
		Absolute frequencies	%	Absolute frequencies	%
Gender	Male	985	49,00%	19.982.317	49,90%
	Female	1025	51,00%	20.051.811	50,10%
Age	Generation Z (18-26)	259	12,89%	5.346.832	13,40%
	Millennials (27-42)	501	24,93%	10.561.927	26,40%
	Generation X (43-55)	576	28,66%	11.624.945	29,00%
	Baby boomers (56-70)	674	33,53%	12.500.424	31,20%
Geographical origin	North-west	531	26,43%	10.716.471	26,77%
	North-east	409	20,36%	7.824.154	19,54%
	Center	406	20,21%	7.935.642	19,82%
	South + islands	663	33,00%	13.557.861	33,87%
Education	Graduate and post-graduate	565	28,11%	8.272.490	19,10%
	High school	1270	63,18%	18.989.628	43,90%
	Middle school	172	8,56%	12.213.216	28,20%
	Elementary school or no-title	3	0,15%	3.187.770	7,40%
	Not available			625.473	1,40%
Wealth perception ("My family income allows me to live…")	Comfortably	78	3,88%		
	Peacefully	898	44,68%		
	I feel difficulties	753	37,46%		
	I arrive at the end of the month with many difficulties	198	9,85%		
	I feel poor and I can't make it to the end of the month	83	4,13%		

Measurement

To measure our constructs of interest we took inspiration from validated scales in literature. When necessary, we adapted, revised, or created our own items to suit the purpose and context of the study.

Each construct scored a satisfying Cronbach's alpha (> 0.7). All details are reported in Table 2.

Tab. 2: Measures

Latent constructs	Items	Response scale	Source	Alpha
Environmental concern about electronic sector (ECES)	The consumer electronics sector (e.g. smartphones) generates very serious impacts on the environment	7 points Likert scale from 1=Totally disagree to 7=Totally agree	Adapted to the electronic sector from Trivedi et al., 2018	0.833
	Changing the choice of a smartphone towards more sustainable options should be a priority			
	It is extremely important to reduce the environmental impact of electronic products (e.g. smartphones)			
Perceived Tensions with sustainability (TES)	Cheap smartphones are often made in a way that makes them less sustainable for the environment and society, and vice versa	7 points Likert scale from 1=Totally disagree to 7=Totally agree	Authors' elaboration	0.793
	New smartphones that perform better technically are less sustainable for the environment and society, and vice versa			
	The most fashionable smartphones are less sustainable for the environment and society, and vice versa			
Paradoxical mindset (PM)	When you feel conflicts/incompatibilities between two features in choosing a smartphone, you feel… … able to grasp and manage all aspects related to the choice	7 points Likert scale from 1=Totally disagree to 7=Totally agree	Adapted to the consumer context from Miron-Spektor et al., 2018	0.889
	… comfortable in looking for a solution that includes both			
	… more aware of the action I am about to take			
	… excited about having to reconcile contrasting aspects			
	… amused when I manage to pursue both			
	… excited every time such contradictory questions arise in front of me			
Awareness of green value (AGV)	A used/refurbished smartphone has environmental benefits that add value to the product	7 points Likert scale from 1=Totally disagree to 7=Totally agree	Adapted from Bigliardi et al., 2022	0.897
	Buying a used/refurbished smartphone helps satisfy the need to have less impact on the environment			
	For me, buying a used/refurbished smartphone - instead of a new one - is preferable because it is less harmful to the environment			
Perceived risks (PR)	Buying a used/refurbished smartphone is risky because the technical performance (e.g. battery life) is not certain	7 points Likert scale from 1=Totally disagree to 7=Totally agree	Authors' elaboration inspired by Nasiri & Shokouhyar, 2021	0.868
	There is a risk that a used/refurbished smartphone may have scratches or unattractive aesthetic defects			
	There is a risk that the performance of a refurbished phone may not be as desired			
Purchasing behaviour (PB)	When I needed to buy a smartphone, I chose a used one	5 points frequency scale from 1=never to 5= always/ all the times	Authors' elaboration	0.835
	When I needed to buy a smartphone, I chose a refurbished one (i.e. a used smartphone subjected to a verification, repair and cleaning process by a specialized company)			

Results. *We performed Harman's single factor test to control whether a single factor accounted for the majority of variance (Podsakoff & Organ, 1986), finding no evidence of serious common method bias (Fuller et al., 2016).*

We used SEM and multi-group structural equation modelling to analyze data.

Validation of the measurement model

The convergent and discriminant validity of our constructs meet Fornell and Larcker's (1981) criteria. Specifically, the Average Variance Extracted (AVE) for each latent construct exceeds the threshold of 0.5, confirming convergent validity, indicating that the constructs adequately explain their variance. Furthermore, since the AVE values are greater than the squared correlations (SC), there is no issue with discriminant validity, meaning that the constructs are distinct. The fulfilment of both discriminant and convergent validity criteria suggests strong measurement quality, reinforcing the reliability of our model. See Table 3.

Tab. 3: Measures validity assessment

Convergent and Discriminant Validity Assessment

Squared correlations (SC) among latent variables

	ECES	AGV	PR	TES	PB	PM
ECES	1.000					
AGV	0.271	1.000				
PR	0.000	0.002	1.000			
TES	0.085	0.047	0.005	1.000		
PB	0.000	0.031	0.013	0.063	1.000	
PM	0.061	0.026	0.011	0.079	0.032	1.000

Average variance extracted (AVE) by latent variables

AVE_ECES	0.629	No problem with discriminant validity No problem with convergent validity
AVE_AGV	0.746	No problem with discriminant validity No problem with convergent validity
AVE_PR	0.691	No problem with discriminant validity No problem with convergent validity
AVE_TES	0.572	No problem with discriminant validity No problem with convergent validity
AVE_PB	0.739	No problem with discriminant validity No problem with convergent validity
AVE_PM	0.573	No problem with discriminant validity No problem with convergent validity

Note: when AVE values >= SC values there is no problem with discriminant validity
when AVE values >= 0.5 there is no problem with convergent validity

SEM results

As suggested by Kline (2016) and Bagozzi and Yi (2012), to evaluate the model fit, we considered the Chi-square test ($\chi 2=397$; degrees of freedom=70), the Root mean square error of approximation (RMSEA=0.048), the comparative fit index (CFI=0.976), the Tucker-Lewis index (TLI=0.968), and the standardized root mean square residual (SRMR=0.043). Based on these indicators of fit, falling within the suggested thresholds, our model gives a good representation of the data (Bagozzi & Yi, 2012).

Looking at the structural relations among variables (see Table 4), we found that: Environmental Concern about the Electronic Sector (ECES) has a strong positive effect on Awareness of Green Value (AGV) (coefficient: 0.523; $p < 0.001$). This means that individuals who are more concerned about the environmental impact of the electronics industry tend to be more aware of the environmental benefit/value associated with second-hand and refurbished smartphones. The relatively high coefficient (0.523) suggests that environmental concerns regarding the electronic sector significantly shape the perception of product green benefits. Hence H1 was supported.

Awareness of Green Values (AGV) has a small but still significant effect (coefficient: 0.116; $p < 0.001$) on Purchasing Behavior of Used/Refurbished Smartphones (PB), supporting H2. The effect size is relatively low, suggesting that green awareness alone may not be enough to drive purchasing behavior.

Perceived Risks (PR) negatively impact the Purchasing Behavior of Used/Refurbished Smartphones (PB) (coefficient: -0.126; $p < 0.001$) suggesting higher perceived risks (e.g., concerns about product performance, battery duration, and aesthetics) discourage consumers from buying used/refurbished smartphones and supporting H3. Since this effect is

statistically significant, companies should focus on reducing perceived risks (e.g., offering warranties, certifications, or transparent refurbishing processes).

Experiencing Tensions with Environmental Sustainability (TES) while choosing a smartphone, positively influences the Purchasing Behavior of Used/Refurbished Smartphones (PB) (coefficient: 0.233; p < 0.001) supporting H4. The positive coefficient indicates that individuals who feel strong tensions with sustainability are more likely to choose refurbished smartphones as a solution. This supports the Cognitive Dissonance Theory, suggesting that when consumers recognize a conflict between their consumption habits and sustainability concerns, they may change their behavior to reduce the dissonance.

Multigroup SEM results

To test the moderation effect of the paradoxical mindset (H5), a Multigroup Structural Equation Modeling was employed (Jöreskog, 1971; Sorböm, 1974). Multigroup models test a model in two or more discrete groups to investigate differences. This method allows us to examine whether the model structural relationships differ across groups based on the hypothesized moderating variable (paradoxical mindset).

To analyze the moderation effect of the paradoxical mindset using Multigroup SEM, we identified two sub-groups based on individuals' paradoxical mindset scores. A group with a lower Paradoxical Mindset was made up of individuals with PM scores below (Mean - SD); a group with a higher Paradoxical Mindset was made up of individuals with PM scores above (Mean + SD). We preliminary checked the measurement validity in both the two groups finding no differences/issues in terms of convergent and discriminant validity.

Then we analysed differences in structural paths (see Table 5 and Table 6) finding that:

In the High PM group, awareness of green value (AGV) significantly increases the likelihood of purchasing used/refurbished smartphones (PB). In the Low PM group, AGV has no effect on actual behaviour. This suggests that paradoxical thinkers are better at translating the awareness of refurbished smartphones' green value into real purchasing decisions, while low paradoxical thinkers may recognize products' green benefits but fail to act upon them. In practice, this means that just increasing sustainability awareness is not enough to drive green consumption in individuals with a low paradoxical mindset.

In the High PM group, perceived risks (PR) actually have a positive influence on purchasing behaviour. In the Low PM group, perceived risks strongly discourage purchasing behaviour (-0.402).

This means that high paradoxical thinkers are less affected by potential risks and may even see them as challenges to overcome. Low paradoxical thinkers, however, are highly risk-averse and avoid buying refurbished smartphones due to concerns about reliability, performance and aesthetic features. For companies targeting low paradoxical consumers, reducing perceived risks (e.g., offering warranties, transparent refurbishing processes, brand trust) is essential.

For high paradoxical thinkers, perceiving sustainability tensions significantly increases their likelihood of purchasing refurbished smartphones. For low paradoxical thinkers, perceived sustainability tensions have no significant impact on their behaviour. This suggests that high paradoxical thinkers actively engage with and resolve sustainability dilemmas, leading them to choose refurbished products as a way to mitigate sustainability conflicts. Low paradoxical thinkers, on the other hand, may struggle with these contradictions and experience decision paralysis, preventing them from making sustainable purchasing choices.

Concluding, our results show that the paradoxical mindset significantly moderates consumer decision-making intervening in the relations between AGV, PR, TES and Purchasing Behaviour of refurbished and second-hand smartphones (PB). Hence H5 is supported.

We can say that high paradoxical thinkers are more flexible and adaptive. They act considering the perceived product green value and the tensions with sustainability and are not deterred by perceived risks. They view sustainability tensions as motivators rather than obstacles. Instead, low paradoxical thinkers are more rigid and risk-averse. They may be aware of green value but do not translate this awareness into action. They strongly avoid risks and struggle with sustainability tensions, leading to inaction.

Our results confirm that the paradoxical mindset is a key consumer psychological factor. Businesses and policymakers should tailor their strategies accordingly to effectively promote refurbished smartphone purchases among different consumer segments.

Table 7 provides a summary of hypotheses and results.

Tab. 7: Summary of hypotheses and results

Hypotheses	Results
H1: Environmental Concern about Electronic Sector (ECES) positively influences the Awareness of Green Value (AGV) of refurbished and second-hand smartphones	Supported
H2: The Awareness of Green Value (AGV) positively influences the Purchasing Behaviour of refurbished and second-hand smartphones (PB)	Supported
H3: Perceived risks (PR) negatively influence the Purchasing Behaviour of refurbished and second-hand smartphones (PB)	Supported
H4: Perceived Tensions with Environmental Sustainability (TES) positively influence the Purchasing Behaviour of refurbished and second-hand smartphones (PB)	Supported
H5: Paradox mindset (PM) moderates the relation between (a) Tensions with Environmental Sustainability/ (b) Perceived Risks/ (c) Perceived Green Value and the Purchasing Behaviour of refurbished and second-hand smartphones (PB)	Supported

Research limitations. *Despite our efforts to minimize bias in questionnaire design, this study may still be subject to the typical limitations associated with cross-sectional design and self-reported measures (Podsakoff & Organ, 1986). These limitations include the inability to establish causal relationships and the potential for response biases, such as social desirability or recall errors. Additionally, while the sample is representative of the Italian population, the findings may not be fully generalizable to other cultural contexts. To address these limitations, future research could adopt longitudinal approaches that track real consumption choices over time, providing a more dynamic and comprehensive understanding of how targeted interventions and educational initiatives might foster paradoxical thinking, helping consumers navigate the inherent trade-offs between sustainability, affordability, and other product attributes.*

Managerial implications. *From a practical standpoint, businesses and policymakers should focus on reducing perceived risks through transparent refurbishment processes, extended warranties, and quality certifications. At the same time, they should enhance both the economic and environmental benefits of remanufactured devices through marketing strategies and awareness campaigns. They can develop tools to leverage consumers' paradoxical thinking, helping them embrace conflicting aspects that arise when choosing a smartphone and encouraging greener solutions such as opting for remanufactured/used smartphones. Policymakers can support more sustainable consumption by promoting the purchase of refurbished devices through awareness campaigns and tax benefits (EEA, 2020). Tailoring communication strategies to different consumer mindsets can optimize the impact of pro-environmental messaging.*

Originality of the paper. *This study contributes to a deeper understanding of consumer behaviour regarding refurbished and second-hand products, with a particular focus on smartphones. Indeed, despite the recognized*

environmental benefits of choosing a used device over a new one, this behaviuor still encounters contradictions and barriers (Bigliardi et al., 2022; Mounesan, 2023).

Moreover, our study flows well with embryonic research leveraging Paradox Theory into the field of sustainable consumption, offering a novel perspective on consumer decision-making in the refurbished smartphone market (Smith & Lewis, 2011; Testa et al., 2025). By examining the moderating role of PM, the research provides insights into how cognitive flexibility influences greener purchasing behavior.

Grounded in behavioural theories such as the Theory of Planned Behavior (TPB) (Ajzen, 1991), our paper confirms the significant role of environmental awareness in shaping consumer preferences. In particular, awareness of the environmental impact of the electronics sector - termed Environmental Concern about the Electronics Sector (ECEC) - strongly influences the awareness of green value (AGV) of second-hand and remanufactured electronic products. However, while awareness of products' environmental benefits has a positive effect on refurbished smartphone purchases, this effect remains weak, suggesting that awareness alone is not enough to drive action. As also previous studies have suggested, perceived risks (PR) emerge as a barrier to purchasing refurbished smartphones, highlighting the need for companies to build consumer trust (Mugge et al., 2017; Agostini et al., 2021). These findings tell us that while sustainability concerns and product' awareness can promote the adoption of used/refurbished smartphones, perceived risks remain a key challenge that must be addressed through marketing strategies, product assurances, and consumer education.(Sharifi &.Shokouhyar, 2021). Consumers often struggle to balance environmental benefits against concerns related to product reliability, performance, and aesthetics. This reinforces previous research indicating that green consumption choices are complex and involve trade-offs between sustainability and other product attributes (Testa et al., 2022; Olson, 2022; Swait & Adamowicz, 2001).

An interesting insight of our study is that the perception of tensions between products' characteristics (performance, price, etc.) and environmental sustainability can act as a driver of behavioural change. This can be interpreted under the light of the Cognitive Dissonance Theory (Festinger, 1957) where consumers tend to align their attitudes and behaviour when they feel a psychological discomfort. We found that higher perceived tensions with sustainability encourage used/refurbished smartphone purchases, supporting the idea that recognition of trade-offs between products' favored features and environmental aspects can drive a pro-environmental change.

In our study, the paradox mindset emerges as a significant moderating factor in consumer decision-making suggesting that Paradox Theory can provide a useful interpretive framework for understanding how individuals approach trade-offs and how their ability to accept and manage contradictions influences purchasing decisions (Smith & Lewis, 2022; Miron-Spektor et al., 2018). Consumers with a high paradox mindset are better equipped to reconcile conflicting product attributes, making them more likely to opt for used/refurbished devices. This suggests that promoting cognitive flexibility and emphasizing the compatibility of sustainability with performance and affordability could enhance consumer adoption of refurbished products.

Key words: *Consumer behavior, paradoxical mindset, refurbished smartphones, second-hand smartphones, perceived tensions, sustainability trade-offs.*

Acknowledgments
This study was funded by the European Union - NextGenerationEU, Mission 4, Component 2, in the framework of the GRINS -Growing Resilient, INclusive and Sustainable project (GRINS PE00000018 - CUP J53C22003140001). The impact of sustainability in work psychology and corporate training

MARIO D'AVINO[1] GIOVANNI SPATOLA[2] ANTONIO CAPASSO[3]

Abstract

The article explores the impact of sustainability in work psychology and corporate training. Using a blended approach, the research analyzes how sustainable practices affect employees' psychological well-being and the effectiveness of corporate training programs. The results show that sustainability can improve the quality of working life, increase motivation and reduce stress. The managerial implications suggest the adoption of company policies that promote sustainability to achieve long-term competitive advantages. Sustainability has become a central theme in business and academic discussions, influencing various areas, including work psychology and corporate training. This study aims to explore the intersection between these domains, using a theoretical framework that integrates self-determination theory and stakeholder theory. The research methodology combines qualitative and quantitative methods, including in-depth interviews, surveys, and case study analyses, to gain a comprehensive understanding of the phenomenon being studied. Preliminary results indicate that sustainable practices can significantly improve employees' psychological well-being, reducing stress and increasing job satisfaction. In addition, corporate training programs that integrate sustainability principles are effective in promoting sustainable skills and improving job performance. The managerial implications suggest that companies should adopt flexible work policies, psychological support programs and initiatives to promote work-life balance. The originality of the article lies in its ability to integrate two fundamental theories for understanding motivation and organizational behavior, offering an innovative theoretical framework for understanding how sustainable practices can influence employee well-being and business performance. In addition, the article stands out for its innovative methodology and focus on the practical implications of the results, offering concrete recommendations for companies on how to integrate sustainable practices into work psychology and corporate training. Companies that adopt these practices can improve employee well-being, increase motivation and engagement, reduce turnover and absenteeism, improve business performance, strengthen their reputation, and contribute to the Sustainable Development Goals. These benefits can lead to long-term success and increased competitiveness in the global marketplace, but also contribute to a more sustainable and prosperous future.

Research framework. *Sustainability has become a central theme in business and academic discussions, influencing various areas, including work psychology and corporate training. This article explores the impact of sustainability in these areas, proposing a work-in-progress research project that clearly identifies the conceptual development, objectives and methodological frameworks. The research project is based on a theoretical framework that integrates the theory of self-determination and the theory of stakeholders. The theory of self-determination, developed by Deci and Ryan, suggests that individuals are inherently motivated when they experience autonomy, competence, and relationality. Stakeholder theory, on the other hand, emphasizes the importance of considering the interests of all stakeholders in the implementation of sustainable practices.*

Sustainability in work psychology is not only limited to mental health, but also includes the promotion of a safe and healthy work environment. Companies can implement measures to reduce physical risks and improve workplace safety, thereby contributing to the overall well-being of employees. Corporate training is crucial for developing the skills needed to meet sustainability challenges. Well-designed training programs can increase employees' awareness of sustainability issues and provide them with the tools to implement sustainable practices in their daily work. Self-determination theory suggests that training can meet the basic psychological needs of autonomy, competence, and relationality, thereby increasing employees' intrinsic motivation.

An example of sustainability-oriented corporate training is the inclusion of specific modules on the principles of sustainability in professional development programs. These modules can cover topics such as waste management, energy efficiency, and corporate social responsibility. In addition, companies can organize workshops and seminars to raise awareness among employees about the importance of sustainability and provide them with the necessary skills to implement sustainable practices.

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

Corporate training can also include the use of innovative technologies to promote sustainability. For example, companies can use e-learning platforms to offer online training courses on sustainability topics, allowing employees to access training content in a flexible and convenient way.

Purpose of the article. *Exploring the impact of sustainability on employees' psychological well-being: This objective aims to understand how sustainable practices affect workers' mental health and well-being. Evaluate the effectiveness of corporate training programs: This objective focuses on analyzing how training programs can promote sustainable skills and improve job performance. Identify best practices: This objective aims to identify the most effective strategies for integrating sustainability into work psychology and corporate training.*

The research project aims to:

- *explore how sustainability practices affect employees' psychological well-being;*
- *analyze the effectiveness of corporate training programs in promoting sustainable skills;*
- *identify best practices for integrating sustainability into work psychology and corporate training.*

Methodology. *The research uses a mixed approach, combining qualitative and quantitative methods. In-depth interviews with industry experts and employee surveys will be conducted to gather data on perceptions and experiences related to sustainability. In addition, case studies of companies that have successfully implemented sustainable practices will be analyzed. Work psychology is concerned with studying human behavior in the work context, with a particular focus on employee well-being. Psychological sustainability involves creating work environments that support workers' mental health and well-being. This can be achieved through company policies that promote work-life balance, stress reduction, and the promotion of an inclusive and respectful organizational culture.*

A practical example of sustainability in work psychology is the implementation of psychological support programs for employees. These programs may include one-on-one counseling, support groups, and mental wellbeing workshops. Additionally, companies can adopt flexible work policies that allow employees to better balance their work and personal responsibilities.

The research uses a mixed approach, combining qualitative and quantitative methods. In-depth interviews with industry experts and employee surveys will be conducted to gather data on perceptions and experiences related to sustainability. In addition, case studies of companies that have successfully implemented sustainable practices will be analyzed.

Data collection

Data collection will take place through three main tools:

1. ***In-depth interviews**: Semi-structured interviews will be conducted with industry experts, managers, and employees. The interviews aim to gather detailed information about perceptions and experiences related to sustainability and psychological well-being. The questions will be designed to explore themes such as the impact of sustainable practices on motivation, stress and job satisfaction.*
2. ***Surveys**: Structured surveys will be administered to employees of the selected companies. Surveys will include closed-ended and open-ended questions to collect quantitative and qualitative data. The questions will be based on validated measurement scales, such as the Job Satisfaction Scale and the Perceived Stress Scale.*
3. ***Case study analysis**: Case studies of companies that have successfully implemented sustainable practices will be analyzed. The analysis of the case studies will allow you to identify best practices and lessons learned. The case studies will be selected based on relevance and representativeness criteria.*

Results. *Preliminary results indicate that sustainable practices can significantly improve employees' psychological well-being, reducing stress and increasing job satisfaction. In addition, corporate training programs that integrate sustainability principles are effective in promoting sustainable skills and improving job performance.*

Psychological well-being of employees

In-depth interviews and surveys have revealed that employees who work in companies with sustainable practices report lower levels of stress and higher job satisfaction. These employees highlighted how company policies that promote work-life balance, stress reduction, and the promotion of an inclusive and respectful organizational culture have a positive impact on their psychological well-being. For example, employees of companies that offer psychological support programs and flexible work policies have reported a significant reduction in stress levels and an improvement in the quality of work life.

Employee motivation and engagement

The results indicate that corporate training programs that integrate sustainability principles can increase employees' intrinsic motivation. According to self-determination theory, meeting psychological needs for autonomy, competence, and relationality can lead to greater engagement and job satisfaction. Employees who participate in sustainable training programs reported an increase in intrinsic motivation, feeling more autonomous, competent and connected with colleagues. This has led to increased engagement and job satisfaction.

Work performance

Quantitative analyses have shown that companies that implement sustainable practices and offer sustainable training programs experience improved job performance. Well-trained and motivated employees are more productive and

innovative, contributing to the long-term success of the organization. Companies that have adopted sustainable practices have reported increased productivity, reduced operating costs, and improved overall performance.

Reduction of turnover and absenteeism

Another significant result is the reduction of turnover and absenteeism in companies that adopt sustainable practices. Satisfied and motivated employees are less likely to leave the company and take sick days. Companies that have implemented flexible work policies, psychological support programs and initiatives to promote work-life balance have reported a significant reduction in turnover and absenteeism, contributing to greater stability and continuity.

Corporate Reputation

Companies that adopt sustainable practices and invest in employee well-being have improved their reputation and attracted talent. A good reputation can increase customer and stakeholder trust, leading to increased loyalty and new business opportunities. Companies that communicate their sustainability efforts through sustainability reports, marketing campaigns, and corporate social responsibility initiatives have reported a significant improvement in their reputation.

Contribution to the Sustainable Development Goals

Finally, sustainable practices in work psychology and corporate training can contribute to the United Nations Sustainable Development Goals (SDGs). Companies that adopt sustainable practices can play a key role in promoting environmental, economic, and social sustainability, contributing to a fairer and more prosperous future for all.

Search limitations

The main limitations of the research include the limited sample size and the possible lack of generalizability of the results. Furthermore, the work-in-progress nature of the project means that further data and analysis are needed to confirm the preliminary results.

Managerial implications. *The managerial implications suggest that companies should adopt flexible work policies, psychological support programs and initiatives to promote work-life balance. Additionally, investing in corporate training programs that integrate sustainability principles can increase employees' intrinsic motivation and improve the company's overall performance.*

Research findings on the impact of sustainability in work psychology and corporate training can have several practical implications for organizations. The following are some of the key implications:

1. ***Improved psychological well-being of employees**: Adopting sustainable practices can lead to a significant improvement in the psychological well-being of employees. Creating a work environment that promotes mental health and reduces stress can increase job satisfaction, reduce absenteeism, and improve productivity. Companies can implement flexible work policies, psychological support programs, and initiatives to promote work-life balance;*
2. ***Increased motivation and engagement**: Corporate training that integrates sustainability principles can increase the intrinsic motivation of employees. According to self-determination theory, meeting psychological needs for autonomy, competence, and relationality can lead to greater engagement and job satisfaction. Companies can design training programs that provide opportunities for personal and professional development, strengthening employees' sense of belonging and effectiveness.*
3. ***Reduced turnover and absenteeism**: A sustainable work environment and effective corporate training can help reduce turnover and absenteeism. Satisfied and motivated employees are less likely to leave the company and take sick days. Organizations can benefit from greater stability and continuity, reducing the costs associated with replacing and training new employees;*
4. ***Improved business performance**: Sustainable practices and corporate training can improve the overall performance of the company. Well-trained and motivated employees are more productive and innovative, contributing to the long-term success of the organization. Companies can gain a competitive advantage by integrating sustainability into their operational and human resource development strategies;*
5. ***Strengthening corporate reputation**: Companies that adopt sustainable practices and invest in employee well-being can improve their reputation and attract talent. A good reputation can also increase customer and stakeholder trust, leading to increased loyalty and new business opportunities. Organizations can communicate their sustainability efforts through sustainability reports, marketing campaigns, and corporate social responsibility initiatives;*
6. ***contribution to the Sustainable Development Goals**: Finally, sustainable practices in work psychology and corporate training can contribute to the United Nations Sustainable Development Goals (SDGs). Companies can play a key role in promoting environmental, economic, and social sustainability, contributing to a fairer and more prosperous future for all.*

Originality of the article. *This article contributes to the existing literature by exploring the intersection of sustainability, work psychology, and corporate training. The combination of self-determination theory and stakeholder theory offers an innovative theoretical framework for understanding how sustainable practices can affect employee well-being and business performance.*

The originality of the article lies in its ability to integrate two fundamental theories for the understanding of motivation and organizational behavior: the theory of self-determination and the theory of stakeholders. The theory of self-determination, developed by Deci and Ryan, emphasizes the importance of meeting psychological needs for autonomy, competence, and relationality to promote intrinsic motivation. This approach is particularly relevant in the context of sustainability, as sustainable practices can create a work environment that supports these fundamental needs, improving the psychological well-being of employees.

Stakeholder theory, on the other hand, emphasizes the importance of considering the interests of all stakeholders in the implementation of sustainable practices. This approach allows for a broader and more inclusive vision of sustainability, which is not limited only to environmental aspects, but also includes economic and social dimensions. By integrating these two theories, the article offers a comprehensive and multidimensional theoretical framework for understanding the impact of sustainability in work psychology and corporate training.

In addition, the article stands out for its innovative methodology, which combines qualitative and quantitative methods to obtain a comprehensive understanding of the phenomenon studied. The use of in-depth interviews, surveys, and case study analysis allows the data collected to be triangulated, increasing the validity and reliability of the results. This methodological approach allows for an in-depth exploration of participants' perceptions and experiences, providing a detailed and multifaceted view of the impact of sustainable practices.

A further element of originality of the article is represented by its attention to the practical implications of the results. The article not only provides a theoretical description of the impact of sustainability, but also offers concrete recommendations for companies on how to integrate sustainable practices into work psychology and corporate training. These recommendations can help organizations improve employee well-being, increase motivation and engagement, reduce turnover and absenteeism, improve business performance, and strengthen their reputation.

Finally, the article contributes to the United Nations Sustainable Development Goals (SDGs), highlighting the role of companies in promoting environmental, economic and social sustainability. This multidimensional approach to sustainability can help organizations play a key role in creating a more equitable and prosperous future for all.

New sustainability models in businesses of the italian inland areas

ANTONIO CAPASSO[1] GIOVANNI SPATOLA[2] MARIO D'AVINO[3]

Abstract

Italian inland areas, characterized by low population density and limited access to essential services, face significant economic and social challenges. In this context, local businesses are adopting new sustainability models to promote territorial development and economic resilience.

This paper analyzes innovative environmental, social, and economic sustainability strategies implemented by businesses in these areas, highlighting the role of local resources, digitalization, and collaborative networks; through a multidisciplinary approach and case studies, the study explores how these models can contribute to the regeneration of entrepreneurial fabric and the creation of shared value for local communities.

Framing of the research. *Italian inland areas represent a unique context characterized by economic fragility, depopulation, and limited access to essential services; however, these regions also possess a rich natural, cultural, and productive heritage that can serve as a catalyst for new sustainable development strategies.*

In this scenario, local businesses play a crucial role in implementing innovative sustainability models that integrate economic growth, environmental protection, and social well-being.

This research aims to analyze how businesses operating in Italian inland areas are adopting and experimenting with new sustainable approaches by leveraging local resources, digital technologies, and cross-sectoral collaboration.

Through an interdisciplinary perspective and case study analysis, the study seeks to highlight both the opportunities and challenges of these models, providing valuable insights for more effective territorial development policies.

Purpose of the paper. *The objective of this research is to analyze and understand how businesses operating in Italian inland areas are developing and adopting new sustainability models to address the economic, social, and environmental challenges of these territories. Specifically, the study aims to:*

- *identify sustainability strategies implemented by local businesses, with a particular focus on circular economy practices, the use of local resources, and digital innovation;*
- *assess the impact of these models on business resilience and territorial development;*
- *explore the role of collaborative networks between businesses, institutions, and local communities in promoting sustainability;*
- *provide useful insights to support policies and initiatives aimed at fostering sustainable business models in inland areas.*

Through a multidisciplinary approach and case study analysis, this research seeks to contribute to the debate on sustainable development strategies in marginal territories, offering concrete recommendations for strengthening the local economic fabric.

Methodology. *This study employs a qualitative research approach to explore new sustainability models in businesses operating in the Italian inland areas; the methodology is structured as follows:*

Research Design: the research follows a case study approach, focusing on selected businesses in Italian inland areas that have adopted innovative sustainability models. This method allows for an in-depth understanding of the specific challenges and strategies employed by these businesses.

Data Collection: data is gathered through a combination of primary and secondary sources:

- *Interviews: semi-structured interviews with business owners, managers, and key stakeholders to gain insights into their sustainability practices, motivations, and outcomes;*
- *Surveys: online surveys targeting a broader group of businesses in these areas to capture general trends and attitudes towards sustainability;*
- *Document Analysis: examination of business reports, sustainability statements, and policy documents to understand the frameworks guiding sustainability initiatives;*
- *Field Observations: site visits to selected businesses to observe sustainability practices in action.*

DOI 10.7433/SRECP.SP.2025.01

Data Analysis: a thematic analysis is conducted to identify recurring patterns and key themes in the data; the analysis follows these steps:

- *Transcription and coding of interview responses to extract major themes;*
- *Statistical analysis of survey results to highlight prevalent sustainability trends;*
- *Cross-case comparison to identify commonalities and differences among businesses.*

Validation and Reliability: to ensure reliability and validity, the study employs triangulation by cross-referencing data from multiple sources; additionally, member-checking is conducted by sharing preliminary findings with participants to confirm accuracy.

Ethical Considerations: all participants provide informed consent before data collection; confidentiality and anonymity are maintained to protect sensitive business information.

This methodology provides a comprehensive framework to explore how sustainability is integrated into businesses in Italian inland areas and the factors influencing their success.

Results. *The analysis conducted on new sustainability strategies in the Italian inland areas has highlighted several key elements characterizing the behavior of local businesses concerning environmental, economic, and social sustainability. Below are the main findings of the research.*

Adoption of Circular Economy Models: many businesses in the Italian inland areas are implementing circular economy practices to reduce resource waste and improve production efficiency; in particular, sectors such as agri-food and craftsmanship are showing a growing trend toward using recycled materials and reusing production waste.

Innovation and Digitalization: the most dynamic businesses are investing in digital technologies to optimize production processes and reduce environmental impact; the adoption of blockchain-based solutions for supply chain traceability and the use of e-commerce platforms to enhance local products are emerging strategies.

Collaboration between Business and Local Communities: the research has identified a strengthening of synergies between businesses, local institutions, and trade associations to promote sustainable initiatives; this collaboration manifests through short supply chain networks, consortia for territorial enhancement, and corporate social responsibility projects.

Challenges and Obstacles: despite positive developments, businesses still face several barriers, including difficulty accessing funding for sustainable innovation, complex bureaucracy, and a lack of specific skills in the field of sustainability.

Impact on Local Economies: the new sustainability models are contributing to greater economic resilience in inland areas, fostering job creation and enhancing territorial resources, however there remains a need for supportive policies to ensure the scalability of these models.

In summary, businesses in the Italian inland areas are adopting innovative sustainability strategies, although structural obstacles still limit their full development; institutional support and the dissemination of best practices could accelerate the transition toward a more sustainable and competitive economic model.

Research limitations. *This study on new sustainability models in businesses of the Italian inland areas presents some limitations that should be acknowledged.*

Firstly, the research is based on a limited sample of businesses, which may not fully represent the diversity of economic activities and sustainability practices across all inland regions of Italy; future studies could expand the sample size to enhance generalizability.

Secondly, the data collection relies primarily on qualitative methods, such as interviews and case studies: while these methods provide in-depth insights, they may introduce subjectivity and limit the ability to establish broader statistical trends; complementing qualitative findings with quantitative analyses could strengthen the robustness of the conclusions.

Thirdly, the study focuses on specific geographic and socio-economic context: the sustainability challenges and solutions identified may not be directly transferable to other regions or countries with different economic structures, policy frameworks, and cultural factors; comparative studies across different geographical areas could provide a more comprehensive understanding of sustainability models.

Lastly, the research period covers a specific timeframe, and sustainability practices in businesses are continuously evolving due to regulatory changes, technological advancements, and market dynamics; a longitudinal approach in future research could capture these evolving trends and offer a more dynamic perspective on sustainability models.

Despite these limitations, this study contributes valuable insights into the emerging sustainability approaches adopted by businesses in the Italian inland areas, paving the way for further research and policy development.

Managerial implications. *The findings of this study offer several important implications for business managers operating in the Italian inland areas.*

Firstly, companies should proactively integrate sustainability into their core business strategies, recognizing that sustainable practices can drive long-term profitability and competitive advantage. Investing in green innovation, circular economy practices, and energy efficiency can reduce costs and improve brand reputation.

Secondly, collaboration among businesses, local institutions, and policymakers is crucial to creating a supportive ecosystem for sustainable growth. Managers should engage in public-private partnerships and industry networks to share best practices, access funding opportunities, and influence sustainability policies.

Thirdly, given the evolving nature of sustainability regulations and consumer expectations, businesses must remain adaptable and responsive. Managers should implement continuous training programs for employees, ensuring that sustainability is embedded in corporate culture and operational processes.

Lastly, digitalization and technological advancements offer opportunities to enhance sustainability efforts. Companies should leverage digital tools such as data analytics, blockchain for supply chain transparency, and smart resource management systems to optimize their sustainability performance.

By adopting these strategic approaches, businesses in the Italian inland areas can not only meet regulatory and social expectations but also enhance their resilience and market positioning in an increasingly sustainability-driven economy.

Originality of the paper. *The paper tries to offer, by means of a multidisciplinary approach and case study analysis, an accurate evaluation of the sustainable development strategies in marginal territories with the final goal of providing effective recommendations for strengthening the fragile local economic fabric remaining within the scope of the holistic concept of sustainability (economic, environmental, social and governance).*

Key words: *green strategies; sustainable development; inland areas; local economies; business strategies; territory*

Addressing Biodiversity Loss: How can management studies contribute to public policy development?

JACOPO CRICCHIO[1] ANDREA PICCALUGA[2] ALBERTO DI MININ[3]

Abstract

Biodiversity loss is a grand challenge-a complex, urgent global issue requiring systemic, coordinated action. Deeply interconnected with ecological, economic, and social systems, it cannot be addressed in isolation. More concretely, effective solutions must go beyond science and technology, embracing innovative policies that integrate diverse perspectives and stakeholders. This research analyzes the public policy implications relating to biodiversity loss that emerge from management studies. Through a systematic literature review, this study identifies six key contributions from the management literature that can provide actionable insights for policymakers dealing with biodiversity loss: 1) Knowledge Integration and New Conceptual Thinking, 2) Inclusivity and Cooperation 3) Innovation and Science-based approaches 4) Incentives and Economic Drivers 5) Regulations and Accountability and 6) Agility and Directionality. More concretely, addressing biodiversity loss requires a multidisciplinary approach and a paradigm shift, coupled with adaptive governance capable of responding to evolving socio-ecological dynamics.

Framing of the research. *Biodiversity loss represents one of the most critical challenges of our time, profoundly impacting global economic and social well-being (Boiral and Heras-Saizarbitoria 2017; Leclère et al. 2020). The degradation of ecosystems disrupts essential services, including provisioning, regulating, and cultural functions, which underpin human survival and economic activities (Panwar et al. 2023). Extinction rates are estimated to be 100 to 1,000 times higher than natural levels, with 25% of known species at risk and wild mammal biomass declining by 82% since 1970 (IPBES 2019). These trends highlight the urgency of transformative action at individual, organizational, and societal levels to halt and reverse biodiversity loss (Leclère et al. 2020; Dasgupta 2021).*

The consequences of biodiversity loss extend beyond ecological systems to directly affect economic stability and growth. For instance, the failure of ecosystem services could lead to an estimated global GDP reduction of $2.7 trillion annually by 2030 (Johnson et al., 2021). Key industries, such as agriculture, forestry, and energy, not only depend heavily on biodiversity but also contribute significantly to its decline through habitat destruction, pollution, and overexploitation of resources (IPBES, 2019). Despite these challenges, innovative solutions such as nature-based strategies, regenerative business models, and technological advancements offer pathways for aligning economic activities with ecological health (Hahn and Tampe 2021; Unter et al. 2023). For example, tools like remote sensing and mobile survey platforms are now enabling businesses to monitor biodiversity and improve mitigation measures (White et al. 2021; Westerlaken 2024).

Governments and institutions have started to respond to this crisis with significant funding commitments and regulatory measures, such as the European Union's Biodiversity Strategy for 2030 and the new directive on sustainability reporting (Hassan et al. 2020; Schaltegger et al. 2023). These initiatives underscore the growing recognition that businesses must not only mitigate their impacts on biodiversity but also actively contribute to conservation and restoration efforts. However, the integration of biodiversity considerations into corporate strategies remains limited, often driven by compliance and reputational concerns rather than transformative change (Panwar 2023). Addressing this gap requires robust policies, stakeholder collaboration, and innovative approaches that align economic and ecological priorities (Di Minin et al. 2023; Mäkinen-Rostedt et al. 2023)

The role of public policy in driving transformative development and addressing societal goals, such as biodiversity conservation, has evolved significantly in recent years (Borrás and Schwaag Serger 2022). Historically, Science and Technological Innovation (STI) policies focused on promoting economic growth through mechanisms such as R&D incentives, technology transfer initiatives, and public-private partnerships (Schot and Steinmueller 2018). These traditional frameworks emphasized entrepreneurship and knowledge exchange within innovation ecosystems to enhance technological progress and economic performance (Voß et al. 2009). However, addressing grand challenges like

DOI 10.7433/SRECP.SP.2025.01

biodiversity loss requires a paradigm shift in policymaking, prioritizing societal objectives over purely economic outcomes (Kattel and Mazzucato 2018).

This shift toward societal goals is exemplified by transformative policies that aim to align innovation with the resolution of grand challenges (Bergek et al. 2023). Such policies seek to overcome resistance from entrenched stakeholders and transcend traditional path dependencies by fostering co-creation and innovation alliances that accelerate systemic change (Kemp and Never 2017; Schot and Steinmueller 2018). However, the design and implementation of transformative policies often fall short of their ambitious goals due to misaligned governance frameworks (Borrás and Schwaag Serger, 2022).

Purpose of the paper. *To address these gaps, public policy frameworks must better integrate insights from sustainability and management literature, bridging the disconnect between policy design and practical implementation (Edmondson et al. 2019). This integration requires a multi-layered approach, where governance, coordination, and operational measures are cohesively nested to achieve synergetic outcomes (Schofield 2001; Howlett 2009). Adaptive governance, which emphasizes flexibility, stakeholder engagement, and responsiveness to uncertainty, is critical to addressing the complex socio-ecological challenges of biodiversity loss (Arnold et al. 2023). Without such frameworks, even well-intentioned policies risk failing to deliver meaningful societal change.*

Despite the growing recognition of public policy as a critical driver of transformative societal change, management research has yet to fully embrace its potential to inform policy design and implementation. This disconnect limits the ability of policymakers to harness management research to address complex societal challenges, such as biodiversity loss, climate change, and social inequalities (Dwivedi et al. 2024).

The underrepresentation of policy implications in management literature is compounded by the discipline's focus on theory development over actionable insights. Unlike fields such as medicine, where evidence-based practices directly inform policy and clinical applications, management research often prioritizes abstract theorization, which can obscure its relevance for practitioners and policymakers (Pfeffer 2023). Moreover, the lack of standardization in how researchers articulate policy implications further complicates their accessibility and applicability, leaving policymakers to navigate fragmented and inconsistent insights (Eby and Facteau 2023). This challenge is particularly pronounced in addressing grand challenges, where aligning research findings with practical solutions requires collaboration across disciplines and sectors (Kunisch et al. 2023).

Bridging this gap necessitates a paradigm shift in how management research is conducted, communicated, and contextualized. Collaborative approaches, such as engaging policymakers during the research design phase and co-creating recommendations, have shown promise in making research more actionable (Sharma and Bansal 2023). Additionally, systematic reviews, which synthesize existing evidence, can serve as a powerful tool to translate theoretical knowledge into practical insights for policymaking (Aguinis et al. 2023). However, these efforts remain limited, and the potential of management research to shape policies addressing biodiversity loss and other societal challenges remains largely untapped.

To address this critical gap, this paper seeks to answer the following research question: What public policy implications have been derived from business and management studies, and how can academic findings offer actionable advice to policymakers working on biodiversity loss?

Methodology. *To answer our research question, we conducted a systematic literature review using the methodology described by (Tranfield et al. 2003; Macpherson and Jones 2010; Danese et al. 2018). As highlighted by several authors (Spina et al. 2013; Wang and Chugh 2014), this approach has numerous advantages compared to unstructured translational reviews. In particular, it adopts a replicable, scientific, and transparent process (Tranfield, Denyer, and Smart 2003, p. 209) which allows: (1) minimizing biases and errors; (2) improving the quality of the review process and outcomes (Mihalache and Mihalache 2016); confirming validity through the replication of clear steps during the review process (Wang and Chugh 2014); and synthesizing and organizing accumulated literature in a specific field (Wang and Chugh 2014), often providing academics and practitioners with insights into existing knowledge (Kunisch et al. 2018; Mihalache and Mihalache 2016).*

Furthermore, the systematic literature review is a versatile approach, widely adopted in recent studies published in high-quality scientific journals on different research topics, such as innovation (Adams et al. 2016). For these reasons, we believe that the systematic literature review is the most suitable method for our research objective, which is to offer a systematic and in-depth review of the policy implications emerging from management studies on biodiversity.

To address this, we aim to conduct a systematic literature review, critically analyzing the contributions of management academia to the development of public policy implications for biodiversity protection. Specifically, the methodology consists of seven steps.

In the first step, we built on the literature review of (Llorente-Culebras et al. 2023) to build our base keyword search. To ensure comprehensiveness, we searched both in Web of Science (WoS) and Scopus databases. We conducted the search in the title, abstract and keywords. Our search terms encompassed biodiversity and its various dimensions, including functional, trait, phylogenetic, evolutionary, taxonomic, and species diversity, as well as species richness. This resulted in 484,697 papers.

Specifically, the first step included the following keywords:

biodiversity OR "functional diversity" OR "trait diversity" OR "phylogenetic diversity" OR "evolutionary diversity" OR "taxonomic diversity" OR "species diversity" OR "species richness"

In Step 2, recognizing that biodiversity encompasses a broader spectrum of concepts, we expanded the keyword search to include the concept of ecosystems. Within management and business research, there is an expanding body of literature related to "innovation ecosystems" or "entrepreneurial ecosystems", thus necessitating a focused search on specific ecosystem terms. Thus, we followed the IUCN Global Ecosystem Typology (Keith et al. 2020) to derive more detailed ecosystem definitions associated with biodiversity. The query included natural, terrestrial, subterranean, marine, freshwater, and atmospheric ecosystems, along with ecosystem services, leading to 890,855 papers.

biodiversity OR "functional diversity" OR "trait diversity" OR "phylogenetic diversity" OR "evolutionary diversity" OR "taxonomic diversity" OR "species diversity" OR "species richness" OR "natur ecosystem*" OR "terrestrial ecosystem*" OR "subterranean ecosystem*" OR "marine ecosystem*" OR "freshwater ecosystem*" OR "atmospheric ecosystem*" OR "ecosystem* service**

To refine our dataset, we applied language, time, and document-type limitations, selecting only English-language articles published between 2011 and 2023 (Step 3). The decision to start in 2011 was made because this year marked the beginning of the United Nations Decade on Biodiversity (UN, 2011), during which an international strategy for biodiversity protection was initiated, guided by the Aichi Biodiversity Targets. These targets were identified as the first globally recognized concrete policy goals of the 21st century (IPBES, 2019; Secretariat of the Convention on Biological Diversity, 2020).

In Step 4, we filtered the results by subject categories relevant to our study. In Web of Science, we included Management, Business, Business Finance, Social Sciences Interdisciplinary, and Multidisciplinary Sciences, while in Scopus, we focused on Business, Management and Accounting, Social Sciences, and Multidisciplinary studies, reducing the dataset to 67,641 papers.

To ensure research quality, we applied journal ranking criteria in Step 5, selecting only papers published in ABS-ranked 3, 4, and 4 journals, following the approach of (Acciarini et al. 2023; Bonfanti et al. 2024). This step refined the dataset to 2,263 articles.*

In the sixth step, we removed 585 duplicates. This resulted in 1,678 papers.

Finally, in Step 7, we applied exclusion criteria, removing papers that were not directly relevant (e.g., focusing on innovation ecosystems or team functional diversity), along with review articles, conceptual papers, and studies lacking explicit policy implications following the approach of Aguinis et al. (2023). We then clustered the policy implications into themes as proposed in the result section.

Results. *Six key themes emerge from management studies that offer actionable insights for biodiversity policy:*

Knowledge Integration and New Conceptual Thinking - Biodiversity loss requires moving beyond disciplinary silos to integrate diverse forms of knowledge. Framing biodiversity loss as a systemic challenge helps policymakers incorporate scientific evidence, local knowledge, and social values into policy design.

Inclusivity and Cooperation - Effective biodiversity governance requires multi-stakeholder collaboration. Policies should prioritize participatory decision-making, ensuring local communities and marginalized groups are included. Revenue-sharing schemes and buffer zone programs help align conservation goals with local socio-economic needs.

Innovation and Science-Based Approaches - Integrating science and technology enhances biodiversity policymaking. Tools such as remote sensing, real-time monitoring, and Integrated Assessment Models improve decision-making and policy evaluation. Collaborative knowledge-sharing platforms facilitate adaptive governance.

Incentives and Economic Drivers - Economic mechanisms such as Payments for Ecosystem Services (PES), tax incentives, and eco-labeling encourage businesses and communities to support biodiversity conservation. Well-designed incentives foster long-term stakeholder engagement and equitable benefit distribution.

Regulations and Accountability - Structured regulations and accountability mechanisms ensure compliance with biodiversity goals. Transparent reporting systems, biodiversity disclosure mandates, and adaptive regulatory frameworks strengthen conservation efforts and prevent policy fragmentation.

Agility and Directionality - Policies must be adaptable to evolving environmental and socio-economic conditions. Regional experimentation and multi-level governance structures enable iterative policy improvements, allowing for localized solutions that scale up to broader conservation efforts.

Research limitations. *Future research should further investigate how nested policy frameworks-which align governance structures across local, national, and global levels-can enhance systemic resilience, ensuring that biodiversity policies remain responsive, equitable, and adaptable to emerging socio-ecological challenges. In particular, understanding how different governance layers interact and influence each other is critical for preventing policy fragmentation and fostering coherent, long-term strategies. Additionally, further exploration is needed on the role of*

institutional learning and feedback loops in biodiversity governance, ensuring that policies are continuously refined based on new scientific insights, technological advancements, and stakeholder engagement.

Managerial and policy implications. *From a governance perspective, knowledge must be disseminated through systemic feedback loops to inform iterative policy improvements. Mechanisms such as participatory research platforms, open data-sharing initiatives, and cross-sectoral advisory bodies can enhance learning capacity within the policy system (Edmondson et al., 2019). Without such systemic knowledge flows, policies risk remaining static and fragmented, unable to respond to emerging biodiversity threats.*

Systems theory emphasizes interconnectivity and nested hierarchies-subsystems that are interwoven within larger governance structures (Schad and Bansal 2018)*. In biodiversity conservation, multi-level cooperation among governments, businesses, NGOs, and local communities is essential to ensuring cohesive and synergistic policies (Voß, Smith, & Grin, 2009). Our review highlights the role of inclusive decision-making in enhancing policy legitimacy and effectiveness, particularly in cases where indigenous knowledge and local stakeholder engagement shape governance outcomes.*

Hierarchical structures must be designed to support decentralized, bottom-up engagement, ensuring that local actors influence higher-level policy decisions rather than merely being subject to top-down mandates (Schot & Steinmueller, 2018). Instruments such as stakeholder forums, co-management agreements, and multi-tier governance platforms facilitate cooperation, creating a governance structure that mirrors the complexity of biodiversity systems.

A defining feature of complex systems is their capacity for self-organization and adaptation in response to environmental changes (Schneider et al. 2017)*. In policymaking, this necessitates evidence-based innovation, ensuring that biodiversity conservation strategies remain scientifically robust and responsive to evolving ecological conditions (Schot & Steinmueller, 2018). Management research highlights the role of science-policy interfaces, such as big data analytics, environmental monitoring, and AI-driven biodiversity modeling, in enhancing the predictive capacity of governance systems. These tools enable policymakers to anticipate biodiversity trends and adjust interventions in real time.*

However, technology-driven innovation alone is insufficient without a nested governance framework that ensures knowledge generated at one level of the system informs decision-making at others (Edmondson et al., 2019). Adaptive policymaking structures, such as regulatory sandboxes and experimental policy zones, allow for policy refinement through iterative learning.

Economic systems are deeply interwoven within socio-ecological frameworks, with market mechanisms often serving as either drivers of biodiversity loss or levers for systemic transformation (Bergek, Hellsmark, & Karltorp, 2023). Our findings emphasize the role of economic incentives-including payments for ecosystem services (PES), tax benefits for conservation, and biodiversity credits-in realigning market incentives with ecological priorities. From a systems perspective, these mechanisms function as feedback loops, altering the behavior of actors by integrating long-term ecological considerations into economic decision-making (Schneider et al., 2017).

However, economic incentives must be nested within broader regulatory frameworks, ensuring they do not merely offset biodiversity harm but actively contribute to systemic regeneration. This requires policymakers to structure incentives in ways that foster cumulative, cross-sectoral benefits, such as linking PES schemes with community development programs to ensure equitable distribution of conservation benefits.

In complex systems, regulatory mechanisms act as stabilizers, providing constraints that prevent systemic degradation while enabling positive feedback loops for sustainability (Schneider et al., 2017). Our review underscores the necessity of strong accountability mechanisms, including mandatory biodiversity disclosures, corporate governance reforms, and stricter compliance frameworks, to align corporate behavior with conservation goals (Panwar et al., 2023).

However, rigid regulatory structures risk creating inertia, limiting the system's ability to adapt to emerging challenges. Thus, regulations must be designed with built-in flexibility, enabling periodic reassessment and recalibration based on real-time biodiversity data. Polycentric governance models, which distribute regulatory authority across multiple levels, offer a potential solution, ensuring that regulatory oversight is both stringent and context-sensitive (Arnold et al., 2023).

Finally, a systems approach to biodiversity policy must embrace agility and directionality, ensuring that governance structures remain adaptable yet mission-driven (Schot & Steinmueller, 2018). Agility is crucial in responding to emerging ecological threats, technological advancements, and socio-economic shifts, while directionality ensures that policies are not reactive but aligned with long-term sustainability goals. Our findings suggest that successful biodiversity policies balance regional experimentation with strategic coherence, ensuring that local pilot programs inform broader policy transformations.

From a systems perspective, policy spillover effects must be harnessed, ensuring that successful biodiversity initiatives cascade across sectors and jurisdictions. Regional policy coordination, cross-border conservation strategies, and transnational governance frameworks can enhance the systemic impact of biodiversity interventions.

Originality of the paper. *By framing biodiversity policy as an interconnected and dynamic system, this study lays the groundwork for a structural approach that bridges management research with policymaking. The six key clusters identified-knowledge flows, multi-level cooperation, adaptive innovation, economic incentives, regulatory frameworks, and agility-serve as the foundation of a systemic governance model. Rather than treating these elements in isolation, our findings emphasize their interdependence, highlighting how an integrated policy approach can create self-reinforcing mechanisms that drive transformative change in biodiversity governance. Drawing from systems theory, we argue that*

these policy dimensions must be understood as interdependent components of an adaptive system. Policy interventions must not be designed in isolation but rather as part of a broader governance framework that considers hierarchies, feedback loops, and dynamic interactions between system actors (Schad & Bansal, 2018; Schneider et al., 2017).

A fundamental principle of systems theory is that the capacity of a system to adapt and evolve is dependent on its ability to process and integrate information from multiple sources (Schneider et al., 2017). In biodiversity policymaking, this translates into the need for knowledge integration and new conceptual thinking, incorporating scientific expertise, local knowledge, and interdisciplinary insights. Traditional policy frameworks often suffer from reductionist thinking, addressing biodiversity loss as a series of isolated challenges rather than as part of a broader socio-ecological system (Grewatsch et al. 2023). A systems perspective calls for transdisciplinary collaboration, ensuring that decision-making reflects both scientific evidence and context-specific socio-economic realities.

Key words: *biodiversity; systematic literature review; policy; system theory; complexity*

Leading data-driven transformation towards sustainability: the role of transformational leadership and digital-enabled capabilities

MARICA GREGO[1] COSTANZA BALDRIGHI[2] STEFANO DENICOLAI[3]

Abstract

This study explores the complex relationship between data-driven transformation and sustainability-oriented innovation (SOI). While digital transformation is often seen as a driver of sustainability initiatives, our findings suggest that its impact is not straightforward and depends on key contextual factors. We examine the moderating roles of transformational leadership and digital-enabled capabilities to assess how organizations navigate the trade-offs between digitalization and sustainability. Analysing a sample of 314 Italian companies, we find that transformational leadership strengthens the positive effect of data-driven transformation on SOI, whereas digital-enabled capabilities unexpectedly weaken this relationship, suggesting the emergence of complex trade-offs between digitalisation and sustainability priorities. These results highlight the need for a strategy that places emphasis on particular characteristics of leadership and integrates competing objectives into a coherent and shared vision. The study contributes to the current literature on sustainability offering managerial implications into the leadership and resource configurations necessary for achieving sustainable innovation.

Framing of the research. *Over the last two decades, sustainability has evolved from a reactive, compliance-based approach to a proactive, core component of organisational strategy (Lubin and Esty, 2010). Many organisations adopt sustainability-oriented innovation (SOI) practices to enhance competitiveness. In the context of this study, SOI is defined as "a process deliberately seeking outcomes to improve current environmental and/or social performance while simultaneously finding competitive advantage" (Kennedy et al., 2017, p.713).*

Research reveals that sustainability can drive significant innovation, reduce costs, and open new revenue streams, making it a powerful competitive advantage (Nidumolu et al., 2009). However, despite the benefits and the regulatory pressure to introduce SOI, its implementation presents several obstacles. One of the primary challenges is the upfront significant investment required, with benefits that may not be visible in the short run (Doni and Fiameni, 2023). Second, balancing environmental, social, and economic goals is complex and this complexity is further exacerbated by the organisational structures, and the presence of different business streams, functions and projects (Keeble, 2003). Finally, a sustainability focus requires managers to integrate SOI initiatives into existing business processes without disrupting the traditional company's operations (Harsanto et al., 2024, Wang et al., 2023).

To overcome these challenges the literature suggests that digital transformation could enhance a company's capabilities achieving a better alignment between sustainability goals, innovation outcomes, and company performance (Ashaari et al., 2021, Behl et al., 2022, Jibril et al., 2024, Yu et al., 2021). Particularly, we focus on the role of data analytics in supporting business model transformation: data analytics enhances decision-making by enabling companies to leverage large volumes of information, characterised by high velocity and significant variety (Mcafee et al., 2012). The effective management and exploitation of data can provide organisations with at least three enhanced capabilities: spotting customer behaviour, enabling real-time market responsiveness and fostering data-driven market ambidexterity (De Luca et al., 2020). Organizations can leverage these enhanced capabilities to promote and achieve SOI goals (Fosso Wamba et al., 2015). This transformative process is known as data-driven transformation: the process by which organisations recognise data as a strategic asset, leveraging it to inform core decision-making, generate value through internal optimisation and external monetisation, and undergo a cultural, strategic, and leadership shift to fully integrate data-driven practices across all levels of the organisation.

Big data technologies and analytics have attracted considerable attention from practitioners because of their potential to drive the development of new digital services and support the achievement of sustainability goals (Deloitte, 2012). Existing literature confirms that digital tools, and particularly big data analytics, can enhance environmental sustainability by optimising resource consumption, reducing waste, and improving supply chain efficiency (Dubey et al., 2019a, Dubey et al., 2019b, Guandalini, 2022). The extensive use of digital technologies indeed brings significant changes

to both businesses and society (Van Veldhoven and Vanthienen, 2022). Also, they can play a critical role in enabling sustainability processes (Melville, 2010). Carlsson et al. (2022) point out that digitalization is crucial for an organisation to achieve sustainability leadership, conform to sustainability objectives, and exchange information with consumers and stakeholders throughout the circular life cycle.

This argument can be expressed more formally by advancing the following hypothesis:

***H1a:** There is a positive relationship between data-driven transformation and sustainability-oriented innovation.*

However, it is also important to note that a positive relation is not a unanimous finding among scholarly literature (Guandalini, 2022). There is a generally optimistic attitude towards the opportunities offered by digital technologies and data management, however, these technologies can be potentially disruptive if not adequately managed (Ciulli and Kolk, 2023). Verbeke and Hutzschenreuter (2021) refer to a bright as well as a dark side of digital transformation arguing that digital transformation may enable new revenue streams but also heighten unintended and unexpected digital vulnerabilities. One major risk is cybersecurity, as the adoption of digital technologies increases exposure to data breaches and attacks (Kraemer-Mbula et al., 2013). In addition, the fragility of digital infrastructures poses another vulnerability which can hinder widespread adoption and challenge organisational governance (George et al., 2020, Koutsikouri et al., 2018). Technological obsolescence further complicates digital investments, as organisations may struggle to commit to costly digital resources that quickly become outdated (Hitt et al., 1997). This is exacerbated by the nature of sustainability initiatives, which often require iterative processes with trials and errors, leading to further pressure on digital systems (Baldassarre et al., 2020, Elf et al., 2022). The threat of job losses due to automation and the adoption of digital technologies is another potential disruption, with human resources being displaced or reshaped by the digital transformation (Basu et al., 2023). Furthermore, the challenge of digital inclusion—finding and retaining qualified talent—creates an additional barrier, particularly in aligning digital transformation with sustainability goals (Pekkala, 2022). This trade-off between digital transformation and sustainability initiatives is particularly evident in smaller companies with limited resources and narrow strategic vision (Denicolai et al., 2021).

These arguments underpin the formulation of a concurrent hypothesis with respect to H1a:

***H1b:** There is a negative relationship between data-driven transformation and sustainability-oriented innovation.*

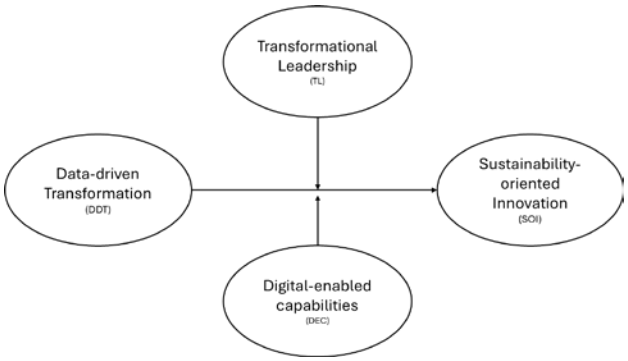
To achieve alignment of strategic goals and the development of strategies that balance between concurrent objectives, the role of leadership becomes crucial (Weiner and Mahoney, 1981, Wiengarten et al., 2017). We specifically refer to transformative leaders who can manage innovation by inspiring and supporting employees to collectively achieve a shared goal. Transformational leadership is defined as the leadership capability of "moving the follower beyond immediate self-interests through idealized influence (charisma), inspiration, intellectual stimulation, or individualized consideration" (Bass, 1999, p.10). Transformational leaders possess a clear vision of the firm's current and future trajectory, especially in dynamic markets (Avolio and Bass, 1995). They articulate and communicate this vision with conviction, inspiring employees to believe in and engage with the leader's vision (Schiuma et al., 2021, Singh et al., 2020, Zhu et al., 2005).

Sustainable oriented practices are actively shaped and spread across the organisation by motivated leadership (Akhtar et al., 2018, Çop et al., 2020, Piwowar-Sulej and Iqbal, 2023). Transformative leaders persuade followers to reach high performance and their presence is considered one of the most important organisational factors related to boost innovation (Rosing et al., 2011). The characteristics of the leaders, combined with the organisational context strongly influences the strategic trajectory (Papadakis and Bourantas, 1998).

We argue that data-driven transformation may be a good contributor to SOI, but an effective leadership is also required. While digital technologies provide the tools for business transformation, it is strong leadership that ensures these tools are used effectively by setting clear goals and empowering employees to promote sustainability initiatives (Mcafee et al., 2012).

These considerations allow to formulate the following hypothesis:

***H2:** Transformational leadership positively moderates the relationship between data-driven transformation and sustainability-oriented innovation.*



In parallel to transformational leadership, the digital context in which organisations operate also shapes their sustainability orientation; Indeed, organisations with a strong digital orientation are more likely to achieve SOI goals because digitization provides better control over the process, enhancing transparency and manageability of resources (Hojnik et al., 2023, Mishra et al., 2022). This orientation depends on the possession of digital-enabled capabilities together with a digital transformation culture (Mishra et al., 2023). Digital-enabled capabilities reflect the company ability to actually realise the transformative potential and leverage digital infrastructures and information management to support high quality decisions to achieve the desired performance (Levallet and Chan, 2022). These digital-enabled capabilities extend beyond static technological assets; they are dynamic organisational competencies that contribute to improved financial outcomes, enhanced productivity, greater agility, higher customer satisfaction, and more effective collaboration and knowledge management (Levallet and Chan, 2022). Importantly, such capabilities are cultivated through ongoing digital transformation processes, which continuously refine and reinforce successful SOI practices (Mishra et al., 2023). When data-driven transformation is integrated with strong digital-enabled capabilities, organisations create a synergistic environment where digital tools are not only adopted but are also optimally exploited. This interaction implies that the combined presence of data-driven transformation and digital-enabled capabilities enhances the positive influence on SOI more than each single factor could achieve independently.

These considerations allow to formulate the following hypothesis:

H3: *Digital-enabled capability positively moderates the relationship between data-driven transformation and sustainability-oriented innovation.*

As shown in Figure 1, our conceptual model posits that data-driven transformation represents the primary driver of sustainability-oriented innovation, while transformational leadership and digital-enabled capabilities function as moderators that can enhance the effectiveness of data-driven initiatives.

Fig. 1: Conceptual model

Purpose of the paper. *The main objective of this paper is to investigate the complex relationship between digital transformation and sustainability initiatives, with particular attention to how data analytics drives and shapes this trajectory. By offering empirical evidence, the study offers managerial guidance on how to align digital strategies with sustainability priorities, especially when organisations face the challenge of balancing multiple objectives.*

The study also aims to establish if and how transformational leadership can reorient the focus of data-driven initiatives towards a clear sustainability strategy. By articulating a clear vision and fostering a positive environment, transformational leaders inspire trust and commitment and motivate employees to look beyond short-term gains.

Finally, the paper aims to clarify which set of digital resources and capabilities are essential to achieve sustainability objectives. Digital-enabled capabilities represent the tangible resources and competencies necessary for leveraging data analytics effectively. They ensure that digital transformation efforts are not merely adopted but are optimally integrated into operational practices to achieve sustainable outcomes.

Methodology. *The data for this study is collected through a questionnaire. The empirical analysis is focused on Italian companies. The study deliberately targets highly innovative companies that are likely to be in a process of digital transformation or sustainability transition. The presence of a dedicated leader for innovation, sustainability or digitalisation was used as a viable indicator. Data collection took place between July and December 2023. The questionnaire received a total of 314 complete responses yielding a response rate of 13%. The sample contains a mix of small (51%), medium (7%) and large companies (42%) from different industries. Information on the variables are included in Table 1.*

Tab. 1: Variables

Variable name	Type	Description	Operationalisation	Originally developed by	α
Sustainability-oriented innovation (SOI)*	Dependent variable	Improving ecological sustainability (e.g. reduction of environmental impact) is a top priority We assess customers' views of green products/services through market analysis Multiple departments are engaged in sustainability-related initiatives. We consider sustainability as an opportunity for differentiation Non-market stakeholders* are involved in design and development We actively engage external partners to gather innovative ideas We leverage data and digital solutions (to promote sustainability) Improving social sustainability (e.g. inclusion, work-life balance, etc.) is a top priority Sustainability goals pushed us to a radical transformation	1 - 5 Likert scale (1 strongly disagree - 5 strongly agree)	(Maletič et al., 2016)	0.878
Data-driven Transformation (DDT)*	Independent variable	My company is transforming in the way we make money form data We generate remarkable value from data we collect We exchange strategic data with key partners and/or supplier Digitalization is today at the core of our competitive advantage Digitalization pushed us to a radical transformation	1 - 5 Likert scale (1 strongly disagree - 5 strongly agree)	(Proksch et al., 2021)	0.712
Transformational Leadership (TL)*	Moderator	I seek differing perspectives when solving problems I get others to look at problems from many different angles I help others develop their strengths I spend time teaching and coaching I help others develop their strengths I am an inspiration to other people I make other people enthusiastic about assignments	1 - 5 Likert scale (1 strongly disagree - 5 strongly agree)	(Avolio and Bass, 1995, Stock et al., 2016)	0.856

Digital-enabled capabilities (DEC)*	Moderator	In the last 3 years, the introduction of digital solutions in your company has improved: … cost reduction … productivity and process optimization … company agility … customer satisfaction … collaboration between employees and/or departments … learning and knowledge management … quality of work	1 - 5 Likert scale (1 strongly disagree - 5 strongly agree)	(Levallet and Chan, 2022, Rasool et al., 2021)	0.857
AGE_FIRM	Covariate	Age of the firm	Year count since the foundation	---	---
BUDGET	Covariate	Budget of the manager filling the survey (proxy for resources)	% of company revenues	---	---
DIR_REP	Covariate	Proxy for authority and independence of the respondent	1= directly reports to the CEO; 0=all other	---	---
FOREIGN	Covariate	Degree of internationalisation	% of foreign sales	---	---
LEAD_INN	Covariate	To account for different strategic focus	1=innovation leader; 0=all other	---	---
LEAD_SUS	Covariate	To account for different strategic focus	1=sustainability leader; 0=all other	---	---
MANU	Covariate	To capture industry effect	1=manufacturing industry; 0=all other	---	---
SIZE	Covariate	To capture dimension effect	Log of turnover	---	---

* Variable scores are generated via principal factors extraction with varimax rotation

The research hypotheses are tested on the following regression equations:

(1) $SOI = c + \beta_1 DDT + \beta_2 TL + \beta_3 DEC + \beta_4 (DDT * TL) + \beta_5 (DDT * DEC) + control + \varepsilon$

where SOI is sustainability-oriented innovation, c is the constant or intercept, β_n represents the estimated coefficients, DDT is data-driven transformation, TL is transformational leadership, DEC is digital-enabled capabilities, control represent the covariates, and ε is the error terms. Preliminary results

Results (preliminary)

Table 2 presents the preliminary results of the regression analysis.

The effect of data-driven transformation (DDT) is consistently non-significant across all models suggesting that DDT, when considered in isolation, does not directly influence SOI outcomes. Although the non-significant findings support and confirm the idea of complexity of the relationship between a data-driven strategy and a sustainability orientation, the statistical analysis does not support either H1a or H1b. This could mean that the relationship between DDT and SOI is more complex than a simple positive or negative linear association and could be contingent on other contextual factors.

One of the key contextual factors examined is transformational leadership (TL). Although TL alone is not significantly related to sustainability-oriented innovation (SOI), the interaction between data-driven transformation (DDT) and TL is positive and statistically significant. This indicates that the effect of DDT on SOI is contingent upon the presence of TL. More specifically, data-driven transformation positively influences SOI only when transformational leadership drives the process. These findings support H2 and highlight the critical role of the leadership in motivating other members within the organization towards the achievement of sustainability goals.

Another key contextual factor is digital-enabled capability (DEC), which exhibits a positive main effect on sustainability-oriented innovation (SOI), suggesting that these capabilities can support sustainability initiatives. However, contrary to the expectations, the interaction between data-driven transformation (DDT) and digital-enabled capability (DEC) is negative and statistically significant. This indicates that when organisations engage in DDT and simultaneously achieve high levels of digital-enabled capabilities, they tend to place less emphasis on sustainability projects. While the literature suggests that organizations can leverage DEC to achieve SOI, our findings show that companies with a pronounced focus on digital transformation may not strategically prioritise sustainability-oriented innovation, as the two objectives appear conflicting. The results of the empirical analysis do not support H3 but instead reveal a clear trade-off that organisations must acknowledge when defining their strategic objectives.

In summary, our findings demonstrate that the relationship between digital transformation and sustainability is complex and marked by significant trade-offs, even in larger companies with more resource availability. The transition toward sustainability remains a challenging process. However, our results indicate that strong transformational leadership—characterised by clear objectives and employees' empowerment—can drive these sustainability initiatives towards a positive outcome.

Research limitations. *Some limitations should be acknowledged. First, this study is preliminary, and some of the findings may require further elaboration with a check for robustness. Second, the study is based on cross-sectional data, which limits the ability to infer causal relationships. A third potential limitation is the geographic context of the companies in our sample: cultural and economic factors unique to the Italian region might not apply to other countries.*

Managerial implications. *Managerial implications can take at least three directions. First, managers must recognise that pursuing digital transformation and sustainability-oriented innovation concurrently may lead to trade-offs. A balanced strategic focus is required to ensure that investments in digitalisation do not inadvertently deprioritise sustainability initiatives. Managers should therefore allocate resources wisely, ensuring that digital infrastructures support sustainability goals rather than displace them.*

Second, the findings emphasise the critical role of transformational leadership in driving sustainability outcomes. Organisations should invest in leadership development programs that foster a clear vision, empower employees, and promote a long-term focus on sustainability.

Third, the findings suggest that organisations need to adopt integrative strategic frameworks that reconcile the competing demands of digital transformation and sustainability. This requires cross-functional collaboration, shared accountability, and integrated objectives with aligned performance evaluations. Emergent roles such as the Chief Sustainability Officers will become increasingly critical in steering organisations toward sustainability goals. Sustainability leaders are expected to work closely with other executives to visualise common objectives and align the company's vision with a coherent sustainability strategy.

Originality of the paper. *The originality of this paper lies in its comprehensive analysis of how organisations manage multiple strategic objectives and foci. It offers an alternative approach to the general optimistic attitude towards digital technologies emphasising the emergent trade-offs and potential conflicts that originate when firms invest heavily in digitalisation. Also, the paper focuses on the critical role of leadership characteristics as a key important organisational resource in managing trade-offs.*

***Key words**: Sustainability-oriented innovation; Data-driven transformation; Digital-enabled capability; Transformational leadership; Trade-offs.*

Social innovation and well-being: exploring the relationship through a bibliometric analysis

GIORGIA MASILI[1] DANIELE BINCI[2]

Abstract

The study explores the relationship between social innovation and well-being through a bibliometric analysis. The research highlights emerging trends, conceptual structure, and global collaborations and reveals the impact of social innovation across different contexts, emphasising its role in improving the quality of life. The theoretical and practical implications provide insights for policies and sustainable development strategies.

Framing of the research. *Social innovation is a research field gaining increasing scholars' attention (Solima et al., 2021). The research on the topic has consistently expanded in the last decade by embracing various approaches and diverse disciplines (Janik et al., 2021). Such multidisciplinarity shows evidence of the concept analysis fragmentation, highlighting the absence of a commonly accepted definition (Ziegler, 2017; Cajaiba-Santana, 2014; Pol and Ville, 2009). However, the scientific debate encompassing several disciplines has fostered a meaningful discussion (Van der Have and Rubalcaba, 2016), recognising the importance of the social innovation process in finding solutions to specific social problems by exploiting creative paths (Solis-Navarrete et al., 2021).*

Social innovation has been recognised as a collaborative concept (Van der Have and Rubalcaba, 2016) focusing on social progress (Rocha et al., 2023; Cajaiba-Santana, 2014) that promotes "social inclusion, quality of human life and well-being, changing social relationships, engaging and mobilising beneficiaries, creating new roles and relations, enhancing society's capacity to act and empowering its beneficiaries" (Dias and Partidário, 2019; pag. 1). It is driven by social concerns that lead to developing solutions to improve social conditions (Dowson and Daniel, 2010) by producing a social impact that contributes to satisfying "human and societal well-being needs" (Rocha et al., 2023; pag. 3). Accordingly, van der Have and Rubalcaba (2016) encouraged researchers in the field of innovation studies to explore social innovation when interested in people's well-being. Moreover, by focusing on subjective well-being (Ryff et al., 2021; Diener et al., 2018), Engelbrecht (2018) emphasises the importance of considering it as an additional metric when evaluating social innovations to understand the benefits to individuals and society. Similarly, Calò et al. (2024) suggest that individuals' involvement in social innovation during emergencies can influence "the impact on their health and well-being" (pag. 1724) and studying the individuals' emotional responses and community ethos can help develop social innovation initiatives based on inclusion.

Purpose of the paper. *Today, scientific literature does not show a clear picture of the relationship between social innovation and well-being studies, making it challenging to identify the current and emerging trends in the literature and the conceptual and intellectual structure of studies exploring this link to give direction for a more concrete contribution on both theoretical and practical side. Therefore, this study aims to fill this gap by answering the following research questions: What relationship exists between social innovation and well-being studies? and particularly, how do social innovation, across global contexts, impact well-being according to the literature? What are the current trends and evolution of publications and citations in this research field? What is the conceptual and intellectual structure of studies dealing with social innovation and well-being?*

Methodology. *To study the relationship between social innovation and well-being in the scientific literature, we opted for a bibliometric analysis using Biblioshiny, an interactive R-based application (Huang et al., 2021; Aria and Cuccurullo, 2017;). Data were extracted from the Scopus database using two sets of keywords combined with boolean operators. Words such as "well-being", "life satisfaction", "quality of life", and "social innovation" were adopted, and 458 articles were identified. Then, after applying filters based on subject area, document type, time and language, 175 articles were selected for the analysis. Bibliometric analysis was carried out by calculating key bibliometric indicators, such as the number of articles, average citations per article (ACA) and year (ACY), and the time distribution of publications. The analysis focused on identifying the most cited and influential articles in the field, assessing publications' volume and temporal distribution, and analysing co-authorship networks to visualise research collaboration patterns (Majumder and Biswas, 2023). A network analysis was also conducted to visualise collaborations between authors in different countries, and thematic mapping was used to identify key topics and monitor their evolution over time. The*

conceptual map highlighted the centrality of concepts such as "social innovation" and "well-being" among the visualisations generated. Such an approach has provided a comprehensive view of research dynamics and global collaboration patterns in well-being and social innovation fields of research.

Findings. The following subparagraphs present the main results of the analysis.

Main Statistics.

The analysis thoroughly examines the relationship between the literature on well-being and social innovation covering ten years from 2015 to 2024. The study focuses on a sample of 175 documents developed by 515 researchers with a citation average of 19.10 and published in 125 journals. The articles reveal that authors' engagement in international co-authorships equals 26.29% and that publications on well-being and social innovation show an annual growth rate of 20.68%. More specifically, considering the scientific yearly production (Figure 1), we can notice a positive trend with an all-time high in 2024. Such a positive trend suggests the increasing interest of researchers in studying the topic and, accordingly, its relevance to the academic community. The significant fluctuations between specific years, such as the drop between 2018 and 2020 and between 2022 and 2023, could reflect changes in interest and potential influences from external factors that may have impacted scientific production.

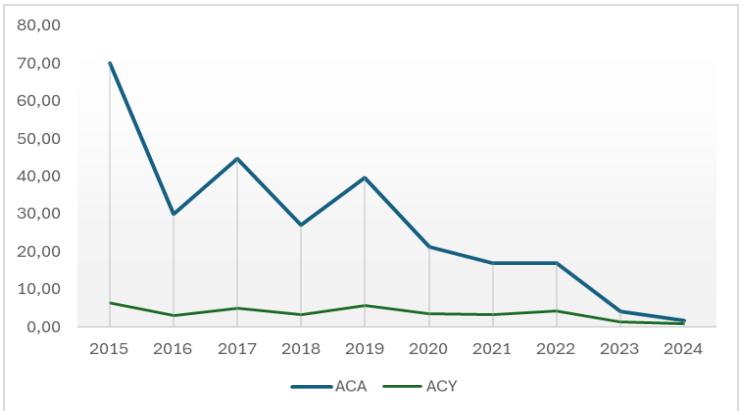

Fig. 1: Annual Scientific Production

Source: authors' elaboration on Biblioshiny's analysis

Considering the citations of articles, Figure 2 illustrates the "Average Citations Per Article" (ACA) and the "Average Citations Per Year" (ACY) indicators over time. The ACA started at a very high value in 2015, averaging approximately 70 citations per article. After 2015, it shows a steady decline, with occasional fluctuations that never come close to the initial peak. From 2019 onward, the average stabilises at approximately 10-20 citations per article before experiencing a sharp drop starting in 2021-2022 and continuing through 2024. In contrast, the ACY indicator remains consistently lower than the ACA, staying below 10 throughout the entire period. It exhibits a slight rise from 2015 to 2020, stabilising at low levels (approximately 2-5 citations per year) before further declining in 2023-2024.

Fig. 2: ACY and ACA indicators

Most relevant sources and documents

Focusing on the 125 sources in which the articles on the relationship of well-being and social innovation were published, they encompass academic disciplines such as business and management, social sciences, economics,

econometrics and finance, arts and humanities and psychology. The most relevant ones are depicted in Table 1. Considering the total citation number (TC), the Sustainability (Switzerland) journal dominates with 396 citations and 14 papers (NP), followed by the Journal of the Knowledge Economy (330) and the Ecosystem Services Journal (330).

Tab. 1: Most relevant Sources

Source: extrapolated from Biblioshiny's analysis

The TC index in Table 2 indicates the impact of the most globally cited articles on the relationship between well-being and social innovation. In particular, the articles by Carayannis and Morawska-Jancelewicz (2022), Purcell et al. (2019), and Carayannis et al. (2021) emphasise that universities and platforms such as living labs can act as catalysts for social and digital innovation, improving the quality of life through co-creation with different stakeholders and the adoption of innovative technologies, emphasising that the goal of social innovation is well-being. In contrast, articles by McPhearson et al. (2015) and Eichler and Schwarz (2019) focus on social innovation in urban settings and explore the link between well-being and social innovation through the integration of ecosystem services and collaborative solutions to address sustainability challenges, demonstrating that participatory green spaces and multifunctional infrastructure can improve people's physical, mental and social well-being. In parallel, Richter (2019) and Dax and Fischer (2018) focus on the rural context, highlighting how social innovation can adapt to the needs of local communities, improving social capital and addressing issues such as demographic decline through participatory initiatives that enhance resilience and quality of life. Vickers et al. (2017) analysed hybrid organisations that provide health and well-being services in England and provided a theoretical framework for understanding how innovation in public services emerges from the fluid and creative interaction between multiple institutional logics. Finally, while Rahman et al. (2017) explore the impact of financial instruments in improving the economic and social inclusion of marginalised communities in Bangladesh, Cattivelli and Rusciano (2020) demonstrate how self-organised initiatives during the Covid-19 pandemic helped to respond to the challenges of the food crisis, promoting social cohesion and well-being. In summary, all these studies underline that by adopting sustainable, collaborative and inclusive approaches, social innovation improves the well-being of individuals and communities and addresses complex challenges by adapting to the specificities of each context.

Source: adapted from Biblioshiny's analysis

Most productive countries

Considering the most productive countries in terms of contribution to the well-being and social innovation literature, Figure 3 shows those with the highest impact, as they demonstrated a consistent contribution in terms of publications in this field of research.

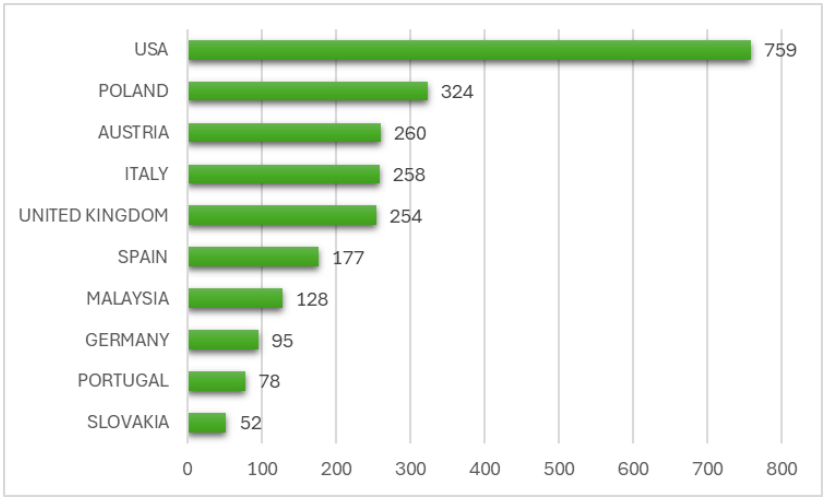

Fig. 3: Countries' Scientific Production

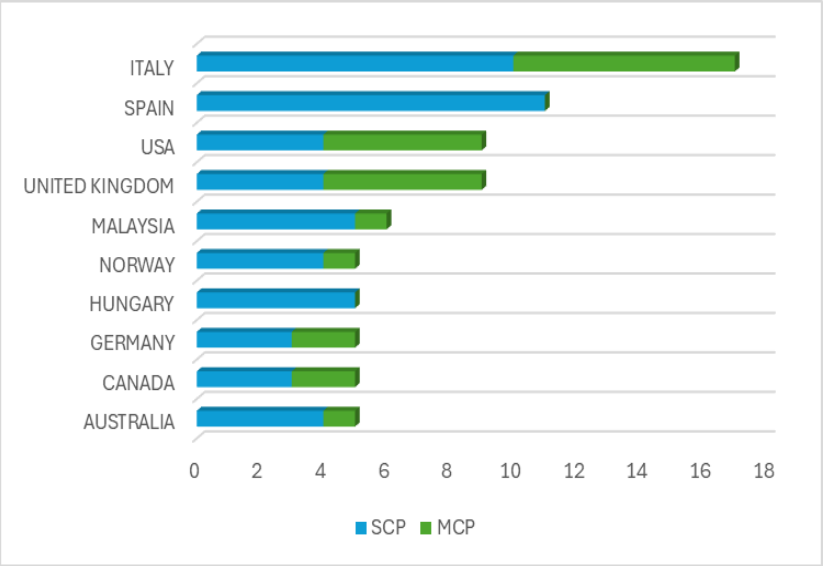
Source: extrapolated from Biblioshiny's analysis

More in detail, Figure 4 indicates the most cited countries - meaning the number of citations received by academic articles according to the author's country of origin, showing a clear predominance of the United States of America (USA) with 759 citations, indicative of significant high-impact academic production. Europe, Poland (324), Austria (260), Italy (258) and the United Kingdom (254) are at the top, reflecting a substantial contribution from European countries in this field of research. Moreover, Spain (177), Germany (95) and Portugal (78) are in an intermediate range, demonstrating a consistent level of scientific production with international impact. Concerning Asia, Malaysia (128) emerges as the most cited Asian country, a sign of the growing contribution of research from this region. Overall, the distribution shows a strong correlation between academic resources, research infrastructure and global scientific impact, with the increasing internationalisation of scholarly research, as evidenced by the significant contribution of non-Western regions.

Fig. 4: Most Cited Countries



Source: authors' elaboration on Biblioshiny's analysis

Furthermore, focusing on collaborations among authors, Figure 5 shows the distribution of academic publications classified according to their geographical origin and type of collaboration, distinguishing between SCP (Single Country Publications) and MCP (Multiple Country Publications). The graph highlights the strong correlation between international collaborations and overall academic productivity, with some countries balancing both types (such as Spain and the United Kingdom) and others favouring a more focused mode (such as Malaysia and Hungary). In particular, Italy stands out as the country with the highest overall number of publications, both for SCP and MCP, with an evident prevalence of publications produced in collaboration with other countries (MCP), indicating an academic production

resulting from partnerships with other countries and an active commitment to global integration and cooperation in the field of research. Spain shows a balance between national and international publications, followed by the UK and the USA, which show significant numbers but in a more balanced proportion between SCPs and MCPs, suggesting active participation both nationally and internationally. Conversely, Malaysia, Norway and Hungary emphasise in-country collaborations (SCPs) in contrast to Germany, Canada and Australia, which show a higher propensity for international cooperation than exclusively national publications.

Fig. 5: Most relevant countries by corresponding authors

Keywords and Topics Trend

The graph in Figure 6 shows the distribution of the most frequently used keywords within the examined documents, sorting them according to frequency. The graph highlights the wealth of research on social innovation and the links between it and other topics, such as welfare and sustainability. In particular, the term 'social innovation' is the most recurrent word, indicative of being the key or transversal theme in the narrative. The term ' well-being', placed immediately after, demonstrates the close relationship between the theme of social innovation and the improvement of well-being, be it of an individual or a community. Equal in occurrence are the terms 'sustainable development' and 'social entrepreneurship', which reflect the researcher's strong focus on sustainable development and the role of social entrepreneurship in promoting innovative solutions to social challenges. In addition, words such as 'rural development', 'innovation' and 'social inclusion' indicate the development of analysis in specific contexts, such as rural areas mentioned in several papers and about key values such as social inclusion. Further terms such as 'entrepreneurship', 'quality of life' and 'sustainability' emphasise issues related to quality of life, the role of entrepreneurship and sustainability.

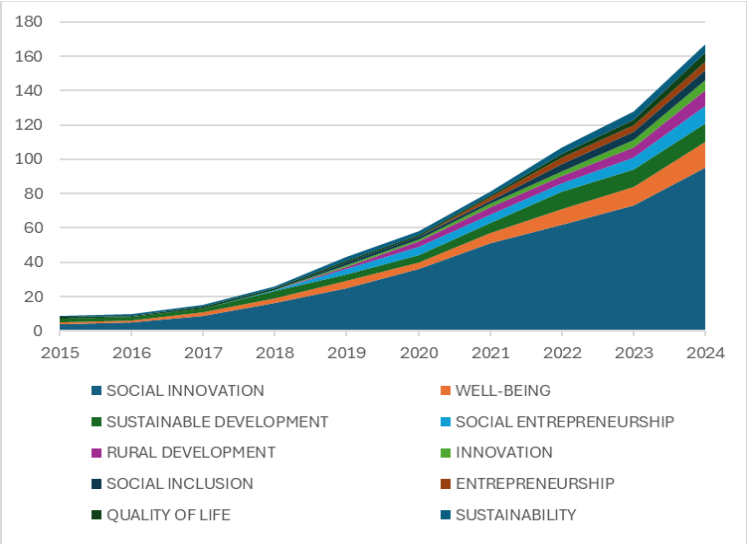

Fig. 6: Most Frequent Word

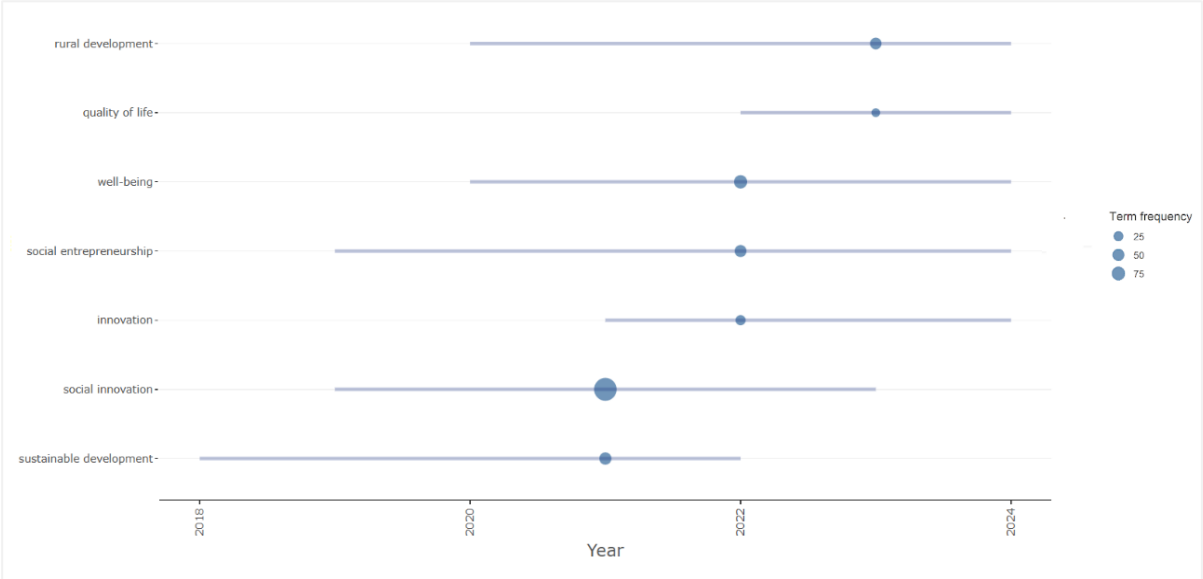
Source: authors' elaboration on Biblioshiny's analysis

As for the cumulative trend of occurrences of these terms over 2015-2024, the graph in Figure 7 reflects the growing importance of social innovation as a transformational driver to address global challenges. The centrality of the term 'social innovation' is supported by the parallel interest in well-being, sustainable development, and social inclusion issues, highlighting a research landscape evolving towards interdisciplinary and high social impact solutions.

Fig. 7: Words' Frequency over Time

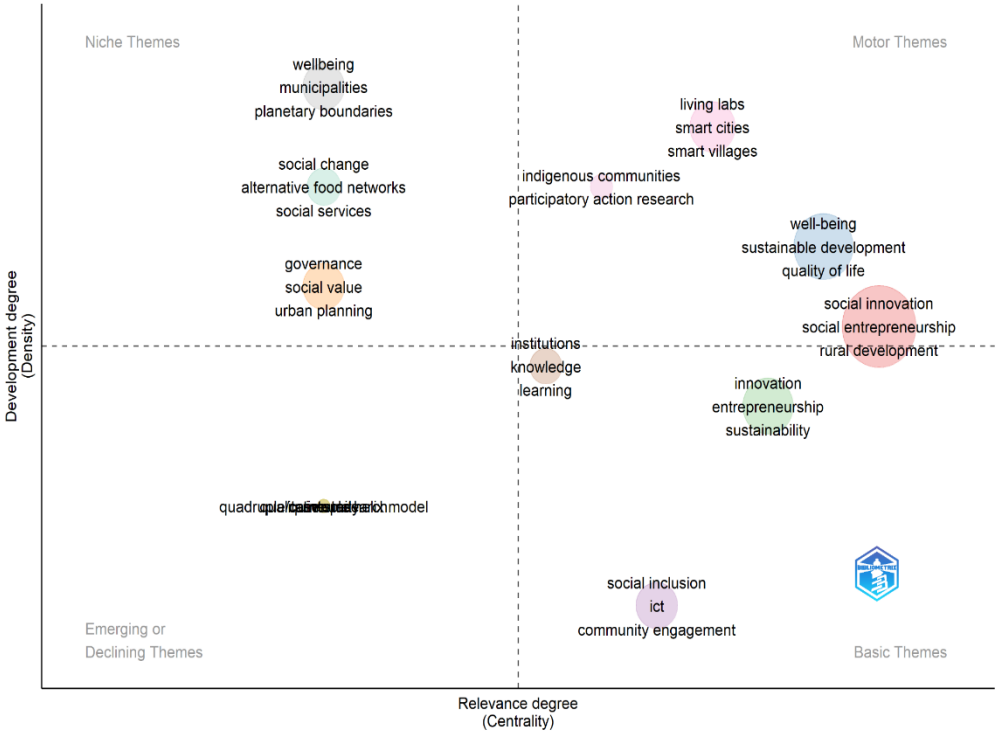


Source: elaboration on Biblioshiny's data analysis

Evolution of trends topic over time

Figure 8 explains trending topic dynamics by presenting the most cited articles and showing how their relevance has evolved. The chart illustrates the temporal trends of the most significant terms in the analysed corpus, highlighting the periods during which these terms were most discussed. Larger circles indicate peaks in frequency during specific years, suggesting greater attention toward those terms at those times. It is evident that the main terms, such as "social innovation," "well-being," and "sustainable development," show a consistent presence but with peaks of attention in specific years — for example, "social innovation" peaks in 2022, "well-being" in 2023, and "sustainable development" between 2022 and 2023. Additionally, the themes of "well-being" and "quality of life" gain more relevance toward the end of the analysed period, suggesting that these are emerging topics. As for social entrepreneurship, researchers' interest appears to be concentrated more in the middle of the analysed period, with active research activity between 2020 and 2022.

Fig. 8: Trend topics



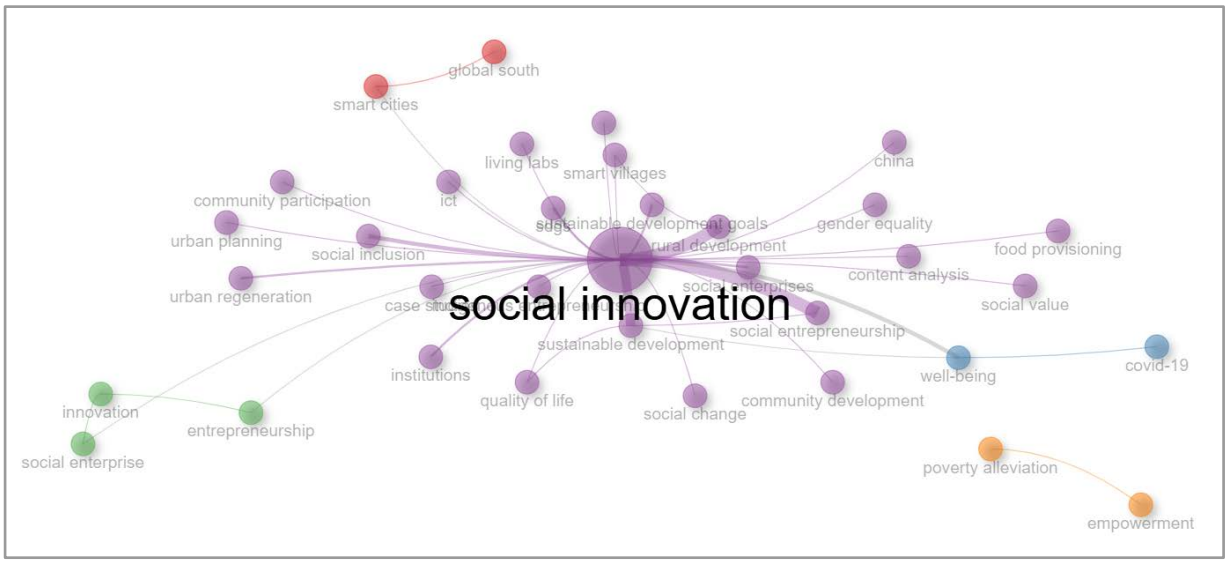
Source: adapted from Biblioshiny's analysis

Conceptual thematic map

The thematic map was used to analyse and visualise the main themes within the corpus of scientific articles identified (Figure 9). It was constructed using Louvain's algorithm, making it possible to create a hierarchical structure that helps study the main themes (macro-clusters) and the sub-themes. Such a map is based on two main dimensions: the degree of centrality (relevance), which indicates how well the theme is connected to other themes in the network, and the degree of development (density), which measures the internal cohesion of the theme. The map's area is divided into four quadrants: at the top right are the 'motor themes', which include core concepts such as well-being, sustainable development and social innovation that are high centrality and density themes. They are well-developed and fundamental to the corpus, representing key academic and operational interest areas in the research context. At the top left are the 'niche themes', which include urban planning and governance topics that are highly specific and in-depth but weakly connected to other core topics, suggesting research opportunities to explore their intersection with main topics. On the bottom left, the 'emerging or declining themes' are placed, such as quadruple helix approaches representing marginal topics that may emerge as future trends or are gradually losing relevance. Finally, in the lower right-hand corner, we have the 'basic themes', such as social inclusion and community engagement, with high significance and often linked to other themes but less explored in-depth. They are fundamental to understanding the context and offer room for further study. Overall, this analysis allows us to identify consolidated areas and new research directions, highlighting the conceptual structure of the field studied and its theoretical and applicative evolution.

Moreover, it is possible to identify the role and temporal dynamics of the leading research topics by integrating the information deriving from the Trend Topics graph (Figure 8) and the Thematic Map (Figure 9). Motor themes emerge in the trend topics graph with increasing frequency in 2022-2024, confirming their centrality in contemporary literature. In particular, social innovation with a dominating frequency represents a conceptually and practically key topic. Well-being and quality of life follow a similar trend, highlighting their nature as central and established themes. Shifting the focus to the basic themes, they do not appear with particularly significant frequencies in the trend topics graph, confirming that although central, they lack depth over time and require further research. Moreover, in the trend topics graph, the niche themes are of little interest in recent years, as they are probably confined to particular research areas. Finally, the quadruple helix approach identified in the quadrant of "emerging or declining themes" does not appear in the trend topics graph, indicating, as per the significance of the thematic map, that it may be a topic still being defined or of declining interest in relation to the literature under study.

Fig. 9: Thematic Map



Source: Biblioshiny's data analysis

Co-occurrence of keywords

The co-occurrence graph represents a conceptual network visualising the links between the most frequently used terms in the analysed literature. The clusters identified in the co-occurrence of keywords analysis in Figure 10 are the following five. Cluster 1 - Social innovation and global issues (purple), is the largest, including 26 nodes, with social innovation at its centre. It serves as the network's core and represents the connection between social innovation and global challenges, such as environmental sustainability, gender equality, and rural development.

Cluster 2 - well-being and social impacts (blue) includes nodes such as well-being and encompassing themes related to health, quality of life, and the social impact of global events such as the pandemic. It highlights the central role of well-being in discussions on social innovation (Vázquez-Maguirre, 2020; de Carvalho and Oliveira-Melo, 2024; Bona et al., 2024). Cluster 3 - urban and geographic innovation (red) includes nodes such as smart cities (Cortés-Cediel et al., 2021; Smith et al., 2023) and global south (Calzada, 2023) and focuses on concepts related to smart cities, their role as hubs of innovation, and the importance of geographic context in the application of social innovation. Cluster 4 - entrepreneurship and innovation (green) contains nodes such as innovation, entrepreneurship, and social enterprise, representing concepts related to the promotion of innovative entrepreneurial initiatives to foster social change (Cole and Hagen, 2024; Caro-González, 2023; Maguirre et al., 2016). This cluster plays a key role in exploring technological and entrepreneurial innovation within the context of social innovation. Cluster 5 - poverty and empowerment (orange) includes nodes such as poverty alleviation and empowerment. Despite its small size, it represents significant themes related to improving living conditions and promoting individual and community autonomy (Robby et al., 2023; Huang et al., 2020).

Fig. 10: Co-occurrence of keywords

Source: Biblioshiny's data analysis

Implications. *This study - still in progress - shows important implications that deepen understanding of the relationship between social innovation and well-being. On the one hand, the analysis contributes to the theoretical debate by offering an integrated framework linking fragmented literature and providing a structured overview of existing literature, identifying key themes and emerging trends. On the other hand, the results show the transformative potential of social innovation in several contexts, such as urban, rural, technological and academic. More in detail, the centrality of social innovation in addressing global challenges like environmental sustainability, gender equality, and rural development emphasises the need for interdisciplinary strategies to enhance well-being. Measuring its impact within global contexts and adopting reliable methodologies and context-related tools are essential to understanding the link between social innovation and well-being improvements, ensuring the relationship's consistency. Moreover, social innovation processes should prioritise improving people's lives by considering tailored well-being solutions to specific communities, supporting their resilience. Increasingly, the success of social innovation for well-being relies on understanding geographic context, particularly within the disruptive impact of smart cities. Social enterprises and technological innovations should address sustainable social change by developing customised strategies recognising the uniqueness of cultural factors of each geographic context while leveraging entrepreneurs' innovative capacity to lead impactful solutions. Finally, to alleviate poverty, social innovation must enable empowerment to actively build individual and community autonomy, fostering sustainable living conditions and long-term self-sufficiency. Such results demonstrate the positive change social innovation initiatives can generate, such as inclusive practices, strengthening community resilience, and supporting sustainable development. Therefore, businesses, policymakers and non-profit organisations could capitalise on the findings of these scientific studies and adopt innovative, cross-sectoral strategies that holistically address environmental and social challenges and promote social cohesion and long-term well-being.*

Limitations. *At the current state, the analysis shows also some limits. Indeed, relying only on the Scopus database may have excluded relevant studies potentially narrowing the scope of the review. In addition, focusing on a specific period (2015-2024) might have offered a view on recent developments in the relationship between social innovation and well-being.*

Originality of the article. *The paper offers an integrated and up-to-date perspective about the relationship between social innovation and well-being, by filling a critical gap in the literature. It is the point of departure to explain how social innovation can be strategically leveraged to promote well-being at both individual and community levels, effectively responding to contemporary social challenges.*

A systematic literature review on drivers and barriers for supply chain decarbonization

GIORGIA CONDOMITTI[1] MARIA ROSA DE GIACOMO[2] MARCO FREY[3]

Abstract

Climate change presents a major disruption to natural ecosystems and a critical challenge for both the global community and academic research. In response, achieving net-zero supply chains has become a key priority within Sustainable Supply Chain Management (SSCM). While prior studies have proposed conceptual frameworks to integrate sustainability into supply chains, many lack a solid theoretical foundation. Thus, scholars have highlighted the need for theory-driven research to deepen understanding in this area.

This paper addresses this gap by conducting a systematic literature review focused exclusively on organizational and managerial theory-grounded studies. The research identifies the key drivers and barriers that influence supply chain decarbonization strategies. A multi-level perspective is employed to analyze how these forces operate across institutional, supply chain, and firm-level domains.

The study offers both theoretical and managerial contributions. It enhances the field of Green Supply Chain Management (GSCM) by systematically mapping factors shaping decarbonization through a rigorous theoretical lens. From a managerial standpoint, it delivers insights to help practitioners develop strategies for the net-zero transition.

Framing of the research. *In recent decades, the transition to net-zero supply chains has gained increasing attention in sustainable supply chain management (SSCM) research (Ghadge et al., 2020; Vimal et al., 2022; L. Xu et al., 2023; Hettler & Graf-Vlachy, 2024). Foundational studies by Seuring & Müller (2008) and Carter & Rogers (2008) established conceptual frameworks for integrating sustainability across supply chains. Subsequent research has examined low-carbon supply chains (Shaharudin et al., 2019), cultural influences on carbon-neutral capabilities (Ambekar et al., 2019) and challenges in building resilient net-zero supply chains (Vimal et al., 2022).*

While these contributions provide valuable insights, many lack a strong theoretical foundation, prompting calls for theory-driven research in this context (Sarkis et al., 2011; Allen et al., 2021; Seuring et al., 2022). Some scholars have sought to address this gap. Daddi et al. (2018) explored the application of organizational theories in climate change studies, while Kannan (2021) reviewed theoretical approaches in sustainable procurement. Similarly, Todaro et al. (2020) examined theories in environmental management systems, and Govindan et al. (2024) analyzed theoretical trends in SSCM.

The application of management theories is essential for framing and explaining complex phenomena in SSCM, given the field's multi-stakeholder nature, multi-level analyses (product, company, supply chain), and intersection of environmental, economic, and social dimensions (Govindan et al., 2024). Additionally, Mishra et al. (2022) identified a critical research gap, highlighting both the need for supply chains-focused studies in the context of the net-zero transition and theory-driven research.

Purpose of the paper. *Our study aims to understand the factors that influence supply chain decarbonization strategies, ensuring scientific rigor by including only studies grounded in recognized management and organizational theories. By adopting a systematic literature review (SLR) approach, we address the need for theory-driven research in the field of supply chain decarbonization. To this end, we pose the following research question:*

RQ: What are the main drivers and barriers that influence the development of a carbon-neutral strategy at the supply chain level?

The main contributions are twofold. First, it advances theoretical understanding of supply chain decarbonization by systematically mapping the factors shaping this transition through a rigorous theoretical lens. Second, it offers practical contributions by providing science-based insights to support practitioners in developing strategies that effectively take into consideration all the relevant factors and mechanism influencing climate change mitigation strategies at the supply chain level.

Methodology. *This study employs a SLR approach to ensure methodological rigor and minimize researcher bias in the inclusion and exclusion of studies. Following Pittaway et al. (2004) and Rousseau et al. (2008), the SLR approach*

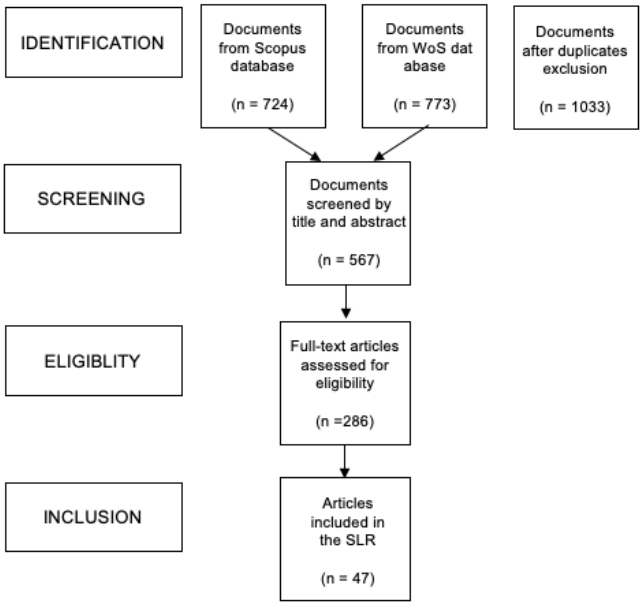
DOI 10.7433/SRECP.SP.2025.01

offers a high level of transparency, allowing for replicability and clear communication of the review process. Moreover, this methodology is particularly suited for synthesizing evidence across a diverse body of literature (Crowther & Cook, 2007). The review was conducted in line with the guidelines proposed by Tranfield et al. (2003).

Data collection. The data collection process was iterative, involving the identification of relevant sources through the application of carefully selected keywords. The datasets consulted were Scopus and ISI Web of Science, two widely recognized databases that provide comprehensive and reliable results (Harzing & Alakangas, 2016; Liao et al., 2017). The query was designed to capture studies related to climate change mitigation at the supply chain level, with a focus on contributions to organizational and management theories. The search algorithm employed was: ("climate change" OR "net zero" OR "carbon neutral" OR "decarbon*") AND (“supply chain*" OR “value chain*” OR SSCM OR SCM OR “scope 3) in titles, abstract and keywords. This broad query ensured the inclusion of diverse yet relevant studies, reducing the risk of excluding pertinent literature. Denyer & Tranfield (2009) emphasize the importance of a broad spectrum of studies in an SLR to mitigate researcher value judgments and threats to validity. To ensure the quality of the included studies, only articles published in journals listed in the AJG (formerly ABS) 2024 rankings were selected. Knowing that this choice reduces the inclusiveness and breadth of the review, we decided to include only higher-impact journals as they contain state-of-the-art research and set the future agenda (Keupp et al., 2012; Savino et al., 2017), thereby ensuring coverage of dominant themes and debates. Following Williams et al. (2024), we selected the AJG list due to its broad interdisciplinary focus. The list provides a quality ranking of sustainability-focused journals and includes wide range of journals, stretching across fields that are either central or salient to business and management studies.*

The research domain was restricted to articles categorized under business, management, economics, social and environmental sciences, and econometrics. Additionally, the selection was limited to peer-reviewed journal articles and review articles written in English, with no restrictions on the time span. The initial query was executed in September 2023 and updated in November 2024, yielding 724 papers from Scopus and 773 from ISI Web of Science. After removing duplicates, 1,033 unique articles remained for further analysis.

Tab. 1: Summary of SLR criteria



Database	Scopus; Web of Science
Time period	None selected*
Search fields	Title, Author, Keywords
Search keywords	("climate change" OR "net zero" OR "carbon neutral*" OR "decarbon*") AND (“supply chain*" OR “value chain*” OR SSCM OR SCM OR “scope 3)
Research domain	Scopus: Business, Management and Accounting; Social Sciences; Economics, Econometrics and Finance; Environmental Science Web of Science: Environmental Sciences Ecology; Business Economics; Operations Research Management Science
Publication Title	Only AJG (former ABS) listed journals
Document type	Article or Review Article
Language	English

Data extraction and synthesis. In the data extraction and synthesis stage, a structured framework for data analysis was developed, along with the identification of key research themes (Rousseau et al., 2008). This stage involved screening abstracts to identify relevant literature and establish clear inclusion and exclusion criteria. Studies were excluded if they lacked a management or organizational theory in their theoretical background, did not analyze the supply chain as the unit of analysis, adopted a broader sustainability perspective unrelated to climate change mitigation, or applied macroeconomic rather than managerial approaches. In the first phase, titles and abstracts were screened, resulting in the retention of 567 documents, while 180 studies were excluded for not meeting the inclusion criteria.

The second phase involved a full-text assessment of 286 papers, systematically coding the sample for the presence of organizational and management theories. The Excel software facilitated systematic categorization and filtering. The classification was based on established frameworks (Defee et al., 2010; Sarkis et al., 2011; Chicksand et al., 2012; Touboulic & Walker, 2015; Daddi et al., 2018; Todaro et al., 2020; Del Gesso & Lodhi, 2024), identifying 30 organizational and management theories.

The eligibility phase resulted in a final dataset of 47 papers.

Fig 1: Screening process

Results. *A thematic analysis was conducted adopting a qualitative approach to identify and examine the main drivers and barriers against climate change mitigation strategies within SCM. The analysis is grounded in established organizational management theories, ensuring both theoretical rigor and relevance. The entire process was facilitated using Excel software, which enabled systematic categorization, filtering, and evaluation of the critical variables and concepts.*

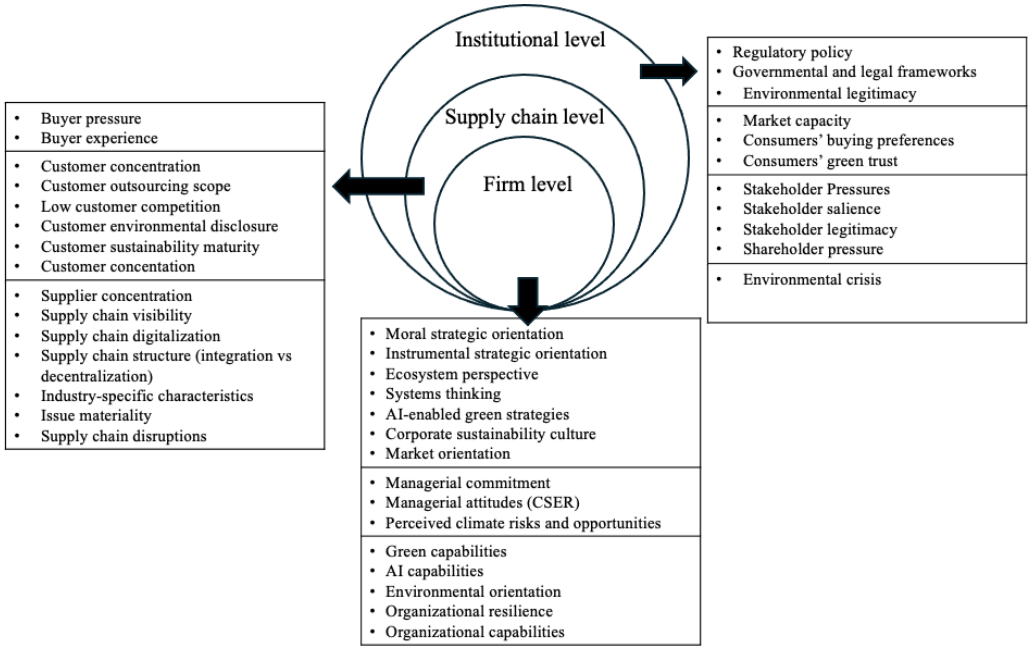
The following sections will provide a deeper understanding of the main drivers and barriers to supply chain decarbonization. These forces are grouped in three main categories encompassing the different domains in which they emerge, including the broad institutional context, the supply chain level, and the firm level.

Drivers

We conceptualize drivers are internal or external pressures that necessitate or motivate change within an organization. They create a sense of urgency, compelling organizations to initiate change to maintain competitiveness or compliance (Fig 1).

At the institutional level, regulatory, governmental and legal frameworks play a key role in driving supply chain decarbonization (Kolk & Pinkse, 2004; Cristina De Stefano et al., 2016; Furlan Matos Alves et al., 2017; Liu et al., 2020; Linares-Rodriguez et al., 2022; Harahap et al., 2023; Deng et al., 2024; Dohale et al., 2024). However, Oyewo et al. (2024) argue that high-quality policy formulation and implementation - characterizing effective governance - do not necessarily lead to carbon reduction unless it addresses properly scope 3 emissions.

Market dynamics also serve as institutional drivers. Consumer preferences, market capacity, and green trust encourage firms to adopt decarbonization strategies (Zu et al., 2018; Niu et al., 2022; Zhou et al., 2023). Competitive pressures (Deng et al., 2024), environmental crises (Touboulic et al., 2018), and the pursuit of environmental legitimacy (Deng et al., 2024) further reinforce decarbonization efforts. Additionally, shareholders and stakeholders exert influence, particularly through salience (Kolk & Pinkse, 2004) and legitimacy (Block et al., 2024).



At the supply chain level, buyer and customer-related pressures significantly impact decarbonization. Buyers exerting strong pressure or that have experience can drive suppliers toward carbon reduction (Damert & Baumgartner, 2018; Eggert & Hartmann, 2021). Customer-related drivers include customer concentration (Xu et al., 2024), customer outsourcing scope (Liu et al., 2020), low customer competition and customer-base environmental disclosure (Song et al., 2024). Downstream customer characteristics, such as customer concentration, sustainability maturity, and shifts in power as a result of sustainability-related maturity also influence the transition (Theien et al., 2014; Xu et al., 2024). Similarly, supplier concentration fosters supply chain decarbonization (Xu et al., 2024). Structural and contingency factors within the supply chain also drive change. Supply chain visibility and digitalization act as indirect driver (Balci & Ali, 2024; Li et al., 2025), while supply chain integration presents mixed findings: some studies indicate internal and external integration as a driver (Balci & Ali, 2024; Javed et al., 2024), whereas Chen & Wang (2017) argue that decentralized structures better support emissions reduction. Industry-specific characteristics, issue materiality and supply chain disruptions also emerge as drivers (Eggert & Hartmann, 2021; Kolk & Pinkse, 2007; Furlan Matos Alves et al., 2017).

At the firm level, several strategic and managerial factors drive decarbonization efforts. Lintukangas et al. (2023) distinguish firms with moral motives, integrating climate change into corporate strategy and influencing public policy,

from firms with instrumental motives, which prioritize emissions reduction due to sectoral GHG intensity and reputational concerns. Moreover, the adoption of an ecosystem perspective and systems thinking facilitates carbon neutrality (Man et al., 2024; Papadonikolaki & Anumba, 2024), while AI-enabled green business strategies significantly accelerate this transition (Chotia et al., 2024). Managerial commitment and corporate culture play a critical role, as do managers' attitudes toward corporate social and environmental responsibility (Damert et al., 2018). These authors show that also perceived climate-related risks and opportunities influence firms' proactive engagement in decarbonization.

Finally, a growing body of literature highlights organizational capabilities as key drivers of supply chain decarbonization. Studies identify green capabilities, environmental orientation, AI capabilities, market orientation, resilience, and broader organizational capabilities as enablers of carbon neutrality (Akter et al., 2024; Block et al., 2024; Man et al., 2024; Song et al., 2024). These capabilities enhance firms' ability to navigate regulatory challenges, develop innovative low-carbon solutions, and integrate decarbonization into long-term business strategy.

Fig 1. Drivers towards supply-chain decarbonization across the institutional, supply-chain and firm level.

Barriers

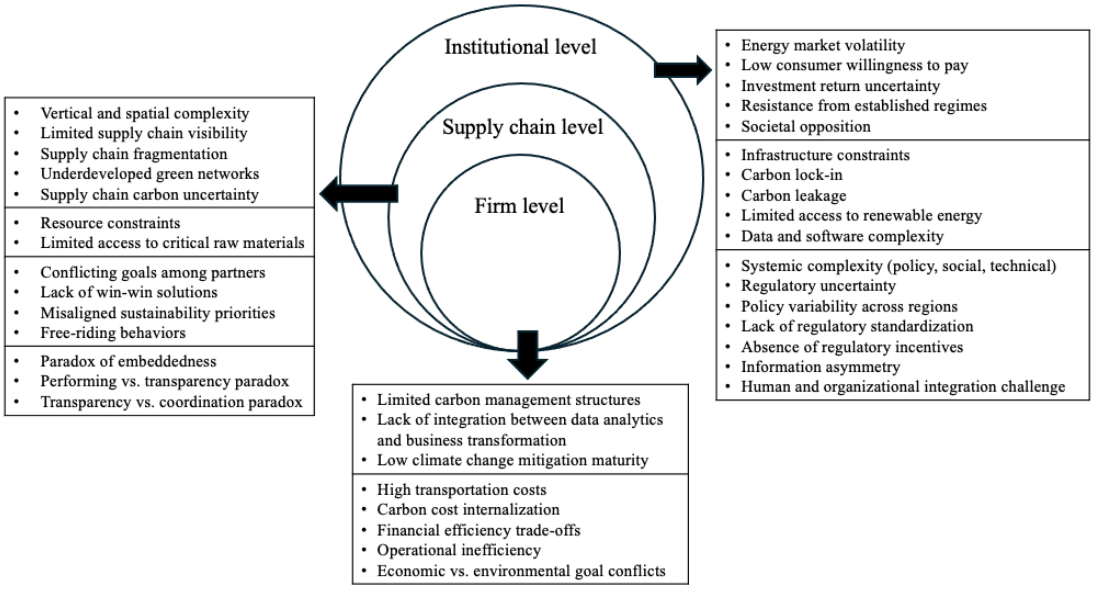
In our conceptualization, encompass the challenges, uncertainties, and opposing forces that hinder or prevent supply chains from achieving decarbonization goals (Fig 2).

At the institutional level, economic and market-related barriers significantly obstruct the transition to carbon neutrality. Uncertainty in the returns of decarbonization investments, and energy market volatility create financial risks that discourage action (Miklautsch & Woschank, 2022; Niu et al., 2022). Additionally, Harahap et al. (2023) identified other institutional barriers in infrastructure constraints, carbon lock-in, carbon leakage and low consumer willingness to pay for certain low-carbon products, such as sustainable fuels. Similarly, resource constraints, including limited access to renewable energy sources, negatively impact scope 3 decarbonization efforts (Sharma et al., 2024).

Regulatory challenges also emerge as critical barriers. Regulatory uncertainty, policy variability among different regions, lack of standardization, and absence of regulatory incentives weaken firms' commitment to decarbonization (Cristina De Stefano et al., 2016; Damert & Baumgartner, 2018). At the social level, resistance from established regimes and societal opposition slow progress (Harahap et al., 2023; Man et al., 2024). Additionally, information asymmetry among stakeholders hinders coordination and decision-making, particularly for scope 3 emissions (Niu et al., 2022). Finally, leveraging on system's theory, Papadonikolaki & Anumba, (2024) investigated the impact of joint complexity stemming from policy-related, social and technical forces - analyzing the interaction between data complexity and software system together with human and organizational factors.

At the supply chain level, structural factors pose significant barriers. Vertical and spatial complexity, limited visibility, fragmentation, and underdeveloped green supply chain networks limit firms' ability to coordinate decarbonization efforts (De Stefano & Montes-Sancho, 2024; Li et al., 2025; Sharma et al., 2024). Resource constraints and limited access to critical raw materials represent a contingent constraint (Furlan Matos Alves et al., 2017). Additionally, supply chain carbon uncertainty creates risk-averse decision-making, delaying decarbonization pathways (Belhadi et al., 2024).

Relational barriers also play a crucial role. Conflicting goals among supply chain partners, difficulties in finding win-win solutions and the misalignment of sustainability priorities challenge collaborative decarbonization efforts (Chen



& Wang, 2017; Miklautsch & Woschank, 2022). Man et al. (2024) conceptualize this misalignment of goals as an interoperability challenge, where stakeholders operate under conflicting sustainability schemas. Furthermore, free-riding behaviors undermine collective efforts, as some firms benefit from sustainability initiatives without actively contributing (Kang & Tan, 2023).

Drawing on paradox theory, the paradox of embeddedness has been identified as another key barrier (Dahlmann et al., 2023). This paradox arises at the intersection of the performing paradox - where firms struggle between sustainability transparency and performance improvements - and the organizing paradox, where supply chain transparency conflicts with coordination efforts. These tensions complicate firms' ability to implement effective carbon reduction strategies.

At the firm level, organizational constraints hinder decarbonization efforts. Limited carbon management structures and lack of integration between data analytics and business transformation slow progress (Furlan Matos Alves et al., 2017; Belhadi et al., 2024). Firms in the early stages of climate change mitigation management face additional obstacles in establishing robust decarbonization strategies (Chiappetta Jabbour et al., 2015; Li et al., 2025).

Economic and financial constraints also emerge as major barriers. High transportation costs and internalization of carbon-related costs add financial burdens (Miklautsch & Woschank, 2022), while achieving financial and operational efficiency remains challenging (Sharma et al., 2024). Trade-offs between economic and environmental goals further complicate firms' ability to commit fully to decarbonization strategies (Mahapatra et al., 2021).

Fig 2. Barriers against supply-chain decarbonization across the institutional, supply-chain and firm level.

Research limitations. *This study is grounded in a rigorous and robust sample, including only AJG-listed journal articles explicitly referring to management theories as their theoretical background. This methodological choice ensures credibility and alignment with established research standards. However, few criticalities can be identified.*

The first limitation of this study, as it remains a work in progress, is the absence of a structured framework for the interpretation and visualization of drivers and barriers. While the analysis identifies and categorizes these factors, their integration into a cohesive framework is yet to be developed. This limitation also extends to the theoretical dimension of the study. Although the sample includes only articles that explicitly reference management theories, the current version does not establish a direct connection between these theories and the identified drivers and barriers.

Managerial implications. *This study provides valuable insights for practitioners navigating the decarbonization of entire supply chains, offering evidence-based guidance grounded in high-rigor academic research. By synthesizing findings from AJG-listed journal articles, it delivers a comprehensive perspective on the factors influencing the net-zero transition.*

Specifically, the study outlines both internal and external drivers that initiate and shape change, alongside barriers that generate uncertainty or threaten transition success. This holistic understanding equips supply chain managers with a structured view of the dynamics at play, enabling them to design strategies that align with the complexity and scale of the challenge. Recognizing the interplay between these factors allows firms to anticipate risks and mitigate barriers, ultimately enhancing the feasibility and resilience of supply chain decarbonization efforts.

Originality of the paper. *This study provides valuable original contributions both from a practical and theoretical perspective. Beyond the managerial insights outlined in the previous section, its theoretical originality lies in advancing*

the field of Green Supply Chain Management (GSCM) by offering new evidence on the factors shaping supply chain decarbonization.

To the best of the authors' knowledge, no prior literature review has systematically structured the state of the art on supply chain decarbonization strategies with a rigorous theoretical approach. This study uniquely builds on recognized management and organizational theories, ensuring a theory-driven examination of the topic. Furthermore, it comprehensively maps drivers and barriers - capturing both forces that stimulate and facilitate supply chains toward carbon neutrality and those that hinder this transition. Unlike existing studies, it adopts a multi-level perspective, analyzing how these factors operate across different domains: the institutional environment, the supply chain and the single firm levels. By integrating these dimensions, this research advances theoretical understanding and provides a solid foundation for future studies on the role of management theories in guiding supply chain decarbonization.

Key words: *Climate change mitigation; Supply Chain Decarbonization; Literature Review; Management theories; Drivers; Barriers*

Decoding the Twin Transition: Integrating Theory and Practice in Digital and Sustainable Transformation

GIUSEPPE BONGIORNO[1] MARIA COLURCIO[2]

Abstract

The intersection of digital transformation and sustainability, known as the "twin transition", is gaining importance in management but remains theoretically and practically fragmented. This paper presents a systematic literature review (SLR) following PRISMA guidelines to synthesize current knowledge on this dual challenge. The review shows growing interest in using digital technologies (such as AI, IoT, and blockchain) to drive sustainability across sectors like agrifood, supply chains, and smart cities, with research in this area growing at 18.56% annually. However, most studies address digitalization and sustainability separately, lacking an integrated framework. Key themes, including technology-sustainability synergies, stakeholder collaboration, and hybrid skills, are identified but remain underexplored. Significant gaps include fragmented perspectives and limited empirical evidence. This study outlines future research directions and proposes a management-oriented framework to strengthen both theory and practice. It offers an original synthesis of the twin transition and calls for a holistic approach to align digital innovation with sustainability, enhancing competitiveness and socio-environmental impact.

Framing of the research. *In both academia and management practice, digital and sustainable transitions are increasingly recognized as highly significant (Plekhanov et al., 2023; Gillani et al., 2024; Ernst et al., 2016; Almeida et al., 2017). Recent studies emphasize process digitization, the use of enabling technologies, and their effects on enterprises and external stakeholders (Lim et al., 2020; Dhar et al., 2022). Meanwhile, sustainability has motivated numerous investigations into reducing environmental impact, promoting green innovation, and examining corporate roles in global challenges like climate change (Saunila et al., 2018; Van Loon et al., 2021). However, growing contextual complexity and converging international policies underscore the limitations of siloed approaches. Attention is increasingly focusing on a "twin transformation/transition" that merges digital and sustainable dimensions (Montresor & Vezzani, 2023; Tabares et al., 2025). This integrated perspective reveals synergies between technological innovation and sustainable development, promoting new business models that fuse competitiveness, resource efficiency, and socio-environmental responsibility (Schiederig et al., 2012; Song et al., 2019). This twin transition is now a key strategic priority for European institutions, significantly influenced by public policies (European Commission, 2020a, 2020b, 2021, 2022; OECD, 2019). According to the Digital Economy and Society Index (DESI), only 56% of European small and medium-sized enterprises have a basic level of digital intensity. Meanwhile, the urgency to lower greenhouse gas emissions and foster a circular economy has intensified (European Commission, 2019). Consequently, substantial funds (e.g., through the Next Generation EU plan) are dedicated to supporting investments in projects that further both digital and sustainable goals (European Commission, 2022). Despite policymakers' strong interest and significant resource allocation, management literature often treats digital transformation and sustainability practices separately. Consequently, integrated analyses of these dimensions remain scarce (Gao, 2024). Numerous studies investigate advanced technology adoption and its influence on business activities and value creation (Vial, 2021; Feliciano-Cestero et al., 2023), recognizing that digitization fundamentally reshapes business models, organizational processes, role structures, and value chains (Ritter & Pedersen, 2020). However, they frequently focus on performance outcomes and the strategic, technological, or organizational implications, neglecting other crucial considerations (Caputo et al., 2021). Conversely, research on sustainable development and green innovation has examined how environmental, social, and governance (ESG) principles can be embedded in corporate strategies (Bansal, 2005; Schaltegger et al., 2016). These principles increasingly relate to efficiency gains, enhanced reputation, and new market prospects (Yang et al., 2024). Approaches that integrate economic, social, and environmental objectives are crucial to understanding long-term value creation (Ghobakhloo et al., 2021), particularly in resource-intensive sectors where economic-environmental tensions can be more acute (Bansal, 2005). Consequently, sustainability-focused research emphasizes technological solutions that reduce emissions and encourage circular consumption and production patterns (Geissdoerfer et al., 2017). Digital technologies can diminish waste and optimize production flows, while environmental aims guide the circular redesign of products and services (Rehman et al., 2023). Therefore, digital and sustainable dimensions are deeply intertwined, as digital tools*

DOI 10.7433/SRECP.SP.2025.01

boost the efficacy of green initiatives, while sustainability principles guide responsible implementation (Abbate et al., 2023; Tabares et al., 2025). Limiting technology analyses to specific industries (e.g., manufacturing or logistics) without considering broader environmental and social implications is no longer adequate (Faggian et al., 2024). A focus on the twin transitions is needed to capture the diverse elements of innovation, governance, and socioeconomic impact that emerge from jointly applying digital solutions and sustainable practices (Montresor & Vezzani, 2023; Rehman et al., 2023). In a networked landscape, the simultaneous adoption of digital systems and sustainability initiatives by many stakeholders, both internal and external, demands integrated evaluation (Montresor & Vezzani, 2023; Christmann et al., 2024; Trevisan et al., 2024). This combined approach not only fosters competitiveness but also accelerates decarbonization and curbs environmental damage (European Commission, 2019; Rehman et al., 2023).

Purpose of the paper. *Despite the magnitude and relevance of the digital and sustainable transition, research in management literature on the convergence of these two elements (the so-called "twin" transition) remains underdeveloped. A strong, shared theoretical framework is needed to clarify how both research and practice can effectively address this dual challenge. Such a framework would position digitalization not merely as a supportive tool, but as a driver of sustainability, while ensuring that sustainability imperatives also inspire new forms of digital innovation. This gap in the literature, alongside the fragmented knowledge on the subject, underscores the need for a comprehensive systematic review. Such a review should illuminate the dynamics among the various research streams that converge on this topic and emphasize the importance of conceptualizing it through a management-oriented lens. To address this gap, the present paper conducts a systematic review of the most influential literature reviews on the subject, with the aim of (a) examining existing synthesized knowledge, (b) mapping the current state of the art, (c) identifying key concepts, and (d) suggesting future research directions to advance the field.*

Methodology. *According to Kraus et al. (2022), a SLR represents a rigorous and relevant approach that produces knowledge, helps to identify trends and research paths as well as potential future developments. In order to understand the phenomenon under analysis, a focus was provided exclusively on literature reviews on the topic. To select the useful and relevant ones, a set of keywords was established to compose a search query that could be used in the Web of Science (WoS) database. This approach may prove useful in ensuring that the articles covered are more complete, so that the analyses do not omit relevant information (Lim et al., 2022). The query used to search for the most relevant and inherent works on the topic was formulated taking into account the various nuances that this topic takes on; in fact, a first part takes into consideration the digital element ('digital transform*' OR 'digital transition*' OR digitalization OR ICT) followed by the element of sustainability (sustainab* OR 'green transform*' OR 'green transition*' OR 'ecological transition' OR 'eco-transition' OR 'eco transform*') and finally we look directly for the terms used in the definition of the topic of interest ('twin transform*' OR 'twin transition*' OR 'dual transform*' OR 'dual transition*'). In order to develop the analysis of the theoretical framework, the guidelines of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) (Moher et al., 2009) were followed (Figure 1), presented below.*

Fig. 1: PRISMA Diagram

The search covers the period from 2021 until March 2025, a time period dictated by the chosen papers and not imposed by the authors. In addition, the search was refined by applying the following inclusion criteria: categories (Business, Management); language (English); publisher excluded (MDPI); source type (review); filter on journal quality

(e.g. '4', '4', '3', '2'); and contextual filter (field-relevant papers). No time interval was specified, which led to the inclusion of a total of 16 articles in the final analysis (Table 1 contains details of all articles examined in the study).*

Results. *We began with a descriptive analysis to clarify the quantitative composition of the research and to gauge its impact in terms of citations. From 2021 to 2024, interest in the twin transition has grown within the scientific community, yet the literature remains comparatively limited when measured against more established fields. Of the 16 selected papers, 9 different publication outlets were represented, demonstrating a degree of heterogeneity without excessive dispersion. Scientific collaboration appears to be prevalent. Each paper has an average of 3.81 co-authors, and 68.75% show international co-authorship, indicating a strong propensity for transnational research initiatives. The annual growth rate of 18.56% suggests that interest in this area is steadily increasing. While only a few relevant publications emerged in 2021, the number has gradually risen, stabilizing between 2022 and 2023 and reaching a peak in 2024. Although not exponential, this trend indicates the formation of a core set of studies that is likely to expand further as theoretical and practical insights into twin transformation become more established. The 16 collected articles show an average of 93.31 citations each, highlighting a notable degree of influence given that this is still an emerging research area. Their combined 2,098 bibliographic references attest to a broad conceptual scope ranging from sustainability to digitization, innovation, and strategy. While the literature remains in its early stages, interest in the twin transition is clearly on the rise, evidenced by numerous references pointing to cross-disciplinary approaches and potential integration. Table 1 summarizes the most relevant aspects of the content analysis and contributions of the selected reviews.*

Trevisan & Formentini (2024) - IEEE Transactions on Engineering Management	SLR on food loss & waste	Blockchain, IoT, and sharing platforms	Waste reduction and food equity	Clear twin perspective in agrifood	Mapping technologies across food supply chain stages	Multi-actor governance and infrastructural barriers	21
Chopra et al. (2024) - Review of Managerial Science	Bibliometric review on digitalization and sustainability	AI, IoT, Big Data across sectors	Triple bottom line impacts	Interdisciplinary twin	Focus on efficiency and ethical governance	Social disparities and inclusive policy recommendations	15

This analysis confirms that the existing literature reflects a growing interest in integrating digital technologies (e.g., AI, Big Data, blockchain, IoT) and sustainable practices across multiple domains ranging from agrifood (Dal Mas et al., 2023; Trevisan & Formentini, 2024) to supply chains (Rad et al., 2022; Di Vaio et al., 2024), smart cities (Sha et al., 2024; Mora et al., 2023; Esashika et al., 2020), and business model innovation (Chauhan et al., 2022; Madanaguli et al., 2023, 2024). Various studies indicate that digital transformation can bolster sustainability by enhancing traceability, transparency, and waste reduction (Guandalini, 2022; Rusch et al., 2023; Parmentola et al., 2022), as well as by strengthening competitive advantage and fostering innovation (Di Vaio et al., 2021; Ghobakhloo et al., 2021).

Urban and inclusive governance perspectives (Mora et al., 2023; Sha et al., 2024) and stakeholder co-creation mechanisms (Esashika et al., 2020) also emerge as important factors, highlighting organizational barriers and skill gaps (Chopra et al., 2023). While numerous studies focus on either the digitalization dimension or sustainability, and some explicitly address a "twin" perspective (Guandalini, 2022; Madanaguli et al., 2024; Di Vaio et al., 2024), there remains a lack of a solid conceptual review and categorization that systematically situates twin transformation within the management domain. On the institutional side, the European Commission (2021) underscores this topic as a strategic pillar for future competitiveness. At the same time, classic contributions emphasize the necessity of addressing sustainability through an integrated approach, such as the triple bottom line (Elkington & Rowlands, 1999). Research on digitalization (Brennen & Kreiss, 2016) likewise affirms that simply adopting new technologies is insufficient without concurrently rethinking organizational models, processes, and competencies. Consequently, there is a pronounced need for a robust conceptual framework that not only describes the dynamics of twin transformation but also classifies its practices, challenges, and impacts from a managerial perspective.

Discussion. *The systematic review of the twin transition reveals a field brimming with potential yet marked by fragmentation and underdeveloped theoretical grounding. While the literature underscores the growing relevance of this dual paradigm, it also exposes critical gaps in understanding how these dimensions interact within managerial contexts. To advance the field, this section outlines five research trajectories that emerge from the review's findings, followed by a comprehensive research agenda designed to guide future scholarship and practice. These trajectories aim to bridge the siloed perspectives of digitalization and sustainability, fostering an integrated approach that resonates with the strategic imperatives of modern organizations.*

Research Trajectories

1. ***Unpacking Integration Mechanisms: How Digital Tools Drive Sustainable Outcomes***
   Digital technologies (AI, IoT, blockchain) can drive sustainability by improving resource tracking and reducing waste, but the mechanisms and trade-offs (e.g., energy use vs. e-waste) remain unclear. Future research should map synergies and tensions through detailed case studies or simulations, offering managers guidance for technology adoption.
2. ***Exploring Stakeholder Dynamics in Networked Ecosystems***
   Collaboration among firms, governments, and communities is crucial in networked ecosystems. However, power dynamics, incentives, and governance structures are not well understood. Future studies should examine coordination mechanisms using qualitative and quantitative methods to assess their impact on innovation and sustainability.
3. ***Building Organizational Capabilities for Dual Transformation***
   Organizations need hybrid competencies that blend digital and sustainability expertise. Research should focus on how firms restructure, train leaders, and foster cultures that support dual transformation, using case studies of companies leading in this space.
4. ***Developing Integrated Measurement Systems***
   Current metrics for digitalization and sustainability are siloed. There's a need for holistic indicators (e.g., carbon footprint of digital operations) and dynamic dashboards. Research should validate these KPIs through experimental studies in different organizational contexts.
5. ***Understanding Sectoral and Contextual Variations***
   The twin transition varies by industry and region. Comparative research should explore how factors like resource intensity, regulatory frameworks, and regional support influence adoption, identifying both universal strategies and sector-specific best practices.

Research Agenda. *In response to these gaps, a structured research agenda emerges along three overarching objectives: theoretical consolidation, empirical validation, and managerial operationalization. The agenda first advocates for a unifying conceptual framework that bridges digitalization and sustainability paradigms, providing a basis for studies on how specific technologies either amplify or constrain sustainable outcomes. Second, it calls for robust empirical investigations to validate how stakeholder configurations, leadership models, and cultural factors can shape organizations' ability to pursue dual transformation. Finally, it underscores the need to translate findings into integrated metrics and best practices, empowering managers to strategically align digital initiatives with environmental and social imperatives. Collectively, this agenda aims to overcome the field's current fragmentation, guiding scholars and practitioners toward a more coherent and impactful understanding of the twin transition.*

Tab. 2: Research Agenda for Advancing the Twin Transition in Management

Goal	***Objective***	***Agenda Items***	***Expected Outcome***
Theoretical Consolidation	*Develop a comprehensive framework integrating digitalization and sustainability*	*- Map digital technologies to sustainability outcomes (e.g., AI for circularity).* *- Theorize stakeholder ecosystems using governance models.* *- Define hybrid capabilities via a competency model (e.g., RBV extension).*	*A unified framework linking technology, stakeholders, and capabilities, guiding future research and practice.*
Empirical Validation	*Ground the framework in evidence across diverse settings*	*- Longitudinal case studies on integration mechanisms (e.g., agrifood, smart cities).* *- Surveys/network analysis of stakeholder dynamics.* *- Action research on hybrid capabilities.* *- Pilot integrated metrics.* *- Cross-sectoral/regional comparisons.*	*A validated framework with empirical support, enhancing its credibility and adaptability.*
Managerial Operationalization	*Equip managers with tools and strategies for implementation*	*- Develop technology selection guides.* *- Create governance templates for partnerships.* *- Design training for hybrid skills.* *- Prototype integrated dashboards.* *- Curate a sectoral/contextual playbook.*	*Practical resources (e.g., tools, playbooks) that operationalize the framework for managerial use.*

This research agenda not only addresses the embryonic state of twin transition literature (Gao, 2024) but also aligns with the strategic priorities of institutions like the European Commission (2021). By pursuing these trajectories, scholars can move beyond descriptive accounts of digital and sustainable practices toward a dynamic, management-oriented paradigm. For practitioners, the agenda offers a pathway to harness digitalization for sustainability-driven innovation (Adams et al., 2016), fostering competitiveness while tackling global challenges like climate change. As the field matures, these efforts will cultivate a shared language and toolkit, enabling organizations to navigate the complexities of the twin transition with confidence and purpose.

Research limitations. *This systematic approach primarily relies on high-quality articles from the Web of Science database, ensuring strong, reputable sources. However, this focus may overlook valuable contributions from other formats, such as institutional reports, working papers, and conference proceedings. As a result, the findings reflect the most recognized research but may miss additional perspectives that could enrich understanding, especially in a relatively new and fragmented field. Expanding the search to other scientific databases, like Scopus, could help address this limitation.*

Managerial implications. *Not applicable as the paper is conceptual and based on a literature review.*

Originality of the paper. *This paper aims to systematize knowledge on the concept of twin transformation within the management field, thereby addressing a fragmented body of literature that often tackles digitalization and sustainability through largely sector-specific or technological lenses. Consequently, it fills a gap by proposing an overarching framework that interlinks diverse analytical perspectives and offers a systematic categorization of the principal theoretical and practical research strands.*

Key words: *Twin transition; Digitalization; Sustainability; Transformation.*

Choose Sustainable! How Digital Nudging positively impacts consumer behavior and corporate reputation

SIMONE AIOLFI[1] CHIARA BACCHILEGA[2] SILVIA BELLINI[3] DAVIDE PELLEGRINI[4]

Abstract

Digital nudging has recently gained relevance across multiple domains; however, its effectiveness in fostering sustainable consumer behaviour remains underexplored. This study is part of ongoing research on digital nudging for sustainability and contributes to a broader research project on conscious shopping. This study builds upon previous research that identified three predominant digital nudging architectures and aims to empirically test their effectiveness in promoting conscious shopping. Employing a between-groups experimental design and a structured online questionnaire, the results confirm the efficacy of all three proposed architectures in driving sustainable consumption. The study found that the crowd-sourcing model was the most effective in increasing engagement, while the in-sourcing model had the strongest effect on consumers' willingness to pay a premium price for sustainable products. The study also emphasized the crucial role of retailers in fostering consumer trust and credibility through digital nudging strategies. While prior research has examined digital nudging for sustainability, this is the first empirical study to evaluate the effectiveness of dominant nudging architectures within the realm of conscious shopping.

Framing of the research. *Sustainability has become a defining challenge of the 21st (Schaefer & Crane, 2005). Originally conceptualized as the scarcity of natural resources (Kuhlman & Farrington, 2010), sustainability now encompasses three interrelated pillars: environmental, social, and economic (Purvis et al., 2018). Although the relevance of sustainability has become one of the main goals pursued by the United Nations with the design of the Sustainable Development Goals (SDGs) (Whittimgham et al., 2023), the efforts made to achieve these goals are insufficient (United Nations, 2023) with substantial gaps remaining between sustainability commitments and actual progress. As Sheth et al. (2011) have emphasized, the responsible behaviour of individuals is a pivotal driver of sustainable development.*

Consumer behaviour is of crucial importance in achieving sustainability targets; nevertheless, research indicates that despite consumers seeking companies that align with their values and expressing concern for sustainability (Anuradha et al., 2023), their purchasing habits do not always reflect these intentions. This discrepancy between intention and action can be attributed to various factors, including the reluctance of consumers to adopt more sustainable choices, particularly when these choices involve higher costs or compromises in product performance (Olson, 2013). This paradox presents an opportunity for behavioural interventions such as nudging to bridge the gap between sustainable intentions and actions. Consequently, companies have adopted marketing strategies (Anuradha et al., 2023) that effectively encourage consumers to make sustainable choices. In this regard, the promotion of sustainable behaviours has emerged as a primary domain for the application of nudging and digital nudging (Bergram et al., 2022).

Nudging, as defined by Thaler and Sunstein (2008), refers to the implementation of subtle interventions that influence behaviour in a predictable way without restricting choices or significantly altering economic incentives. This concept is rooted in the idea that 95 percent of daily decisions are not entirely rational (Bargh et al., 2001; Caraban et al., 2019) but are instead shaped by heuristics and cognitive shortcuts that simplify decision-making by reducing cognitive effort (Shah & Oppenheimer, 2018; Caraban et al., 2019). By leveraging these cognitive tendencies, nudging can effectively guide individuals towards socially beneficial behaviours, including those that support sustainability (Mont et al., 2014; Lehner et al., 2016).

The application of nudging in the context of sustainability is a growing field of research, as evidenced by the increasing volume of literature on the subject (see Mont et al., 2014; Lehner et al., 2016; Trewern et al., 2021; Mirbabaie et al., 2022). The utilisation of nudges has garnered increased attention as a promising strategy to encourage sustainable societal behaviours. Despite the presence of certain limitations, the efficacy of nudges appears to exceed that of conventional marketing methodologies (Gonçalves et al., 2021).

Digital nudging is a concept that has been expanded into the online sphere, leveraging the increasing presence of digital touchpoints in decision-making (Weinmann et al., 2016; Mirsch et al., 2018; Jesse & Jannach, 2021; Mele et al., 2021). In comparison to physical environments, digital nudging offers a cost-effective, scalable, and personalised approach to influencing consumer behaviour, enabling real-time monitoring and behavioural analysis (Schneider et al., 2018). While it has demonstrated potential in shaping consumer decisions, its effectiveness remains largely unexplored (Henkel et al., 2019; Auf der Landwehr et al., 2021), particularly in the context of sustainability (Stieglitz et al., 2023).

Pellegrini et al. (2022) identified three distinct digital nudging architectures, each differing in the level of consumer involvement. The first, "Make Together", represents a collaborative effort between the retailer and the consumer, where purchasing decisions contribute directly to a sustainability initiative. For example, a retailer may choose to donate 1% of sales to an environmental cause when consumers purchase a specific product (e.g., "If you buy this product, we donate 1% of sales to an environmental initiative"). The second, "In-Sourcing", requires more active participation from consumers, as the retailer organizes and communicates a sustainability initiative through a digital call-to-action, but individuals must take action to benefit from it. An example of this approach is a loyalty program that rewards customers with points for donating to a green initiative (e.g., "Earn loyalty points for donating to a green initiative"). The third, "Crowd-Sourcing", fosters collective consumer engagement in sustainable actions, encouraging participation in community-driven or group efforts. A common example of this is a bottle return programme, in which consumers collectively contribute to a recycling initiative (e.g., "Return used bottles to support a community recycling program"). The three architectures differ in their psychological mechanisms and engagement levels, and it is therefore crucial to empirically test their effectiveness in driving sustainable shopping behaviours.

Fig. 1: Digital nudging architectures by Pellegrini et al. (2022)

Source: Authors' elaboration

Objective of the paper. *The present study is part of ongoing research on digital nudging for sustainability and contributes to a broader research project on conscious shopping The objective of the present study is to empirically assess the effectiveness of the three digital nudging architectures proposed by Pellegrini et al. (2022) in influencing consumer decision-making within the context of sustainability. By applying these architectures to the context of conscious shopping, the research seeks to determine which is most effective in fostering sustainable behaviours. The study will specifically focus on the persuasive impact of the message conveyed, potential purchase intentions, consumer engagement, and the role of retailers in promoting sustainability. The study will also explore how decision-making may change based on the presence of specific stimuli and examine how these interventions shape consumers' perceptions of retailers as sustainability ambassadors. Specifically, this study investigates:*

RQ1: How do different sustainability message presentations influence consumer attitudes and behaviors?
RQ2: Can digital nudging strategies effectively increase consumer willingness to purchase sustainable products and pay a price premium?
RQ3: What role do retailers play in enhancing consumer trust and credibility through digital nudging?
RQ4: Which of the three digital nudging architectures is most effective in fostering sustainable consumption?

By addressing these questions, this research contributes to the broader discussion on behavioural marketing and sustainable consumption, providing actionable insights for both academia and practitioners.

Methodology. *In order to explore the effectiveness of the three digital nudging architectures in supporting conscious shopping and consumption, a between-group experimental study was conducted using an online structured questionnaire administered to 195 participants. This method was consistent with previous research (Adelaar et al., 2003; Sharma et al., 2010; Mohan et al., 2013; Bellini and Aiolfi, 2019; Aiolfi, 2023), which has found both techniques to be effective in understanding the stimuli that generate responses in consumers' perceptions and attitudes toward marketing communications. The administration of the questionnaire was conducted online, a medium deemed suitable for consumers who frequently engage with the Internet as it is likely to align with their familiarity with digital communications (Aiolfi, 2023). The experimental design entailed the presentation of a singular treatment to each participant, based on their last name initial, which was assigned to them according to the group they belonged to (Charness et al., 2012). Participants*

were randomly assigned to one of three groups, each exposed to a different digital nudging stimulus (Make Together, In-Sourcing, or Crowd-Sourcing). Each group, with a total of 65 participants per group, was presented with a unique visible stimulus referring to one of the three digital nudging architectures. As demonstrated in Figure 2, the three communications have been designed for the implementation of digital nudging for conscious consumption by an Italian retailer. The aim of this initiative is to communicate to its potential customers a sustainable initiative to benefit the environment and society. Specifically, each group was exposed to a standardized marketing message featuring the same graphics, slogan, and visual layout, with only the call-to-action differing depending on the target architecture and the resulting level of customer engagement required (see Table 1).

Fig. 2: Experimental stimuli

Tab. 1: Call to action and customer engagement

	Make together	**In-sourcing**	**Crowd-sourcing**
Call to Action	Buy this product: 1% of sales proceeds will be donated to the "BEST Together" association	Buy this product: the loyalty points accumulated will be donated to the association "BEST Together"	Buy this product: returning the empty bottle to the supermarket will support the "BEST Together" association.
Responsibility	The consumer buys and the retailer donates	The consumer buys and donates	The consumer buys and has to return to the supermarket
Level of customer engagement required	Low	Medium	High

Source: authors' elaboration

Following their exposure to the communication, participants were invited to respond to a series of questions designed to evaluate the effectiveness of the communication and the impact of digital nudging techniques. These responses were collected by prompting participants to imagine that the initiative had been proposed by a trusted retailer. The questionnaire encompassed a range of domains, including the perceived usefulness and relevance of the promoted initiative, attitudes towards the advertising message, perceptions of compulsion and persuasion, intention to purchase sustainable products, willingness to pay a premium price, and the retailer's role in credibility, trust, and charitable contributions in sustainable initiatives through digital nudging mechanisms. Key variables assessed in the survey included perceived usefulness, relevance of the initiative, attitudes toward the advertising, Sense of constraint and persuasion, intention to purchase sustainable products, willingness to pay a premium price, corporate charitable contribution, credibility of the retailer and trust in the retailer. The measurement of these variables was conducted employing Likert scales adapted from validated literature (White et al., 2016; Netemeyer et al., 2004). Specifically, 5-point Likert scales were tailored to the digital nudging context and translated into Italian to enhance participant comprehension, as detailed in Table 2. Prior to the analysis of differences between the three groups, the data reliability was assessed using Cronbach's alpha, with all values exceeding the minimum acceptable threshold of 0.70 (Santos, 1999), thus confirming the internal consistency of the scales. Finally, in order to gain a comprehensive understanding of the distinctions among the three types of digital nudging architecture, a comparative analysis was conducted using analysis of variance (ANOVA). The study examined the three groups - make together, in-sourcing, and crowd-sourcing - by performing ANOVA tests with IBM SPSS 25.0 statistical software, ensuring statistical rigor in evaluating consumer responses across the different architectures (Bellini & Aiolfi, 2020).

Tab. 2: Scales summary

Variables	N. Item	Cronbach's Alpha	Mean
Perceived usefulness (adapted from Altsech, 1996) 1. The advertising message is perceived as credible. 2. The advertising message provides relevant information. 3. The advertising message effectively conveys the benefits of the initiative. 4. The advertising message provides a positive image of the initiative. 5. The advertising message provides practical information.	5	.88	2.81
Relevance of the initiative (adapted from Chen et al., 2016) 1. The initiative promoted by the supermarket is of great significance. 2. The initiative is consistent with my concerns about the environment. 3. The initiative responds well to my needs. 4. The initiative is important to me.	4	.91	3.26
Attitudes toward the advertising message (adapted from Cleveland et al., 2005) 1. After seeing this advertisement I will talk about the initiative with my family and friends 2. Seeing this advertisement makes me think that what it promotes is important 3. Seeing this advertising message makes me more willing to devote my time to the initiative 4. Seeing this advertising message, I feel like being an active part of the initiative 5. Seeing this advertising message makes me want to devote money to the initiative	5	.91	2.60
Sense of constraint and persuasion (adapted from Chang, 2017) 1. When faced with the message, it was difficult not to be persuaded by what it communicated 2. While viewing the advertisement, I had difficulty finding arguments against the proposed initiative 3. I was easily influenced by the advertisement for the initiative	3	.81	2.64
Intention to purchase sustainable products (adapted from White et al., 2016) Referring to the initiative proposed by the supermarket, indicate how much you agree with the following statements. 1. Very unlikely to buy/very likely to buy 2. I am not at all willing to buy / I am very willing to buy 3. I am not at all inclined to buy / I am very inclined to buy	3	.91	2.97
Willingness to pay a premium price (adapted from Netemeyer et al., 2004) 1. I am willing to pay a higher price for a sustainable product 2. I am willing to pay much more for a sustainable product	2	.73	2.77
Corporate charitable contribution (adapted from Hildebrand et al., 2017) The initiative promoted by the retailer: 1. Requires effort on the part of the retailer 2. It is charitable 3. It is human 4. It is sincere 5. It is useful	5	.88	3.40
Credibility of the retailer (adapted from Gupta, 2009) 1. The retailer seems reliable to me 2. I think the retailer will also be reliable in the future 3. I think the retailer keeps its promises 4. I think the supermarket is open to interacting with me 5. I think the supermarket is transparent	5	.94	2.96
Trust in the retailer (adapted from Darke et al., 2016) 1. I think I can trust the retailer 2. I think I can rely on this supermarket 3. I think I can trust the supermarket to do what it says it will do 4. The supermarket has a high level of moral integrity	4	.95	3.01

Source: authors' elaboration

The analysis demonstrates that participants, no matter the target group, hold a favourable attitude towards the proposed sustainable initiatives. Specifically, the three proposed initiatives were found to be useful and relevant, with values at or above the average. Individuals exposed to sustainable nudges experience a sense of constraints and persuasion, though on average these values are not excessively high.This indicates that nudges enable free and thoughtful choice by empowering individuals to make an informed decision. These perceptions influence subjects' propensity to join the initiative (RQ1). Analyses indicate a relatively high intention to participate in the initiative by purchasing sustainable products. However, the values of willingness to pay a premium price for the sustainable product promoted through the three architectures are lower (RQ2). The present study investigated the role of retailers in promoting digital push mechanisms for sustainability (RQ3). The results reveal that individuals place high levels of credibility and trust in retailers in relation to the three architectures, showing that retailers act as guarantors of the authenticity of what is promised. Similarly, the variable with the highest values, regardless of the proposed architecture, is the level of appreciation by customers about a company's charitable commitments. It is therefore suggested that a company's proactive and sustainable commitment to charitable causes can positively impact its corporate image, which in turn can influence consumer behaviour in a positive manner.

Tab. 4: ANOVA Test

Variables for each group		*Mean*	*SD*	*SE*	*ANOVA*
Perceived usefulness	Make together	2.588	.945	.117	Test of homogeneity of variance: Levene F(2, 192)=.037 (Mr. .963); ANOVA test: F=2.774 (Mr. .065) - no significant difference observed between groups
	In-sourcing	2.975	1.012	.126

Source: authors' elaboration

In order to facilitate a comparison of the variables analysed and the behaviour of the respondents, the three groups were compared based on the architectures identified in the study undertaken by Pellegrini et al. (2022) (RQ4). The degree of significance for each variable was measured using analysis of variance (ANOVA) (Bellini and Aiolfi, 2020). The results of the ANOVA analysis presented in Table 4 demonstrate that the only statistically significant difference between the three groups was in relation to initiative relevance. Within the context of a crowd-sourcing-based nudging stimulus, individuals exposed to this approach perceived the message as more relevant (mean = 3.512) compared to those who received the Make Together architecture message (mean = 3.108). It is hypothesised that retailers will favour the Crowd-sourcing model, as it fosters greater consumer engagement. While both models involve retailers and consumers, the higher level of consumer involvement in the Crowd-sourcing approach suggests a stronger impact of nudging techniques compared to the Make Together model.

No significant differences were identified between the groups for other variables. However, it is noteworthy that the Crowd-sourcing architecture demonstrated superior performance in terms of attitude, sense of constraint and persuasion, trust in the retailer, and corporate charitable contributions when compared to the other two models. Conversely, the Make Together architecture exhibited higher levels of intention to purchase sustainable products and willingness to pay a premium price compared to the other models. This outcome can be attributed to the Make Together approach requiring minimal consumer engagement while relying more on the retailer's resources. In contrast, the In-sourcing architecture was associated with higher perceived usefulness and retailer credibility.

In conclusion, this study provides a preliminary exploration of the effectiveness of digital nudging in promoting conscious and sustainable shopping. The findings confirm that digital nudging stimuli are effective in encouraging

sustainable behaviors, fostering free choice without generating a strong sense of constraint or persuasion among consumers. Notably, all three nudging architectures proved effective in promoting sustainable shopping, reinforcing prior theoretical expectations.

The findings of this study underscore the considerable promise of digital nudging in fostering conscious shopping and consumption, regardless of the implemented architectural framework. However, further examination reveals that the most impactful approach is the crowdsourcing model, characterized by its capacity to engage consumers at a high level. This model elicited the most substantial levels of consumer engagement and perceived relevance, indicating that collective action reinforces sustainability commitments. The In-sourcing model demonstrated the most significant impact on consumers' willingness to pay a premium price, likely due to the perceived personal investment in sustainability initiatives.

Retailers play a crucial role in enhancing consumer trust, as digital nudging mechanisms are perceived as credible and persuasive, underscoring the importance of brand reputation in sustainability messaging. The psychological dimensions of digital nudging effectiveness are also evident: perceived autonomy and motivation were higher in the crowdsourcing model, while perceived obligation was greater in the in-sourcing initiatives. These findings reinforce the conclusions of Pellegrini et al. (2022), emphasizing that greater consumer involvement enhances the impact of digital nudging strategies.

Research limitations. *The present study is not without its limitations. Firstly, the analysis itself was hindered by the fact that each group provided only one independent data point, which made it challenging to achieve sufficient statistical power. This issue is further compounded by the difficulties of conducting online studies, where controlling for external variables is problematic, and the between-group analysis method presents significant constraints when testing a large set of parameters (Charness et al., 2012). The initiatives employed in this study were hypothetical, allowing for the possibility of uncertainty due to the potential influence of variations in message wording or the introduction of different initiatives on the research outcomes. Furthermore, the selection of the supermarket chain was delegated to the participants to circumvent potential bias associated with prior familiarity with a particular retailer. However, it should be noted that retailers adopt diverse approaches to sustainability, which might have affected responses. While this study provides valuable insights into the role of digital nudging in promoting sustainable consumer behaviour, it is essential to acknowledge the limitations inherent in the study design. Firstly, the study made use of an online survey-based experiment, a method that, whilst appropriate for digital nudging research, may not fully capture real-world shopping behaviours. Future studies could incorporate field experiments to validate these findings in actual retail environments. Secondly, the sample consisted of 195 participants, a number sufficient for statistical testing but not necessarily representative of broader consumer populations. Expanding the sample to include diverse demographic and cultural backgrounds would enhance the generalizability of the findings. The self-reported nature of the data introduces the possibility of social desirability bias, where respondents may overstate their willingness to engage in sustainable behaviours. Complementary methods, such as behavioural tracking or observational studies, could mitigate this limitation. Finally, this study is notable for its focus on the short-term impact of digital nudging interventions. It is recommended that future research employ longitudinal analyses in order to determine whether digital nudging leads to lasting behavioural changes in sustainability-oriented consumption.*

Managerial implications. *The present study should be of high relevance to retailers, whose role has been confirmed as essential in stimulating conscious and sustainable consumer behaviour (Smith, 2023). Digital nudging enables retailers to gain high levels of credibility and trust from consumers, who perceive them as reliable sources for useful and relevant messages, reinforcing a positive charitable image. Given consumers' favourable perceptions of companies' charitable commitments, retailers might consider forming partnerships with reputable charitable organization. Collaborative efforts in support of social and environmental causes can further strengthen retailers' image and positively influence consumer behaviour. Retailers can leverage these insights to design tailored digital nudging strategies that align with consumer psychology and engagement preferences. Specifically, investing in Crowd-sourcing initiatives can maximize consumer participation and drive long-term behavioural change. At the same time, integrating incentive structures - such as loyalty points or exclusive offers - within the in-sourcing model can enhance consumer commitment by increasing perceived personal gain. Transparent communication and ethical framing are also crucial to ensuring that digital nudging is not perceived as manipulative, ultimately strengthening brand trust (Smith, 2023). A comprehensive strategy integrating all three nudging architectures has the potential to yield optimal outcomes, enabling retailers to address a diverse range of consumer segments and preferences.*

Furthermore, the incorporation of educational components into nudging messages has been demonstrated to enhance consumers' comprehension and acknowledgement of the consequences of their decisions, thereby facilitating more informed and deliberate choices. The positive responses to the Crowd-sourcing model suggest that retailers may benefit from exploring collaborative initiatives that involve consumers in decision-making processes, enhancing consumer engagement and fostering a sense of co-creation, contributing to greater loyalty.

In light of the aforementioned points, it is imperative for retailers to perpetuate their investment in digital nudging for sustainability, thereby cultivating novel competencies and insights to promote future conscious behaviour, elevate their reputation, and propel comprehensive business success. This necessitates an enduring dedication to sustainability messaging and initiatives, with the demonstration of continuity over an extended period serving to fortify retailer credibility and nurture consumer confidence. Furthermore, it is paramount for retailers to furnish their personnel with the requisite competencies and aptitudes to adeptly operationalize and communicate nudging strategies. Employees who

understand digital nudging principles and architectures can provide better support to consumers, improving both the customer experience and the impact of sustainability initiatives. One of the critical challenges retailers must address is ensuring security and data privacy. The use of digital nudging requires retailers to implement clear communication and transparent practices regarding data usage to safeguard consumer trust, which is a key element in building credibility and ensuring the effectiveness of nudging initiatives.

It is recommended that future research investigate how cultural differences influence the perception and effectiveness of digital nudging strategies, given that attitudes towards sustainability and consumer autonomy may vary across contexts. In addition, longitudinal studies are required to determine whether digital nudging fosters lasting behavioural change or merely triggers short-term reactions. Ethical considerations should also be explored, particularly regarding consumer autonomy and the potential for manipulative effects. Finally, examining the role of artificial intelligence and machine learning in refining and personalizing digital nudging interventions could offer valuable insights into enhancing their effectiveness at an individual level.

Originality of the paper. *The present study makes a unique contribution to the existing literature on digital nudging and sustainability by empirically testing the effectiveness of distinct digital nudging architectures within the domain of sustainable shopping. Previous research has examined digital nudging in various contexts, but the present study is among the first to integrate behavioural economics, consumer psychology and digital marketing to offer a comprehensive and nuanced analysis of how different nudging strategies affect consumer decision-making.*

This research represents a significant endeavour in the field, as it is the first study to categorize and measure digital nudging in the context of conscious and sustainable consumption. The study provides a foundation for the development of effective sustainability marketing campaigns by leveraging digital technologies and nudging theory. By evaluating three different digital nudging architectures, the study highlights their differential impact on consumer engagement, purchase intentions, and price sensitivity. The study identifies Crowd-sourcing as the most effective strategy for fostering consumer engagement and in-sourcing as the most influential in driving willingness to pay, marking a key theoretical and practical advancement. Furthermore, while this study provides a solid basis for understanding digital choice architecture and consumer motivation, future research should explore the role of emerging technologies-such as AI-driven personalization and blockchain transparency-in shaping sustainability marketing. In addition, the exploration of the ethical considerations and long-term effects of digital nudging interventions would further contribute to the development of responsible and effective strategies for influencing sustainable consumer behaviour. These insights provide valuable guidelines for retailers seeking to implement digital nudging strategies that align with consumer psychology and engagement preferences.

Keywords: *digital nudging, sustainability, consumer behavior, choice architecture, conscious consumption.*

Diversità di genere nella leadership: Un fattore chiave per la resilienza d'impresa?

FURIO URSO[1] CRISTINA LEONE[2] PASQUALE MASSIMO PICONE[3]
MARIA FRANCESCA CRACOLICI[4]

Abstract

Questa ricerca indaga se e in che modo la diversità di genere nella leadership delle imprese influenzi la loro resilienza a seguito di shock esogeni, analizzando diverse fasi temporali, ovvero la fase di resistenza *e la fase di* ripresa a livello settoriale. *In particolare, ipotizziamo che, nella fase di resistenza successiva ad uno shock esogeno, la composizione della leadership abbia un ruolo determinante nella capacità di un'impresa di fronteggiare lo shock. Nello specifico, ipotizziamo che una maggiore diversità di genere nel consiglio di amministrazione (CdA) possa indebolire la capacità dell'impresa di resistere allo shock, mentre una leadership esecutiva più diversificata possa avere un effetto positivo sulla resilienza. Tuttavia, con il passaggio alla fase di ripresa, il ruolo della diversità di genere nella leadership cambia. In questo contesto, una maggiore diversità di genere nel CdA potrebbe favorire il recupero dell'impresa, mentre una leadership esecutiva più diversificata potrebbe avere un impatto negativo sulla sua resilienza. Utilizziamo un campione di 485 imprese europee quotate, osservato nel periodo compreso tra il 2014 e il 2023 e deduciamo empiricamente le diverse fasi di resistenza e ripresa sulla base della performance di settore a seguito dei due shock. Nello specifico, identifichiamo il biennio 2017-2018 come una fase di resistenza, determinato dalla guerra commerciale tra Stati Uniti e Cina, seguita da una fase temporale di ripresa (2018-2020). Il periodo 2020-2023 è, invece, interpretato come un'ulteriore fase di resistenza a causa della pandemia COVID-19. Per testare le nostre ipotesi, adottiamo un modello panel dinamico e un approccio controfattuale per ottenere previsioni dei prezzi di chiusura delle azioni delle imprese nelle tre fasi temporali. La serie controfattuale dei prezzi di chiusura delle azioni viene confrontata con i corrispondenti valori osservati, e la differenza tra i due rappresenta la nostra misura di resilienza d'impresa. I risultati della ricerca mostrano che la diversità di genere nella leadership-sia nel CdA che tra i dirigenti esecutivi-ha un impatto significativo sulla resilienza delle imprese. Tuttavia, questo impatto cambia a seconda della fase temporale analizzata (fase di resistenza e di ripresa) e del tipo di shock esogeno che l'impresa affronta. Tali differenze si spiegano con la diversità di ruoli e responsabilità che i CdA e i dirigenti esecutivi devono gestire nelle varie fasi e in risposta a differenti tipi di shock. Questo studio apporta tre contributi principali. Primo, approfondisce la natura contestuale della resilienza d'impresa, mostrando come l'effetto della diversità di genere nella leadership vari in base alla fase temporale e alla natura dello shock esogeno. Secondo, arricchisce la teoria degli* upper echelons*, evidenziando il ruolo distinto della diversità di genere nel CdA e nella leadership esecutiva. Infine, introduce un contributo metodologico, adattando un modello statistico usato per misurare la resilienza a livello macro all'analisi della resilienza d'impresa*[5].

Inquadramento della ricerca. *Conflitti, pandemie, crisi ambientali e rapidi avanzamenti tecnologici sono eventi in grado di provocare effetti perniciosi sulle performance d'impresa (Korber & McNaughton, 2018), di conseguenza, le imprese devono coltivare la loro resilienza (Beamish & Hasse, 2022; Conz & Magnani, 2021; Rannucci & Wang, 2024), ossia la loro capacità di adattarsi a uno shock durante la fase di resistenza e di sfruttare le nuove condizioni durante la fase di ripresa (Martin, 2012). Con l'aumento della frequenza e dell'intensità degli shock esogeni imprevisti, la resilienza è diventata un tema centrale negli studi di management (Aversa et al., 2024; Hepfer & Lawrence, 2022; Hillmann & Guenther, 2021; Iftikhar et al., 2021).*

In questo dibattito, gli studiosi rilevano che la leadership deve adottare azioni efficaci per affrontare gli shock esogeni e accrescere la resilienza delle imprese (Akgün & Keskin, 2014). Inoltre, recenti studi hanno esaminato come la composizione del CdA (ad esempio, il numero di amministratori indipendenti e le dimensioni del CdA; Croci et al., 2024) e le caratteristiche individuali dei dirigenti esecutivi (ad esempio, l'avidità del CEO; Sajko et al., 2021), nonché le interazioni tra questi livelli di leadership (Ranucci & Wang, 2024), influenzino la resilienza delle imprese dopo uno shock esogeno.

Tuttavia, la ricerca su come la diversità di genere nei CdA e tra i dirigenti esecutivi possa, grazie all'integrazione di esperienze e prospettive diverse (Cox et al., 1991; Mendiratta & Tasheva, 2024), migliorare la resilienza delle imprese, è ancora limitata (Azeem et al., 2023; Sun et al., 2015). La maggior parte degli studi si è concentrata sulla diversità di genere (Triana et al., 2014) e sulla presenza di donne (Azeem et al., 2023) nei CdA. Solo pochi hanno esplorato la diversità di genere nei ruoli dirigenziali esecutivi (ad esempio, il ruolo di CEO; Shropshire et al., 2021; Tiscini et al., 2023). Questi studi suggeriscono che, sebbene le imprese possano soddisfare le quote rosa nei CdA, ciò non si traduce necessariamente in una diversità di genere nella leadership esecutiva (Dezső et al., 2016; Matsa & Miller, 2013). Di conseguenza, l'attenzione al CdA ha paradossalmente ridotto l'analisi della diversità di genere nella leadership esecutiva, la quale è direttamente responsabile per l'attuazione delle azioni strategiche e l'esecuzione operativa durante periodi di crisi delle imprese (Håkonsson et al., 2012; Van Essen et al., 2013). Al contrario, l'enfasi sulla diversità di genere tra i dirigenti esecutivi ha distolto l'attenzione dal ruolo cruciale del CdA, il quale è responsabile del monitoraggio dei dirigenti e dell'allineamento degli interessi degli stakeholder per supportare la performance a lungo termine dell'impresa (Hendry & Kiel, 2004; Smulowitz & Smulowitz, 2024). Inoltre, resta da chiarire se le caratteristiche specifiche dei CdA e dei dirigenti abbiano un impatto universale sulla resilienza, o se tale impatto vari in funzione del contesto in cui l'impresa opera (Schaedler et al., 2022). Le diverse fasi che seguono uno shock esogeno (Martin, 2012) danno origine a contesti distinti, ciascuno dei quali presenta sfide specifiche che il CdA e i dirigenti esecutivi devono affrontare.

Obiettivo del paper. *Sulla scorta della teoria degli upper echelons (Cho & Hambrick, 2006; Hambrick & Mason, 1984), il presente studio si pone l'obiettivo di esplorare come la diversità di genere nel CdA e tra i dirigenti esecutivi influenzino la resilienza delle imprese a seguito di shock esogeni. In particolare, esaminiamo l'impatto della diversità di genere, nei due livelli di leadership, sulla resilienza delle imprese, analizzando i suoi effetti attraverso due fasi temporali distinte: la fase di resistenza innescata dagli shock esogeni e la successiva fase di ripresa.*

Metodologia. *Per rispondere alla nostra domanda di ricerca, stimiamo un modello panel dinamico su un campione composto da 485 imprese europee quotate, analizzate nel periodo 2014-2023. Tale modello è stato utilizzato per rappresentare accuratamente le relazioni economiche, tenendo conto delle dipendenze temporali e cross-sectional. Utilizzando i prezzi di chiusura delle azioni delle imprese come proxy delle performance d'impresa (DesJardine et al.2019; Ortiz-de-Mandojana & Bansal, 2016), identifichiamo empiricamente tre fasi temporali, a livello settoriale, a seguito di shock esogeni: il periodo 2017-2018 come fase di resistenza, determinato dalla guerra commerciale tra Stati Uniti e Cina, seguito da una fase di ripresa (2018-2020), e il periodo 2020-2023 come ulteriore fase di resistenza causata dalla pandemia di COVID-19. Partendo dalle stime del modello panel e seguendo un approccio controfattuale, così come adottato da Doran e Fingleton (2018) a livello macro, determiniamo una misura di resilienza a livello di impresa. Successivamente, attraverso il ricorso a un'analisi di regressione lineare, la misura di resilienza è stata utilizzata per testare le nostre ipotesi al fine di esplorare se la resilienza delle imprese agli shock esogeni sia influenzata da differenze nelle caratteristiche interne all'impresa, in particolare dalla diversità di genere nei due livelli di leadership.*

Per ragioni di parsimonia, in questo short paper *presentiamo esclusivamente i risultati del modello finale, che consente di analizzare l'impatto della diversità di genere nella leadership come elemento determinante per la resilienza d'impresa.*

Risultati. *I risultati mostrati nella tabella sopra rivelano che l'effetto della diversità di genere nella leadership sulla resilienza d'impresa possa dipendere dalle fasi temporali e dalla natura dello shock esogeno; queste divergenze derivano dai ruoli e dalle responsabilità differenti che i CdA e i dirigenti devono ricoprire in una fase di resistenza scaturita da uno shock esogeno e nella successiva fase di ripresa.*

Nella fase di resistenza (2017-2018) causata dalla guerra commerciale tra Stati Uniti e Cina, la diversità di genere all'interno del CdA esercita un effetto positivo sulla resilienza d'impresa, suggerendo che la presenza femminile favorisca un approccio più collaborativo con i dirigenti esecutivi. Questo risultato non corrobora la nostra ipotesi secondo cui una maggiore rappresentanza femminile nel CdA rafforzerebbe la funzione di monitoraggio del CdA sulla leadership esecutiva, determinando un impatto negativo sulla resilienza d'impresa come dimostrato nel lavoro di Croci et al. (2024). Questi risultati evidenziano come la natura articolata e contingente delle caratteristiche del CdA, dimostrando che alcuni elementi, come la diversità di genere, possono influenzare positivamente la resilienza attraverso meccanismi che trascendono il ruolo di controllo del CdA sui dirigenti esecutivi (Rosener, 1995; Smulowitz & Smulowitz, 2024). Nel medesimo periodo, la diversità di genere tra i dirigenti esecutivi influenza positivamente la resilienza d'impresa.

Nella fase di resistenza (2020-2023) causata dalla crisi della pandemia di COVID-19, i nostri risultati mostrano che la diversità di genere nella leadership non ha alcun effetto statisticamente significativo sulla resilienza d'impresa. La pandemia di COVID-19 ha rappresentato una crisi esistenziale, con conseguenze profonde di carattere fisico, emotivo e sociale per individui e imprese. La complessità di questa crisi (Tiscini et al., 2023), unita alla sua prolungata incertezza (Compagni et al., 2024), potrebbe aver diluito i benefici specifici della diversità di genere nella leadership. Ad esempio, le decisioni e le azioni della leadership durante questo periodo sono state probabilmente influenzate più da vincoli esterni-come le disposizioni normative sanitarie (Chen et al., 2023) e le interruzioni nelle catene di approvvigionamento (Choudhury et al., 2022) -piuttosto che dalle caratteristiche interne della leadership. Questo contesto potrebbe aver annullato la rilevanza della diversità di genere nella leadership come precursore della resilienza d'impresa.

Durante la fase di ripresa nel periodo 2018-2020, la diversità di genere nel CdA ha un impatto positivo sulla resilienza, mentre quella nella leadership esecutiva perde rilevanza, risultando non significativa. Questo cambiamento evidenzia il ruolo strategico cruciale dei CdA nella fase di ripresa che richiede compiti come la pianificazione a lungo termine e la ridefinizione della strategia, tipiche responsabilità degli amministratori (Zahra et al., 2009; Boivie et al., 2016). In questo contesto, le prospettive diverse date da un bilanciamento dei generi nei CdA possono giocare un ruolo più prominente rispetto alla leadership esecutiva nel trattare nuove informazioni, favorendo un equilibrio tra le esigenze operative a breve termine e gli obiettivi strategici di lungo periodo.

Limiti della ricerca. *Come ogni ricerca, anche questo studio non è scevro di limitazioni che rappresentano anche stimoli per nuove investigazioni teoriche ed empiriche. In primo luogo, per la valutazione della resilienza noi utilizziamo i prezzi di chiusura delle azioni come proxy della performance. Sebbene questa prassi sia consolidata in letteratura e, come sottolineano DesJardine et al. (2019, p. 1456; trad. nostra), "i prezzi delle azioni sono tra i migliori indicatori disponibili per valutare la resilienza", noi riconosciamo che le dinamiche dei mercati finanziari possano introdurre distorsioni nei risultati. Questo è oltremodo vero nel contesto di alcuni mercati finanziari europei caratterizzati da una minore efficienza, dove il trading speculativo e le dinamiche legate alle aspettative dei risparmiatori possono influenzare più facilmente i prezzi azionari delle imprese. Ricerche future potrebbero integrare ulteriori indicatori di resilienza d'impresa. In secondo luogo, la nostra analisi non tiene conto del fenomeno del "glass cliff", secondo cui le donne tendono a essere nominate in posizioni di leadership durante periodi di crisi (Sun et al., 2015). Studi futuri potrebbero esplorare se e in che misura questo fenomeno incida sul contributo delle donne alla resilienza delle imprese. Infine, il nostro studio si concentra sulla "surface-level diversity" (Tonoyan & Olson-Buchanan, 2023; trad. nostra), ossia su attributi osservabili come il genere, assumendo implicitamente che individui di generi diversi presentino differenze nei processi cognitivi (Smulowitz & Smulowitz, 2024). Tale assunzione appare coerente con l'idea che la resilienza cognitiva-definita come la "capacità di notare, interpretare, analizzare e rispondere ai cambiamenti" -possa variare in funzione della composizione di genere nella leadership (Dewald & Bowen, 2010, p. 199; trad. nostra). Inoltre, il nostro modello non considera caratteristiche più difficilmente rilevabili, quali valori, competenze e tratti della personalità, che potrebbero avere un ruolo determinante nel plasmare la resilienza d'impresa. Pertanto, ricerche future potrebbero adottare una prospettiva più ampia, includendo misure di diversità ad un livello più profondo (Tonoyan & Olson-Buchanan, 2023) per cogliere in modo più completo l'impatto che la composizione della leadership ha sulla resilienza delle imprese.*

Implicazioni pratiche. *Il nostro studio offre due principali implicazioni per i manager. In primo luogo, evidenzia il ruolo cruciale della composizione della leadership nel rafforzare la resilienza d'impresa. I nostri risultati mostrano che la diversità di genere nella leadership tende ad agire positivamente sulla resilienza o, al più, a non produrre effetti significativi, senza mai risultare dannosa. Tuttavia, il suo impatto dipende dal livello di leadership in cui si manifesta-CdA e dirigenti esecutivi-e dal contesto temporale -fase di resistenza e di ripresa- in cui l'impresa sta operando in seguito a uno shock. In secondo luogo, la relazione tra diversità di genere e resilienza è modulata dalla natura dello shock esogeno subito dall'impresa (ad esempio, economico in senso stretto rispetto a un'emergenza sanitaria). Sottolineiamo, dunque, la necessità per i manager di adottare strategie di leadership flessibili e adattabili, calibrandole sulle specificità di ciascun tipo di shock, così da rendere la risposta d'impresa più efficace di fronte alle sfide esterne.*

Originalità del paper. *Il presente studio, ancora* in fieri*, mira ad offrire tre contributi principali. In primo luogo, arricchisce la letteratura sulla resilienza delle imprese, approfondendo la comprensione della sua natura contestuale (Ducheck, 2020; Su & Junge, 2023). In particolare, esplora come l'effetto della diversità di genere nella leadership sulla resilienza d'impresa dipenda dal contesto temporale a seguito di uno shock esogeno, distinguendo tra fasi di resistenza e di ripresa, e dalla natura dello shock. Questa distinzione si rivela cruciale, poiché le diverse fasi temporali e/o i differenti tipi di shock richiedono, a ciascun livello di leadership, sfide specifiche per affrontare uno shock.*

In secondo luogo, il lavoro contribuisce alla teoria degli upper echelons*, rivelando come gli attributi collettivi della diversità di genere, sia nel CdA che tra i dirigenti esecutivi, influenzino la resilienza delle imprese in modo distinto. Tale effetto si manifesta in virtù dei ruoli che ciascun livello di leadership ricopre durante le fasi successive a uno shock esogeno, con la diversità di genere che agisce in maniera specifica in relazione alle funzioni e responsabilità che il CdA e i dirigenti esecutivi detengono.*

Infine, lo studio offre un significativo contributo metodologico alla misurazione della resilienza d'impresa, adottando per la prima volta un approccio precedentemente utilizzato per la valutazione della resilienza regionale e applicandolo con successo a livello d'impresa (Doran & Fingleton, 2018; Costantino et al., 2023).

Parole chiave: *resilienza; diversità di genere; leadership; upper echelons*

Leveraging DEI to Foster a Sustainable Work Context: A Study on Italian Employees

SILVIA RAVAZZANI[1] MARGHERITA ZITO[2] CHIARA FISICHELLA[3] ALESSANDRA MAZZEI[4] ALFONSA BUTERA[5]

Abstract

This study deals with the comprehensive concept of sustainability, which includes the social dimension besides the environmental and governance dimensions. In particular, it examines how organisations approach Diversity, Equity, and Inclusion (DEI), focusing on the internal levers that support DEI efforts through both symbolic and tangible actions, i.e. diversity communication and diversity-oriented leadership, which can have an impact on creating an inclusive climate and employee engagement, which in turn influences employees' Organisational Citizenship Behaviour (OCB). A research model is used to hypothesise the path from these levers (antecedents) to creating an inclusive climate and employee engagement (mediators), which ultimately impacts employees' OCB (behavioural outcomes). The preliminary results of a survey on a sample of 302 employees in Italy confirm that the antecedent variables have direct and positive associations with the two mediating variables. The two mediating variables also show a direct and positive association with OCB. In addition, the model shows the mediating role of both inclusive climate and employee engagement between diversity communication and OCB and between diversity-oriented leadership and OCB, but with stronger values for employee engagement. Overall, this study highlights the critical role of diversity-driven leadership in fostering DEI-conscious attitudes and behaviours, while promoting a true culture of inclusion. Although less impactful, diversity communication can complement leadership efforts by providing context and relevant information to help employees understand DEI strategy, programmes and the benefits of DEI interventions. This study is a response to the lack of studies on the essential role that diversity-oriented leadership and communication levers within organisations play in planning and executing an effective DEI strategy, looking at both tangible (i.e. diversity-oriented leadership) and symbolic (i.e. diversity communication) dimensions.

Purpose of the paper. *This study examines how organisations approach DEI (Diversity, Equity, and Inclusion) as part of the social dimension of their sustainability efforts. The focus is on the internal levers that support DEI efforts through both symbolic and concrete actions, i.e. diversity communication and diversity-oriented leadership, which have a particular impact on creating an inclusive climate and employee engagement towards DEI measures, which in turn has an impact on employees' Organizational Citizenship Behaviour (OCB).*

Framing of the research. *Diversity has undeniably become a key business priority and an essential practice for modern organisations, driven by demographic changes, a globalised corporate landscape, best practices of multinational companies, increased societal demands for responsible corporate behaviour from internal and external stakeholders, and the collective goals of the UN 2030 Agenda for Sustainable Development (Ravazzani et al., 2025; Wolfgruber et al., 2021). Indeed, efforts to create a workplace that reflects the values of equality and promotes people's growth as well as economic growth can serve to address the social dimension of business sustainability internally and, in particular, contribute specifically to Goal 5 (Gender equality), Goal 8 (Decent work and economic growth) and Goal 10 (Reduce inequalities) of the UN 2030 Agenda for Sustainable Development. In addition, several scholars are increasingly pointing out the close links between workplace diversity and CSR, as DEI management is one of the main areas of concern for internal CSR (Hameed et al., 2016) and its external communication (Maier & Ravazzani, 2019).*

In relation to the DEI acronym, Hays-Thomas (2023) states that "diversity" refers to the differences between employees, "equity" refers to the outcomes for employees (e.g. promotion) along with the organisational practices that influence these outcomes, while "inclusion" describes the psychological state in which employees feel a sense of belonging

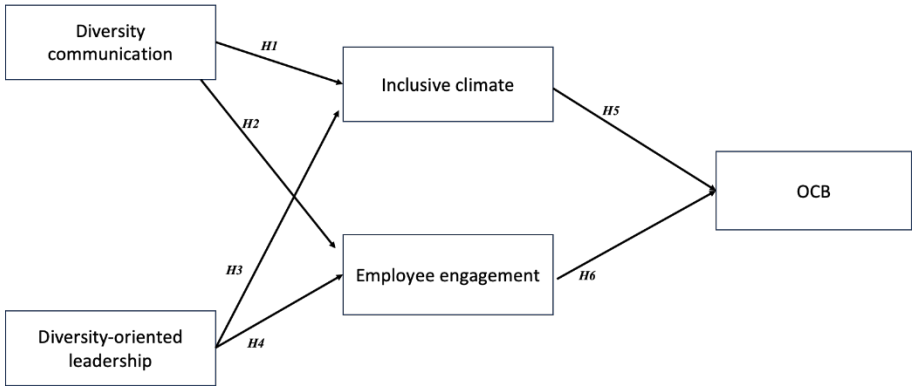
and recognition of their uniqueness in the workplace. Organisations approach DEI in different ways, influenced by factors such as organisational culture, management perspectives, national legal and societal characteristics (Jonsen et al., 2011; Ravazzani, 2025). The resulting approach may differ in terms of overarching DEI goals, dimensions of diversity in focus (e.g., gender, age, religion, professional experience), and practical initiatives and programmes. Overall, a DEI strategy aims to optimize the potential of all people in an inclusive organisation based on an appreciation of the different qualities that make up each individual's unique identity, while contributing to the achievement of organisational goals (Ravazzani, 2025).

DEI research (e.g. Mor Barak, 2017) has highlighted the key benefits of strategic and intentional organisational approaches to managing diversity in the workplace, such as improving employee satisfaction, retaining talent, fostering innovation and reputation. However, more needs to be understood about the impact of organisational levers used to promote DEI strategy internally through symbolic and concrete actions, and in particular diversity communication and diversity-oriented leadership, which is the focus of this study. Furthermore, a more comprehensive understanding of the pathway leading from these levers (antecedents) to the creation of an inclusive climate and employee engagement (mediators), ultimately impacting employee organizational citizenship behaviours (behavioural outcomes), is required.



For these reasons, this study proposes a model that includes the following key constructs. First, 'diversity communication' which is intended as "communication that signals an organization's initiatives in caring, recognizing, and supporting employees from all backgrounds" (Men et al. 2023, p. 5). Internal communication is an important lever to break down communication barriers related to DEI issues and to outline the rationale and actions of the DEI strategy (DeConinck et al., 2008; Wahl & Einwiller, 2023). Second, 'diversity-oriented leadership', which consists of "leadership behaviors that invite and appreciate the contributions of employees of diverse backgrounds and characteristics" (Lee et al., 2021, p. 2). Thus inclusive and empathic leadership that is sensitive to DEI also plays a particular communicative role in shaping perceptions of an inclusive workplace through supportive actions (Wolfgruber et al., 2021). Third, an 'inclusive climate' that "enables individuals with diverse backgrounds to be themselves, feel a sense of belonging to the group, and treated equally, and express their unique identity" (Men et al. 2023, p. 6). Creating a sense of inclusion creates a perception among employees of a fair workplace where they know they will be treated equally regardless of their different backgrounds (Mor Barak, 2017; Wahl & Einwiller, 2023). Fourth, 'employee engagement', where "employees who are connected to the values and mission of the company, feel empowered, bring energy, passion, and discretionary effort to their jobs, and serve as advocates" (Ewing et al., 2019, p. 4). The literature dealing with internal communication and diversity has already shown that this enduring motivational and psychological state of employees is one of the main outcomes of diversity-oriented leadership and internal communication practices (Lee et al., 2021). Finally, 'organisational citizenship behaviours' (OCB), which represent supportive work behaviours that go beyond the job description and manifest themselves in the three areas of loyalty, obedience and participation (van Dyne et al., 1994). The diversity literature suggests that OCB is more likely to occur as a behavioural outcome when employees perceive an inclusive climate in their workplace and feel engaged (Wahl & Einwiller, 2023).

Building on this, this study advances the following hypotheses:

- *H1: An organization's diversity communication is positively associated with an inclusive climate among employees.*
- *H2: An organization's diversity communication is positively associated with employee engagement.*
- *H3: Diversity-oriented leadership is positively associated with an inclusive climate.*
- *H4: Diversity-oriented leadership is positively associated with employee engagement.*
- *H5: An inclusive climate is positively associated with OCB.*
- *H6: Employee engagement is positively associated with OCB.*
- *H7: An inclusive climate mediates the effects of both diversity-oriented leadership and diversity communication on OCB.*
- *H8: Employee engagement mediates the effects of both diversity-oriented leadership and diversity communication on OCB.*

The model with key constructs and relationships is illustrated in Figure 1.

Fig. 1: Research model: the pathway leading from diversity communication and diversity-oriented leadership to employee organizational citizenship behaviours

Methodology. *The data was collected as part of a quantitative study in Italy, in which a convenience sample of 302 Italian employees took part in September 2024 using an online questionnaire. The sample was provided by the company SWG and consisted of employees from Italian private and public companies, excluding those in the education sector. Although this sampling method is not probabilistic and does not guarantee the representativeness of the population, it is valuable when random sampling is difficult due to a large and indeterminate population, and it still allows the identification of people with characteristics relevant to the study (Etikan et al., 2015). The questionnaire was written in Italian so that respondents could clearly understand the questions and the research context. The Brislin's (1970) back-translation method was used for all scales used in the model. The questionnaire contained the following measures related to the variables considered in the research framework (see Figure 1).*

Diversity communication was measured using the scale for diversity communication satisfaction developed by Wahl & Einwiller (2023), which was based on Downs and Hazen's (1977) scale on satisfaction with corporate information and reassessed by DeConinck et al. (2008) by adding "diversity and inclusion" to extend the measurement to satisfaction with corporate diversity information. The scale measures 6 items on a 6-point Likert scale ranging from 1 (very dissatisfied) to 6 (very satisfied). Examples of items are: "Communication about company policies and goals concerning diversity and inclusion" and "Communication about accomplishments and/or failures of my organization concerning measures which should promote diversity and inclusion".

Diversity-oriented leadership was measured using the scale for diversity-oriented leadership developed by Lee et al. (2022), which was originally adopted by Luu et al. (2019). The scale comprises 4 items on a 7-point Likert scale from 1 (strongly disagree) to 7 (strongly agree). Examples of items are: "My manager is committed to a workforce representative of all segments of society" and "My manager asks for the input of employees that belong to different demographic and expertise groups".

Inclusive climate was measured using the scale developed by Wahl & Einwiller (2023), which goes back to Mor Barak (2016). The scale measures 6 items on a 7-point Likert scale from 1 (strongly disagree) to 7 (strongly agree). Examples of items are: "I feel that I have been treated differently in my organization because of my race, gender, sexual orientation, religion, or age" and "In my organization employees are treated fair by managers, regardless of employees' race, gender, sexual orientation, religion, age or social background".

Employee engagement was measured using the scale for employee engagement originally developed by Men and Bowen (2017) and more recently employed by Lee, Li & Tsai (2021). The scale measures 9 items on a 7-point Likert scale from 1 (strongly disagree) to 7 (strongly agree). Examples of items are: "One of the most exciting things for me is getting involved with things happening in my organization" and "I understand how my role impacts the mission and business goals of this company".

Organisational Citizenship Behaviour (OCB) was measured using the scale by Wahl & Einwiller (2023), which originates from van Dyne et al. (1994). The scale measures 3 subscales (Loyalty, Obedience and Participation) with 5 items each (15 items in total) on a 7-point Likert scale from 1 (strongly disagree) to 7 (strongly agree). Examples of items are: "I go out of my way to defend my organization if someone says something negative about it" (Loyalty), "While at work, I make sure that my appearance meets my management's expectations" (Obedience) and "I share ideas for improvements with my colleagues" (Participation).

Frequencies, means, standard deviations and correlations were calculated for all variables. Previously validated scales were used in this study. The reliability of all scales was assessed using Cronbach's a. To evaluate potential effects of common method bias, Harman's single-factor test was conducted using confirmatory factor analysis (Podsakoff et al., 2003). The results showed that a single factor accounted for 40.2% of the variance among the five measures, indicating that common method bias was unlikely to be a significant concern.

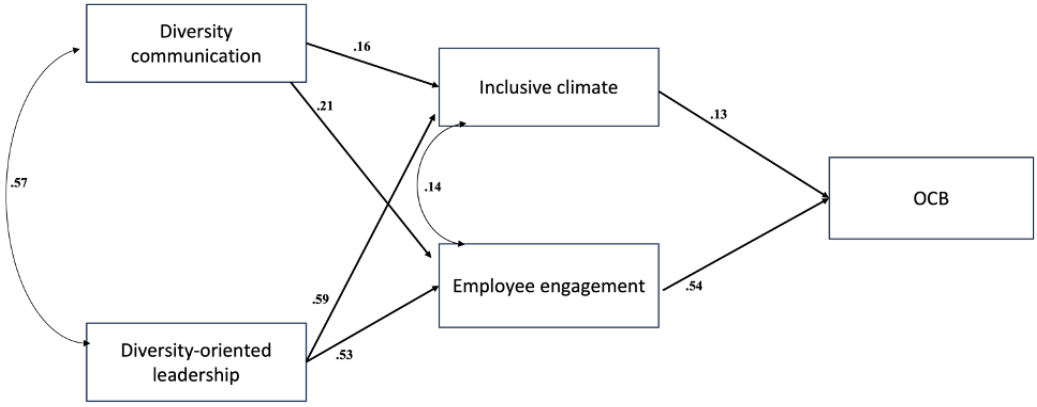
The estimation of a SEM model with five latent variables was performed considering diversity communication (6 manifest indicators), diversity-oriented leadership (4 manifest indicators), inclusive climate (6 manifest indicators), employee engagement (9 manifest indicators) and OCB (15 manifest indicators). The model was performed using MPLUS 8 software to test the relationships between the detected variables and the mediation of inclusive climate and employee engagement.

In this study, the hypotheses were determined a priori (James et al., 2006), and a multiple mediation model was used. The goodness of fit of the model was assessed using the chi-square value (χ2), the comparative fit index (CFI), the Tucker-Lewis index (TLI), the root mean square error of approximation (RMSEA) and the standardised root mean square residual (SRMR).

Results. *The final sample of 302 respondents was predominantly male (51 per cent), between 44 and 58 years old (43 per cent), and professional (60 per cent) working in the areas of administration, finance and control (22 per cent). In terms of the companies in which they work, they are mainly from the service sector (37 per cent) and have fewer than 500 employees (58 per cent).*

Table 1 shows the means, standard deviations, internal consistencies (Cronbach's α) and intercorrelations of the study variables. All reliability estimates were greater than 0.70, which confirms the reliability of all scales in the Italian context too. Firstly, it is important to point out that on average the sample shows a fair tendency towards diversity-oriented leadership (M= 4.16; SD=1.74), inclusive climate (M= 4.04; SD=1.34), employee engagement (M= 4.28; SD=1.42), OCB (M= 5.03; SD=1.07) and a downward tendency towards diversity communication (M=2.94; SD=1.27).

Secondly, almost all variables are statistically significant and are positively correlated with each other, with the exception of the OCB Obedience subscale, which correlates negatively with diversity communication, although this correlation is not significant (r = -0.102, p >0.05).



Tab. 1: Means, standard deviations, Cronbach's α and intercorrelations

	M	SD	Cronbach's α	1	2	3	4	5	6	7
1_Diversity communication	2.94	1.27	0.96							
2_Diversity-oriented leadership	4.16	1.74	0.96	0.576**						
3_Inclusive climate	4.04	1.34	0.81	0.510**	0.692**					
4_Employee Engagement	4.28	1.42	0.94	0.531**	0.688**	0.592**				
5_OCB	5.03	1.07	0.71	0.278**	0.512**	0.428**	0.642**			
6_OCB_Loyalty	*4.38*	*1.58*	*0.94*	*0.443***	*0.593***	*0.493***	*0.738***	*0.790***		
7_OCB_Obedience	*5.70*	*1.16*	*0.91*	*-0.102*	*0.153***	*0.170***	*0.200***	*0.729***	*0.274***	
8_OCB_Participation	*5.01*	*1.31*	*0.90*	*0.235***	*0.404***	*0.306***	*0.506***	*0.855***	*0.488***	*0.574***

**p <0.05, **p <0.01.*

The estimated SEM (Figure 2) showed satisfactory fit indices (Kline 2016), confirming the goodness of fit of the model: χ2 (9) = 554.991, p < 0.00, CFI = 0.99, TLI = 0.97, RMSEA = 0.07; SRMR = 0.04. The significance level for all statistical analyses was p< 0.05.

Fig. 2: Results of the estimated SEM.

In this model, the antecedent variables showed direct and positive associations with both the two mediation variables. Specifically, diversity communication showed a direct and positive association with inclusive climate (β = 0.16) and employee engagement (β = 0.21), confirming H1 and H2, and diversity-oriented leadership showed a stronger positive association with inclusive climate (β = 0.56) and employee engagement (β = 0.53), confirming H3 and H4. The two mediation variables also show a direct and positive association with the outcome, i.e. OCB, with a moderate association between inclusive climate and OCB (β = 0.13) and a stronger association between employee engagement and OCB (β = 0.54), confirming H5 and H6.

In addition, the model was able to demonstrate the mediating role of inclusive climate between diversity communication and OCB and between diversity-oriented leadership and OCB. Furthermore, the mediating role of employee engagement was found between diversity communication and OCB and between diversity-oriented leadership and OCB. More precisely, as shown in Table 2, three significant mediations were found among the two mediators, partially confirming H7 and fully confirming H8: with higher levels in the case of employee engagement as a mediator (diversity communication → employee engagement → OCB = β = 0.11; diversity-oriented leadership → employee engagement → OCB = β = 0.30); and with lower or not significant values in the case of the inclusive climate as a mediator (respectively, diversity-oriented leadership → inclusive climate → OCB = β = 0.07; diversity communication → inclusive climate → OCB = β = not significant).

Tab. 2: Indirect effects of the estimated SEM

Indirect Effects	Standardized Indirect Effects		
	Est.	s.e.	p
DC →IC →OCB	*n.s.*	*0.01*	*0.06*
DC →EE →OCB	*0.11*	*0.03*	*0.00*
DOL →IC →OCB	*0.07*	*0.03*	*0.02*
DOL →EE →OCB	*0.30*	*0.03*	*0.00*

Note. DC = Diversity Communication; IC = Inclusive Climate; OCB = Organizational Citizenship Behaviour; DOL = Diversity-Oriented Leadership; EE = Employee Engagement.

Research limitations. *This study has some limitations that future research could try to overcome. First of all, the data were collected in Italy. It would be necessary to repeat the same study in other countries for comparison. In addition, future studies should increase the sample studied and possibly use probability sampling to increase the generalisability of the results. Furthermore, this study could be repeated in the near future to see longitudinally whether the proposed research framework and the analysed relationships could change. Finally, while the relationships examined in this study are well-supported in existing literature, future research could explore alternative model pathways.*

Managerial implications. *The preliminary findings of this study emphasize the critical role of leadership in addressing the social dimension of business sustainability within the organisation, particularly with regard to the efforts a company makes to promote equality and people's growth as well as the economic dimension. In particular, the study highlights the impact of diversity-oriented leadership on fostering DEI-conscious attitudes and behaviours, while nurturing a genuine culture of inclusion. This is indeed made possible through meaningful action and role modelling of leaders on DEI issues. Building on this, an effective DEI strategy should involve leaders in both the planning and implementation phases, with targeted internal communication and training programmes that are specifically tailored to them and increase their awareness of DEI issues in the workplace. While less impactful, diversity communication can complement leadership efforts by providing context and relevant information to help employees understand DEI strategy, programmes and the benefits of DEI interventions. DEI strategists should pay particular attention to how this communication directly impacts employee engagement and, by extension, OCB and thus the behavioural dimension of employees. Promoting engagement and supporting the DEI strategy at all levels of the organisation is essential for effective DEI management.*

Originality of the paper. *This study is a response to the lack of studies regarding, on the one hand, the close links between DEI and internal CSR and sustainability efforts (Maier & Ravazzani, 2019) and, on the other hand, the essential role that communication levers within organisations (Wolfgruber et al., 2021; Ravazzani, 2025) play in the planning and execution of an effective DEI strategy, considering both symbolic (i.e. diversity communication) and concrete (i.e. diversity-oriented leadership) dimensions. In addition, it provides empirical evidence rooted in the Italian context, given the lack of studies outside the US and considering the influence of the macro-national context on how DEI is perceived and responded to by and within organisations (Jonsen et al., 2011).*

Key words: *diversity, equity and inclusion; diversity communication; diversity-oriented leadership; inclusive climate; employee engagement; organizational citizenship behaviours*

Mapping the Stakeholder Network and Value Creation in Grassroots Football: Evidence from Italy

ANDREA FRANZONI[1] MARCO TRAVERSI[2] RONGTITYA RITH[3] RICCARDO SPINELLI[4]

Abstract

This study is a work in progress that aims to analyse the value creation process and map the stakeholder network of a grassroots football context in the Italian region of Lombardy. This study is conceptually and empirically grounded in stakeholder theory with a two-fold research aim. The first objective is to theoretically identify the main grassroots football stakeholders. The second objective is to examine the integrated value that they collectively generate through grassroots football and within the respective stakeholder ecosystem. Collectively, the value-based analysis in this study will help guide the development of a generic preliminary framework of stakeholder value co-creation and inter-relationship dynamics in the grassroots football context. Additionally, the study identifies and maps the relationship types of the different stakeholders involved by distinguishing between the primary stakeholders (e.g., federation, league, players, coaches, fans, sponsors, etc.) and the secondary stakeholders (e.g., local institutions, educational entities, mass media outlets, community members, non-profits, professional football clubs, etc.). The analysis also highlights how the integrated value of grassroots football emerges from the dynamic interaction between various types of stakeholders and materialises through three main value creation processes: (1) social inclusion and community integration, (2) economic sustainability, and (3) sport and educational training. Furthermore, this study advances stakeholder theory by providing a pragmatic framework, useful for guiding the strategic management of grassroots clubs, and with other policymaking implications that may further explicate the socio-economic significance derived from grassroots football. This study also contributes to the sport management literature by contributing more insights into the value co-creation process through grassroots football and within its stakeholder network, whilst also providing a replicable value-based model for future research on similar or different stakeholder networks in the broader sport sector.

Framing of the research. *Football is renowned as the world's most popular sport which constitutes an important segment in the sport industry and represents tremendous socio-economic values within local communities (Raiola et al., 2023; Roberts et al., 2016). Whilst the configuration of the football industry is a complex and dynamic environment comprising both football organisations and institutions at different levels and of different types, Roberts et al. (2016) and Todaro et al. (2023) denoted that the stakeholder ecosystem of football as a whole is intricate and multi-faceted with various types of stakeholders interacting and generating values in both social and economic terms.*

Grassroots football is a particular division of football that is neither professional nor elite, and its practical focus is participatory in nature, rather than performatory (UEFA, 2023). Thus, it is typically played by non-elite players at amateur levels for leisure and recreational purposes in various communal settings, including schools, youth sport clubs, local leagues, to name a few. This type of football plays a crucial role in promoting sport participation (Sugiyama et al., 2017), integrating communities, and developing the physical and social skills of participants of all ages (Hindmarsh et al., 2023). Previous research indicates the importance of grassroots football, not only for the technical training and development of players, but also for its wider socio-economic impacts in society at large (e.g., Raiola et al., 2023; Roberts et al., 2016). In this regard, the grassroots football ecosystem is formed by a myriad of stakeholders operating at a regional level, all the way to a more local or national governance structure, within which the relationship between clubs and stakeholders exists. According to Hindmarsh et al. (2023), grassroots football clubs are a complex ecosystem comprising differing types of stakeholders, including football governing bodies, professional clubs, grassroots clubs, local authorities, players, coaches, fans, sponsors, mass media outlets, community members, etc. These stakeholders collectively contribute to the value creation process within the system through the notions of sustainability and corporate social responsibility (CSR) (Daddi et al., 2021).

Another important aspect of grassroots football is its contribution to social cohesion and inclusion. Grassroots football clubs provide opportunities for sport participation to marginalised community members such as refugees and

individuals from disadvantaged backgrounds, whilst also promoting their integration into local communities (Göçer et al., 2024). From an economic perspective, grassroots football has a significant impact on local economies. The study of Birdsall-Strong (2022) has illustrated that participation in grassroots football in the UK annually contribute over £10 billion to the national economy through various benefits related to physical and mental wellbeing, social development, and the creation of employment opportunities in the sport sector. From a governance and strategic perspective, grassroots football provides as a platform to promote inclusive sport participation and sustainability values within local communities. The study of Sugiyama et al. (2017) on the Japanese grassroots football, for instance, has highlighted how strategic investment in coach training and social inclusion initiatives through football has contributed to a constant growth in youth sport participation and an improvement in sport performance at a national level.

According to Woratschek et al. (2014), the value creation process in sport is not only intrinsic to sport events and activities, but it emerges through a dynamic and constant interaction between stakeholders. This systemic process makes football an effective medium for building social connections and strengthening local communities (Yiapanas et al., 2024). It is crucial to note that the football stakeholder environment is not a set of individual linkages but a systemic network of a variety of stakeholders with differing values, whose collective effort shapes the essence of the football ecosystem as a whole (Yiapanas et al., 2022). In this regard, grassroots football may serve as a platform for many stakeholders to co-create value. This study is situated in this particular context with certain key perspectives to highlight the role of grassroots football as an agent of social change, offer useful insights for sport academics, practitioners, and policy makers, and contribute to the broader academic debate on the value co-creation process involving different types of grassroots football stakeholders. Specifically, this study aims to provide a comprehensive stakeholder network and value co-creation analysis generated through the grassroots football and its stakeholder ecosystem based on an Italian regional context (i.e., Lombardy).

The theoretical framework of this study is grounded in the implications of stakeholder theory. Stakeholder theory is primarily concerned with understanding the nature of relationships between an organisation and its stakeholders who can be characterised as those "who can affect or be affected by the achievement of an organisation's objectives" (Freeman, 1984). A core implication of the theory is the purpose of a business being able to create value for all stakeholders (Freeman et al., 2010). The practical utility of stakeholder theory has been thoroughly examined in previous studies in relation to sustainability and stakeholder governance issues in the football industry (e.g., Daddi et al., 2021; Hernandez-Hernandez et al., 2023; Yiapanas et al., 2024). This perspective is also prolific for grassroots football, a context where the socio-economic value generated by clubs goes beyond sport-related outcomes and includes certain positive aspects of social cohesion and inclusion, youth development, and economic growth. Some studies have analysed the mapping of stakeholder networks of sport clubs and their social impacts (e.g., Mendizabal et al., 2020; Perechuda & Čater, 2021). Mendizabal et al. (2020) developed a detailed map of sport clubs' stakeholders, highlighting the importance of considering the value perceived by different stakeholders for a more comprehensive value-based analysis (Mendizabal et al., 2020). Perechuda & Čater (2021) highlighted how stakeholder perception influences the measurement of football clubs' value, suggesting a multi-dimensional approach to the evaluation of sport clubs' performance. Considering the aforementioned notions, our study proposes that the football stakeholder network can be mapped and inclusive of a wide range of stakeholders that can be divided into two main classifications: "primary" and "secondary" stakeholders.

Primary stakeholders are individuals who have a direct and continuous interaction with football clubs and are essential for their functioning. The primary stakeholders may consist of club owners and directors, players, technical staff, other managers and administrators, fans and supporters, community members, sponsors and commercial partners, football governing bodies and other authoritative figures, etc. Secondary stakeholders have an indirect role but contribute to the creation of social value in football networks. Some of these are educational institutions, sport clubs, non-profits, mass media outlets, associations, and other local institutions, etc.

In grassroots football, the role of stakeholders changes significantly (Hindmarsh et al., 2023). Grassroots clubs often rely heavily on voluntary commitment, the support of players' families and local publics, and private funding. The limited capital pushes these clubs to create closer cooperative networks with local institutions, educational entities, non-profit organisations, and social associations, etc. to sustain and support their operational activities. Likewise, the social value of football manifests in multiple dimensions, including social inclusion and cohesion, the promotion of healthy lifestyles, and the strengthening of local economies (Vrontis et al., 2014; Kunkel et al. 2017). Previous research has illustrated that football has a strong impact on the lives of its supporters, uniting different cultures, contributing to local development, and the creation of social identity (e.g., Hyndman & Liguori, 2024; Zagnoli & Radicchi, 2010). Furthermore, the football business and stakeholder networks collectively provide a significant support to the community through welfare, healthcare, and financial initiatives (Lapsley, 2024). In this regard, the socio-economic value produced through football is manifested through three main dimensions: (1) social and cultural value, (2) economic value, and (3) educational value. In the socio-cultural value, football is a tool for social cohesion by promoting inclusion and strengthening the sense of belonging within local communities. In the economic value, football clubs, including the amateur clubs, generate direct and indirect economic impacts through sport events, the involvement of local businesses, sport tourism, and other business-related activities (e.g., events, sponsorships, etc.). In the educational value, football plays a fundamental role in transmitting values such as fair play, respect, and teamwork. Through grassroots football, amateur clubs often collaborate with schools and other educational institutions for sport-related education projects and provide pathways for personal and professional growth amongst youth.

The analysis of stakeholders and the values associated with the grassroots football stakeholder network itself allows a better understanding of how football, even at the amateur level, can be an effective tool for socio-economic value enhancement. Therefore, mapping the dynamic interactions between stakeholders and assessing the socio-economic impact resulting from their activities are instrumental.

Purpose of the paper. *The aim of this study is twofold. First, it aims to map the stakeholder network in grassroots football by analysing their structure and dynamic interactions. Second, it aims to assess the value generated by those primary and secondary stakeholders in the network. To achieve the first objective, the stakeholders involved with grassroots football clubs will be identified, as suggested by Mendizabal et al. (2020) whose study has demonstrated how the classification of stakeholders based on their degree of influence and interest can allow a comprehensive understanding of the strategic role of a grassroots football stakeholder network. The analysis of the relationships between clubs, fans, sponsors, media, institutions, and other types of stakeholders will also help identify the mechanisms through which these stakeholders co-create value. Regarding the second objective, this study will rely on the football context-specific social value assessment frameworks developed by Yiapanas et al. (2024) and Perechuda and Čater (2021).*

Methodology. *This study adopts a qualitative approach based on an analysis of the main stakeholders of a grassroots football stakeholder network based in an Italian region, Lombardy. Starting from the review of the existing literature – particularly the methodology and theoretical framework developed by Yiapanas et al. (2024) – a three-step model was created to identify the stakeholders of Italian non-professional or grassroots football clubs (i.e., Amateur Sports Associations and Amateur Sports Clubs), their relationships, and the value categories associated with them. In Step 1, the stakeholders are identified and divided into their primary and secondary roles, whilst in Step 2, the relationships between the clubs and the stakeholders are defined (i.e., direct vs. indirect and formal vs. informal). Direct relationships occur when clubs interact with stakeholders without intermediaries (e.g. clubs vs. players), whilst indirect relationships occur through intermediaries (e.g. clubs vs. players' families). Formal relationships are structured and regulated by contracts, regulations, or institutional agreements (e.g. clubs vs. the league), whilst informal relationships are based on less structured interactions such as community involvement or spontaneous support from fans. Finally, in Step 3, the values created by each relationship are evaluated and classified into (1) social and cultural value, (2) economic value, (3) educational value.*

The developed theoretical model will be first validated by an expert panel potentially consisting of a number of sport management academics and practitioners. This panel may include various professionals in the sport sector, sport management academics, and other key stakeholders identified in the framework. Interviews will be conducted to collect the feedback and insights necessary for validating the theoretical framework with a proper emphasis on the peculiarities and characteristics of the Italian grassroots football context. These interviews will serve to confirm or adapt the categorisation of stakeholders and the mapping of their relationships and values, as well as to integrate any new emerging perspectives.

Preliminary results. *As this study is a work in progress, preliminary results can be presented to a certain extent for the first and second steps. Whereas the third step is less definitive with certain plans to be executed subsequently as per the description outlined in the methodology section.*

Step 1: Stakeholder identification and type of relationship (Preliminary findings)

In the context of grassroots football in Lombardy, grassroots football clubs represent the core of the stakeholder network. They operate as central actors, around which interactions develop between different individuals (hereby stakeholders) who contribute to the functioning, regulation, and overall support of sport-related activities (Birdsall-Strong, 2022).

Primary stakeholders are those stakeholders who interact directly with the football clubs and are essential to their operations. These amateur clubs are composed of owners and a management structure, who are responsible for the strategic and administrative functions, and players and staff, who are the individual athletes participating in training programmes and competitions and those who take care of the athletes and players respectively. In addition to those internal actors, amateur football clubs interact with a series of external stakeholders. Those may include the Italian Football Federation (FIGC) - Lombardy, the National Amateur League (LND) and other amateur sport associations, that regulate and supervise the football system and coordinate competitions. Local sponsors, on the other hand, guarantee direct financial support, contributing to the economic sustainability of amateur clubs and promoting their visibility, whilst suppliers provide essential equipment and services for the clubs' daily activities. The family members of athletes are another group of primary stakeholders, and they are responsible for providing financial and logistical support to young athletes and facilitating their continuous participation. Fans and local communities also play an essential role in creating a collective identity associated with the clubs, and they contribute to the aspects of social inclusion and cohesion and the sense of belonging.

On the other hand, secondary stakeholders are those subjects who influence the system through financial, logistical or other contributions despite their indirect involvement in the operational management of clubs. Local institutions, such as the local and regional municipalities, play an important role in providing infrastructural support and financing. Educational institutions such as schools and universities often collaborate with clubs to offer educational opportunities and sport training courses, thus creating and maximising the education vis-à-vis sport synergies. On a similar note, non-profit organisations and social associations cooperate with clubs on executing community development projects, using

sport (i.e., football) as a tool to promote the value of community integration. Mass media outlets and sport journalists contribute to the promotion and dissemination and coverage of sport activities and events, whilst also amplifying its impact and influence at a local or even a national level. Other secondary stakeholders include professional clubs, which also maintain relationships with amateur football clubs for the purpose of recruitment and development of talented players, as well as other (rival) amateur football clubs, which compete in various championship events. Notably, parishes and other religious institutions also play a role in providing safe spaces and resources for recreational football plays.

As summarised in Table 1 below, our identification and classification of the different stakeholders highlight the complex and dynamic stakeholder network of amateur football. In Step 2, the mapping of the relationships between those stakeholders will be analysed to comprehensively illustrate the value creation and distribution process in the grassroots football context.

Tab. 1: Grassroots Football Stakeholder Identification and Classification

Stakeholder Type	**Description**	**Responsibilities**	**Relationship Role**	**Relationship Type**	**Relationship Nature**
Owners and directors	Management and supervision of amateur football clubs	Strategic management and control	Primary	Direct	Formal
Players and staff	Athletes and technical and operational managers	Participation in technical training and competitions	Primary	Direct	Formal
Italian Football Federation (FIGC) - Lombardy	Regulatory body of regional football activities	Regulation and management of amateur football clubs	Primary	Direct	Formal
National Amateur Football League (LND)	Association of FIGC-affiliated clubs competing in championships	Management of competitions and championships	Primary	Direct	Formal
CSI/ANSPI/UISP	Amateur sport promotion bodies	Promotion of grassroots sports	Primary	Direct	Formal
Local sponsors	Business entities that help finance football clubs and their activities	Economic and financial support	Primary	Direct	Formal
Suppliers	Companies interested in football for commercial purposes	Supply of equipment and services	Primary	Direct	Formal
Family members	Parents and relatives of players	Financial and logistical support for athletes	Primary	Direct	Informal
Fans	Supporters interested and involved in football activities	Creating a collective social identity and common interest in football	Primary	Indirect	Informal
Local communities	Residents who benefit from sport-related activities	Sharing a social and cultural interest	Secondary	Indirect	Informal
Local institutions	Public bodies that help coordinate and support sport activities	Providing spaces, financing, and logistical support	Secondary	Direct	Formal
Schools and universities	Educational institutes involved in delivering sport-related activities or educational projects	Providing collaborative platforms for sport activities and academic training	Secondary	Indirect	Formal
Non-profit organisations and social associations	Entities that engage in community development initiatives	Supporting sport-for-development projects	Secondary	Direct	Formal
Mass media and journalists	Journalists and newspapers covering amateur football-related news	Disseminating and promoting football or other sport-related activities	Secondary	Indirect	Informal
Professional football clubs	Serie A, B, and C clubs that collaborate with amateur clubs	Providing partnerships to support youth and recruitment opportunities	Secondary	Direct	Formal
Other amateur football clubs	Other rival non-professional football clubs	Participating in local or regional competitions and enhancing the development and competitiveness of grassroots football	Secondary	Indirect	Informal
Parishes and other religious institutions	Entities that support football activities	Promoting social inclusion and cohesion through sport and providing resources and facilities	Secondary	Direct	Informal

Source: Authors' own work

Step 2: Relationship mapping (Preliminary findings)

The owners and directors of grassroots football clubs manage strategic and administrative decisions, directly influencing governance and resource management. The relationship between these actors and the clubs is direct and formal, affecting all operational aspects of the clubs. Likewise, players and staff are crucial to the functioning of the clubs, with a direct and formal relationship, considering their primary involvement in the clubs' sporting and

organisational activities. The FIGC and the LND regulate and supervise amateur football activities in a direct and formal relationship, ensuring standards of competition, sport training, and economic development of the clubs. Additionally, local sponsors play a key role in providing the financial support to partially sustain the clubs, so they have a direct and formal relationship with the clubs. Local institutions, such as municipalities and the region, provide logistical support and funding through a direct and formal relationship with the clubs. Schools and universities also take part in coordinating sport activities and academic training of young athletes, establishing an indirect and formal relationship with the clubs. Similarly, non-profit organisations and social associations also promote social development projects with a focus on football or other sport-related areas, thus enabling them to have a direct and formal relationship with the clubs. Media outlets and sport journalists amplify the visibility and popularity of grassroots football through an indirect and informal relationship with the clubs. The family members provide logistical and financial support to young athletes, so they have a direct and informal relationship with the clubs. Specifically, football fans and other local community members interact with the clubs through an indirect and informal relationship, contributing positive values to the sense of belonging and collective social identity. Finally, professional football clubs provide scouting opportunities and pathway programmes for young athletes affiliated with amateur clubs; thus, the two parties have a direct and formal relationship. Last but not least, parishes and other religious institutions also provide safe spaces and resources for football-related activities, establishing a direct and informal relationship with the clubs.

Overall, our analysis highlights the multi-faceted dynamics and complexities of the relationships between grassroots football clubs and their stakeholders, characterised by their direct vs. indirect and formal vs. informal interactions.

Step 3: Evaluation of the relationship values (Expected findings)

In Step 3, the theoretical evaluation of the relationship values embedded in the grassroots football stakeholder network and the dynamic interactions of the different stakeholders identified can be explicated in three value creation processes, namely (1) social and cultural value, (2) economic value, and (3) educational value. The social and cultural value emerges from the ability of clubs to emphasise the virtues of social cohesion and inclusion and a community sense of belonging. Whereas the economic value can be linked to the profitability of football activities and events conducted by clubs, sponsorships provided by sponsors or other commercial partners, and other economic factors associated with the local business environment and creation of job opportunities in the sport sector as a whole. Additionally, the educational value is derived from the role of clubs in transmitting and fostering sport-related knowledge, soft skills, and other conducts of intellectual and personal development to young athletes.

As this study is a work in progress, it is important to disclose that we are currently working on refining the classification and evaluation of the relationship values. The preliminary results have shown how the dynamic interactions between grassroots football clubs and local institutions generate a clear social and cultural value because the logistical and financial support provided by the municipalities can allow clubs to organise sport events and youth programmes, promoting the inclusion of vulnerable groups of the population and strengthening social cohesion. At the same time, with regard to collaborations with local sponsors, the creation of a significant economic value emerges, since they guarantee essential resources for the operational management of sports clubs and encourage the growth of the territorial economic sector through events and tournaments involving local businesses. The activity of amateur clubs, in this sense, represents a driving force for the local economy, increasing the visibility of partner companies and encouraging forms of investment in the sports sector. At the same time, the relationships between amateur clubs and schools confirm the presence of a strong educational and training value. Football is configured as a pedagogical tool that promotes the learning of fundamental values such as fair play, discipline and respect for the rules. Finally, the analysis of the dynamics with fans and local communities shows how amateur football generates social and cultural value through the construction of a collective identity around teams and clubs, transforming them into real territorial reference points. The active participation of the community, the sense of belonging and the emotional bond with the clubs represent a key factor for the sustainability of the amateur football system in the long term.

Research limitations. *This ongoing study also presents certain limitations to be considered. First, the study adopts a qualitative approach and utilises interview data. These factors may lead to a certain degree of subjectivity in the data interpretation process. Furthermore, the geographical focus on Italy at a regional level may limit the generalisability if and when other regions or countries with different sporting and socio-economic contexts are considered. Finally, the absence of longitudinal data may present a limited view of the complex value-creation process in grassroots football and its stakeholder network that is constantly evolving over time. Future studies should integrate these limitations by adopting quantitative approaches and expanding the scope of the current analysis.*

Managerial implications. *The preliminary findings of this study may offer insightful implications for sport managers and public institutions in the following manners. Concerning engagement strategies, grassroots football clubs can orient their stakeholder engagement strategies to be more inclusive and proactive by fostering and expanding relationships with different and more stakeholder groups, including but not limited to, players' family members, local community members, sponsors, and local institutions, etc. With regards to social inclusion policies, the local government can utilise the findings of the study to design more effective sport policies and further promote youth participation in football or other sport-related activities. The financial sustainability aspect is also crucial as having a proper understanding of the integrated value created through grassroots football in its stakeholder network can help amateur clubs obtain more visibility and attract public and private funding.*

Originality of the paper. *First, the interdisciplinary nature of this study allows an integrated perspective of multiple domains such as sport management, economics, and social network analysis and provides a in-depth analysis of the relevance and significance of grassroots football and its socio-cultural and economic impacts on local communities. Second, this study utilises and advances stakeholder theory and proposes a value-based perspective on the value creation process in the context of grassroots football and its multi-faceted stakeholder network. Third, this study adopts a three-step methodological approach that rigorously analyses not only the various relationships between stakeholders, but also the dynamics in which certain values are co-created by the concerned stakeholders involved. Finally, the study focuses on a specific geographical context, Lombardy (Italy) and provides an evidence-based analysis to characterise the salient features of the region's grassroots football system and its stakeholder ecosystem as a whole. The proposed framework is potentially replicable to help frame future studies that focus on other geographical settings or similar sporting contexts. Furthermore, this study also addresses an important gap in the existing literature raised by Torres-Pruñonosa et al. (2020) whose study calls for more empirical research on specific indicators and measurements of social value in sport.*

Key words: *Corporate social responsibility; Grassroots football; Stakeholder theory; Sustainability; Value creation*

Smart Cities e Mega-Eventi tra Opportunità ed Elefanti Bianchi: L'Impatto della Finale UEFA Champions League sulla Digitalizzazione Urbana

FILIPPO MARCHESANI[1] GIUSEPPE CECI[2]

Abstract

I mega-eventi sono stati a lungo promossi come motori di sviluppo urbano, con la promessa di stimolare la crescita economica e accrescere il prestigio internazionale delle città ospitanti. Tuttavia, il dibattito sulla loro efficacia è ancora aperto, poiché i benefici attesi spesso si scontrano con costi elevati, dislocamenti urbani e impatti socio-economici controversi. In questo contesto, il concetto di smart city emerge come una risposta alle sfide della crescita urbana, sfruttando la tecnologia per migliorare la qualità della vita e rendere le città più efficienti e sostenibili. Nonostante il crescente interesse per le smart cities, la relazione tra mega-eventi e trasformazione digitale urbana rimane ancora poco esplorata. Questo studio si propone di analizzare in che modo i mega-eventi possano fungere da catalizzatori per la digitalizzazione delle città, con particolare attenzione ai servizi digitali, alle infrastrutture digitali e agli strumenti di comunicazione digitale. Attraverso l'analisi di 11 città europee che hanno ospitato la finale della UEFA Champions League tra il 2012 e il 2023, il lavoro esplora il ruolo di questi eventi nello sviluppo di nuove infrastrutture digitali e nell'adozione di tecnologie innovative. I risultati preliminari offrono un'interessante panoramica sull'evoluzione delle infrastrutture digitali, sollevando al contempo interrogativi su quanto i mega-eventi possano effettivamente promuovere lo sviluppo dei servizi digitali. Questo studio arricchisce la letteratura sulla digitalizzazione urbana, evidenziando il potenziale dei mega-eventi nell'accelerare l'innovazione tecnologica e il miglioramento delle infrastrutture cittadine. Dal punto di vista pratico, i risultati possono supportare policy maker e amministrazioni locali nell'identificare strategie per trasformare questi eventi in opportunità di crescita e sviluppo duraturo per le città ospitanti.

Inquadramento della ricerca. *Il concetto di "elefante bianco" è stato spesso utilizzato come metafora per descrivere beni o progetti imponenti ma poco funzionali, caratterizzati simultaneamente da costi di realizzazione e gestione elevati e benefici attesi limitati. Analizzata da una lente economica, la metafora dell'elefante bianco è stata impiegata da Robinson & Torvik (2005, p.198) per definire un progetto con un surplus sociale negativo. Radicato in questo concetto e nella letteratura economica, si colloca un tema ampiamente dibattuto sia da accademici che practitioners: il ruolo dei mega-eventi sullo sviluppo delle città. Storicamente, tale dibattito si è concentrato sulla complessa valutazione di sviluppo delle città ospitanti mega-eventi sportivi, come le Olimpiadi, il Super Bowl o la Coppa del Mondo FIFA[3]. Da un lato, questi eventi sono percepiti come strumenti di crescita economica e prestigio internazionale, oltre che occasioni importanti per attrarre e catalizzare fondi per la riqualificazione delle città e lo sviluppo di infrastrutture più efficienti (Preuss, 2007, 2018). Dall'altro, sempre più ricerche dimostrano come i costi effettivi superino di gran lunga i benefici attesi, portando a un generale scetticismo tra le comunità locali che spesso, oltre ad affrontare frequenti episodi di dislocamento, devono far fronte ad un aumento generale dell'inflazione e della criminalità (Gursoy et al., 2011; Ritchie et al., 2009; Winter et al., 2021). Per questi motivi, sebbene la letteratura che metta in relazione mega-eventi e città sia ben nutrita e si articoli su approfondite valutazioni sulle sue dimensioni economiche, politiche e sociali differenti, la ratio del nostro studio si colloca nella complessa ma inesplorata relazione tra mega-eventi e smart cities.*

Negli ultimi anni, il concetto di smart city si è sviluppato come una risposta alle sfide della crescita urbana, essendo esse stesse considerate e definite come sistemi urbani che sviluppano tecnologie per rispondere a bisogni sia economici che sociali, realizzando effetti tangibili in termini di benefici alla comunità (Eger, 2009). Sulla base di questa definizione, le smart cities dovrebbero essere capaci di rispondere in modo efficiente allo sviluppo delle tecnologie: tuttavia, il legame tra mega-eventi e trasformazione digitale delle città è ancora inesplorato (Marchesani & Masciarelli, 2025). In quest'ambito, i pochi studi esistenti affrontano il ruolo delle smart cities nella gestione operativa dei mega-eventi, come il controllo delle folle e la logistica urbana, ma il corrente sviluppo della letteratura è deficitario nell'esaminare come (e se) questi eventi possano rappresentare un volano per l'innovazione digitale. (Hefnawy et al., 2016).

Tale lavoro si inserisce in un dibattito più ampio che coinvolge il futuro delle città e il loro adattamento alle trasformazioni tecnologiche. Le città che ospitano eventi di grande portata devono bilanciare lo sviluppo delle infrastrutture fisiche, sociali e digitali, evitando di creare infrastrutture obsolete e scarsamente utilizzate. Seguendo questa logica, il carattere "smart" delle città dovrebbe fungere come leva nel riuscire ad evitare la proliferazione massiccia di elefanti bianchi, ivi compresa la loro gestione e manutenzione. In questo contesto, il presente studio esamina il potenziale dei mega-eventi non solo come fonte di criticità economiche, ma anche come opportunità di trasformazione digitale per le città ospitanti proponendo due domande di ricerca: "Come le smart cities sfruttano l'impatto dei mega-eventi per avanzare nelle tecnologie digitali?" e "In che modo i mega-eventi influenzano le diverse dimensioni delle tecnologie digitali, come i servizi digitali, le infrastrutture digitali e la comunicazione digitale?".

Obbietivo della ricerca. *L'obbiettivo di questo studio è esplorare come le smart cities possano sfruttare i mega-eventi per accelerare la loro trasformazione digitale. In particolare, la ricerca si concentra sull'impatto che eventi sportivi di grande portata, come le Olimpiadi o la Coppa del Mondo, hanno su tre dimensioni fondamentali delle tecnologie digitali: i servizi digitali, le infrastrutture digitali e la comunicazione digitale.*

Nonostante la questione sia ancora poco esplorata nella letteratura accademica, numerosi studi dimostrano come i mega-eventi possano agire come catalizzatori per la digitalizzazione dei servizi urbani. In effetti, eventi di questa portata attraggono risorse economiche significative e stimolano l'adozione di soluzioni digitali da parte dei cittadini, delle imprese e delle amministrazioni locali. Ad esempio, durante le Olimpiadi di Tokyo 2020, le tecnologie digitali sono state utilizzate per promuovere un maggiore coinvolgimento dei cittadini, seguendo un approccio basato sull'economia collaborativa, che ha permesso di sviluppare soluzioni innovative per l'interazione sociale e la partecipazione cittadina (Kolotouchkina, 2018). Questo esempio dimostra come i mega-eventi possano servire non solo come terreno fertile per l'innovazione tecnologica, ma anche come "testing ground" per cogliere importanti opportunità di sviluppo per le smart cities.

Parallelamente, un altro aspetto cruciale riguarda lo sviluppo delle infrastrutture digitali. L'esigenza di gestire grandi afflussi di visitatori spinge le città a investire in reti di telecomunicazione avanzate, Wi-Fi pubblico e tecnologie IoT. Queste infrastrutture, sebbene "invisibili" e progettate principalmente per supportare gli eventi, tendono a rimanere attive anche dopo il termine degli stessi, contribuendo potenzialmente alla crescita e alla modernizzazione delle città. Ad esempio, molte delle reti di telecomunicazione sviluppate per le Olimpiadi di Londra 2012 e le recenti edizioni della Coppa del Mondo sono rimaste in funzione, supportando ulteriormente l'urbanizzazione e l'innovazione tecnologica nelle città ospitanti (Burchell, 2015; Hefnawy et al., 2016). Tuttavia, non mancano i rischi: c'è la possibilità che queste infrastrutture non vengano utilizzate a lungo termine, risultando in pericolosi "elefanti bianchi": costose da mantenere e talvolta inefficaci se non adeguatamente integrate nel contesto urbano. Questo solleva preoccupazioni legate alla sostenibilità e all'ottimizzazione delle risorse investite (Preuss, 2018; Wu et al., 2016).

Infine, la letteratura ha dimostrato come i mega-eventi hanno un impatto significativo anche sulla comunicazione digitale delle città ospitanti. Questi eventi globali offrono un'opportunità unica per aumentare la visibilità internazionale delle città, grazie alla diffusione delle immagini e delle informazioni tramite i social media e le piattaforme digitali. Tuttavia, tale effetto sembra essere ambivalente e meno netto: mentre l'impatto comunicativo è evidente durante l'evento stesso, è stato osservato che la visibilità tende a diminuire nel tempo, una volta che l'evento è concluso (Kassens-Noor et al., 2019; Knott et al., 2015; Molinillo et al., 2019).

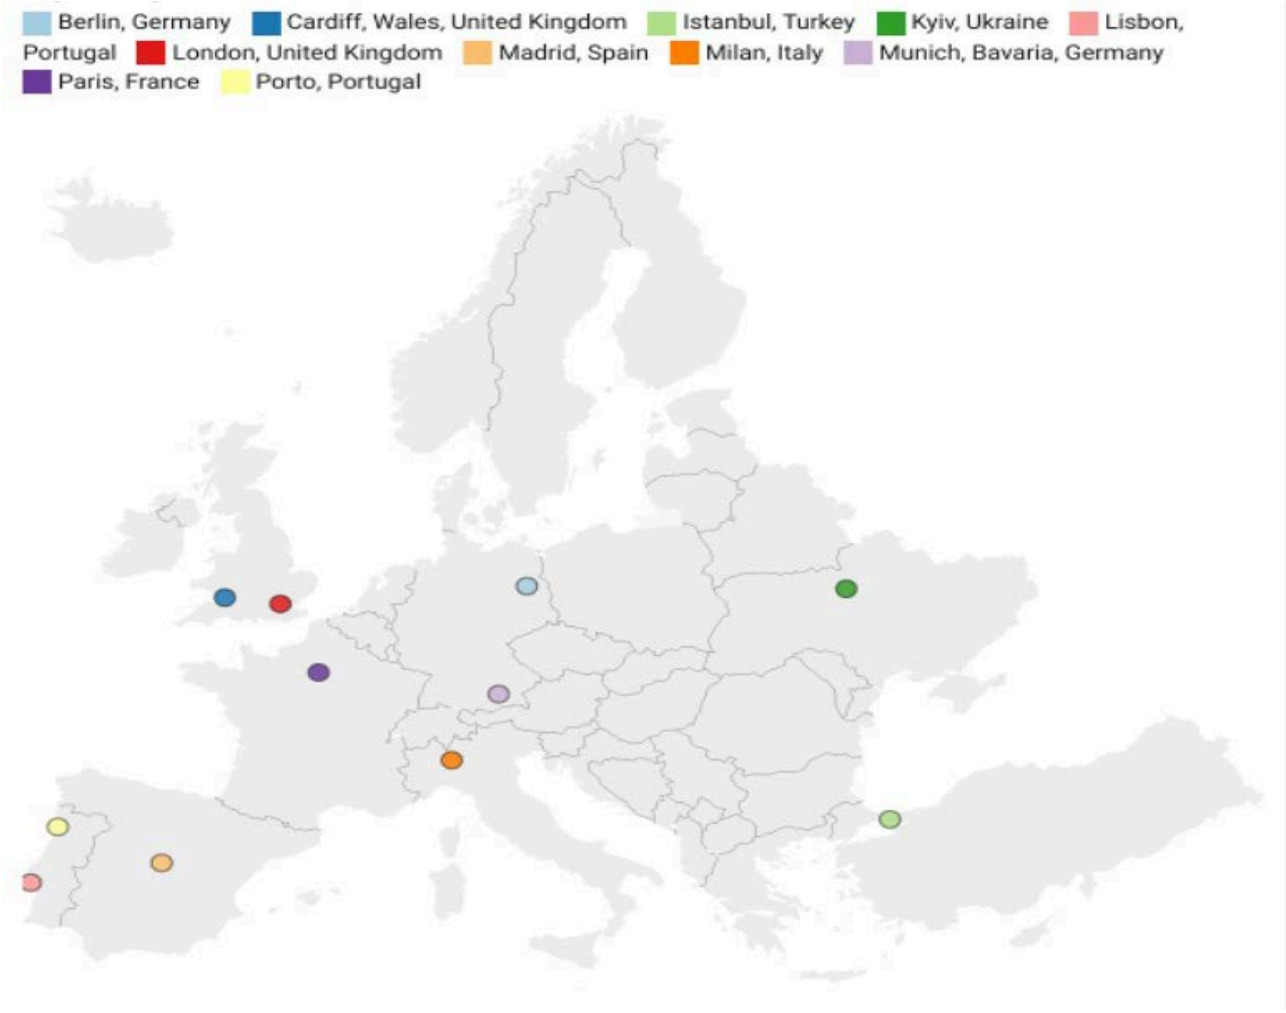
Sula base di questo discorso proponiamo le seguenti tre ipotesi:

H1: Ospitare mega-eventi influenza positivamente la sviluppo di servizi digitali nelle smart cities;

H2: Ospitare mega-eventi influenza positivamente lo sviluppo di infrastrutture digitali nelle smart cities;

H3: Ospitare mega-eventi influenza positivamente lo sviluppo di strumenti di comunicazione digitale nelle smart cities.

Per rispondere alle nostre domande di ricerca e testare le nostre ipotesi, tale studio propone un'analisi empirica di undici città europee che hanno ospitato la finale della UEFA[4] Champions League tra il 2012 e il 2023. L'obiettivo è analizzare l'impatto di questi eventi come stimolo esogeno per l'innovazione tecnologica urbana. In particolare, si adotta un approccio dinamico che risponde alla crescente necessità di studi longitudinali e comparativi sui mega-eventi, al fine di comprendere come le città rispondano agli input esterni e come questi eventi possano contribuire alla loro trasformazione digitale (Müller et al., 2022; Schulenkorf et al., 2024).



Dal punto di vista teorico, il contributo di questo studio si sviluppa su tre direttrici principali. In primo luogo, amplia il dibattito sull'implementazione delle tecnologie digitali nelle smart cities, esplorando il ruolo dei mega-eventi nell'influenzare tale sviluppo tecnologico (Albino et al., 2015; Marchesani, 2023).In secondo luogo, contribuisce alla letteratura sugli impatti urbani dei mega-eventi, approfondendo il loro potenziale trasformativo e le opportunità di efficientamento delle infrastrutture (Müller, 2015; Preuss, 2018). In terzo luogo, si inserisce nel filone di ricerca che esamina la relazione tra innovazione digitale e trasformazione urbana, valutando se i mega-eventi siano effettivi catalizzatori di innovazione o se, al contrario, rappresentino solo generatori di infrastrutture scarsamente utilizzate ed estremamente costose per la città (Safarov, 2021; Sorri et al., 2024).

[4] Union of European Football Association, letteralmente "Unioni delle federazioni calcistiche europee"

Metodologia. *Il presente studio utilizza un dataset longitudinale che comprende dati primari, raccolti tramite il Wayback Archive, e dati secondari provenienti da fonti nazionali e internazionali. L'analisi si concentra su 11 città europee che hanno ospitato la finale di Champions League tra il 2012 e il 2023. Le 11 città costituiscono un contesto ideale per esplorare l'evoluzione digitale urbana ricalcando la logica con cui viene attualmente valutata l'implementazione di tecnologie nelle smart cities nella letteratura corrente (Hajduk, 2018; Kummitha, 2018; Marchesani & Ceci, 2025).*

Inoltre, tutte le città comprese nell'analisi possono essere considerate smart cities (Fig.1) in quanto stanno affrontando diversi percorsi di trasformazione digitale, implementando tecnologie avanzate per migliorare la qualità della vita dei cittadini, l'efficienza dei servizi digitali, infrastrutture digitali e la comunicazione digitale (Unione Europea, 2014[5]; Istanbul Metropolitan Municipality, 2021[6]; World Cities Culture Forum[7]).

Fig. 1: Città Ospitanti le finali di Champions League (2012-2023)

Fonte: Elaborazione degli autori

Il modello considera tre variabili dipendenti: Servizi Digitali, Infrastrutture Digitali e Comunicazione Digitale. La variabile Servizi Digitali misura il numero di servizi online forniti dai siti web municipali tra il 2012 e il 2023, analizzati retrospettivamente tramite il Wayback Machine, con categorizzazione standardizzata e dati normalizzati su una scala da 0 a 1 per garantire comparabilità. La variabile Infrastrutture Digitali combina due indicatori chiave: il numero di hotspot Wi-Fi pubblici e l'investimento annuo in infrastrutture Wi-Fi, normalizzati tramite z-score o min-max scaling e aggregati attraverso l'utilizzo della Analisi per Componenti Principali (PCA). La variabile Comunicazione Digitale valuta l'adozione di piattaforme social da parte delle città (Twitter, Facebook, Instagram, LinkedIn, Telegram e TikTok), con presenza codificata binariamente e analizzata tramite l'Indice di Herfindahl-Hirschman (HHI) per misurare la

[7] Fonte: https://worldcitiesculturereforum.com/city-project/kyiv-digital/

diversificazione delle strategie di comunicazione digitale. L'evento oggetto di studio è la finale di Champions League, trattata come variabile binaria (0 per gli anni precedenti, 1 per l'anno dell'evento e quelli successivi).

Il modello adotta un approccio difference-in-time per valutare l'impatto pre e post-evento controllando gli effetti specifici di ogni città e conducendo test di robustezza su città che hanno ospitato più finali. Per isolare il ruolo della digitalizzazione urbana, sono inclusi fattori economici e urbani, come investimenti in R&D, PIL, popolazione, classificazione UE per dimensione e sviluppo urbano, turismo e flussi aeroportuali. L'analisi utilizza un modello a effetti fissi su dati panel (144 osservazioni) per controllare l'eterogeneità non osservabile tra le città (Hong et al., 2023; Su & Ju, 2018). Abbiamo quindi incluso effetti fissi per anno e città, con standard errors clusterizzati per gestire eteroschedasticità e correlazione seriale. Sono stati condotti placebo test, il test di Hausman, la stima di Arellano-Bond per l'endogeneità e il controllo della multicollinearità (VIF), che confermano la validità del modello nel valutare l'impatto della finale di Champions League sulla digitalizzazione urbana.

Risultati attesi. *I risultati preliminari evidenziano la complessità nella relazione tra Mega-Eventi e Smart city evidenziando come, sebbene vi sia un effetto positivo sulla digitalizzazione delle città, questo differisce in base alla struttura digitale analizzata. In particolare, sulla base del nostro panel e dalle prime valutazioni, possiamo anticipare che le città che hanno ospitato la finale di Champions League tra il 2012 e il 2023 hanno visto un'accelerazione nei processi di digitalizzazione urbana. Dai primi riscontri possiamo notare un incremento significativo per quanto concerne più specificatamente le infrastrutture digitali, confermando quanto i mega-eventi possono essere davvero catalizzatori nello sviluppo di infrastrutture (Burchell, 2015; Hefnawy et al., 2016) . In tal senso, la nostra analisi preliminare sulle infrastrutture digitali fotografa un aumento generale del numero di hotspot Wi-Fi pubblici e un incremento degli investimenti in connettività, probabilmente dovuti sia alla necessità di supportare l'elevato afflusso turistico sia a strategie di lungo termine delle amministrazioni locali che vedono nei mega-eventi un'occasione preziosa per consolidare il progresso tecnologico maturato. Anche la comunicazione digitale potrebbe aver subito una trasformazione, con un uso più diversificato e strategico delle piattaforme social da parte delle città ospitanti pre e post-evento.*

Questo fenomeno potrebbe derivare dalla volontà di promuovere l'evento, gestire i flussi di visitatori e consolidare un'immagine di città innovativa e connessa a livello internazionale. In questo contesto, i mega-eventi possono fungere da vere e proprie leve per accrescere e rafforzare non solo l'immagine della città per i propri residenti ma anche per potenziali nuovi entranti (sotto forma di nuovi residenti, aziende o turisti nazionali ed internazionali). Infine, non ci immaginiamo un aumento sostanziale dell'implementazione dei servizi digitali. In effetti, nonostante il dibattito corrente che mette in risalto come i mega-eventi possano essere una leva per stimolare l'innovazione tecnologica, anche grazie al coinvolgimento di cittadini in questo processo di innovazione collaborativa (Kolotouchkina, 2018; Mason et al., 2024) riteniamo che i mega-eventi, per quanto possano rappresentare veri e propri shock per le città ospitanti in termini di aumento di risorse, investimenti, attrattività e creazione di nuove infrastrutture, non riescano a fungere da catalizzatori nella creazione di servizi digitali. In tal senso, riteniamo che i servizi digitali seguono percorsi di implementazione tecnologica con logiche top-down che i mega-eventi non riescono a smussare nonostante la loro portata e i benefici che ne conseguono.

Limitazioni della ricerca. *Nonostante la robustezza metodologica del modello adottato, la ricerca presenta alcune limitazioni. In primo luogo, l'uso di dati storici provenienti dal Wayback Archive potrebbe non catturare pienamente le modifiche implementate nei siti web municipali, specialmente nei casi in cui le amministrazioni abbiano archiviato non correttamente alcune delle informazioni o nel caso in cui non le abbiano tempestivamente aggiornate. Inoltre, la variabile indipendente binaria, che considera solo la presenza o assenza dell'evento, potrebbe non cogliere la variabilità nei livelli di investimento in digitalizzazione tra le diverse città ospitanti. Alcune città potrebbero aver già intrapreso strategie di innovazione digitale indipendentemente dal singolo evento della finale di Champions League, rendendo difficile attribuire con certezza gli effetti osservati all'evento stesso. Un'ulteriore limitazione riguarda la generalizzabilità dei risultati: sebbene lo studio si concentri su città europee con caratteristiche socioeconomiche relativamente simili, i risultati potrebbero non essere estesi a contesti con dinamiche di sviluppo urbano differenti, come città di paesi in via di sviluppo o con limitata possibilità di accedere a fondi per lo sviluppo e la riqualificazione urbana. Infine, il periodo di osservazione, pur coprendo un arco temporale di oltre un decennio, potrebbe non essere sufficiente per valutare appieno gli effetti di lungo termine della digitalizzazione urbana post-evento.*

Implicazioni manageriali. *I risultati attesi suggeriscono diverse implicazioni per policy maker e amministratori urbani. In primo luogo, le città che ospitano eventi di grande rilevanza internazionale dovrebbero considerare tali occasioni come opportunità per accelerare lo sviluppo delle infrastrutture digitali e migliorare i servizi offerti ai cittadini e ai visitatori. La possibilità di usufruire della portata di tali eventi permette alle città di investire e testare nuove tecnologie su grande scala per poter rispondere in modo più efficiente ai repentini cambiamenti della popolazione dovuti non solo a flussi di turismo internazionale - come nel caso della finale di UEFA Champions League - ma anche a flussi di turismo nazionale dovuti a eventi simili - come nel caso di eventi sportivi di campionati nazionali. In tal senso, il miglioramento delle infrastrutture digitali permette ai governi locali di poter mitigare fenomeni di sovraffollamento, traffico e congestionamento che interessano le smart cities durante i mega-eventi. Nello specifico, gli investimenti in Wi-Fi pubblico e in piattaforme digitali potrebbero non solo rispondere alle esigenze dell'evento, ma anche generare benefici a lungo termine, favorendo la transizione verso modelli di smart city più avanzati e responsivi.*

Inoltre, la gestione strategica della comunicazione digitale si rivela un fattore chiave: le amministrazioni pubbliche dovrebbero adottare un approccio integrato, sfruttando le diverse piattaforme social per interagire con la cittadinanza e rafforzare la propria immagine. In tal senso, lo sviluppo di strumenti per la comunicazione digitale diventa un fattore

cruciale a beneficio sia delle comunità locali, tramite un miglioramento dei servizi per la diffusione di informazioni utili e aggiornate in tempo reale, ma anche per potenziali turisti, visitatori o aziende. In quest'ottica, lo sviluppo di piattaforme di comunicazione digitale diventa una vetrina per le città favorendo la crescita delle attività economiche, l'attrazione di nuovi eventi e il rafforzamento della loro competitività nel panorama turistico e commerciale. Infine, la nostra ricerca evidenzia anche l'importanza della pianificazione post-evento: una volta terminato l'evento, le città dovrebbero continuare a investire nella digitalizzazione per evitare un ritorno ai livelli preesistenti e consolidare i progressi raggiunti. Con ciò non si auspica a una costosa manutenzione degli "elefanti bianchi" quanto ad un consolidamento del progresso tecnologico maturato, cucito sulle esigenze specifiche e prospettiche della città. Infine, gli sponsor e gli attori del settore privato coinvolti nell'organizzazione dell'evento potrebbero trarre vantaggio dalla creazione di partenariati con le amministrazioni locali per promuovere soluzioni tecnologiche innovative e sostenibili.

Originalità dell'articolo. *Questo studio contribuisce alla letteratura esistente sulla digitalizzazione urbana e sugli impatti economici e sociali dei mega-eventi, introducendo un'analisi empirica comparativa dettagliata basata su un dataset longitudinale. L'uso del Wayback Archive per tracciare l'evoluzione dei servizi digitali municipali rappresenta un approccio innovativo che consente di superare le limitazioni dei dataset tradizionali. Inoltre, la combinazione di indicatori di infrastrutture digitali e strategie di comunicazione permette di ottenere una visione più completa della trasformazione digitale delle città ospitanti. L'approccio econometrico adottato, con l'integrazione di un modello a effetti fissi e test di robustezza avanzati, garantisce una maggiore affidabilità dei risultati, contribuendo al dibattito accademico sull'efficacia degli eventi sportivi come catalizzatori di innovazione urbana. Infine, il lavoro si distingue per la sua duplice rilevanza sia teorica che pratica.*

Dal punto di vista teorico, è il primo lavoro che analizza lo sviluppo tecnologico delle smart cities dalla lente dei mega-eventi, aprendo interessanti orizzonti di ricerca su queste tematiche. Dal punto di vista pratico offre indicazioni utili non solo per la comunità scientifica, ma anche per policy maker, amministratori locali e aziende interessate a comprendere le dinamiche della digitalizzazione urbana e le opportunità offerte dai mega-eventi internazionali. In tal senso, organizzazioni come la UEFA o la FIFA possono utilizzare i mega-eventi come leve per co-creare ed innovare insieme alle città ospitanti.

Festivals' long-term benefits to a host destination: the challenge to adopt a legacy perspective

ELENA BELLIO[1] FRANCESCO CASARIN[2]

Abstract

Cultural events and festivals are a key component of the tourism sector, influencing both the cultural identity of local communities and their economic vitality, while offering visitors unique experiences that foster long-term benefits and community development. Although much of the research on event tourism focuses on economic impacts, recent studies have expanded the scope to include long-lasting effects.

This paper addresses a gap in the literature by exploring the long-term benefits of cultural events, specifically considering the legacy they can leave on local development. The research aims to apply the legacy concept—widely studied in the context of mega-events and sport events like the Olympics—to festivals, proposing they can play a significant role in community development and placemaking through their contribution in social cohesion, community well-being, and cultural preservation.

The Treviso Festival network in Italy is considered, due to its variety and relevance at both a local and national level. Through semi-structured interviews with festival founders and organizers, the study will assess the long-term benefits of Festivals. The collected data will be analysed using Atlasti tool.

By incorporating a strategic long-term perspective, the research advocates for a holistic managerial approach to cultural event planning that recognizes the importance of community-driven development and heritage preservation.

The study will also provide a contribution to the empirical literature on the legacy applying it to the cultural context, offering valuable insights for cultural managers to leverage Festivals' effects in the long run.

Framing of the research. *Cultural events and Festivals play a key role in shaping the world's cultural tourism landscape becoming important drivers, offering unique experiences that attract people while shaping the identity and vitality of local communities (Lopes and Hiray, 2024). Much of the literature studying event and festival benefits builds on the early work in the area of event tourism, in which Getz (2005), Ritchie (1984b) and Hall (1992) are the most often cited authors. It must be noted that, despite the growth and popularity of Festivals and special events, researchers have been very slow in directing their studies beyond economic impacts (Gursoy et al., 2004). There is evidence to suggest that, only in recent years, such a broader perspective has come to be adopted, identifying a variety of potential effects, including social, cultural, political, physical and environmental ones in the long run. The concept of legacy seen as the planning effort to confer long-term benefits to a host destination (Hartman and Zandberg, 2015) and to be distinguished from the word "impact" which is caused by a short-term impulse to the economy as an outcome directly connected to an event (Thomson et al., 2019), has mostly been applied to large scale events and specifically sporting ones (Langen and Garcia, 2009). While legacy studies have not been specifically designed to provide evalutaions in the cultural context, cultural events and Festivals are able to provide long lasting effects to a territory contributing by attracting visitors, increasing spending on lodging, food, transportation, and shopping, and providing cash for local companies. Furthermore, they generate job opportunities and encourage investment in tourism infrastructure. Being also vital in conserving and promoting cultural history, customs, and identity. In fact, cultural events and Festivals increase community participation, capacity building, improving social cohesion, pride, and identity within the community (Lopes and Hiray, 2024).*

Cultural events and Festival: value in the current tourism field

Events are one of the ways in which the community can find an opportunity to meet, share, be proud, develop cohesion and experience different cultures (Grassi, 2023). In the past, events were arranged to celebrate a specific happening, now they may be presented in order to meet specific objectives with the emphasis on attracting more visitors and the expenditure associated with them.

Main benefits or objectives of events can be listed as follows (Saayman and Saayman, 2006):

- *Increased community pride and spirit;*
- *Strengthening of traditions and values;*

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

- *Greater participation related to the theme of the event;*
- *Adaptation of new social patterns or cultural forms through exposure at the event;*
- *Marketing benefits, which include branding and creation of a positive image;*
- *Increased volunteerism and community group activity;*
- *Intercultural interaction and co-operation;*
- *Economic benefits.*

Several authors (Miles and Green, 2008, Stoneman, 2015) have suggested that, the cultural context has some differences if compared to other industries or service provision models; furthermore, when dealing with the innovation process related to the creative industries it is noticed that it requires particular and detailed investigation (Salvador and Pedersen, 2022) having often been analyzed in terms of specific subsectors, such as art restoration, music, archaeology companies, book publishing and museums. A particular creative industry case is cultural Festivals (music, cinema, etc.), which are classified as events and, due to their singularity, are analyzed from the perspectives of their management (Getz, 2008), the degree of uncertainty (Rüling and Pedersen, 2010) and their social impact (Del Barrio et al., 2012).

Getz (2005) defines Festivals as public celebrations with a special theme, while Smith (2015) defines them as special events or themed celebrations open to public and organized annually or more rarely. Festivals can be understood as periodically recurrent, social and open occasions that last for several days and contain a series of coordinated events with a theme that is culturally significant for the local (Getz, 2010); being meant as an important attraction for tourism destinations (Cudny and Cudny, 2016). The growth in the number of Festivals means that the festival sector has increased in economic and cultural significance and it also means that there is greater competition to attract a large enough audience to secure the necessary benefits linked to it (Knardal and Bjørnenak, 2020).

A precise measurement of the long term value generated by a cultural event such as a festival offers arguments about the contribution of culture to society and the economy. In fact, Festivals provide the opportunity for locals to preserve their culture and history through art, crafts and performances (Yozukmaz et al., 2020). At the same time, they attract foreigners to their destination of which they present customs and traditions (Long et al., 2004). But as Goldblatt, Getz, Hall (2002, 1997, 1992) argue, the festival organisers and local governments seem only to take into account the economic impacts ignoring the other huge implications especially forgetting to adopt a long term perspective.

Cultural events and Festival: benefits measurement

Festivals play a major role in culture-led development. However, the way the value of the creative industries (including Festivals) is assessed is skewed toward economic impact studies (Safari et al., 2021) or socio-economic ones (Attanasi et al., 2013). The purpose of an economic impact analysis is to measure the economic benefits that accrue to a community (Saayman and Saayman, 2004). According to Getz (1997) economic impact assessments often includes a multiplier calculation to demonstrate that incremental tourist expenditure has direct, indirect and induced benefits for the local economy. These economic-centric approaches to the evaluation of arts and culture are in contrast to the "ecosystem" view of cultural events that highlights the interdependencies between economic, social, and cultural outcomes (Jeffcutt, 2004, Holden, 2004). Events have long been viewed as only a tool for economic development (Saayman, 2012), while, since the early 2000s, it has been understood that events can provide the impetus for the transformation of host cities. These events offer opportunities for changes to the tangible and intangible or material and symbolic - characteristics of cities through, for example, regenerating downtown areas, upgrading public infrastructure, and enhancing or altering a city's image (Cantillon, 2022). There is today a growing number of studies dedicated to developing tools to measure all the impacts of Festivals as the one of Fredline, Jago et al. (2003) who documented the processes involved in developing a scale to be used in assessing the social impacts of three different events. Hall (1992), from the very beginning of his studies, had argued that, looking at events and specifically Festivals, environmental, socio cultural and political effects are probably more important than economic ones, but have tended to be ignored because they are hard to be quantifiable.

Festivals, both in the pre and post-event stages, can offer a range of opportunities, and the bundling of planned activities should be combined with local services, capabilities and capacity within the region's supply chain (Chalip, 2004). Doing so can retain festival expenditure inside the destination creating strategic convergence between the characteristics of a focal event and the ways a destination wishes to portray its "distinctive" brand producing tangible benefits for both city and festival stakeholders. As Chalip's (2004) proposes, developing the features and images of the event and incorporating them into the destination's overall marketing mix is the natural outcome of such strategic convergence. Hamilton et al. (2008), represent one rare example in which an evaluation on a cultural event is made (of the Highland Year of Culture) focusing on economic, social and cultural impacts before, during and after the festival year, using a range of qualitative and quantitative methods.

Event Legacy as a long term perspective: from mega events to Festivals

Due to the wide range of benefits an event can provide, the interest in the so-called event legacies specifically linked to mega events or mega sport events has grown exponentially, and has become central to the rhetoric and practice of event committees, event governing bodies, and host governments (Thomson et al., 2013).

Mega-events can be defined as "high-profile phenomena associated with prestige and global visibility that frequently cause large-scale transformations of cities and regions through their legacies" (Kassens-Noor et al., 2015). More broadly, sport mega-events are a type of "hallmark event" which "provides the host community with an opportunity to secure high prominence in the tourism market place" (Hall, 1992). They have been one of the fastest

growing segments of the tourism industry, with cities and countries vigorously competing to host such events (Zarotis, 2021).

Legacy is used to refer to the effects before, during, and after an event on a host destination. Legacies can be classified in different ways (Hartman and Zandberg, 2015). One of the earlier articles to consider event legacies outlined that "part of the justification for enormous capital investment in events is the promise of legacy for the host community or nation" (Gets, 1991). Over the last 2 decades, event legacies definitions have been rationalized behind the longer term perspective (Girginov and Hills, 2013). A further discussion concerns the temporal aspect. Some authors define legacy as a set of "permanent" consequences, while others "as a set of long-lasting effects." A further perspective argues, however, that legacy can include both short-term and long-term consequences. Getz (1991, 2005) for example, defines legacy as a set of permanently conferred benefits. Hiller (2000) also defines legacy as "(a set of) permanent improvements on the surrounding environment." Chappelet (2003), on the other hand, defines it as a long-term impact, and McCloy (2003), in a more narrowly sporting context, refers to legacy as "a long-term use of sports equipment." Another widely debated issue concerns when legacy occurs. Indeed, scholars are asking whether these occurs before, during or after the event. McCloy (2003), for example, defines them exclusively as a post-event consequence. Chalip (2003), on the other hand, analyzing the field of tourism, argues that tourism visits that occur before the event itself should also be considered legacy. Roche (2003) and Barney (2003) highlight how the symbolic value of the Olympics and its commercial potential are not limited to a specific point in time, but represent something that organizers must manage before, during and after the event.

Preuss (2007) focused and defined legacies in sport mega event as the "planned and unplanned, positive and negative, tangible and intangible structures created for and by a sport event that remain longer than the event itself". He also identified six elements through with to explain it: infrastructure, know-how, networks, culture, emotions, and image. Moreover, Chappelet (2012) pointed out that legacies may be planned and top-down implemented such as enhanced infrastructure and mobility. Legacies could also be unplanned and emerge from the bottom-up, such as positive and negative emotions towards an event and its impacts. Yet, the unplanned side of legacy and its delivery is rarely acknowledged in research on legacy, in fact the issue is still at the center of the academic debate but as Thomson et al. (2013) point out, most of the publications that support the idea that legacies are a consequence of strategic planning are recent.

Furthermore, literature on event planning, legacy planning, and impact studies of mega events can be distinguished as a positive legacy (critical success factors) and factors that are related to a negative legacy (failure factors). By doing so, it is possible to discuss the relationships between legacies and planning strategies. The legacy of an event has direct effects such as spatial/physical, economic and social-cultural as well as indirect effects such as image, branding and urban recognition. Policies, culture, social structure and economic power that dominate the city have a decisive role in the legacy of activities. In this sense, each host area shapes its event legacy and determines whether the sustainability of event venues is ensured or not. More recently, Allen et al. (2022) highlighted the increased importance of legacy within the event management context, noting that for some events, the issue of legacy has become central to the decision to host or create them.

Although economic mega event impacts are strong, they are short-term and therefore not a legacy. Researchers and policy makers have called for a longer term focus and a more comprehensive evaluation of outcomes which are included in the notion of legacy (Thomson et al., 2013). The legacy, is all additional post-event value (Thomson et al., 2019). A frequently highlighted aspect is the need to develop this long-term perspective, whereby an event is embedded in a larger pre and post event development programme. For instance, organizing side events prior, during, and after the main mega event. Alternatively, an event can be used as a catalyst to encourage youth to participate in sports, for urban redevelopment, or to enhance infrastructure (Ritchie, 2000). These aspects implicitly articulate the need for a focus that goes beyond economic factors, and includes social, community, and education objectives (Smith, 2014). Post-event planning includes keeping the memory of an event alive, through a legacy (Chappelet, 2012).

Lately, attention for the legacy of events has grown substantially and the literature review brings to the conclusion that legacies are likely to be multifaceted because benefits can range from political, infrastructural, temporal and place specific (Whitson and Horne, 2006).

Since Festivals are now considered as critical issues in the current tourism field, by determining interactions between local people and guests as an element of tourism experience (Intason, 2024), this research proposes to apply the theoretical and managerial implications of sport meta-events legacies to Festivals, specifically considering the distinct characteristics of cultic events compared to sports events.

Purpose of the paper. *Many studies focus on the short-term economic benefits of cultural events on tourism, such as immediate revenue generation. In respect of culture as a means of regeneration there are policy documents which allude to a long-term and sustainable legacy left by festivals. However, while there is agreement that they have the potential to offer long and positive benefits (Arcodia and Whitford, 2007, Tucker and Property, 2008) there is rarely clear guidance as to how this will be determined or measured in the policies that accompany festival-development projects. Furthermore, the focus has tended to be on either specific pieces of legacy or an incomplete selection of legacies, and the concept of legacy has often been confused with leveraging, sustainability or even impacts. To attempt to reduce the confusion, and fill the gap, this paper would like to understand the long-term benefits of Festivals on destination development, community*

well-being, and cultural preservation. The overall purpose of this research is to explore if and how the legacy of mega-events can be applied to Festivals to analyze their long-term role in promoting local development.

The framework proposed by Robertson (2009) and made of the following six key themes: festivals and policy; stakeholders and contested meaning; social impacts and social impact measurement scales; community and networks; community and social capital; and festival directors, has been identified for further exploration. These themes are used in this work to critically reflect on Festivals in the light of some specific considerations emerged in literature such as: (a) bestowed or planned; (b) temporal or continuous (c) local or global (Thomson et al., 2009); (d) type of topic/content and (e) age of the event.

The paper will also identify new legacy dimensions specifically applicable to the cultural context and Festivals.

Starting from the proposed framework, the authors would like to understand (1) which are the possible long-term effects that can be referred to Festivals; (b) what are the conditions under which these long-term benefits emerge; (c) if and how effects vary depending on the festival typology and content in order to properly explain what levers need to be implemented to foster them.

The strength of the study lies in demonstrating how a legacy framework—adapted from mega-events—can be operationalised in smaller-scale, recurring cultural contexts by showing what aspects of existing legacy models are being confirmed, challenged, or extended. This perspective provides a way to leverage the Festival delivery to achieve outcomes which go far beyond the immediate economic ones. This will emphasize the significant role that Festivals can play in contributing to placemaking and generating well-being within communities with a specific focus on long-term benefits.

Managerially, the paper offers practical guidance on how to design and manage festivals with long-term community impact in mind.

Methodology. *This research project starts from a medium-long term reflection on how it is becoming increasingly important to be able to maximize the positive effects over time deriving from a cultural event. Noticing that in event evaluation, traditionally only short-term impacts (mostly economic) are measured and analyzed. In order to perform the study, a qualitative approach is adopted because, compared to the quantitative research methods, the focus is on a small number of subjects, from which a substantial amount of information is obtained. Semi-structured interviews are conducted as they represent a powerful qualitative research method (Gallata, 2013) to obtain an in-depth understanding of the dynamics of Festivals planning and measurements, representing the best option for the present paper as already explained by Denyer and Tranfield (2006) and Dixon-Woods et al. (2006) who reflected on the growing recognition of the capacity for qualitative studies to inform policy and practice. Through this methodology it is possible to address a series of key questions, bringing up new ideas during the interview. In fact, semi-structured interview are informal, use open-ended questions, let the interviewees talk without interrupting them, and allow follow-up questions. Interviews are mostly organized face-to-face, when possible, but also online ones have been scheduled (according to the interviewed needs) since they are now accepted as a valid and trustworthy alternatives to traditional in presence interviews (Saarijärvi and Bratt, 2021).*

Semi-structured interviews, as the name implies, need to be pre-planned and well prepared, since the interviewers (the authors in our case) need a guide made of general questions related to the research topic (Hancock et al., 2001). The first step is to develop the interview guide which in this case allows to:

- *reflect on the long-term benefits identified through the literature review: social, cultural, physical, tourist, psychological, political (Brent Ritchie, 1984a, Hall, 1992, Fredline et al., 2003, Jeon et al., 2016);*
- *deepen the understanding of long-term benefits of cultural events on (1) destination development, (2) community well-being, and (3) cultural preservation;*
- *explore the difference in terms of effects, between one-time events or recurring events taking place on a regular basis (as Festivals);*
- *divide the effects on those directly involved in the cultural event and on the indirect stakeholders;*
- *understand the role that components such as tradition, innovation already explored in previous researches both at a general level in cultural contexts (Salvador and Pedersen, 2022) or applied to specific realities such as the Italian Albergo Diffuso form of accommodation (Presenza et al., 2019) can play in fostering a legacy.*

The Treviso Festival network (made of 16 well-established Festivals) is considered since it has gained the visibility, credibility and favor of the public. In fact, it is meant as a "Festival of Festivals" that (a) represents a true excellence in the Italian scene, testified by the fact that most festivals have been taking place for several years now, (b) the network is in continuous evolution and expansion, (c) the network spans multiple areas of culture and knowledge: from literature to sustainable development, from cinema to music, from computer science to comics, from statistics to knowledge of other cultures, from philosophy to theater and visual arts.

For each Festival the founder is identified as the key informant to be interviewed. Stakeholder analysis and most particularly the stakeholder group made of festival directors and festival organizers are highly relevant since they have great significance in determining the relationship of the festival with the local community (Gursoy et al., 2004).

Each interviews lasts between one hour and one hour and a half. The two researchers apply an inductive and deductive processes by putting together the results of previous works and new emerging topics to identify festival activity that will enhance (rather than diminish) their long term effects. Basically, an aggregation of the literature and the central issues that have been repeated within the interviews are identified and assessed for each festival of the network. The qualitative data coming from interviews is analysed using ATLAS.ti tool. The acronym, CAQDAS (Computer Assisted Qualitative Data AnalysiS), refers to software created to aid qualitative data analysis (Friese, Soratto et al. 2018). The software

ATLAS.ti is an example of CAQDAS, which has already been used by many researchers from different fields of knowledge (Flick 2009; Friese 2014). This tool is shown to be a promising strategy for conducting qualitative analysis (Vila-Henninger, 2019, Celia Maria Ronzani et al., 2020). The researchers have worked collaboratively to identify recurring patterns and themes in the data related to the analysed phenomenon. This involved first reading through all the data, making notes using the comments and memos features and planning an initial coding scheme. Then these codes are combined into descriptive themes and quotes are retrieved for each theme. Quotations for each theme help to identify the main findings of the work.

Results. *This research aims to uncover the long-term benefits that Festivals can bring to local communities, cultural preservation, and destination development, extending far beyond the immediate economic advantages typically associated with such events. The study is able to identify and highlight key long-term effects, such as social cohesion, cultural enrichment, sustainable tourism, and improvements in community well-being, which are often overlooked in traditional event evaluations. The findings demonstrate how the concept of legacy can be applied not only to mega events and sport events but also to the cultural context, providing a deep understanding of what is happening in Festivals.*

Insights come from the interviews done involving festival founders and directors' since their perceptions have already been identified as valuable in the development of the body of knowledge in relation to festival evaluation.

Looking at Robertson's 6 key themes (2009), it is possible to emphasize both the general political dimension in terms of support and sponsorship (policy) and the network relevance in terms of synergies. Also the human capital role and how differences occur according to the Festival type becomes a relevant result to be further investigated.

In addition a highly discussed topic in legacy literature, is the role of infrastructures left by a big (sport) event (Preuss et al., 2021). For Festivals the situation is exactly the opposite: it is not the event which creates new facilities and buildings on a territory (where the real legacy value would come from its use over time after the mega event), but the Festival itself uses existing (historical) buildings to exploit them, and creates new ways of usage and the involvement of new targets of visitors.

This research, by seeking to highlight the potential of Festivals, serves as powerful tools for long-term urban, social, and cultural development, providing valuable guidance for future policy-making and event planning strategies.

Research limitations. *The focus on a single city and its festival network represents a limitation. The inclusion of multiple cities or diverse festival networks in future studies could provide a more comprehensive understanding of the legacy phenomenon in cultural studies. Additionally, conducting interviews with individuals directly involved in event planning may introduce researcher bias. Since the interviewees are closely connected to the festivals, their responses might be influenced by their personal views or interests, leading them to provide answers that they perceive as more favorable to themselves. To mitigate this potential bias, future research should include a wider range of participants, such as attendees or community members directly engaged in the festivals. Expanding the scope of informants beyond founders and organisers, would allow for a more balanced perspective, offering insights into how the events are experienced and perceived by diverse stakeholders, beyond just those involved in the planning and in organizational processes.*

Managerial implications. *This research contributes to the growing body of scholarly work that argues the benefits of cultural events and Festivals going beyond the spatial and temporal limits of the festival itself and therefore beyond the scope of typical evaluation tools. In fact, it offers valuable insight into the contribution of cultural events and Festivals on the tourism sector. From a theoretical perspective, the research reinforces the relevance of the Festival ecosystem framework suggesting the need for a more holistic view on legacy creation capacities which should go beyond economic impacts ensuring that Festivals are planned and implemented through a strategic long term approach. The idea could be to embed the cultural event as much as possible in the society, making it a community-driven and community-oriented development project as was suggested by Hartman and Zandberg (2015) when studying the candidature to host the Olympic Games of 2028 in the Netherlands.*

Cultural heritage managers should inform the different stakeholders about the specific benefits of cultural events on local development, as a mechanism to broaden the participation of the population and contribute to the promotion and protection of intangible heritage.

To sum up, the project provides contributions both (1) to the empirical literature adding knowledge on the legacy concept applying it to the cultural context; (2) to the different agents of the cultural and creative sector with benefits measures through a methodology that can be replicated in other cultural events anywhere around the world.

Originality of the paper. *This study highlights the limitations of the traditional focus on short-term economic impact when evaluating events and the lack of legacy consideration in cultural contexts (Langen and Garcia, 2009). By applying an already proposed framework and adapting it to the typical features used to analyze mega sports events, this research demonstrates how the legacy concept can properly be applied to Festivals but in the light of the specific features that cultural events have (when compared to sport ones).*

Key words: *event legacy, culture, festivals, tourism, territory, long-term effects*

Collaborative practices of local operators: Connecting DART model to sense of community in DMO constitution[1]

FABIO CORONA[2] GIUSEPPE MELIS[3]

Abstract

This study investigates value co-creation practices that promote collaboration between local operators and stakeholders in the context of a community-based Destination Management Organization (DMO) constitution in a small town, examining their association with the DART model of value co-creation and operators' sense of community. Despite extensive research on value co-creation in tourism, limited attention has been given to residents as stakeholders, particularly regarding the psychological sense of community as a potential factor in collaborative behaviors.

Using a qualitative methodology, this work-in-progress research analyzes semi-structured interviews with local operators from different productive sectors, employing thematic analysis with a combined inductive-deductive approach. Preliminary findings from 10 interviews (with data collection still in progress) reveal elements connected to some of the DART model's dimensions-particularly Dialogue and Accessibility-and to sense of community dimensions, precisely membership and satisfaction of needs. Preliminary results indicate that reduced communication of initiatives and lack of information represent barriers to collaboration, while training provision and accessibility to institutional resources facilitate collaboration. Respondents reported strong community membership and responsibility, with collaborative behaviors emerging mainly through sector-specific and season-specific initiatives. However, collaboration challenges include inconsistent participation, lack of interest and inter-operator (more generally inter-community) jealousy.

This study provides valuable insights for destination managers by highlighting how specific actions- that can be intended as value co-creation practices- associated with the perception of a sense of community may enhance local stakeholder collaboration in small territorial contexts like the one considered for the study.

Limitations of the study include the specific, small-scale setting, insufficient sample size for theoretical saturation (at the moment), and the explorative nature of the research, that doesn't allow to take conclusion about the actual relationship between constructs.

The paper contributes to tourism management literature by exploring an underexamined construct-sense of community- and an understudied model of value co-creation-the DART model-while addressing the perspective of local residents in value co-creation processes within the constitution of a community-based DMO.

Framing of the research. *Value co-creation practices represent a significant antecedent of community collaboration in tourism context (John & Supramaniam, 2024). Value co-creation generally refers to interactive relationships between multiple stakeholders who participate in the value creation process (Prahalad & Ramaswamy, 2004; Vargo & Lusch, 2008; Chandler & Vargo, 2011). Value co-creation has been extensively studied in the tourism field, especially in terms of relationship between tourists and local/tourism firms or businesses, while not so much attention has been paid to the role of residents as stakeholders in the tourism destination system (Ribeiro et al., 2023). Some evidence showed that co-creation practices between tourists and residents can foster the residents' well-being, thus representing an important resource (Chen et al., 2020). Other scholars found that value co-creation practices are influenced by perceived economic and social benefits of tourism of local residents (Lin et al., 2017). A recent review of John & Supramaniam (2024) proposed that value co-creation practices in tourism and hospitality field can result in behavioral outcomes, like community collaboration, highlighting that co-creation practices support tourists' and local residents' engagement, promoting also the collaboration of the community and not only the collaboration of the service providers. The role of local residents has been considered crucial for tourism development success (Bichler, 2021) and their involvement and consideration is a priority (Presenza et al., 2013; Del Chiappa et al., 2018). In particular, in the context of Destination Management Organizations, the involvement of local stakeholders and more generally the relationships with the local community represent important antecedents of DMO success (Bornhorst et al., 2010). Findings suggest that value co-creation practices lead to positive outcomes, including destination competitiveness (Melis et al., 2023), enhanced*

collaborative behaviors (John & Supramaniam, 2024), and strengthened community relationships and partnerships (Martini et al., 2017). Since community collaboration and involvement represents an important element for tourism and more specifically destination management, exploring the antecedents and drivers of collaboration (between local community stakeholders) represents an interesting venue to study. Beritelli (2011) suggested considering people first - when thinking about collaboration between different stakeholders in tourism destinations - rather than the institutions they represent. Literature has highlighted different challenges related to collaboration and collaborative initiatives regarding local communities, in the tourism field, such as information gaps, coordination challenges, and cultural barriers (Tosun, 2000) but also funding shortages and divergent stakeholder opinions (Simpson, 2008). It is important that tourism firms, like DMOs, acknowledge the existing constraints to effectively address them in their collaborative efforts.

A construct that has been found to be related to collaboration, cooperation or more generally to community participation, is the psychological sense of community (McMillan & Chavis, 1986), referring to the individual perception of the feeling of connection to a community and the corresponding influence, commitment and responsibility towards it. It originates as a social psychology construct, but has also been employed in management studies, highlighting how it could be linked to prosocial behavior and commitment to the community (Boyd & Nowell, 2014). Also, sense of community is related to community engagement (Talò, 2018). It is a multidimensional construct, consisting of membership (feeling of belonging to the community, identification with it and personal investment), influence (two-way influence between community and individual, possibility of active participation and making changes), satisfaction of needs (perception that one's needs can be satisfied through belonging to the community) and shared emotional bond (emotional bond between community members based on the sharing of common experiences).

In the tourism field, Cai and colleagues (2024) observed that psychological sense of community acts as an antecedent of residents' well-being, configuring itself as an important resource. Other studies have extensively explored community-related constructs, considering residents' perceptions: for example, Del Chiappa and colleagues (2018) studied sense of belonging and its relationship with residents' support for tourism; instead, Lee (2013) considered community attachment related to sustainable tourism development. However, sense of community has been understudied in these terms, considering that it represents a different construct from, for example, community attachment. In fact, the former describes the feeling of belonging to a group with shared interests or concerns and the psychological fulfillment derived from this membership (McMillan & Chavis, 1986), while the latter primarily focuses on affective elements and place-related aspects (Lee, 2013).

Considering that value co-creation is conceptualized as an interactive process, based on collaboration between different actors, and that this collaboration can be associated with sense of community, it could be argued that an association between value co-creation practices and sense of community exist.

Considering the context of a DMO constitution, the promotion of value co-creation practices between local operators can act as a way to reinforce the sense of community of individuals; at the same time, the perception of a sense of community can increase the motivation of the operators to carry on value co-creation practices.

A suitable model of value co-creation for exploring such a hypothesis is the DART model (Prahalad & Ramaswamy, 2004) that highlights the interactional nature of value co-creation through its dimensions: Dialogue, Accessibility, Risk assessment and Transparency. In fact, dialogue is at the basis of sharing and knowledge creation among the participants in the interaction; accessibility allows for a greater involvement of people within the process; information about the risks involved and the limits present in participating in co-creation makes people more active in the process and allows them to have more discretion; transparency of information and processes allows for greater trust to be built among all the actors involved (Taghizadeh et al., 2016).

Purpose of the paper. *The present study is based on the following research questions: "What are the value co-creation practices that can promote collaboration between local operators and other stakeholders in the context of the constitution of a DMO? How can these practices be associated to DART model of value co-creation and operators' sense of community?".*

The main objective of the paper is then to explore what are, from the point of view of the local operators, the practices that can be related to value co-creation and that are carried out in the relationship between operators, the local community and external stakeholders, in the context of the constitution of a DMO in a small rural town. Specifically, the paper intends to highlight which practices are carried out by the operators and to interpret them through the lens of the DART model of value co-creation (Prahalad & Ramaswamy, 2004). The second objective of the research is to explore if the practices can be related to a feeling of sense of community of the operators, intended as McMillan & Chavis (1986) defined it. Considering the importance of the local community in community-based tourism management and especially in the "community model" DMO (Flagestad & Hope, 2001), exploring the point of view of the operators of the community represents an insightful resource of information to understand the mechanisms and conditions that motivate local community collaboration and participation. Also, the point of view of the residents of tourism destination (in this case the operators) in value co-creation processes has been understudied in tourism literature and represents an interesting theme that can be further explored (Ribeiro et al., 2023).

Methodology. *The study employs a qualitative methodology utilizing semi-structured interviews with key informants from the tourism development project location. The sample selection criteria incorporated diverse production sectors and varying community roles. Both entrepreneurs (from hospitality, food service, agriculture and farming sectors) and presidents of cultural associations (female chorus, local folk group, art collective) were considered, because of their role*

in the community. All subjects belonged to the local community of the development area, that is a small town. Currently, a total of 10 interviews have been conducted, and the interview process is still in progress, to reach a minimum sample of 20 respondents, to reach theoretical saturation (Hennink et al., 2017). As for now, participants' age range is from 32 to 66 years old.

The interview protocol was developed through a comprehensive literature review of the sense of community (McMillan & Chavis, 1986) and DART model of value co-creation (Prahalad & Ramaswamy, 2004), and the questions were based on the theoretical sub-dimensions of each construct, as detailed in Table 1. Each interview started with an introduction that included a brief explanation of the research project, clarification of the researcher's role, and collection of basic demographic information of the respondent. Following the introduction, the interview proceeded with the seven open-ended questions. Questions were not administered with a predetermined or strict order, but they were adapted based on the natural flow of conversation and the specific responses provided by each participant. This approach was selected to make it easier for the respondents to freely express their thoughts and experiences, by simultaneously exploring the dimensions of interest in the study. Each interview lasted about 30-40 minutes, was audio-recorded and subsequently transcribed. For data analysis, a thematic analysis methodology (Braun & Clarke, 2006) has been employed, adopting a combined inductive-deductive approach, to interpret and combine the obtained data (Graebner et al., 2012), and seeking to identify elements related to the considered theoretical constructs (DART model and Sense of community) while simultaneously exploring potential relationships between identified concepts.

Table 1. Interview protocol (list of questions).

Construct	***Dimension***	***Question***
VALUE CO-CREATION (Prahalad & Ramaswamy, 2004)	*Dialogue*	*How do you receive information about events and initiatives being carried out in [name of the town]?*
	Accessibility	*What do you think are the resources that can be provided to enable active participation and collaboration by people in the project? (both from the working group and the local administration)*
	Risk assessment	*What do you think could be some problems deriving from participating to the project?*
	Transparency	*What information about the project (DMO constitution) should be shared with the community in your opinion? (both from the working group and the local administration)*
SENSE OF COMMUNITY (McMillan & Chavis, 1986)	*Memebership*	*What are the elements that make you feel you belong to the [name of the town] community?*
	Influence	*In your opinion, what is your role in the community? What do you consider to be your responsibility towards the town and its improvements?*
	Satisfaction of needs	*What are the elements that make you satisfied living in [name of the town]? (both as a town and as a community of people)*
	Shared emotional bond	*How do you evaluate the ability to collaborate on the part of the people in the [name of the town] community? Do you think there is a will to build something together in the community?*

Results. *The results obtained so far from the analysis of the interviews are preliminary but have made it possible to highlight elements that can be associated with both the DART model's dimensions of co-creation of value and the dimensions of the sense of community, as well as to collaborative behaviors between operators and the local community. Specifically, regarding the DART model, the analysis revealed contents that can be traced back to two main dimensions: dialogue and accessibility.*

About Dialogue dimension, respondents highlighted the presence of reduced communication of the initiatives promoted by the administration. In fact, despite the existing initiatives, the communication of these was not always clear and precise. This lack of information also concerned the project within which the initiative of setting up the DMO is present. Many respondents (N=7) reported that they had no idea of the existence of the project despite having it publicized in previous months. Furthermore, respondents believe that information about similar events and initiatives can be a vector for community involvement ("The community can be involved if informed") and collaboration. This theme emerged both from the interviews with entrepreneurs and from the interviews with association presidents and was a shared theme.

Considering the Accessibility dimension, entrepreneurs emphasized the need to provide (entrepreneurial) training to local people to facilitate participation in the project and the establishment of the DMO ("I think a lot has been invested here in "things", but little in training on how to handle these "things"). Training was considered important both for those who are already entrepreneurs and for people in the community who would like to contribute to the project. This aspect can be traced back to the provision (accessibility) of resources - particularly skills - to the operators. A significant example of this is represented by a young entrepreneur in the public green sector who stated: "the municipality has been very cooperative with me, helping me to start my activity", highlighting how access to institutional resources, also in the form of collaboration with the operator, can facilitate entrepreneurial activity.

The analysis also revealed the presence of contents associated with different dimensions of the construct of sense of community, with particular emphasis on belonging and satisfaction of needs.

Indeed, a theme that emerged in all the interviews conducted was that all respondents reported feeling happy to live in the community to which they belonged, perceiving a sense of responsibility towards it and recognizing that they had a

specific role to play within it. The sense of responsibility emerged in all interviews with entrepreneurs, one of whom specifically stated that he had returned 'home' after a period abroad to put the skills he had acquired at the service of the community ("I came back because I wanted to build something here [...]").

Among the presidents of cultural associations, the sense of responsibility takes on connotations more related to the cultural development of the territory ("Our association [folk group] keeps alive aspects of the local tradition […]") and social involvement of the community ("We are available to all associations, for all local events, and it is a pleasure"). These themes can be associated with the dimension of belonging, in terms of the perception of being part of and included within the community, but also partly with the dimension of influence, through the recognition of both the 'relevant' role played by each individual within the community and the role of the community and its characteristics in influencing the individual's behavior.

The satisfaction of needs is manifested in the generally positive perception of the community and the absence of significant problems reported by respondents. In terms of content related to collaborative behavior, interviewees report the presence of several collaborative initiatives at the entrepreneurial level (the farmers' cooperative or groups of young people engaged in the collection and sale of cork), but also at the "cultural" level (different cultural associations that collaborate in local traditional events), all aimed at creating value for the community.

Influence in the community was mainly reported by the presidents of cultural associations, who perceive that their activities have a significant impact on local development, in terms of promoting events that not only involve local people, but also bring people "from outside" the town.

Characteristics of the shared emotional bond dimension emerge in the description of summer events involving a large part of the local community. On these occasions, collaboration between different cultural associations is effective, with presidents stating that it is easy to collaborate and that everyone shows willingness. However, this collaboration is described as 'sectoral' and is not characterized by continuous commitment over time: availability decreases when longer participation is requested.

An ambivalent element that emerged regards the presence of jealousy between operators, interpreted negatively by entrepreneurs (all respondents highlighted this) but seen in terms of 'competition' and therefore in less negative terms, by the presidents of the cultural associations.

Preliminary results show that the aspects considered most relevant by operators and significant actors within the community for facilitating collaboration can be associated mainly with the dimensions of dialogue and accessibility of the DART model. At the same time, the most evident contents associated with the sense of community are those related to belonging and satisfaction of needs. Further interviews could highlight other practices that will be likely explained through other DART model and sense of community dimensions.

Research limitations. *While this study explores the potential relationships between practices and constructs previously underexplored in the literature and provides valuable insights for the management of tourism development initiatives, different limitations must be acknowledged. The primary limitation concerns the small-scale context of the investigation, which doesn't allow for a generalizability of the findings. Additionally, the current sample size is insufficient to achieve theoretical saturation, thus limiting the depth of analytical insights and the coherence of the results. Also, considering the explorative nature of the study, it is not possible to highlight specific relationships between the constructs, which can be further explored and tested in future studies.*

Managerial implications. *From the present study different implications can be derived, that are particularly relevant for destination managers establishing community-based Destination Management Organizations (DMOs), who seek to enhance collaboration within local communities and facilitate cooperation between different local stakeholders. By exploring the association between value co-creation practices and sense of community, this study gives destination managers practical insights regarding specific practices that can be used to support collaborative behaviors between residents of a destination. Specifically, the study proposes the DART model as an effective reference framework that can be followed to determine what practices are more associated to residents' sense of community. Consequently, practices related to dialogue, accessibility, risk assessment and transparency could help in promoting inter-operator collaboration during DMO development phases.*

Originality of the paper. *The paper explores two different constructs which have been underexplored in the context of tourism literature. In fact, in spite of the extensive exploration of constructs such as community attachment and residents' sense of belonging in tourism management literature, sense of community has not received the same attention. The construct, as conceptualized by McMillan and Chavis (1986)-defined as an individual's perception of community quality-has not been related to value co-creation. DART model of value co-creation has not also been considered so much in tourism management literature, and considering its relational nature, it is interesting to explore its potential relationship with the construct of sense of community, to understand how value co-creation practices and process can be used to foster a greater sense of community. Finally, the insufficient attention paid to destination residents' point of view, in the process of value co-creation, underscores the importance of examining their perceptions in greater detail.*

Key words: *value co-creation; tourism management; DMO; sense of community; DART model*

The impact of mountain huts as hybrid organizations in the Italian alpine region towards a sustainable tourism development

GIULIA CAMBRUZZI[1] FEDERICA BUFFA[2] UMBERTO MARTINI[3] MASSIMO MORELLATO[4]

Abstract

Objectives. *Due to the significant evolution over time of the mountain tourism and its recent increasing density of visitors, the aim of this work in progress study is to analyse how the growth and evolution of mountain tourism impacts the management of alpine huts by examining how tourists' awareness and behaviours changes in these specific contexts.*

Methodology. *In the initial phase of the research, a desk analysis will compile a comprehensive list of all mountain huts in the study area, followed by their geographical mapping for spatial identification. The characteristics of these huts will be examined and categorized according to Club Alpino Italiano (CAI)'s classification system and other additional indicators crucial for understanding sustainable practice management due to the complexity of the context management. In the second phase of the study, we plan to implement a fieldwork analysis where tourists' behaviour and mountain huts management will be investigated with questionnaires and interviews in order to understand which actions move the strategic environmental behaviours in mountain huts.*

Findings. *The findings of this research, in its initial phase, contribute to the understanding of mountain huts as key infrastructure within the broader framework of sustainable mountain tourism. By classifying huts based on structural characteristics, geographical distribution, and management models, this research seeks to establish a solid foundation for future investigations.*

Research limits. *One of the greatest challenges of this study is navigating the vast and complex landscape of mountain huts. These structures vary significantly, distinguished by numerous criteria, making it extremely difficult to account for all their differences. Additionally, the Italian Alpine region spans a large and diverse geographical area, with varying environmental conditions that further complicate the analysis.*

Moreover, the absence of a unified national regulation for mountain hut management adds another layer of complexity. Instead, management is governed by individual regional legislations, making it difficult to establish consistent criteria for analysis. This regulatory fragmentation presents a significant challenge in determining the most relevant factors to consider in the study.

Practical implications. T*his research lays the groundwork for future studies by mapping and categorizing mountain huts. It offers both theoretical contributions and managerial implications, helping operators manage tourism's environmental impact.*

Originality of the study. *Existing research on mountain huts is scarce and mainly focuses on engineering sustainability. This study addresses the managerial gap, aiming to expand interest and encourage further academic exploration of mountain hut management.*

Framing of the research. *This work in progress research is grounded in multiple theoretical perspectives that provide a comprehensive framework for analysing mountain huts within the tourism sector development, their hybrid organizational characteristics and sustainability practices. The concept of hybrid organizations is central to understanding how mountain huts operate at the intersection of for-profit and non-profit sectors. These establishments provide essential services (shelter, food, safety) similar to non-profit organizations while simultaneously engaging in market-driven activities to ensure financial sustainability (Boyd et al., 2017; Brozek, 2009). This hybridity influences decision-making processes, management strategies, and operational constraints, particularly in remote and high-altitude locations.*

Mountain tourism is inherently linked to environmental sustainability, as it depends on natural landscapes, biodiversity, and ecological balance (Zuzana & Zuzana, 2015). However, as tourism demand increases, issues such as

waste production, resource consumption, and environmental degradation become critical challenges (Demirović et al., 2017). Sustainable tourism frameworks (Unep/Pnuma, 2007) emphasize the need for responsible management, particularly in fragile ecosystems like the Alpine region where the mountain tourism trend is increasing over and over. In addition, the sustainability practices to reduce the tourism impact have become a significant issue in the hospitality industry, particularly in remote tourism establishments where logistical challenges and supply chain limitations exacerbate waste management difficulties (Bausch & Gartner, 2020). Given the complexity and the logistic provisioning in mountain huts, understanding management strategies is crucial for improving efficiency and minimizing environmental impact. This research focuses on mountain huts as hybrid organizations, conceptualized not only for the dualism between private and public ownership but also for the social impact and value profit generation (Jäger and Schröer, 2013) that they generate, and their role in environment sustainability management. The study is organized into two phases:

1. *Mapping mountain huts in the Italian alpine region. The first phase involves a desk analysis to identify and map the geographical distribution of mountain huts across the Italian Alps. Once identified, the huts will be categorized using specific criteria such as CAI affiliation, accessibility, supply logistics, and other relevant factors.*
2. *Investigating governance, operational challenges, and environmentally sustainable strategies.*

The second phase will explore the managerial perspective by interviewing mountain hut managers to understand their governance structures and operational challenges. Additionally, the visitor perceptions of mountain huts (including awareness of environment impact issues in mountain tourism) will be assessed through surveys to capture tourist behaviour and attitudes. In the end a behaviour-based model will be employed to identify and promote more responsible and sustainable practices and identifying the specific factors for achieving optimal outcomes in order to reduce environmental impact in mountain huts.

Purpose of the paper. *Over the past decade, mountain tourism has experienced significant growth across various countries (Pröbstl et al., 2016; Bertocchi et al., 2021; Moss et al., 2009). It has emerged as the second most visited tourism destination after coastal areas (UNEP/PNUMA, 2007; Zuzana & Zuzana, 2015), contributing approximately 15-20% to global tourism, with an estimated annual economic value ranging between 70 and 90 billion dollars (Taher et al., 2015). The European Alps alone accounted for approximately 7-10% of global tourism revenues in 2002 (Duglio & Beltramo, 2019), demonstrating the economic significance of this sector. However, the concentration of mass tourism in a few alpine areas across Europe (Eurostat, 2025) raises concerns regarding sustainable development and management. A defining characteristic of mountain huts is their fluctuating demand patterns, with peaks occurring during the summer and, in some cases, the winter seasons. Consequently, their management must incorporate flexibility to address uncertainties stemming from climatic conditions, environmental restrictions, and regulatory limitations. Given the increasing importance of mountain tourism in both economic and environmental contexts, research in this field has expanded. This study seeks to analyse the role of mountain huts as hybrid organizations in managing the development of mountain tourism in the Italian alpine region.*

Mountain huts were initially established as shelters for individuals seeking refuge in mountain environments. Over time, they evolved into facilities that provide fundamental needs such as accommodation and sustenance. In Italy, mountain huts are classified as part of the real estate sector; however, they do not operate within the framework of conventional real estate market regulations, nor are they managed by professional real estate entities. Their operational complexity necessitates specialized expertise and technologies to function effectively within the challenging mountain tourism sector.

While Italian legislation subjects mountain huts to Law 135/2001, which governs certain aspects of the tourism sector (such as workplace safety, tourism management, and financial oversight), there is no comprehensive national regulation governing their construction and operation. Instead, individual regions establish their own guidelines, resulting in a fragmented and often ambiguous regulatory landscape. This regulatory deficiency complicates managerial decision-making, leading to inconsistencies in operational strategies.

Given their unique characteristics and the absence of a coherent legislative context, mountain huts can be conceptualized as hybrid organizations that operate at the intersection of for-profit and non-profit models. This classification invites a reconsideration of the traditional managerial roles and business objectives associated with these establishments (Haigh & Hoffman, 2011). Mountain huts occupy a distinctive position between the for-profit and non-profit sectors. On the one hand, they fulfill a social and environmental mission akin to that of non-profit organizations by providing essential refuge and hospitality services. On the other hand, they engage in revenue-generating economic activities characteristic of for-profit enterprises (Boyd et al., 2017). The hybrid nature of these organizations is not merely an empirical observation but an analytical reality inherent to their structural and functional composition (Boyd et al., 2017).

In social sciences, hybridity is often understood as a continuum of characteristics that blend elements from two traditionally opposing domains (Brozek, 2009; Makadok & Coff, 2009). We consider mountain huts as an exemplification of this hybridity through three key dimensions: (1) their organizational purpose, which balances for-profit and non-profit objectives (Brozek, 2009; Boyd et al., 2017); (2) their product status, which encompasses both goods and services (Lusch & Vargo, 2011); and (3) their ownership and governance structures, which can be private, cooperative, or public (Boyd et al., 2017; Billis, 2010). Building upon the theoretical frameworks of Brozek (2009) and Makadok and Coff (2009), mountain huts in the Italian alpine region exhibit hybrid characteristics not only in their business models or product status but also in their governance structures.

One of the most prominent entities overseeing mountain huts in Italy is the Club Alpino Italiano (CAI), a national association founded in the 19th century with the primary objective of promoting the exploration and scientific study of Italian mountains. CAI operates as a non-economic public entity, yet it owns numerous mountain huts, which are managed through a subcontracting system by private operators. Under this arrangement, CAI retains ownership while entrusting the operational management to private individuals who, in turn, develop tourism-based economic activities within the prescribed framework of the CAI statute. This governance model ensures a balance between economic viability and the preservation of the social and environmental functions of mountain huts.

In contrast, privately owned mountain huts are both managed and operated by individual proprietors, who retain full control over their business strategies. Unlike CAI-affiliated huts, these establishments are subject only to national and regional legislation, without additional regulatory constraints imposed by an overseeing institution. This model provides greater operational autonomy but also necessitates strategic adaptability to navigate the complex and often inconsistent regulatory landscape. In both cases, managers must possess not only strong managerial capabilities but also a deep connection to mountain environments and a commitment to sustainability.

Mountain tourism represents a vital segment of the global tourism industry, with significant economic implications. Within this sector, mountain huts serve as pivotal infrastructure, supporting both recreational activities and economic development. However, their management is complicated by fluctuating demand patterns, environmental constraints, and an inconsistent regulatory framework. The classification of mountain huts as hybrid organizations provides a valuable analytical lens through which to understand their dual economic and social roles. By straddling the boundaries between for-profit and non-profit models, these establishments contribute to both economic growth and environmental stewardship. Future research should further explore the implications of hybrid governance structures and the potential for regulatory harmonization to enhance the efficiency and sustainability of mountain tourism management.

The increasing accessibility of mountain areas, facilitated by technological advancements such as improved lift systems and electric bikes, has significantly intensified tourist flows. As a result, even high-altitude mountain huts, once difficult to reach, are now experiencing an overwhelming influx of visitors, creating substantial environmental repercussions (Becken & Hay, 2008). In the European alpine region, many remote wilderness destinations are struggling with the pressures of increased tourism, exhibiting characteristics akin to mass tourism (Nepal, 2002; Eurostat, 2022).

This trend has led to heightened concerns about sustainable tourism management. The environmental impacts of excessive visitor numbers include soil erosion, waste generation, biodiversity loss, and water resource depletion (Demirović et al., 2017). Moreover, the construction and expansion of tourism infrastructure often lead to habitat fragmentation, disrupting local ecosystems (Zuzana & Zuzana, 2015). Consequently, the management of mountain destinations must consider the potential alteration of natural conditions due to increasing tourism demand before making any decisions regarding further development (Demirović et al., 2017). Therefore, destination management should focus not only on environmental protection but also on maintaining social and economic balance.

Mountain huts play a crucial role in sustaining tourism within the Italian alpine region, acting as both economic enterprises and essential providers of shelter in challenging environments. Their hybrid nature demands a governance approach that integrates both financial sustainability and environmental responsibility. However, the regulatory landscape remains fragmented, presenting obstacles to effective management. Addressing these challenges requires increased collaboration between public institutions, private operators, and policymakers to develop coherent strategies that support both tourism growth and environmental conservation.

Methodology. *This study aims to examine the behaviour of mountain hut tourists concerning environmental impact across different types of mountain huts in the Italian alpine area. As first phase of the research, an initial analytical investigation is needed for compiling a comprehensive list of all mountain huts in the study area, followed by their geographical mapping to facilitate their spatial identification. Additionally, during this first phase of desk analysis, the characteristics of the different huts will be examined to categorize them according to CAI's classification system (A, B, C, D, E). The second phase of the research will involve fieldwork, where tourists' behaviour and awareness regarding environmental impact will be investigated through face-to-face interviews with mountain hut managers and surveys administered to mountain hut visitors. This study considers several theoretical frameworks to explain different behaviours and attitudes and how they influence individual actions. For instance, Ajzen et al. (2011) developed the Theory of Reasoned Action, a model that represents personal behaviours in decision-making. By introducing behavioural intention as an intermediary between predisposition and actual behaviour, they emphasized the role of intention over the performed action, suggesting that the desire to purchase may be a stronger determinant than the act of purchasing itself. Another relevant framework is Schwartz's (1977) Norm-Activation Model, which explores how individuals make moral decisions and the values that shape their choices, actions, and preferences. Additionally, the Value-Belief-Norm (VBN) theory by Stern et al. (1999) is particularly useful in environmental contexts, as it identifies the factors that drive pro-environmental behaviours. These three models represent just a few of the theoretical approaches that can be applied in this study. They support the core objective of understanding the factors that influence individual behaviour, particularly in relation to waste separation and responsible waste management. However, additional frameworks may also be explored to provide a more comprehensive analysis. Consequently, a behaviour-based model will be employed to identify and promote more responsible and sustainable practices. Identifying the specific factors that influence behaviour will help determine the most effective interventions for achieving optimal outcomes.*

Results. *The findings of this research, in its initial phase, will contribute to the understanding of mountain huts as key infrastructure within the broader framework of sustainable mountain tourism. This phase focuses on the systematic mapping of mountain huts in the Italian alpine region through desk analysis. By classifying huts based on structural characteristics, geographical distribution, and management models, this research seeks to establish a solid foundation for future investigations.*

A crucial aspect of this research is the categorization system adopted for mountain huts. Following the definition provided by the Club Alpino Italiano (CAI), a mountain hut is not merely an accommodation facility but also a structure designed to support mountain activities by providing hospitality and essential services, including emergency shelter (Club Alpino Italiano, n.d., Title 2, Art. 1). CAI classifies huts based on two primary criteria:

1) *accessibility for hikers and;*
2) *the logistics of supply transport.*

These classifications include: (A) huts accessible by private vehicle or within a 10-minute walk from a parking area (including those reached via ticketed transport services); (B) huts accessible via cableways or within 10 minutes of a lift terminal; and categories (C), (D), and (E), which are determined by the estimated hiking time according to CAI trail maps. In terms of supply logistics, helicopter transport incurs the highest costs, whereas cableways require an initial investment that is amortized over several years. Huts classified as category D or higher typically rely on helicopter transport, while category E huts are invariably located more than four hours from the nearest access point (Club Alpino Italiano, n.d.,).

Tab. 1: CAI categories classification of mountain huts

Hours' hiking	Motorized vehicle	Lift	Helicopter
From 0 to 10 minutes	A	B	-
From 10 minutes to 2 hours	C	C	D
From 2 to 4 hours	C	D	D
More than 4 hours	D	E	E

Beyond these technical categorizations, this study reconceptualizes mountain huts as hybrid organizations that operate at the intersection of economic, social, and environmental responsibilities. Hybrid organizations blend elements from both for-profit and non-profit models, making them particularly relevant to understanding the challenges of mountain hut management. The classification of huts as hybrid organizations stems from their dual nature: they fulfil a social and environmental mission by providing essential services in remote areas while simultaneously engaging in revenue-generating economic activities (Boyd et al., 2017). The extent of hybridity varies depending on ownership and governance structures, which significantly influence operational decision-making.

Mountain huts in Italy fall under two primary ownership and management models: those operated by CAI (or similar associations) and those privately owned. CAI-affiliated huts function under a governance framework that prioritizes accessibility and environmental stewardship. Despite generating revenue through hospitality services, their operational constraints align more closely with public or non-profit models, as they must comply with specific guidelines set by CAI. These huts employ a subcontracting system in which private individuals manage day-to-day operations under CAI's overarching principles. Another important aspect about the hybrid organizations that permits to analyse the mountain huts with management lens is the aim critical trade-off the between the aim to develop a social network and take action to support solidarity common values (Granovetter 1983) and the financial effort in order to maintain a minimum profit to keep the business running (Jäger and Schröer, 2013). This model ensures that while economic sustainability remains important, it does not override the hut's social and environmental obligations.

In contrast, privately owned mountain huts operate autonomously, adhering only to standard hospitality and restaurant service regulations. These establishments function as service enterprises akin to traditional tourist accommodations, with the primary distinction being their location in remote mountain settings. Unlike CAI-affiliated huts, private huts are not subject to additional institutional guidelines, allowing greater flexibility in management decisions. However, this autonomy also introduces challenges, particularly concerning the balance between profitability and sustainability. These huts must independently navigate operational constraints such as supply logistics, seasonal demand fluctuations, and environmental preservation while maintaining financial viability.

By recognizing mountain huts as hybrid organizations, this study highlights the complexities of their management. Their operational models must account for fluctuating visitor demand, environmental restrictions, and regulatory inconsistencies. Moreover, managers must balance their role as service providers with their responsibility to uphold the cultural and ecological integrity of mountain environments. This hybrid nature influences decision-making processes related to sustainable management practices and efforts. According to the literature, one of the most problem of mountain huts management is the provision and disposal of waste, that change consistently depending on the characteristics and location of mountain huts have (Khan et al., 2021; Semernya et al., 2017, Reno, 2015).

The classification system developed for this study builds upon CAI's existing framework but introduces additional indicators crucial for understanding sustainable practice management. These include:

1. *The ownership structure (association managed vs. privately owned);*
2. *The seasonality of operations (year-round vs. seasonal operation);*

3. *The type of power source adopted;*
4. *The type of water stored and distribution;*
5. *The number of supply provisions per season;*
6. *The type of waste disposal management;*
7. *The type of services provided (restaurant only or restaurant with overnight accommodation);*
8. *The average number of meals served per day.*

The selection of these criteria emerged from both a literature review and personal experience. Numerous studies have examined the influence of ownership structures on management financial and communal socially outcomes (Jäger and Schröer, 2013; Granovetter, 1985), while research in environmental engineering has increasingly focused on the sustainability of mountain huts, particularly in terms of energy sources and water management in these unique settings. Additionally, personal experience and firsthand knowledge of this context play a crucial role in this phase, as we are directly immersed in it. The selected indicators reflect our current understanding, but this aspect remains open to further refinements as new insights emerge. Additional factors, such as altitude or the ease of contacting the huts, may be considered as the study progresses. I acknowledge that incorporating a broader range of criteria can enhance the accuracy of the mapping process, yet this step also represents one of the study's key trade-offs. Nevertheless, these criteria provide a solid foundation for selecting huts for further investigation, particularly concerning sustainability management. A thorough understanding of these variables will enable a more detailed analysis of the factors influencing environmental impact and waste disposal strategies. Moreover, this selection process ensures that the research framework accounts for diverse managerial approaches, highlighting the interplay between economic viability and sustainability. Another critical dimension of this discussion is the evolving relationship between tourism demand and the natural mountain experience. Mountain huts cater to a diverse range of visitors, from experienced hikers to casual tourists, each with distinct expectations and consumption patterns. The attractiveness of mountain destinations is rooted in several factors, including scenic landscapes, biodiversity, fresh air, and opportunities for outdoor sports and cultural exploration (Zuzana & Zuzana, 2015). However, as mountain tourism operates as an open-access system, where anyone can visit and benefit from these resources, it also generates environmental challenges that must be mitigated (Demirović et al., 2017). The increasing accessibility of high-altitude areas, facilitated by technological advancements such as improved lift systems and electric bikes, has further intensified tourism flows (Paunović & Jovanović, 2017; Bausch & Gartner, 2020).

This influx of visitors has led to significant environmental and operational pressures on mountain huts. Previously isolated high-altitude huts, which once catered primarily to experienced mountaineers, now accommodate a broader tourist demographic, many of whom have different consumption habits and waste generation patterns. Consequently, tourism operators face increasing pressure to balance visitor satisfaction with sustainable management practices. The challenges posed by mass tourism in alpine regions underscore the need for targeted strategies to ensure environmental conservation without compromising the economic viability of tourism enterprises.

The hybrid nature of mountain hut management presents both challenges and opportunities in responding to these tourism pressures. Association-managed huts benefit from institutional oversight, which helps regulate visitor impact through reservation systems, pricing structures, and environmental guidelines. However, their operational flexibility is often constrained by bureaucratic procedures and funding limitations. On the other hand, privately owned huts enjoy greater managerial autonomy, allowing them to adapt more quickly to market demands. However, this flexibility also entails a higher risk of unsustainable practices driven by profit motives.

Given these dynamics, it is imperative to develop governance strategies that integrate best practices from both management models. Hybrid governance structures that combine elements of institutional regulation with entrepreneurial flexibility may offer a viable solution. For instance, implementing standardized sustainable management protocols across both private and association-managed huts could enhance sustainability efforts. Similarly, fostering collaborations between public institutions and private operators could facilitate knowledge-sharing initiatives, improving resource efficiency and environmental conservation measures.

Mountain huts play a crucial role in the broader landscape of mountain tourism, serving as both economic entities and guardians of alpine heritage. Their classification as hybrid organizations provides a valuable analytical framework for understanding the complex interplay between profitability, sustainability, and visitor management. By mapping mountain huts based on diverse criteria, this research lays the groundwork for future investigations into sustainable management and operational strategies.

Future research should further explore the managerial implications of hybrid governance models, assessing their effectiveness in mitigating tourism pressures while maintaining financial viability. Additionally, comparative analyses between different alpine regions could provide insights into best practices for harmonizing regulatory frameworks and enhancing sustainability efforts. Ultimately, the findings of this study contribute to the ongoing discourse on sustainable mountain tourism, emphasizing the need for integrated management approaches that balance economic growth with environmental preservation and understanding how policymakers and stakeholders can work towards a more sustainable future for mountain tourism.

Research limitations. *One of the main challenges of this study is addressing the diversity and complexity of mountain huts. These structures differ widely in terms of ownership, accessibility, services offered, and environmental conditions, making it difficult to establish a single set of criteria that fully captures their variety. Furthermore, the Italian Alpine*

region is vast and geographically diverse, with variations in climate, altitude, and infrastructure that further complicate the analysis.

Another significant challenge is the absence of a unified national regulation governing mountain hut management. Instead, each region follows its own legislation, leading to inconsistencies in operational standards, sustainability requirements, and waste management policies. For example, some regions may impose stricter environmental regulations, while others prioritize accessibility and tourism development. This regulatory fragmentation makes it more difficult to define common indicators for comparison, requiring a flexible and adaptive approach in selecting relevant criteria for the study.

Managerial implications. *The research establishes a solid foundation upon which further research can build. First of all, this work wants to realize a map and categorization of mountain huts and a further aim will investigate the second phase of the analysis related on research-tools design identified. By addressing this topic, the study not only contributes to theoretical discussions but also offers valuable managerial implications as a strategic management tool for mountain hut operators to mitigate the negative impact of tourism on the mountain environment. Moreover, given the persistent challenge of environmental impact, this research serves as a starting point for a more comprehensive exploration of the issue, ultimately contributing to the development of innovative strategies for reducing tourism negative impact in mountain huts.*

Originality of the paper. *The existing literature on mountain huts is limited, with most studies focusing on sustainability from an engineering perspective. This research aims to contribute to the managerial field, addressing the existing gap and expanding interest in this topic. By doing so, it seeks to stimulate further studies and encourage a broader exploration of mountain hut management within academic research.*

Key words: *Mountain tourism management, Sustainability tourism management, Tourists' behaviour, Alpine huts, Hybrid organizations.*

Il nomadismo digitale come fenomeno turistico. Analisi sull'attrattività dei borghi italiani e sulle opportunità di valorizzazione dei territori

ANTONIO FERRARO[1] FEDERICA BUFFA[2] PIER LUIGI NOVI INVERARDI[3] UMBERTO MARTINI[4]

Abstract

Il fenomeno del nomadismo digitale ha assunto un ruolo crescente nell'economia globale, trasformando profondamente le dinamiche del lavoro e del turismo. Con circa 35 milioni di nomadi digitali nel mondo (Statista, 2024), di cui l'1,4% italiani (Flatio, 2023), emergono nuove opportunità e sfide per le destinazioni turistiche, in particolare per i borghi italiani. Questa ricerca esplora l'attrattività dei borghi italiani per i nomadi digitali, analizzando i fattori che influenzano la scelta di queste destinazioni e le strategie di valorizzazione territoriale più efficaci. A tal fine, è stato sviluppato il Digital Nomads Attractiveness Index (DNAI), un indicatore quantitativo che misura il potenziale attrattivo dei borghi italiani in base a sei dimensioni chiave (costo della vita, connettività, spazi di coworking, ambiente, mobilità, attività). L'approccio metodologico combina un'analisi quantitativa, attraverso la costruzione del DNAI, con l'analisi di un caso studio (che ha previsto la conduzione di interviste e la somministrazione di questionari) focalizzata sul caso studio del borgo di Montecreto, in provincia di Modena, che ha recentemente avviato strategie di valorizzazione e promozione territoriale per attrarre, tra i diversi segmenti turistici ritenuti strategici, i nomadi digitali.

I risultati evidenziano come i borghi situati in aree montane del Nord-Est mostrino un'elevata attrattività, grazie al livello delle attività turistiche e a una crescente infrastrutturazione digitale. L'analisi del caso Montecreto conferma il potenziale dei piccoli borghi nel ridefinire la propria offerta turistica in chiave sostenibile, puntando su soggiorni di media-lunga durata e promuovendo modelli di turismo destagionalizzato.

La ricerca sottolinea l'importanza di strategie partecipative di destination management, in grado di valorizzare le specificità locali e favorire un'integrazione armoniosa tra nomadi digitali e comunità ospitanti. Le implicazioni manageriali evidenziano come l'attrazione di nomadi digitali nei borghi possa rappresentare una leva per la rivitalizzazione delle aree interne e la diversificazione dell'offerta turistica, contribuendo al raggiungimento di obiettivi di sostenibilità sociale ed economica.

Contesto della ricerca. *Il nomadismo digitale rappresenta un fenomeno emergente che si colloca all'intersezione tra trasformazioni socio-economiche globali (D'Andrea, 2016), innovazioni tecnologiche (Richter A. et al., 2018) e nuovi modelli di mobilità lavorativa* (*Uriely, 2001; Bassyiouny & Wilkesmann, 2023). Nato come nicchia culturale alla fine degli anni '90 (Makimoto & Manners, 1997), il fenomeno ha registrato una crescita esponenziale negli ultimi anni, accelerata dall'avanzamento della digitalizzazione e dal diffuso ricorso allo smart working durante la pandemia di COVID-19 (Shawkat et al., 2021). Attualmente, la comunità globale dei nomadi digitali conta circa 35 milioni di individui, con un crescente interesse verso destinazioni che combinano qualità della vita, connessione digitale e ricchezza culturale (Statista, 2024).*

La letteratura scientifica ha analizzato il nomadismo digitale attraverso diverse prospettive disciplinari, tra cui sociologia, economia e studi culturali (D'Andrea, 2016; Hermann & Paris, 2020). Nell'ambito del tourism management, l'attenzione si è focalizzata sui fattori di attrattività delle destinazioni, sugli impatti socio-economici del fenomeno e sulle dinamiche di interazione tra nomadi digitali e comunità locali (Bassyiouny & Wilkesmann, 2023; Hannonen, et al. 2023; Miocevic, 2024; Mancinelli, 2022).

Il fenomeno del nomadismo digitale genera numerosi impatti socio-economici sui territori ospitanti, influenzando in modo significativo lo sviluppo delle destinazioni coinvolte. Zhou et al. (2024) e Bassyiouny & Wilkesmann (2023) evidenziano come l'arrivo di nomadi digitali in territori prevalentemente rurali o marginalizzati possa contribuire al rilancio economico locale, promuovendo la nascita di nuove imprese, l'incremento dei consumi nei servizi locali e la

rigenerazione urbana. Tuttavia, studi recenti (Hannonen, 2023; Miocevic, 2024) hanno messo in guardia su potenziali criticità associate al fenomeno, quali la possibile pressione sul mercato immobiliare con aumento del costo della vita e fenomeni di gentrificazione. Thompson (2019) sottolinea altresì il rischio della formazione di comunità parallele, poco integrate nel tessuto sociale locale, evidenziando la necessità di elaborare strategie di Destination Management orientate all'inclusione sociale e alla sostenibilità di lungo periodo, al fine di garantire un equilibrio tra sviluppo turistico, tutela dell'identità locale e qualità della vita della popolazione residente. A fronte delle opportunità, ma anche delle criticità evidenziate dalle ricerche sino ad ora condotte, emerge un knowledge gap concernente, da un lato strumenti e indicatori per misurazione il potenziale attrattivo dei territori, dall'altro lato, scelte di Destination Management che le destinazioni possono adottare, per attrarre questo segmento di domanda.

In Italia, l'interesse per il nomadismo digitale è cresciuto negli ultimi anni, grazie anche al contributo dell'Associazione Italiana Nomadi Digitali (AIND), che ha evidenziato come il 93% dei nomadi digitali intervistati esprima una preferenza per soggiorni in piccoli borghi e aree interne, percepiti come luoghi di maggiore benessere e autenticità (AIND, 2022). Questo dato apre una riflessione sulle opportunità di valorizzazione territoriale offerte da questo segmento di domanda, in particolare per i borghi italiani, spesso caratterizzati da dinamiche di spopolamento e marginalizzazione economica.

Nonostante l'interesse crescente per il nomadismo digitale, la letteratura scientifica presenta ancora lacune nell'analisi sistematica dell'attrattività dei borghi per i nomadi digitali e nelle metodologie per valutarne l'impatto sulle destinazioni minori. In particolare, manca uno strumento di misurazione che consenta di quantificare il potenziale attrattivo di un borgo sulla base di variabili oggettive, come connettività digitale, costo della vita e qualità dei servizi. Parallelamente, è ancora limitata l'indagine sulle strategie di co-progettazione territoriale, capaci di integrare le esigenze delle comunità locali con quelle dei nomadi digitali, massimizzando i benefici economici e sociali e mitigando al contempo i rischi di gentrificazione e frammentazione sociale.

Per tale ragione si è voluto esplorare un filone di studi del Destination Management che viene incontro al rispondere alle esigenze delle comunità ospitanti e degli ospiti: il destination design. Ildestination design è un approccio interdisciplinare che nasce dagli studi di design e che combina design thinking, gestione strategica e governance partecipativa per trasformare le destinazioni turistiche (Volgger et al., 2021). L'approccio del destination design è stato applicato con successo a diversi contesti, dimostrando la sua efficacia nel favorire innovazione, sostenibilità e rigenerazione territoriale (Scuttari et al., 2021). Attraverso l'utilizzo del design thinking, il modello consente di rispondere alle esigenze emergenti del turismo, integrando le istanze delle comunità locali con le opportunità offerte dai mercati globali. Thomas & McNeice (2022) propongono un modello strutturato in sei fasi, basato su co-creazione, sperimentazione e valutazione degli impatti, ridefinendo il ruolo delle DMO come facilitatori dello sviluppo locale. L'adozione del destination design nelle strategie di Destination Management permetterebbe di rispondere alle esigenze emergenti del turismo, favorendo innovazione, sostenibilità e rigenerazione territoriale.

Obiettivo del paper. *Il nomadismo digitale è un fenomeno complesso, tra le diverse chiavi di lettura ci si è soffermati sull'approccio turistico. L'obiettivo principale di questo studio è analizzare l'attrattività dei borghi italiani come destinazioni per nomadi digitali, esplorando i fattori determinanti nella scelta di tali luoghi e individuando strategie efficaci di valorizzazione territoriale. Il fenomeno del nomadismo digitale, in costante espansione, offre nuove opportunità di sviluppo per le aree interne e i piccoli comuni italiani, spesso soggetti a dinamiche di spopolamento e declino socio-economico (Symbola, 2023). Inoltre, il "Secondo Rapporto del Nomadismo Digitale in Italia" riporta che il 93% dei nomadi digitali intervistati desidera vivere un'esperienza in un borgo italiano (cfr. AIND, 2022). Tuttavia, la mancanza di strumenti specifici per misurare l'attrattività dei territori e la carenza di applicazioni pratiche di modelli partecipativi di Destination Management mirati ostacolano il pieno sfruttamento di questo potenziale.*

Questa ricerca si propone di contribuire a tale dibattito scientifico attraverso due principali direttrici di indagine. In primo luogo, intende sviluppare e applicare un indicatore quantitativo, il Digital Nomads Attractiveness Index (DNAI), capace di misurare il grado di attrattività dei borghi italiani per i nomadi digitali, basandosi su variabili chiave come il costo della vita, la connettività, la disponibilità di spazi di coworking, la qualità ambientale, i trasporti e il livello di attività turistiche presenti. In secondo luogo, lo studio esplora le strategie di Destination Management, in particolare di destination design, che possano supportare i piccoli comuni nell'attrarre e integrare questo segmento di domanda, garantendo uno sviluppo territoriale sostenibile e inclusivo.

Le domande di ricerca che guidano questo studio sono le seguenti:

- *RQ1: Come si può misurare il grado di attrattività dei borghi per i nomadi digitali?*
- *RQ2: Quali strategie devono adottare i borghi per diventare più attrattivi per tale segmento di mercato?*

Attraverso queste domande, lo studio mira a fornire un quadro analitico e operativo utile sia per la comunità scientifica, sia per i policy maker, offrendo strumenti concreti per la valorizzazione dei territori e contribuendo al dibattito su turismo sostenibile e innovazione nelle strategie di sviluppo locale.

L'analisi del caso studio del borgo di Montecreto, in provincia di Modena, consente di approfondire le dinamiche di co-progettazione territoriale e di valutare l'efficacia delle strategie adottate per attrarre nomadi digitali. Il paper evidenzia le implicazioni manageriali delle strategie di attrazione, ponendo attenzione alle opportunità di crescita economica e rigenerazione sociale.

Metodologia. *La metodologia combina approcci quantitativi e qualitativi al fine di adottare una visione completa e multidimensionale del fenomeno del nomadismo digitale nei borghi italiani. L'obiettivo è duplice: 1) misurare il grado di attrattività dei borghi e 2) analizzare le strategie di valorizzazione territoriale più efficaci, con un focus specifico sui*

processi di progettazione partecipata. A tal fine, la ricerca si articola in due fasi principali: 1) costruzione del Digital Nomads Attractiveness Index (DNAI) e 2) analisi del caso studio di Montecreto:

- ***Costruzione del Digital Nomads Attractiveness Index (DNAI)**: la prima fase ha previsto lo sviluppo di un indicatore quantitativo volto a misurare il potenziale attrattivo dei 5.538 borghi italiani (intesi come comuni con meno di 5.000 abitanti[5]). L'indice è stato costruito seguendo un approccio a più fasi (cfr. Tabella 1):*
  1. ***Selezione delle dimensioni rilevanti**: a seguito dell'analisi della letteratura scientifica e degli studi condotti da enti di ricerca internazionali (grey literature) che evidenziano best practice in tema di nomadismo digitale, sono state identificate sei dimensioni chiave per la definizione del DNAI. La scelta delle dimensioni si è basata in particolare sul framework "7 layers" proposta dal Digital Nomads Observatory (2021).*
  2. ***Raccolta dati**: per ogni dimensione, sono stati raccolti dati da fonti secondarie ufficiali come ISTAT, ISPRA ed European Data Journalism Network; altri dati sono stati ottenuti tramite tecniche di web scraping su siti come: Airdna, 3Bmeteo e Google Maps. Per quanto riguarda il periodo di riferimento, i dati raccolti da banche dati di terze parti si riferiscono al 2022 (molti di questi dati descrivono parametri che tendono a cambiare lentamente nel corso del tempo, quindi, prendendo come riferimento il periodo che intercorre tra la fine del 2022 e il 2024, (si ritiene che non siano sopravvenuti grandi cambiamenti), mentre i dati raccolti tramite scraping, risalgono alla prima metà del 2024.*
  3. ***Pulizia dati**: non avendo ottenuto i dati di tutte le dimensioni per tutti i comuni, si è proceduto per una pulizia, eliminando i comuni che avessero mancanti i valori di una o più dimensioni, raggiungendo un campione di 1.825 borghi.*
  4. ***Normalizzazione e ponderazione**: i dati raccolti sono stati normalizzati per garantire omogeneità tra le variabili. Successivamente, ogni dimensione è stata ponderata sulla base delle preferenze dei nomadi digitali, emerse dall'analisi del Secondo Rapporto dell'Associazione Italiana Nomadi Digitali (AIND, 2022) abbinando ogni dimensione dell'indice a risposte emerse dall'indagine.*
  5. ***Analisi delle Componenti Principali**: i dati sono stati sottoposti a un'Analisi delle Componenti Principali, evidenziando che se si volessero scegliere le prime due componenti principali per rappresentare il data set, solo la variabile della "Connessione" sarebbe esclusa; sebbene essa sia quasi totalmente rappresentata dalla terza dimensione, si è optato di mantenerla nell'indicatore.*
  6. ***Calcolo dell'indice e analisi statistica**: il punteggio complessivo per ciascun borgo è stato standardizzato su una scala da 0 a 100. L'indice è stato poi utilizzato per condurre una cluster analysis, al fine di identificare gruppi omogenei di borghi con caratteristiche simili in termini di attrattività per i nomadi digitali. Questa è la formula dell'indice:*

$$DNAI = (At_i)p_{At} + (Am_i)p_{Am} + (MT_i)p_{MT} + (C_i)p_C + (SC_i)p_{SC} + (CV_i)p_{CV}$$

Dove:

- *DNAI corrisponde al Digital Nomads Attractivness Index;*
- *gli altri valori rappresentano: i punteggi per ogni variabile (es. At_i rappresenta il punteggio della variabile Attività) e i pesi (es. p_{At} è il peso della variabile dell'ambiente).*

[5] Ad oggi (anno 2025) non esiste una classificazione che definisca quali e quanti sono i borghi in Italia. Esistono tuttavia circuiti di eccellenza che coinvolgono i borghi, come per esempio "I Borghi più belli d'Italia", la "Bandiera Arancione" del Touring Club, "Borghi Autentici".
Una definizione per "borghi storici" ci perviene dal *Ministero della Cultura* nell'indizione del *Bandi Borghi del PNRR – Linea B*, ovvero sono definiti come <<*quegli insediamenti storici chiaramente identificabili e riconoscibili nelle loro originarie caratteristiche tipo-morfologiche, per la permanenza di una prevalente continuità dei tessuti edilizi storici e per il valore del loro patrimonio storico-culturale e paesaggistico*>> (Ministero della Cultura, 2023). Il possesso di tali requisiti era la *conditio sine qua non* per parteciparvi.
Una caratteristica comune sia ai requisiti del Bando, che a quelli per entrare in uno dei circuiti di eccellenza prima menzionati, è il requisito che il Comune richiedente abbia meno di 5.000 abitanti. I comuni sotto i 5.000 abitanti, definiti "piccoli comuni", sono spesso oggetto di studi ed analisi sociodemografiche, nonché beneficiari di bandi nazionali e locali ad hoc, in quanto soggetti a fenomeni di spopolamento.

- ***Analisi del caso studio di Montecreto****: la seconda fase della ricerca ha previsto l'analisi di un caso studio: il borgo di Montecreto, situato nell'Alto Appennino in Provincia di Modena. Tale borgo è stato selezionato come caso studio per la sua recente strategia di attrazione di nomadi digitali attraverso l'implementazione di una strategia turistica frutto del progetto di riqualificazione turistica e territoriale "Montecreto Reboot" finanziato tramite il Bando Borghi - Linea B del PNRR. Grazie a questo progetto, il Comune ha incaricato una società di consulenza in Destination Management, di elaborare e implementare la strategia turistica del territorio. Il caso studio è stato analizzato attraverso il modello proposto da Thomas & McNeice (2022) che combina approcci di Destination Management e design partecipativo per valutare la metodologia di lavoro applicata nei processi partecipativi e l'impatto delle strategie sul territorio. La ricerca si è avvalsa di molteplici metodi e strumenti di analisi come di seguito indicato:*
  1. ***Osservazione partecipante:*** *coinvolgimento in prima persona di uno dei ricercatori nel ruolo di project manager del progetto di valorizzazione territoriale tra, con partecipazione attiva nei processi decisionali e nelle attività di co-progettazione (periodo: giugno 2023 - marzo 2024).*
  2. ***Interviste semi-strutturate e somministrazione questionari****: sono state condotte interviste semi-strutturate con stakeholder locali (amministratori pubblici, operatori turistici e residenti) (29 interviste tra giugno 2023 e novembre 2023) e somministrati questionari agli operatori turistici locali (es. gestori di hotel, ristoranti, guide turistiche, etc.) per approfondire le percezioni sul fenomeno e valutare l'efficacia delle strategie implementate (32 questionari raccolti nel periodo tra giugno 2023 e novembre 2023).*
  3. ***Tavoli di co-progettazione:*** *sono stati organizzati quattro tavoli di co-progettazione, ciascuno affiancato da un incontro formativo aperto all'intera comunità locale. Durante questi incontri sono state discusse e sviluppate strategie per il territorio, articolate in quattro ambiti chiave: accoglienza, offerta turistica, comunicazione e promo-commercializzazione (55 stakeholder convolti nel periodo tra settembre 2023 – gennaio 2024).*
  4. ***Analisi documentale****: sono stati esaminati documenti strategici, il piano strategico di destinazione e i documenti interni relativi alle attività svolte per attrarre nomadi digitali (periodo: gennaio 2024-dicembre 2024).*

La metodologia adottata ha permesso di integrare i dati emersi dall'applicazione dell'indicatore DNAI, con un'analisi contestualizzata ad uno specifico territorio. La ricerca ha fornito un'analisi approfondita sia dei fattori strutturali che influenzano l'attrattività dei borghi, sia delle dinamiche locali che determinano il successo delle strategie di valorizzazione territoriale.

Risultati. *I risultati della ricerca offrono una panoramica dettagliata sull'attrattività dei borghi italiani per i nomadi digitali e sulle strategie di valorizzazione territoriale adottate per intercettare questo segmento emergente. L'analisi condotta attraverso l'applicazione del Digital Nomads Attractiveness Index (DNAI) e lo studio qualitativo del caso di Montecreto evidenzia tendenze significative e fornisce spunti concreti per il Destination Management. L'applicazione del DNAI ai 1.825 borghi italiani (analisi quantitativa) ha permesso di elaborare un ranking nazionale basato su un punteggio di attrattività compreso tra 0 e 100. I principali risultati emersi evidenziano quanto segue:*

- ***Caratteristiche dei borghi più attrattivi****: i borghi italiani con i punteggi più alti sono localizzati prevalentemente nelle aree del Nord-Est, caratterizzate da un elevato livello di attività ricreative, infrastrutture digitali adeguate e offerta di spazi di coworking. La classe di comune più attrattiva è l'Area ultra-periferica; la zona altimetrica con un punteggio complessivo più alto riguarda la montagna litoranea e la montagna interna. Rispetto alla categoria turistica prevalente, i Comuni a vocazione montana e con vocazione culturale, storica, artistica e paesaggistica sono quelli con un punteggio più alto.*
- ***Analisi cluster****: l'analisi ha individuato cinque cluster principali di borghi italiani:*
  1. *"Borghi flex hubs": situati in aree accessibili del Centro-Nord, attraggono nomadi digitali per il basso costo e la buona mobilità, ma offrono pochi spazi di coworking.*
  2. *"Borghi luxury": localizzati in zone lacuali con alta qualità della vita, attraggono per l'offerta culturale ma hanno costi elevati e scarsa accessibilità.*
  3. *"Borghi smart": connettività e spazi di coworking ben sviluppati li rendono ideali per lavoratori remoti, nonostante un'offerta turistica limitata.*
  4. *"Borghi natural active": destinazioni rurali e montane con forte attrattività naturalistica e culturale, ma con difficoltà di accesso e trasporto; tale cluster presenta anche il punteggio di DNAI medio più alto.*
  5. *"Borghi detox": localizzati in aree marittime o collinari, offrono tranquillità a costi contenuti, ma con infrastrutture digitali e turistiche limitate.*
- ***Evidenze emerse dal caso studio:*** *la ricerca ha esplorato l'efficacia delle strategie di valorizzazione territoriale basate sul destination design. I principali risultati evidenziano:*
  - ***Incremento dell'attrattività****: grazie agli interventi realizzati tra il 2023 e il 2024 (come il potenziamento della rete Wi-Fi pubblica, la creazione di spazi di coworking e l'attivazione di nuovi servizi turistici), il punteggio DNAI di Montecreto è passato da 55,24 a 61,48 collocando il borgo tra il primo quartile del campione di borghi italiani per punteggio di attrattività.*
  - ***Coinvolgimento della comunità****: il processo di co-progettazione ha favorito un forte coinvolgimento degli stakeholder locali. Le interviste condotte e i questionari erogati evidenziano come residenti e operatori turistici percepiscano positivamente l'attrazione di smart workers e nomadi digitali, soprattutto per la destagionalizzazione della domanda turistica e l'apertura di nuove attività economiche. Inoltre, ciò ha stimolato un'iniziativa privata nell'apertura di nuovi servizi, come lo spazio di coworking.*

Questi risultati offrono una base solida per sviluppare ulteriori ricerche sul nomadismo digitale e il suo impatto sui territori, nonché per supportare amministrazioni locali e operatori turistici nell'elaborazione di strategie di valorizzazione sostenibile.

Limiti della ricerca. *Pur offrendo un contributo significativo alla comprensione dell'attrattività dei borghi italiani per i nomadi digitali e alle strategie di valorizzazione territoriale, la ricerca presenta alcune limitazioni che devono essere considerate per una corretta interpretazione dei risultati e come spunti per future ricerche. Il DNAI è uno strumento innovativo per misurare l'attrattività dei borghi, ma presenta alcune criticità legate alla selezione e alla disponibilità dei dati:*

- ***Parametri quantitativi predominanti**: l'indice si basa prevalentemente su dati oggettivi (costo della vita, connettività, spazi di coworking, ecc.) trascurando fattori qualitativi come l'immagine percepita e/o promossa della destinazione o le esperienze soggettive dei nomadi digitali, che possono influenzare significativamente le scelte di viaggio.*
- ***Limiti di aggiornamento dei dati e delle dimensioni**: alcune fonti utilizzate (es. dati ISTAT o di enti locali) potrebbero non riflettere cambiamenti recenti nelle infrastrutture o nei servizi dei borghi, influenzando l'accuratezza dell'indice. Inoltre, essendo un fenomeno recente e in continua evoluzione, i parametri e i pesi scelti potrebbero non essere validi nei prossimi anni.*
- ***Esclusione di alcune dimensioni**: la fase di standardizzazione dei dati ha portato all'eliminazione della dimensione "comunità di nomadi digitali" (presente nel framework "7layers" proposto dal DNO), una variabile potenzialmente rilevante per valutare l'attrattività sociale di una destinazione.*
- ***Focus geografico limitato**: sebbene il DNAI sia stato applicato a un campione esteso di borghi italiani, l'approfondimento di come l'adozione di un approccio partecipato allo sviluppo turistico territoriale possa incidere sull'attrattività dei borghi per i nomadi digitali (e quindi sull'andamento dell'indice) è stato osservato limitatamente ad un caso studio (il borgo di Montecreto). Questo limita la rappresentatività dei risultati, poiché le dinamiche emerse potrebbero non essere replicabili in contesti territoriali che presentano caratteristiche (socio-economiche e/o infrastrutturali) diverse.*
- ***Segmentazione dei nomadi digitali**: la ricerca considera i nomadi digitali come un segmento omogeneo, ma la letteratura evidenzia la presenza di sottogruppi con esigenze e comportamenti differenti (Hermann & Paris, 2020; Cook, 2023). Approfondire le preferenze di questi sottogruppi potrebbe offrire una visione più precisa delle opportunità di valorizzazione territoriale.*
- ***Limiti legati al caso studio**: il caso studio di Montecreto è stato analizzato in una fase intermedia di sviluppo (2023-2024), pertanto alcune iniziative potrebbero non aver ancora manifestato appieno i loro effetti sul territorio, limitando la valutazione di lungo periodo delle strategie implementate.*

Implicazioni manageriali. *I risultati della ricerca offrono numerosi spunti di riflessione per i decisori pubblici, i destination manager, gli operatori turistici e le comunità locali interessate a valorizzare i borghi italiani attraverso l'attrazione dei nomadi digitali. L'approccio integrato tra analisi quantitativa e qualitativa evidenzia strategie e azioni operative che possono supportare lo sviluppo sostenibile di queste destinazioni emergenti.*

- ***Sviluppo di strategie territoriali basate sui dati:** l'adozione di strumenti come il DNAI consente ai manager pubblici e privati di effettuare analisi basate su dati oggettivi per individuare punti di forza e debolezza delle destinazioni rispetto alle esigenze dei nomadi digitali. I risultati del DNAI permettono di pianificare interventi mirati su specifiche dimensioni carenti (es. miglioramento della connettività, creazione di spazi di coworking, potenziamento dei trasporti), ottimizzando l'allocazione delle risorse e massimizzando l'impatto delle strategie di attrazione.*
- ***Pianificazione sostenibile e destagionalizzazione dell'offerta turistica**: il nomadismo digitale rappresenta un'opportunità per contrastare la stagionalità turistica, incentivando soggiorni medio-lunghi anche in periodi di bassa stagione.*
- ***Coinvolgimento delle comunità locali e approcci partecipativi**: l'esperienza del borgo di Montecreto dimostra l'importanza di adottare approcci partecipativi nella progettazione delle strategie di attrazione. Coinvolgere attivamente i residenti e gli operatori locali nei processi decisionali favorisce l'accettazione del fenomeno e contribuisce a creare un'offerta turistica autentica e coerente con le esigenze del territorio. Workshop, eventi di community building e attività di co-progettazione possono facilitare l'integrazione tra nomadi digitali e comunità ospitanti, riducendo il rischio di conflitti sociali e promuovendo la coesione.*
- ***Innovazione dell'offerta e sviluppo di nuovi servizi**: l'analisi evidenzia come i borghi che investono in infrastrutture digitali e servizi specifici per i nomadi digitali ottengano risultati migliori in termini di attrattività. Creare spazi di coworking, potenziare la rete Wi-Fi pubblica, offrire servizi di networking e mentorship sono elementi chiave per attrarre e fidelizzare questo segmento. Inoltre, l'offerta può essere arricchita con attività che valorizzino le risorse locali (es. laboratori artigianali, corsi di cucina tipica, escursioni naturalistiche, etc.) e promuovano uno stile di vita equilibrato tra lavoro e benessere.*
- ***Gestione dei rischi**: sebbene il nomadismo digitale rappresenti un'opportunità di sviluppo, è fondamentale che i decisori locali pongano attenzione ai potenziali rischi, come la gentrificazione o l'aumento dei costi per i residenti. Implementare politiche di gestione del territorio che preservino l'accessibilità abitativa per le comunità locali, garantiscano il rispetto della capacità di carico delle destinazioni e promuovano pratiche sostenibili è essenziale per mantenere l'equilibrio tra sviluppo economico e benessere sociale.*

- ***Comunicazione territoriale e marchi di qualità:*** *la promozione delle destinazioni deve essere orientata a evidenziare i vantaggi competitivi per i nomadi digitali, come l'equilibrio tra lavoro e qualità della vita, la presenza di comunità accoglienti e la possibilità di vivere esperienze autentiche. strategie di marketing mirate, campagne social e storytelling basati su testimonianze di altri nomadi digitali possono rafforzare l'attrattività del borgo e posizionarlo come remote work-friendly. Inoltre, la creazione di marchi di qualità che certifichino i requisiti necessari per attrarre i nomadi digitali, potrebbero favorire una comunicazione trasparente e informativa, nonché stimolare le destinazioni a migliorare i propri servizi per adeguarsi a determinati standard.*

Originalità del paper. *Questo studio si distingue per il contributo innovativo al dibattito scientifico sul nomadismo digitale e sul destination management, proponendo un approccio metodologico integrato e strumenti originali per analizzare e valorizzare l'attrattività dei borghi italiani. L'originalità di questo studio risiede nella combinazione di innovazione metodologica, contributi teorici e rilevanza pratica. La ricerca non solo approfondisce la comprensione del fenomeno del nomadismo digitale, da una prospettiva turistica, ma propone anche strumenti e strategie concrete per supportare lo sviluppo sostenibile dei borghi italiani.*

Key words: *nomadismo digitale; destination management; destination design; borghi italiani; turismo sostenibile; workation*

La digitalizzazione delle collezioni d'arte moderna e contemporanea in Italia

ENRICO CRISAFULLI[1]

Abstract

La crescente terziarizzazione dell'economia ha avuto un impatto significativo sulle istituzioni culturali, in particolare sui musei, che si trovano sempre più spesso a dover integrare servizi digitali per migliorare l'accessibilità, ampliare il coinvolgimento del pubblico e ottimizzare la gestione delle proprie collezioni. La digitalizzazione non è solo un'opportunità tecnologica, ma rappresenta un motore chiave dell'innovazione nel settore culturale, con implicazioni che spaziano dalla conservazione e valorizzazione del patrimonio alla sostenibilità economica delle istituzioni museali (Bertacchini e Morando, 2013). Tuttavia, nonostante il potenziale trasformativo delle tecnologie digitali (Antinucci, 2007), la loro implementazione nel contesto museale rimane spesso frammentata e disomogenea, a causa di vincoli economici, organizzativi e tecnologici (Corte dei Conti, 2022).

Questo studio si propone di esaminare in dettaglio gli sforzi di digitalizzazione messi in atto dalle istituzioni italiane che gestiscono collezioni di arte moderna e contemporanea, mettendo in luce sia le sfide che le opportunità connesse all'integrazione delle tecnologie digitali nei servizi museali. Attraverso l'analisi delle risposte fornite al questionario somministrato a 75 istituzioni - tra cui musei, gallerie, fondazioni e case museo - questa ricerca intende fornire un quadro complessivo della trasformazione digitale nel settore culturale, contestualizzandolo all'interno delle più ampie dinamiche di innovazione nei servizi. L'attenzione è rivolta non solo agli strumenti e alle strategie adottate per la digitalizzazione delle collezioni, ma anche alle modalità di fruizione dei contenuti digitali da parte del pubblico e alle implicazioni che questi cambiamenti comportano per il modello di sostenibilità economica delle istituzioni museali.

Poiché la ricerca è ancora in corso, il presente contributo si concentra sull'elaborazione e l'interpretazione dei risultati preliminari, individuando le principali tendenze emerse dall'analisi dei dati e suggerendo possibili direzioni per futuri approfondimenti. Verranno, inoltre, discusse le criticità riscontrate dalle istituzioni nel processo di digitalizzazione, le risorse impiegate e le strategie adottate per superare gli ostacoli, nonché le prospettive future per un utilizzo più efficace e diffuso delle tecnologie digitali nel settore museale.

Framework teorico. *Questo studio si inserisce nel più ampio dibattito sull'innovazione nei servizi e sulla trasformazione digitale nel settore culturale, offrendo una prospettiva approfondita sulle sfide e le opportunità connesse alla digitalizzazione museale. Esaminando le dimensioni economiche e organizzative della digitalizzazione nei musei, la ricerca mette in luce non solo le disparità esistenti tra istituzioni di diversa scala e capacità di investimento, ma anche il ruolo cruciale che strategie integrate e approcci sistemici possono avere nel facilitare la digitalizzazione nelle arti. Questa, infatti, non si limita a essere un processo tecnico, ma rappresenta un cambiamento paradigmatico che ridefinisce le modalità di interazione tra le istituzioni culturali e il loro pubblico, trasformando l'esperienza di fruizione e ampliando le possibilità di accesso ai contenuti artistici e storici.*

Obiettivi della ricerca. *La ricerca si propone di raggiungere i seguenti obiettivi principali:*

- *Valutare il livello di digitalizzazione tra le istituzioni italiane che gestiscono collezioni di arte moderna e contemporanea, analizzando la diffusione e l'effettivo utilizzo di strumenti digitali per la catalogazione, la fruizione online, l'interazione con il pubblico e la gestione operativa. L'indagine mira a comprendere in che misura la trasformazione digitale abbia già avuto luogo e quali siano i margini di sviluppo futuri;*
- *Analizzare i fattori determinanti della digitalizzazione, con particolare attenzione a variabili quali le risorse finanziarie disponibili, le strategie adottate dalle istituzioni, il livello di competenza digitale del personale e la qualità delle infrastrutture tecnologiche. Questo approccio consente di individuare le principali barriere e facilitatori nel processo di transizione digitale, evidenziando differenze tra istituzioni di diverse dimensioni e tipologie;*
- *Esaminare l'impatto della digitalizzazione su diversi aspetti della gestione museale, dal coinvolgimento dei visitatori all'efficacia organizzativa interna. In particolare, lo studio si interroga su come le innovazioni digitali possano migliorare l'esperienza del pubblico, favorendo nuove forme di partecipazione e interazione, e su come esse possano contribuire all'ottimizzazione delle operazioni amministrative e curatoriali;*
- *Identificare le migliori pratiche e formulare raccomandazioni politiche per supportare la transizione digitale delle istituzioni culturali, con un'attenzione specifica a quelle di dimensioni più ridotte. L'analisi dei dati raccolti*

[1] e-mail: encrisafulli@gmail.com

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

permetterà di individuare modelli virtuosi e strategie efficaci, offrendo indicazioni utili per lo sviluppo di politiche pubbliche e iniziative di sostegno alla digitalizzazione nel settore museale.

Metodologia. *Per condurre un'analisi approfondita sullo stato della digitalizzazione delle collezioni nei musei di arte moderna e contemporanea, è stato adottato un approccio quantitativo basato sulla somministrazione di un questionario strutturato. Questo strumento di ricerca è stato progettato per raccogliere dati dettagliati sulle strategie digitali adottate dalle istituzioni, sulle risorse disponibili, sulle principali sfide affrontate nel processo di digitalizzazione e sull'impatto che l'innovazione tecnologica ha avuto sulla gestione museale e sull'esperienza dei visitatori.*

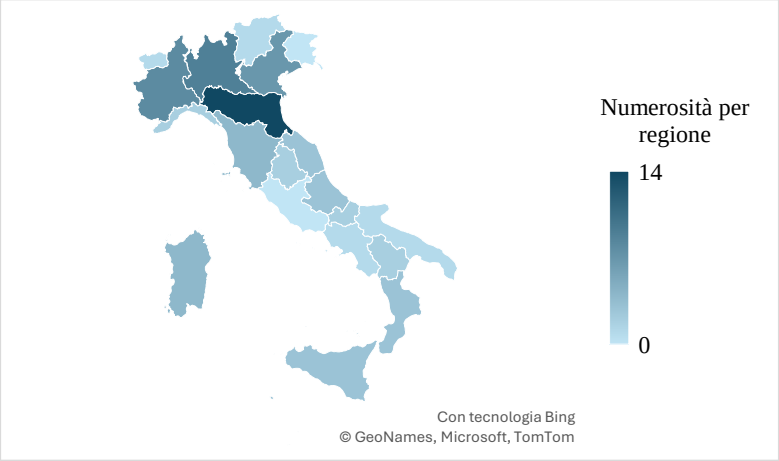
Il questionario è stato inviato a un totale di 330 istituzioni museali, distribuite su tutto il territorio nazionale, selezionate in base alla loro rilevanza rispetto all'oggetto di studio, ovvero la gestione delle collezioni d'arte dalla seconda metà dell'Ottocento fino ai giorni nostri. La selezione è stata effettuata attraverso un'attenta analisi delle istituzioni che possiedono e gestiscono collezioni coerenti con il focus della ricerca, includendo musei pubblici e privati, gallerie, fondazioni e case museo, grazie a piattaforme come "Luoghi del Contemporaneo" e la piattaforma dei luoghi della cultura della Direzione Generale Musei.

Nonostante le numerose sollecitazioni, tra cui l'invio ripetuto via e-mail e un'intensa attività di follow-up telefonico per incentivare la partecipazione, la ricerca ha ottenuto 75 risposte, di cui 5 sono state scartate a causa dell'incompletezza dei dati forniti o per la mancata pertinenza rispetto ai criteri definiti per l'indagine. Il campione finale su cui si basa l'analisi è quindi composto da 70 istituzioni culturali, che rappresentano un segmento significativo del panorama museale italiano dedicato all'arte moderna e contemporanea.

Il questionario è stato progettato per raccogliere informazioni dettagliate su molteplici aspetti della gestione museale, con un focus specifico sui processi di digitalizzazione. La struttura del questionario è articolata in quattro macro-sezioni, ciascuna delle quali mira a esplorare un ambito chiave della digitalizzazione e della gestione istituzionale delle collezioni:

1. *Anagrafica dell'ente e gestione istituzionale: questa sezione raccoglie dati fondamentali sull'istituzione rispondente, tra cui la natura giuridica, la localizzazione geografica e la tipologia di collezione gestita. Inoltre, include domande relative alla gestione economica, con particolare attenzione alle fonti di finanziamento, alla sostenibilità economica e alle eventuali strategie di fundraising adottate per supportare lo sviluppo e l'innovazione digitale;*
2. *Digitalizzazione delle collezioni: analizza in dettaglio lo stato dell'arte del processo di digitalizzazione, raccogliendo informazioni su percentuali di opere digitalizzate, tipologie di contenuti digitalizzati, modalità di archiviazione e livello di accessibilità dei materiali digitalizzati. Un focus particolare è riservato alle risorse impiegate e ai finanziamenti ricevuti, per comprendere meglio le capacità e i limiti delle istituzioni nel portare avanti progetti di digitalizzazione su larga scala;*
3. *Modalità di digitalizzazione delle collezioni: questa sezione approfondisce gli strumenti e le tecnologie adottati nel processo di digitalizzazione, indagando l'uso di software e hardware specifici, le procedure di gestione dei file digitali, le strategie per garantire la conservazione a lungo termine e la compatibilità tra diversi formati e piattaforme;*
4. *Fruizione dei contenuti digitalizzati da parte degli utenti: in questa parte del questionario si esplorano le modalità di coinvolgimento del pubblico con i contenuti digitalizzati, esaminando le strategie di comunicazione, le attività partecipative e le interazioni tra gli utenti e le collezioni digitali. Viene inoltre indagato il ruolo degli strumenti digitali nella valorizzazione delle collezioni, nell'engagement online e nel loro potenziale impatto sulle visite fisiche ai musei.*

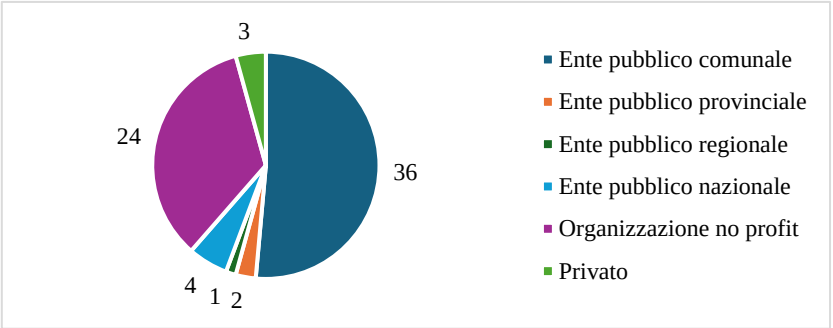
Il questionario è stato strutturato per combinare sia domande chiuse (a scelta multipla e con stime percentuali), che permettono una comparabilità standardizzata dei dati, sia domande aperte, che offrono ai rispondenti la possibilità di aggiungere dettagli qualitativi ed espandere le proprie risposte su aspetti specifici.



Complessivamente, il questionario comprende 60 quesiti, a cui si aggiunge uno spazio finale dedicato a riflessioni e commenti, offrendo ai partecipanti l'opportunità di esprimere considerazioni aggiuntive sulla loro esperienza con la digitalizzazione e sulle sfide future.

Risultati preliminari. *I risultati del questionario indicano che, sebbene molte istituzioni abbiano avviato progetti di digitalizzazione, solo una piccola percentuale ha digitalizzato più della metà delle proprie collezioni, e ancora meno hanno reso questi archivi digitali accessibili al pubblico. Questo scenario riflette un'adozione disomogenea delle strategie digitali, spesso influenzata dalle dimensioni e dalle risorse disponibili. Le istituzioni più grandi, con maggiori capacità finanziarie e tecniche, sono in una posizione più favorevole per implementare strategie digitali complete, mentre le realtà più piccole affrontano ostacoli economici e infrastrutturali significativi. L'assenza di una strategia digitale condivisa nel settore, nonostante la pubblicazione del Piano Nazionale di Digitalizzazione del patrimonio culturale (Digital Library, 2022), limita il pieno potenziale dei servizi digitali nel miglioramento dell'accessibilità culturale e dell'interazione con il pubblico. Quest'ultimo documento, infatti, non fornisce indicazioni operative benché corredato da linee guida per la standardizzazione dei processi.*

Profilo istituzionale e tipologia delle collezioni



I rispondenti si distribuiscono in modo relativamente uniforme sul territorio nazionale, ad eccezione di una prevalenza di istituzioni situate in Emilia-Romagna (20%). La maggior parte delle istituzioni partecipanti all'indagine sono enti pubblici comunali (36 su 70), seguiti da organizzazioni no profit (24), mentre le altre categorie istituzionali, come enti pubblici nazionali, provinciali e regionali, risultano numericamente meno rilevanti. Le collezioni gestite sono prevalentemente miste (35,7%) o composte esclusivamente da arte contemporanea (34,3%), mentre una minoranza include opere sia moderne sia contemporanee (24,3%) o solo moderne (5,7%).

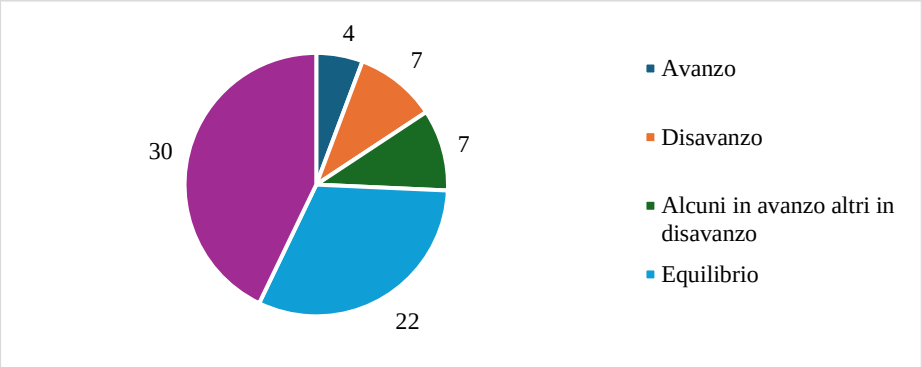
Ente pubblico provinciale	*2*	*2,9%*
Ente pubblico regionale	*1*	*1,4%*
Ente pubblico nazionale	*4*	*5,7%*
Organizzazione no profit	*24*	*34,3%*
Privato	*3*	*4,3%*

Grafico 3. Tipologia delle collezioni degli enti. Elaborazione propria.

Tipologia della collezione	***Numerosità assoluta***	***Numerosità relativa***
Arte contemporanea	*24*	*34,3%*
Arte moderna	*4*	*5,7%*
Sia arte moderna sia contemporanea	*17*	*24,3%*
Collezione mista	*25*	*35,7%*



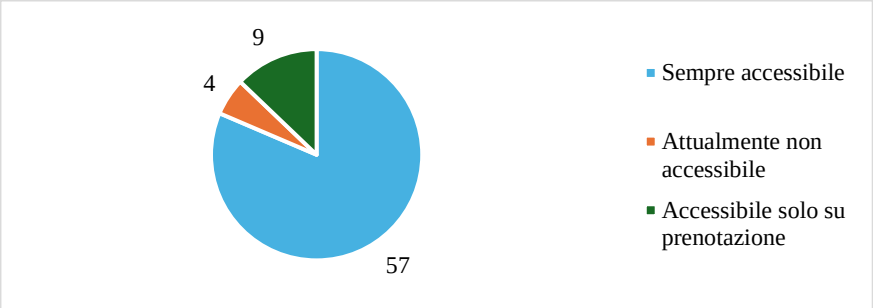
Livello di digitalizzazione delle collezioni

In media, sebbene le istituzioni dichiarino di aver digitalizzato il 68% delle opere di arte moderna e contemporanea della propria collezione, il dato presenta una significativa varianza (1225,63; deviazione standard 35). Questo suggerisce una notevole eterogeneità tra gli istituti, con alcuni che hanno raggiunto un elevato grado di digitalizzazione e altri che sono ancora in una fase iniziale del processo. La dimensione media delle collezioni permanenti ammonta a circa 7.200 opere, mentre il numero di mostre temporanee realizzate negli ultimi tre anni varia notevolmente: in media sono più di 9, ma con casi estremi tra chi non ne ha organizzate e chi ne ha realizzate più di 20 nel periodo 2021-2023.

Situazione economica e sostenibilità finanziaria

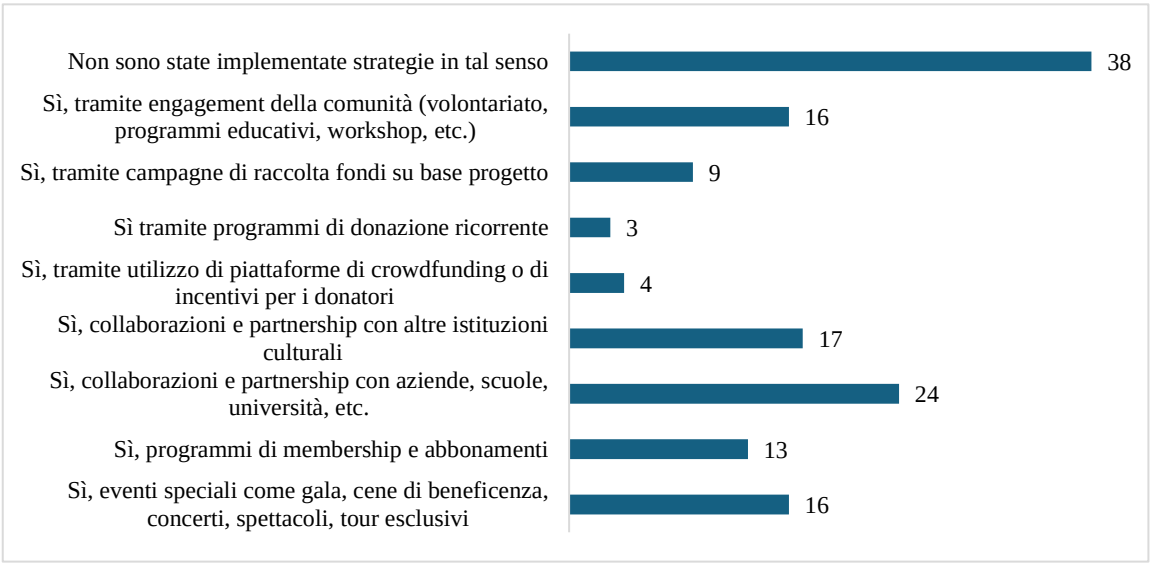
Uno degli aspetti più critici riguarda la sostenibilità economica delle istituzioni: sebbene una parte significativa dei rispondenti abbia dichiarato di aver chiuso gli ultimi tre anni di esercizio in equilibrio (31,4%), il 20% ha registrato disavanzi in almeno un anno del triennio analizzato. Solo quattro istituzioni hanno riportato un utile costante. La raccolta di dati su costi e ricavi ha evidenziato una generale reticenza alla condivisione di queste informazioni, nonostante fossero richieste in forma percentuale rispetto alle voci di bilancio.

Grafico 4. Chiusura del bilancio negli esercizi economico-finanziari 2021-2023. Elaborazione propria



Chiusura di bilancio (2021-2023)	***Numerosità assoluta***	***Numerosità relativa***
Avanzo	*4*	*5,7%*
Disavanzo	*7*	*10,0%*
Alcuni in avanzo altri in disavanzo	*7*	*10,0%*
Equilibrio	*22*	*31,4%*

Modelli di accesso e fundraising

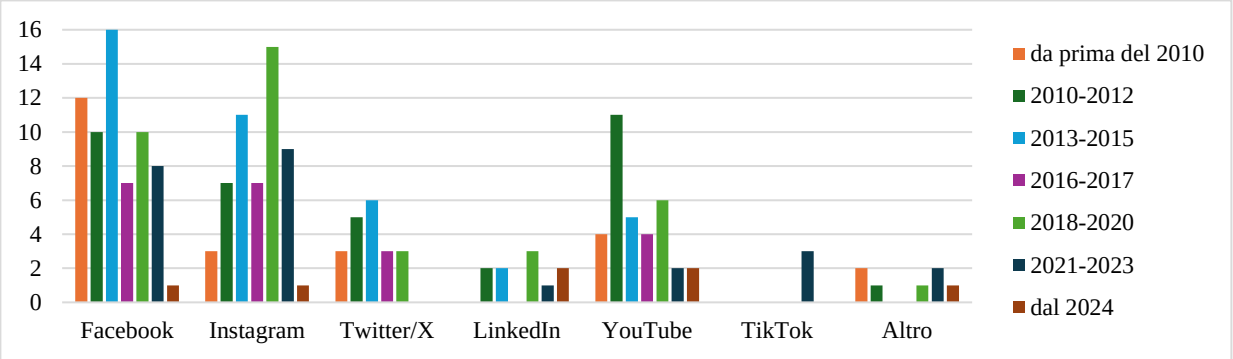


I musei analizzati adottano politiche di accesso variegate: alcuni sono gratuiti, mentre altri applicano tariffe che possono arrivare fino a 25 euro per un biglietto intero, con una media di 5,4 euro e una varianza piuttosto elevata (31,2). L'81% degli istituti è regolarmente aperto al pubblico, mentre il 19% è temporaneamente chiuso o accessibile solo in occasioni particolari. La metà dei rispondenti ha organizzato eventi di fundraising o crowdfunding, utilizzando strategie diversificate tra eventi speciali, programmi di membership, collaborazioni con enti pubblici e privati e campagne di raccolta fondi.

Grafico 5. Attuale accessibilità dell'ente al pubblico. Elaborazione propria.

Accessibilità	***Numerosità assoluta***	***Numerosità relativa***
Sempre accessibile	*57*	*81,4%*
Attualmente non accessibile	*4*	*5,7%*
Accessibile solo su prenotazione	*9*	*12,9%*

Grafico 6. Gestione delle campagne di crowdfunding e fundraising degli istituti. Elaborazione propria.



Strumenti di raccolta fondi utilizzati	***Numerosità assoluta***	***Numerosità relativa***

Sì, collaborazioni e partnership con altre istituzioni culturali	*17*	*24,3%*
Sì, tramite utilizzo di piattaforme di crowdfunding o di incentivi per i donatori	*4*	*5,7%*
Sì tramite programmi di donazione ricorrente	*3*	*4,3%*
Sì, tramite campagne di raccolta fondi su base progetto	*9*	*12,9%*
Sì, tramite engagement della comunità (volontariato, programmi educativi, workshop, etc.)	*16*	*22,9%*
Non sono state implementate strategie in tal senso	*38*	*54,3%*

Strategie di engagement della comunità

L'analisi delle strategie di comunicazione e coinvolgimento del pubblico evidenzia un uso diffuso degli strumenti digitali: il 93% degli istituti utilizza i social media, il 75% ricorre a materiale cartaceo e il 69% sfrutta newsletter per aggiornare il pubblico. Tuttavia, solo il 19% delle istituzioni ha effettuato una stima dell'impatto sociale ed economico del museo sulla comunità locale, suggerendo una scarsa attenzione alla valutazione sistematica delle proprie attività in termini di ritorni territoriali. Il coinvolgimento con i social media è pervasivo: solo cinque istituzioni dichiarano di non possedere alcun account, mentre l'81% ne gestisce almeno due tra Facebook, Instagram, Twitter/X, LinkedIn, YouTube e TikTok.

Grafico 7. Principali account social di cui gli enti sono titolari. Elaborazione propria.

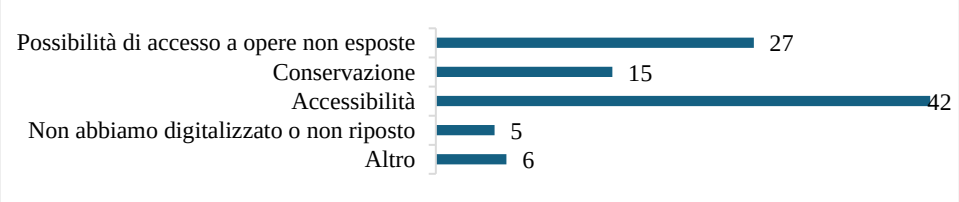
Investimenti in infrastrutture digitali e lavoro agile

La transizione digitale interna è stata affrontata in modo disomogeneo: il 44% degli istituti non ha effettuato investimenti in infrastrutture digitali per il lavoro agile, mentre 22 hanno acquistato portatili (31%) e 21 hanno implementato sistemi di condivisione documentale (30%). Questo indica che, sebbene alcune istituzioni abbiano avviato processi di modernizzazione tecnologica, quasi la metà dei rispondenti non ha ancora intrapreso iniziative strutturali in questo ambito.

Grafico 8. Investimenti realizzati per digitalizzazione interna. Elaborazione propria.

Investimenti per digitalizzazione interna	*Numerosità assoluta*	*Numerosità relativa*
Non risposto	*2*	*2,9%*
Nessun intervento realizzato	*32*	*45,7%*
Sistemi di chat o messaggistica	*15*	*21,4%*
Sistemi di condivisione documenti	*21*	*30,0%*
Piattaforme per videoconferenze	*15*	*21,4%*
Creazione di VPN	*12*	*17,1%*
Portatili per lavoro agile	*22*	*31,4%*
Altro	*4*	*5,7%*



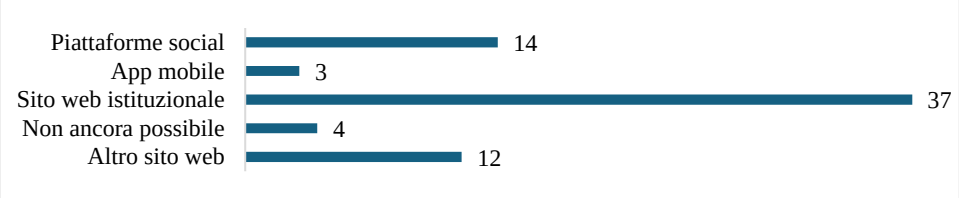
Processi di digitalizzazione delle collezioni

Le opere più frequentemente digitalizzate appartengono alle categorie della pittura (35%) e della scultura (26%). Le risorse economiche destinate alla digitalizzazione si suddividono in costi per il personale interno (25%), servizi esterni (32%) e altre spese, come trasporto e assicurazioni (11%). Tuttavia, il 63% delle istituzioni dichiara di non aver coinvolto figure professionali specifiche per i progetti di digitalizzazione, mentre il restante 37% ha collaborato con specialisti, fra i quali digital humanists, informatici, catalogatori, operatori tecnici, art handlers e conservatori.

Fonti di finanziamento per la digitalizzazione

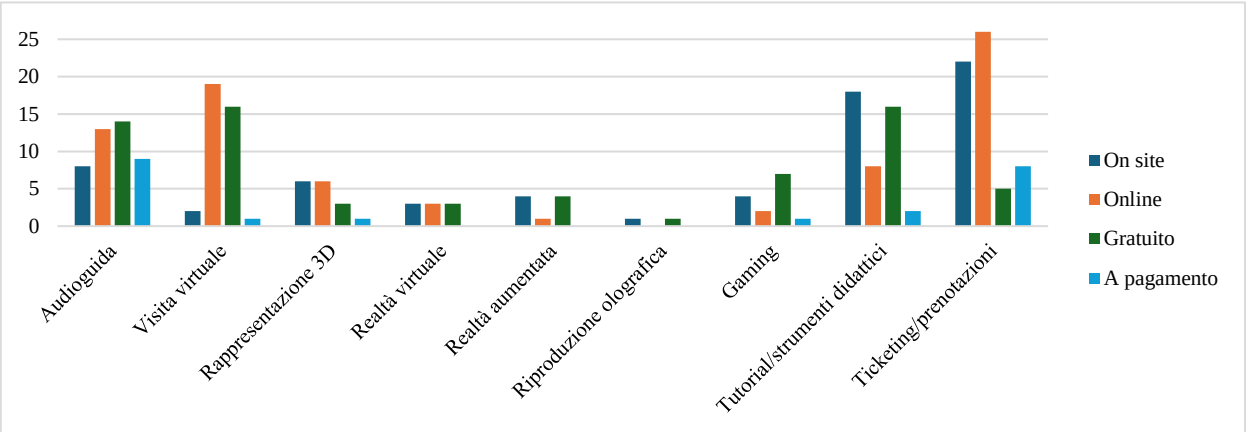
Il 34% degli istituti ha ricevuto finanziamenti esterni per sostenere i costi della digitalizzazione, principalmente da enti pubblici nazionali, ma anche attraverso progetti dell'Unione Europea o sponsorizzazioni private. Tra i benefici riportati dai musei che hanno intrapreso iniziative di digitalizzazione, emergono una maggiore accessibilità ai contenuti digitali, la possibilità di valorizzare opere non esposte al pubblico e, in misura minore, il miglioramento della conservazione digitale.

Grafico 9. Principali motivazioni alla digitalizzazione. Elaborazione propria.



Motivazioni alla digitalizzazione	***Numerosità assoluta***	***Numerosità relativa***
Possibilità di accesso a opere non esposte	*27*	*38,6%*
Conservazione	*15*	*21,4%*
Accessibilità	*42*	*60,0%*
Non abbiamo digitalizzato o non risposto	*5*	*7,1%*
Altro	*6*	*8,9%*

Standard e accessibilità dei contenuti digitalizzati



Le licenze più utilizzate per la condivisione e il riuso delle riproduzioni digitali delle opere d'arte sono Beni Culturali Standard (27%), Pubblico Dominio (23%) e Creative Commons (12%). Un aspetto significativo riguarda la misurazione dell'impatto della digitalizzazione sulle visite fisiche: sebbene non tutti gli istituti abbiano monitorato questa variabile, 12 hanno riportato un incremento dei visitatori, mentre nessuno ha riscontrato una diminuzione.

Gestione interna della digitalizzazione

Un dato critico è che il 97% degli istituti non dispone di un ufficio interno dedicato ai processi di digitalizzazione o trasformazione digitale, e solo il 10% possiede un piano strutturato di digitalizzazione che, quando disponibile, è conforme al Piano Nazionale. Questo evidenzia la necessità di strategie più solide e di una governance interna più strutturata per affrontare la transizione digitale in modo sistematico e duraturo.

I risultati evidenziano un quadro complesso e frammentato: se da un lato molte istituzioni hanno avviato processi di digitalizzazione e innovazione tecnologica, dall'altro emergono limiti significativi, legati alla mancanza di strategie consolidate, alla carenza di figure professionali dedicate e alla difficoltà di accesso a risorse finanziarie adeguate. La digitalizzazione rappresenta una sfida cruciale per il futuro della gestione museale, non solo per migliorare la conservazione e la documentazione delle collezioni, ma anche per rendere le opere d'arte più accessibili a un pubblico più ampio. L'assenza di una pianificazione strutturata e di investimenti adeguati ostacola il pieno sfruttamento delle potenzialità offerte dalle nuove tecnologie rendendo necessario un maggiore coordinamento a livello istituzionale, con una maggiore aderenza alle linee guida nazionali e lo sviluppo di politiche di supporto mirate a garantire una trasformazione digitale sostenibile ed efficace.

Oltre agli aspetti tecnici della digitalizzazione, da questi dati emerge che l'integrazione dei servizi digitali nei siti web e nelle piattaforme museali rimane limitata e disomogenea. Sebbene alcuni musei abbiano avviato iniziative per rendere accessibili online parte delle loro collezioni, la maggioranza lamenta un'inadeguatezza in termini di strumenti e risorse umane. In particolare, poche realtà offrono accesso online in alta risoluzione alle opere presenti nelle loro collezioni, e ancora meno hanno implementato tecnologie interattive come tour virtuali, esperienze in realtà aumentata o piattaforme immersive. La carenza di tali strumenti rappresenta un limite significativo alla capacità dei musei di ampliare il proprio pubblico, attirare nuove fasce di utenti e sviluppare strategie educative innovative basate sulle potenzialità offerte dalla digitalizzazione.

Inoltre, mentre alcuni musei, spesso di grandi dimensioni o con maggiori risorse economiche, hanno potuto sviluppare progetti ambiziosi in ambito digitale, altre istituzioni - in particolare quelle di piccole e medie dimensioni - faticano a tenere il passo con l'innovazione a causa di budget limitati, mancanza di personale qualificato e difficoltà nell'ottenere finanziamenti esterni. Questa disomogeneità rischia di amplificare il divario tra istituzioni con capacità tecnologiche avanzate e realtà meno attrezzate, limitando l'impatto complessivo delle strategie digitali nel settore museale.

Infine, un altro elemento critico emerso riguarda la scarsa valutazione dell'efficacia delle iniziative digitali già avviate. Poche istituzioni hanno implementato strumenti per monitorare l'impatto della digitalizzazione, sia in termini di incremento delle visite fisiche, sia in termini di engagement del pubblico online. Senza una misurazione sistematica dei risultati, diventa difficile per i musei comprendere se e in che modo le risorse investite nella digitalizzazione stiano effettivamente contribuendo a migliorare l'accessibilità, la valorizzazione e la fruizione delle collezioni. Anche in questo caso, per affrontare queste criticità, sarebbe opportuno sviluppare metodologie condivise per valutare il ritorno sugli investimenti digitali, promuovendo un approccio basato su dati concreti e misurabili.

Limiti della ricerca. *Un approccio strutturato alla digitalizzazione, che consideri non solo l'adozione di nuove tecnologie, ma anche l'implementazione di modelli organizzativi innovativi e sostenibili, potrebbe migliorare significativamente il coinvolgimento del pubblico con le collezioni di arte moderna e contemporanea. Questo aspetto è particolarmente rilevante in un contesto in cui la competizione tra le offerte culturali si estende sempre più al digitale e in cui i musei devono trovare nuove modalità per attrarre e fidelizzare visitatori, sia in presenza sia online. Strumenti come piattaforme digitali avanzate, esperienze interattive, realtà aumentata e strategie di engagement basate su dati analitici possono contribuire non solo ad aumentare la partecipazione culturale, ma anche a rafforzare la sostenibilità economica delle istituzioni, aprendo a nuovi modelli di fruizione e monetizzazione.*

A causa della dimensione e della rappresentatività del campione, che, pur includendo 70 istituzioni, potrebbe non riflettere completamente la diversità del panorama museale, è difficile inquadrare lo stato dell'arte dei processi digitali delle collezioni di arte in Italia per contribuire a sviluppare raccomandazioni concrete per i decisori politici, le istituzioni culturali e i professionisti del settore, benché questo sia il fine ultimo della ricerca. Un ulteriore limite è dato dall'attenzione prevalentemente rivolta agli aspetti istituzionali e strategici della digitalizzazione, senza un'analisi diretta dell'esperienza degli utenti finali. Infine, la ricerca si concentra sul contesto italiano, limitando la generalizzabilità dei risultati a livello internazionale, sebbene il quadro emerso possa offrire spunti utili per studi comparativi futuri.

Implicazioni manageriali. *I risultati evidenziano la necessità di politiche coordinate e investimenti mirati a supportare la digitalizzazione delle istituzioni di dimensioni più ridotte. Senza un intervento mirato, il rischio è che si accentui il divario tra i musei più grandi e meglio finanziati, capaci di adottare strategie digitali sofisticate, e quelli di piccole e medie dimensioni, che potrebbero rimanere esclusi da questa trasformazione.*

Superare le barriere economiche e strategiche è essenziale per favorire una transizione digitale più inclusiva, garantendo che il patrimonio culturale rimanga accessibile e fruibile nell'era digitale. In questo contesto, diventa fondamentale il potenziamento dei finanziamenti pubblici e privati, attraverso l'attivazione di fondi dedicati alla digitalizzazione, incentivi fiscali per gli investimenti nella tecnologia e il rafforzamento della collaborazione con il settore privato. Parallelamente, è necessario investire nella formazione di nuove figure professionali in grado di gestire la transizione digitale nei musei, come esperti in digital humanities, data analysts, sviluppatori di contenuti interattivi e specialisti in strategie di engagement online.

La collaborazione tra istituzioni culturali, decisori politici, università, centri di ricerca e partner tecnologici potrebbe contribuire a colmare le attuali lacune e rafforzare il ruolo dei servizi digitali nel settore museale. Creare reti di cooperazione tra musei, sia a livello nazionale sia internazionale, potrebbe facilitare lo scambio di competenze, la condivisione di buone pratiche e la realizzazione di progetti comuni di digitalizzazione. Inoltre, l'implementazione di standard condivisi per la catalogazione, la conservazione e la fruizione dei contenuti digitali consentirebbe una maggiore interoperabilità tra le piattaforme digitali museali, migliorando l'accessibilità e la visibilità delle collezioni.

L'adozione di tecnologie digitali avanzate, come Intelligenza Artificiale, Big Data Analytics e Realtà Virtuale/Aumentata, potrebbe inoltre ottimizzare l'erogazione dei servizi museali, consentendo esperienze più personalizzate e programmi educativi innovativi. Perché queste tecnologie possano realmente trasformare il settore, è necessario non solo adottarle, ma anche integrarle in strategie digitali sostenibili e di lungo periodo. Le istituzioni devono sviluppare piani di digitalizzazione che non si limitino all'acquisto di nuove tecnologie, ma che prevedano anche la formazione del personale, la manutenzione e l'aggiornamento costante delle infrastrutture digitali e una valutazione sistematica dell'impatto di tali strumenti sull'esperienza dei visitatori e sulla gestione del museo. In questo modo, la digitalizzazione non sarà un processo episodico o frammentato, ma una trasformazione strutturale capace di rafforzare la missione culturale e sociale dei musei nell'era digitale.

Originalità del paper. *Questo paper apporta un contributo originale al dibattito sulla digitalizzazione nel settore museale, concentrandosi specificamente sulle istituzioni che conservano collezioni di arte moderna e contemporanea, un ambito ancora poco esplorato rispetto ai musei archeologici o storici. Attraverso un'analisi empirica basata su dati primari, raccolti mediante questionari, lo studio fornisce una visione aggiornata delle strategie digitali adottate e delle barriere che ne ostacolano l'implementazione. Inoltre, il lavoro estende il framework teorico di Bertacchini et al. (2022), applicandolo a un contesto specifico e arricchendone le implicazioni. L'originalità del paper risiede anche nella sua prospettiva applicata: oltre a delineare le criticità del settore, propone raccomandazioni strategiche per favorire una digitalizzazione sostenibile e inclusiva, offrendo così un supporto concreto alle politiche culturali e alle istituzioni impegnate nella trasformazione digitale.*

Museums as knowledge-based organisations and Metaverse: preliminary evidence from a multiple case study

CRISTINA CATERINA AMITRANO[1] CIRO TROISE[2] MARK ANTHONY CAMILLERI[3]

Abstract

Museums serve as significant cultural and educational pillars within societies. They provide access to artefacts, stories, and knowledge that shape collective identity and foster learning, but they have rarely been analysed as knowledge-based organizations. In the actual era of digital transformation, museums are integrating different technologies such as artificial intelligence (AI), virtual reality (VR), augmented reality (AR), and, more recently, the Metaverse with impacts on how knowledge is managed. However, the potential of the Metaverse for museums as knowledge-based organizations remains underexplored, particularly in terms of inclusiveness.

This work-in-progress aims to address this gap by applying a knowledge-based view (KBV) to museums, exploring how they leverage the Metaverse to collect, curate, and disseminate knowledge through the employment of the SECI model by Nonaka and Takeuchi (1994). More specifically, this ongoing study seeks to answer the following research question: How can Metaverse technologies enhance museums' knowledge management (and inclusiveness)?

Adopting a multiple case study approach, this research investigates how museums integrate Metaverse solutions to enhance their knowledge processes. Preliminary results indicate two key themes. First, museums adopting Metaverse technologies are enhancing their knowledge acquisition and dissemination capabilities through strategic partnerships with technology firms. Second, the SECI model is a valid tool for effectively capturing the recent evolution of museums' value proposition, illustrating how virtual interactions can facilitate knowledge socialization, externalization, combination, and internalization. This research contributes to literature by positioning museums as knowledge-based organizations within the Metaverse landscape, bridging the gap between knowledge management and cultural heritage studies.

Framing of the research. *Museums are repositories of human history, culture, and knowledge, playing a crucial role in the preservation and transmission of these knowledge assets, and reinforcing their testimony as civic value to future generations. In recent years, the traditional museum model is undergoing a transformation with the advent of digital technologies (Simone et al., 2021; Russo Spena et al., 2022; Lu et al., 2023; Botti & Baldi, 2025), from virtual and augmented reality (tom Dieck et al., 2018; Errichiello et al., 2019; Trunfio et al., 2020; Khalil et al., 2024; Tang & Zhou, 2025) to the Metaverse (Longo & Faraci, 2023; Sepe et al., 2024). Digital transformation is reshaping the ways museums operate (Li et al., 2024), leading to increasing reliance on both database systems to store and retrieve vast amounts of information related to artifacts, collections, and archives, and online catalogues, making knowledge more accessible and shareable through digital catalogues. More recently, with artificial intelligence (AI) algorithms museums have aided in the classification and interpretation of objects, assisting curators in organizing and presenting collections more efficiently. Further, the museums can exploit their knowledge through Metaverse as a digital space that transforms virtual experiences into a more immersive, three-dimensional environment. Within this environment, users' activities (i.e., actual or potential on-site visitors) are enhanced through augmented reality (AR) and virtual reality (VR) technologies and their engagement is boosted at an increasingly sophisticated level (Longo & Faraci, 2023; Sepe et al., 2024).*

The Metaverse is a rapidly expanding global market, estimated to be worth approximately $130.5 billion in 2024, with projections exceeding $1 trillion by 2030 (Statista, 2024). Its adoption has been increasingly examined from both theoretical and practical perspectives, providing insights into its impact across multiple industries (Dwivedi et al., 2023). In particular, tourism studies have extensively explored its potential to reshape visitor experiences (Gursoy et al., 2022; Buhalis et al., 2023; Liu & Park, 2024; Zhang et al., 2024). From a more applied standpoint, researchers have developed conceptual frameworks to structure its evolution, such as the seven building blocks proposed by Keegan et al. (2024), which encompass identity, conversations, sharing, presence, relationships, reputation, and groups.

In the context of museums, this ongoing discourse on the Metaverse underscores the necessity of designing next-generation cultural organizations where immersive digital environments allow visitors not only to engage with the past

through storytelling and interactive experiences but also to envision the future (Longo & Faraci, 2023). This transformation is particularly relevant for aligning museums' offerings with the expectations of younger, digitally native audiences, ensuring that cultural heritage remains accessible, dynamic, and engaging in an increasingly virtual world.

The Metaverse represents a novel paradigm that has the potential to reshape museums' knowledge processes by enabling immersive, participatory, and socially sustainable experiences. The interactive and multimodal nature of the Metaverse aligns well with knowledge co-creation, as it fosters new forms of engagement through AR and VR (Dwivedi et al., 2023). These technologies not only democratize access to cultural heritage but also enhance inclusiveness by removing physical barriers and providing adaptive environments for diverse audiences, including individuals with disabilities (Arpaci et al., 2022).

Purpose of the paper. *Despite the profound impact of digital transformation on museums and the rapid advancements in immersive technologies such as the Metaverse, existing research has yet to systematically apply a knowledge-based view (KBV) to analyse this evolving landscape. KBV, predominantly used in business studies, posits that an organization's ability to create, capture, and manage knowledge resources is a fundamental source of competitive advantage (Grant, 1996). Extending this perspective to museums provides a valuable framework for understanding their function as knowledge-based organizations dedicated to the collection, curation, dissemination, and interpretation of cultural, historical, and scientific knowledge.*

Previous studies on KM in cultural and creative industries (CCIs) have primarily focused on cultural organizations' roles as collaborators for other firms rather than analysing them as independent knowledge-based organizations (KBOs) (Santoro et al., 2020). This lack of research has led to an underrepresentation of museums' contribution to KM calling for further research on the application of KM in CCIs through a declination of "a knowledge-based perspective related to the adoption of digital technologies in creative and cultural organisations" (Lerro et al., 2022, p. 1935), even though they are deeply involved in knowledge creation, dissemination, and preservation, especially through the opportunities offered by technologies as the Metaverse. On the other side, the integration of technologies by museums (Russo Spena et al., 2022; Longo & Faraci, 2023; Botti & Baldi, 2025) and their impacts has been analysed especially focusing on museums' digitization strategies (Agostino et al., 2020; Simone et al., 2021; Li et al., 2024) while their role in KM remains underexplored, particularly about the opportunity offered by the Metaverse.

This extended abstract aligns with the call for further research trying to fill such a critical gap, given that museums operate as complex knowledge-based organizations, engaging with diverse stakeholders - including visitors, scholars, educators, and policymakers - through both physical and digital interfaces. And these issues are even more evident in the context of technological advancements such as AI, VR, and the Metaverse that have the potential to improve access to knowledge and foster inclusiveness. So, to overcome this gap, we have looked at one of the most influential models in KM (Lambe, 2011; Gaviria-Marin et al., 2019), the SECI model by Nonaka and Takeuchi (1994), that conceptualizes knowledge as an evolving process consisting of socialization, externalization, combination, and internalization to examine museums as knowledge-based organizations. We aim to explore how the Metaverse contributes to the way museums collect, curate, and disseminate knowledge through the adoption of the SECI model. Specifically, this ongoing research seeks to answer the following research question: How can Metaverse technologies enhance museums' knowledge management towards inclusiveness?

Methodology. *This extended abstract employs a qualitative multiple case study methodology, which is particularly suitable for exploring contemporary phenomena in real-world contexts (Yin, 2018). The case study approach allows for an in-depth investigation of how museums are adopting Metaverse technologies to enhance KM and inclusiveness, aligned with the SECI model (Nonaka & Takeuchi, 1995).*

The selected cases include five museums that have pioneered collaborations with technological firms to integrate Metaverse solutions. The selection criteria were based on: a) active use of Metaverse; b) diversity in geographical and institutional context to capture different adoption approaches; 3) availability of data from museum websites, academic literature, and industry reports; 4) potential to contribute to inclusiveness and social sustainability in cultural heritage management.

A summary of the selected museums and their Metaverse initiatives is provided in the following table (Table 1).

Year (↓)	Museum name / Metaverse name	Metaverse platform	Tech company	Country
2021	PODO Museum	Zepeto	Naver Z	South Korea
2022	MAXXI / MAXXIVERSO	Arium.xyz	Arium Virtual Technologies	Italy
2023	The Metropolitan Museum of Art	Roblox	Roblox Corp.	USA
2024	Museo del Cinema	Thenemesis.io	The Nemesis	Italy
2024	Palazzo delle Arti Napoli / MetaPan	Spatial.io	Spatial Systems	Italy

The qualitative research design, after case selection, consists in data collection and analysis. Data collection was primarily conducted through secondary documents as museum reports, press releases, and industry reports, but also through website and digital content as museums' official website and virtual exhibitions. Further, we plan to carry out expert interviews with key stakeholders (i.e., museums' curators, technological partners, accessibility experts).

The collected data will be analysed through thematic coding, focusing on the partnership dynamics between museums and technology firms, and on how knowledge is created and shared through the Metaverse. Findings will be mapped onto the SECI model to understand how tacit and explicit knowledge are transformed within digital museum spaces.

Results. *The initial evidence allows us to delineate two main themes: 1) a narrative analysis of case studies' adoption of Metaverse using a temporal perspective and highlighting the knowledge acquisition through the partnerships with technological firms; 2) a preliminary adoption of the SECI model.*

The first collected data allow us to reconstruct the collaboration process and the main objectives of museums' adoption of Metaverse. Starting from the oldest case study, PODO Museum in Jeju, South Korea, it partnered with Zepeto, a virtual platform where users can create avatars and interact with art in 3D virtual spaces. This partnership aims to provide a digital experience of art exhibitions, enhancing accessibility for a global audience and particularly younger, digitally savvy visitors. The following year, MAXXI, the National Museum of the 21st Century Arts in Rome, has teamed up with Arium to enhance its virtual presence. Arium's platform enables the museum to showcase its collection in a fully immersive virtual environment, reaching audiences who may not be able to visit in person, particularly due to geographic or physical barriers. This collaboration underscores the potential of virtual technologies in promoting inclusiveness and accessibility in the arts. In 2023, also the Metropolitan Museum of Art (Met) in New York partnered with Verizon and Roblox to create an immersive AR experience called Replica. Visitors can use the app to scan artwork from the museum's collection and then access these pieces virtually within Roblox. Users can collect and display digital replicas of famous works, such as Van Gogh's Self-Portrait and ancient Egyptian sculptures. This collaboration not only brings art into the digital realm but also engages younger audiences through gaming, blending education with entertainment. In the last analysed year, 2024, two Italian museums started a collaboration on the Metaverse: the Museo del Cinema in Turin established a partnership with The Nemesis, a virtual world platform, to create a digital space that mimics the physical museum and offer users a chance to interact with cinema history in a virtual format, expanding the museum's reach beyond physical visitors and allowing gamified interactions and new ways to engage with cinematic content and history; the Palazzo delle Arti di Napoli (PAN) started to work with Spatial.io to create immersive virtual galleries as the platform allows users to explore art exhibitions in 3D spaces, allowing for a more interactive and engaging experience.

The second theme reached as a preliminary result is the adoption of the SECI model in analysing museums using the Metaverse technologies. Socialization occurs through virtual interactions, where users can share experiences and knowledge about exhibits.

Externalization involves the transformation of tacit knowledge (personal, experiential knowledge) into explicit forms, allowing curators and museum professionals to articulate their expertise through structured digital initiatives. This process includes the design and documentation of virtual tours, where curators formalize their narratives, historical interpretations, and storytelling techniques. Additionally, the development of gamified experiences transforms curatorial knowledge into interactive, rule-based learning modules that enhance visitor engagement.

Combination is represented by the integration and restructuring of explicit knowledge, merging diverse data sources to create enriched digital experiences, such as combining historical artifacts with interactive digital elements. Internalization allows users to absorb and internalize the knowledge they encounter within the virtual environments, making it more accessible for long-term learning.

The preliminary evidence shows that digital transformation efforts allowed by the Metaverse can facilitate each of the SECI stages, enhancing both the depth and breadth of knowledge shared among audiences, but also between visitors and museums, and museums with high-tech companies managing the Metaverse platforms.

Research limitations. *While this extended abstract aims to provide valuable insights, several limitations must be acknowledged. First, the limited case selection as we focus on five museums, which may not fully represent the broader landscape of digital transformation in cultural organizations. Moreover, the findings may be influenced by the level of digital infrastructure in different regions, affecting the scalability of Metaverse adoption. Finally, as Metaverse technologies are still evolving, further research is needed to assess long-term impacts on knowledge management and social sustainability through longitudinal research.*

Managerial implications. *The preliminary results show potential implications for museums, technology firms, and policymakers. First, museums could benefit from KM strategies and tools to improve their main objectives - e.g., understanding the collection, curation and dissemination of knowledge -, and enhance their efforts in using Metaverse, aligning this innovation with existing knowledge creation and dissemination practices. They can benefit from a partnership with technology firms to accelerate the integration of emerging technologies to improve accessibility and inclusiveness. These potentialities, however, need to be sustained by investment in digital literacy training for staff as it is crucial to manage and curate immersive experiences effectively.*

Looking at technology firms, developing collaboration with museums offers opportunities to co-develop digital solutions tailored to the cultural heritage sector, which is particularly sensitive to accessibility needs (e.g., voice navigation, haptic feedback for visually impaired users, customizable avatars). These developments would also be essential for other sectors with which tech firms collaborate.

Finally, it seems evident how policies should encourage funding and support for digital transformation in museums, ensuring equitable access to Metaverse resources without forgetting to provide regulations on data privacy and digital ownership in virtual museum spaces to protect both institutions and users.

Originality of the paper. *This extended abstract aims to contribute to the literature on knowledge-based organizations by applying this research perspective to an overwhelmed sector as CCIs (Lerro et al., 2022). Focusing on museums, we have tried to start bridging the gap between KM literature and cultural heritage studies, with a particular attention to the application of the SECI model to analyse KM in museums within the Metaverse. We expand the KBV of*

cultural organizations, emphasizing their role in accessibility and inclusiveness thanks to the exploitation of knowledge through Metaverse. By positioning museums as knowledge-based organizations, this research highlights how Metaverse innovations can foster inclusiveness, engagement, and sustainable knowledge sharing in the cultural sector. As digital transformation accelerates, museums must proactively leverage these technologies to remain relevant in an increasingly interconnected world.

The preliminary results show that museums implementing Metaverse technologies in collaboration with technology firms managing platforms like Roblox, Spatial.io, and Zepeto, can enhance the way of collecting, curating, and disseminating knowledge through the adoption of the SECI model.

Through these projects, museums can break down geographical and physical barriers while providing educational experiences that are both inclusive and interactive, especially for younger generations.

Museums play a critical role in engaging various stakeholders, including local communities, scholars, educators, and tourists. The use of the Metaverse can enhance these engagements by creating collaborative spaces where stakeholders can contribute to the development of exhibits, share knowledge, or provide feedback. By using the Metaverse, museums can engage with global audiences, providing virtual tours and interactive experiences that attract people who may otherwise be unable to visit in person due to geographic, financial, or social barriers.

One of the most transformative impacts of the Metaverse on museums is its ability to enhance inclusiveness, particularly for people with disabilities. Traditional museums can present challenges for visitors with mobility impairments, sensory disabilities, or learning difficulties. In contrast, virtual environments such as the Metaverse can be designed to accommodate a wide range of needs, eliminating physical constraints and providing unrestricted access to collections. By breaking down geographical and financial barriers, the Metaverse extends museum experiences to audiences who may otherwise be unable to visit in person. It also offers adaptive tools such as audio descriptions, haptic feedback, and customizable avatars, making art and education more accessible. Additionally, Metaverse technologies can provide real-time translation services for individuals with hearing impairments and create multi-sensory experiences tailored to visitors with autism. These innovations reinforce museums' commitment to social sustainability by fostering greater inclusiveness and ensuring equitable access to cultural heritage.

Key words: *Museums; Knowledge-based organization; SECI Model; Metaverse; Inclusiveness; Social Sustainability*

Does virtual help real? Investigating how virtual tours affect learning, satisfaction, museum liking, and willingness to visit

CONCETTA FERRARA[1] DOMENICO SARDANELLI[2] MARA CERQUETTI[3]

Abstract

Assuming the disruptive role played by Information and Communication Technologies (ICTs) in enhancing museums' appeal and attracting new audiences, this paper focuses on how virtual tours (VTs) can be used as an information tool outside of a museum and their effects on users' learning and satisfaction as well as the museum liking and the intention to visit it. Two experiments were designed. The first experiment was conducted to compare the impact of a text-based tool (a written guide) with the impact of an immersive tool (a virtual tour) on these variables, and to investigate the mediating role of the flow experience. A second study was designed to explore the moderation role of museum reputation, comparing a well-known museum with a less known one. As for the first experiment, both multivariate and post-hoc univariate models show that the VT increases visitors' satisfaction, but does not significantly increase learning levels, museum liking, and willingness to visit. The relationship between VT use and satisfaction is mediated by the flow experience. The differential multivariate effects of VTs strengthen the internal validity of the emerging relationship with satisfaction and the missing relationships with more distal psychological variables. Taken together, the results orient practitioners towards reconsidering the use of traditional written tools and evaluating the quality of VR-based experiences.

Framing of the research. *With recent advancements in Information and Communication Technologies (ICTs) an increasing number of museums has recently resorted to new technologies (Nigro et al., 2018) not only to preserve cultural heritage, but also to make the institution more accessible and appealing to the wider public, thus transforming museums into places where visitors are invited to live memorable experiences (Leoni & Cristofaro, 2021). Virtual reality (VR) is an emerging technology based on interactive simulations recreating physical experiences in a virtual environment (Manis & Choi, 2019), and it is widely used to create virtual museum exhibitions. For instance, virtual tours (VTs) can enhance both the on-site and off-site visitor experience, by creating immersive paths and interactive content that can encourage visits (Jung et al., 2016; Kabassi et al., 2019).*

Several studies have explored some aspects of user experience museums, analysing, for example, the effectiveness of VR technologies in terms of immersion and overall satisfaction (Anastasovitis & Roumeliotis, 2023; Škola et al., 2020; Arayaphan et al., 2022) and learning outcomes (Pei et al., 2023). However, how the use of these technologies outside of a museum impacts users' learning, satisfaction, and intention remains understudied.

It is also unclear how a museum's reputation affects the relationship between VR and visitors' intention and experience. Indeed, even if some studies show that brand awareness – at the aggregate level – is occasionally able to predict the firm's market performance (Homburg et al., 2010), there is a paucity of research on the impact of brand awareness and individuals' purchase intention.

The aim of this ongoing study is to fill these gaps and investigate the impact of museum information tools and museum reputation on users' learning and satisfaction and on museum liking and willingness to visit. To this aim, the impact of VR-based tools on these variables has been compared with that of traditional written guides. A first experiment focusing on a lesser-known museum has been conducted, and a second one comparing two museums that differ in reputation has been designed.

Purpose of the paper. *Satisfaction in museums is influenced not only by the technical quality of the service but also by the emotional, cognitive, and social values associated with it (Caldwell, 2002; Martín-Ruiz et al., 2010). While analysing the image formation process of a museum, Gil and Ritchie (2009) found that the affective and emotional dimensions of the service experience, such as socialising and enjoying, have a greater influence on visitors' perceptions of the museum than cognitive factors. Similarly, Conti et al. (2017) revealed that museum visitors seek new forms of value co-creation, focusing on other dimensions of the cultural experience, such as entertainment, escapism, and socialisation.*

The use of new technologies positively affects cultural consumption, both in qualitative (quality of the diffusion of the knowledge) and quantitative (number of people who can access knowledge) terms (Bekele et al., 2018). For instance, in museums, VR enables a user-centred presentation and provides visitors with authentic, engaging and tailored experiences within the cultural heritage context (Han et al., 2019; Southall et al., 2019). This is particularly true in the case of VTs, immersive visit support tools that place users inside a place or image, improving their "situational awareness and providing the highest level of functionality for viewing, capturing and analysing virtual data" (Osman et al., 2009, p. 173).

Therefore, visitors should be able to better appreciate museums since the interaction between them and cultural artefacts is facilitated (Hawkey, 2004). Integrating traditional cultural content and other experiences, such as socialisation, immersion and entertainment, VR tools can enhance visitors' satisfaction and enjoyment and amplify the experiential value of cultural heritage (Trunfio et al., 2018, 2022).

VR is also recognised as a valuable tool for educational purposes (Arayaphan et al., 2022). It could enhance the whole learning process (Fowler, 2015; Tom Dieck et al., 2018): users can get information about the cultural institution, collections or single objects in a playful and engaging way, with significant benefits also in terms of satisfaction. Existing studies on learning in VR-based museums generally concern knowledge acquisition and cognitive skills but also emotional engagement (Zhou et al., 2022). Some research highlighted the potential of AR and VR tools to enhance higher-order thinking skills, such as creative thinking (Guazzaroni, 2013; Hammady et al., 2020) and critical thinking (Poce et al., 2019).

Furthermore, hard-to-access sites can be made available through VR (Jung et al., 2016). By creating digital learning resources, museum VTs develop an "offsite" offer that stimulates user engagement, thus meeting the needs of those who are not able to physically visit a museum or those who want to have an idea of the museum before visiting it (Kabassi et al., 2019). This represented a crucial opportunity during the Covid-19 pandemic, when the general closure of museums led cultural institutions to develop and adopt a wide variety of approaches, such as VTs, able to stimulate remote engagement (Noble, 2021; Sifaki, 2022). More generally, in a marketing perspective, VTs can act as promotional tools to catch potential visitors' attention and invite them to physically visit a museum (Wang et al., 2024). Based on these premises, VR is also increasingly applied in cultural tourism as a bridge between potential tourists and destinations (Lee et al., 2020).

Thus, we state that:

H1a. The information tool influences visitors' satisfaction.

H1b. The information tool influences museum liking.

H1c. The information tool influences visitors' learning.

H1d. The information tool influences the willingness to visit a museum.

Two crucial elements in VR-based experiences are represented by the "sense of being there" and the flow experience. VR can generate a strong sense of presence in users, offering them the opportunity to experience a high degree of immersion and to interact with virtual spaces in realistic ways (Guttentag, 2010). This immersion can, in some cases, lead to a flow state (Tussyadiah et al., 2018), a mental condition in which individuals become fully engaged in an activity and experience a profound sense of enjoyment and satisfaction (Csikszentmihalyi, 1990; Wang et al., 2024)..

Virtual environments also generate stronger emotional responses that, in some cases, can lead to greater appreciation and liking for the experience (Kim & Hall, 2019).

Furthermore, immersive technologies provide users with engaging experiences and create interactive learning environments that support deeper cognitive and knowledge retention processes (Dede, 2009). Additionally, in this immersive environment, users can experience a museum or a single artefact in a way similar to the real exploration, thus enhancing learning outcomes (Radianti et al., 2020).

In addition to educational benefits, immersive virtual experiences stimulate curiosity and interest by offering a preview of a museum's offerings, thus encouraging users to plan an in-person visit (Tussyadiah et al., 2018). Supporting this, Lee et al. (2020) highlighted that users' willingness to visit museums is influenced by VR's ability to deliver absorbing experiences characterised by high levels of engagement and immersion. Thus, we state that:

H2a: Flow mediates the relationship between the information tool and visitors' satisfaction.

H2b: Flow mediates the relationship between the information tool and museum liking.

H2c: Flow mediates the relationship between the information tool and visitors' learning.

H2d: Flow mediates the relationship between the information tool and the willingness to visit a museum.

Museum reputation, including factors such as brand awareness, can influence both visitor preferences and satisfaction. Indeed, prospect customers are commonly believed to be more attracted to popular locations and museums (Bollo 2004; Solima 2013) and the museum's brand image can positively impact visitor satisfaction, which, in turn, increases their likelihood of recommending the museum to others (Virto et al. 2024). The interaction between awareness and informational tools on visitors' satisfaction is less predictable. On the one hand, it might be that greater museum brand awareness enlarges pre-consumption expectations, making it more difficult for the brand to meet them. Following this line of reasoning, brand awareness might negatively affect visitors' satisfaction, irrespective of the digital tool adopted before the visit. On the other hand, however, well-known museum brands may be buffered against negative

visitors' evaluations, especially because of the higher perceived reliability of renowned institutions (Daskalaki et al., 2020). This might be reflected in greater post-consumption satisfaction.

Additionally, more popular museums might induce greater learning in visitors who encounter them, whether through a written guide or a virtual tour. This effect of museum brand awareness on visitors' learning might be due to the fact that visitors are more motivated to learn about well-known museums rather than about unknown museums (Yang & Lau, 2019).

Museum brand awareness might play an important role in spurring visit intention, especially for first-time visitors (Gartner & Ruzzier, 2011). Indeed, awareness is deemed as a necessary condition for a trial purchase to occur. If people are not aware of the existence of a museum, they do not have the opportunity to develop an intention to visit it. However, awareness is not a sufficient condition for products' first trials, since awareness might fail to induce interest in the product, and so it might not lead to increased behavioural intention. For instance, according to the hierarchy of effects model, consumers' behaviour evolves out of a series of stages that lead one into the other: firstly, consumers have to become aware of the brand, then they acquire knowledge about it, then they eventually start liking the brand, and only at the end of this chain of effects can consumers develop the intention to consume the brand (Hutter et al., 2013). Thus, we state that:

H3a. Museum reputation moderates the relationship between the information tool and visitors' satisfaction.
H3b. Museum reputation moderates the relationship between the information tool and museum liking.
H3c. Museum reputation moderates the relationship between the information tool and visitors' learning.
H3d. Museum reputation moderates the relationship between the information tool and the willingness to visit a museum.

Methodology. *Study 1 was designed to inspect the main effects of information tools (H1a-d) and the mediational role of flow (H2a-d). The online survey experiment was delivered to university students attending different bachelor's and master's degree courses at an Italian University, located in the Marche Region, so focusing on the preferences of younger generations (especially Gen Z). In this between-subjects study, we manipulated the information tool (virtual tour vs written guide), and participants were randomly assigned to either of two experimental conditions.*

The scenario of the manipulation of information tools was constituted by the Civic Museum of Annunziata Church, a painted medieval church located in the small village of Cossignano, in the Marche Region, expected to be very little known even by people living in surrounding areas. Participants were first asked whether they had ever heard of the museum (i.e., museum awareness) and whether they had ever visited it (i.e., past visit experience). We also measured pre-intention to visit by asking participants their willingness to visit the museum within the next 12 months on a 7-point Likert scale (i.e., pre-intention to visit). Then, depending on the information tool condition they were asked to use, we invited participants either to read a written guide or to undertake a virtual tour of the museum.

The survey included four dependent variables (DVs). Learning level was measured through two multiple-choice questions and one true/false question about the VT experience. The learning score was obtained by summing the number of correct answers to the three questions. Subsequently, we measured how much participants liked the museum on a 0 to 10 scale, while users' satisfaction was measured on a 7-point Likert scale (i.e., "How much are you satisfied?"). Flow experience was measured by asking participants to indicate their agreement on a 7-point Likert scale to 7 items, derived from the flow scale (Wang et al., 2024). The scale was synthesised in a single score using Principal Component Analysis. Finally, participants indicated their propensity to visit the museum on a 7-point Likert scale.

In Study 2, the sample was expanded both in size and geographical scope, and museums differing in both popularity and type were considered. The same structure as Study 1 was maintained (same dependent variables and mediator), while introducing the manipulation of museum reputation in order to test the moderation hypotheses (H3a-d), since we expect that, in well-known museums, virtual tours might have a more positive effect on learning and satisfaction than they have in the context of unknown museums. We also want to explore whether, in museums with established names, virtual tours have no effect on intention (as in unknown museums), a positive effect, or a negative effect (testifying a substitution effect). Therefore, this full-factorial experiment involves two between-subjects factors: information tool (written guide vs virtual tour) and brand reputation (Uffizi Galleries - i.e., well-known museum - vs Civic Museum of Todi - less well-known museum).

Results. *Study 1 was carried out between November and December 2024. Our final sample included 190 people (M_{age} = 22.2, SD_{age} = 3.35, age range from 19 to 52 years old; 46 males, 112 females, 1 non-binary, 4 preferred not to disclose; 122 from the Marche Region).*

Table 1. Correlation matrix among the dependent variables

	Satisfaction	Liking	Learning	Intention
Satisfaction	1.00			
Liking	0.48 ***	1.00		
Learning	0.10	0.08	1.00	
Intention	0.39 ***	0.54 ***	0.17 **	1.00

*Significance codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 ' ' 1*

This study focuses on multiple DVs, i.e., satisfaction, liking, learning, and intention. Except for learning and satisfaction, and learning and liking, the DVs are moderately correlated with each other (Tab. 1).

The joint main effects of the information tool on the multiple DVs were assessed through multivariate analysis of variance (MANOVA), revealing a significant multivariate effect (Wilks' λ = .909, F = 3.970, p = .004). Follow-up ANOVAs show that the main effect of the information tool is significant only for user satisfaction (t = 3.812, p < .001).

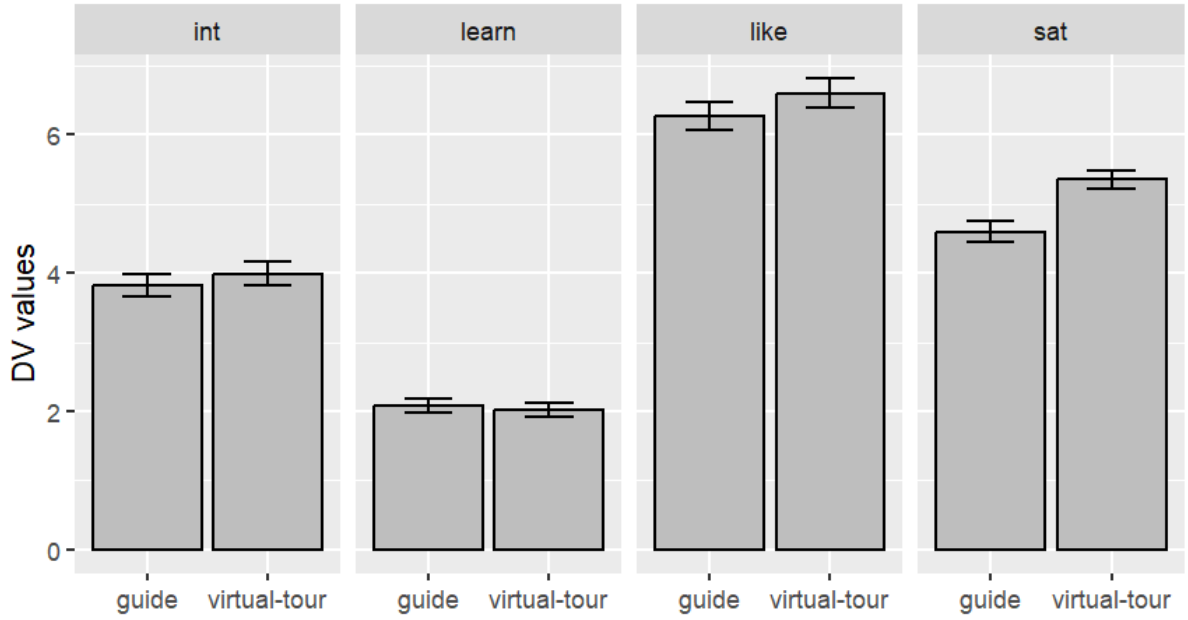

Table 2. Multivariate and post-hoc univariate analysis of variance tables of the relationship between visit support tools, and the DVs

*Significance codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 ' ' 1*

We repeated the same analyses including VR familiarity, museum awareness, past visit experience, and pre-intention as covariates (Tab. 2). The multivariate effects were statistically significant both for the manipulated factor (Wilks' λ = .907, F = 4.002, p = .004) and for the pre-intention control variable (Wilks' λ = .368, F = 66.902, p < .001). Post-hoc ANCOVAs including all the control variables show that the information tool still had a significant effect on user satisfaction (F = 15.724, p < .001) exclusively. Considering these analyses overall, it seems that the VT determines significantly greater satisfaction in users than the written guide does, while a limited impact of the VT on learning and visit intention appears to emerge (Figure 1).

Figure 1. Bar plots comparing experimental conditions' means on intention to visit, learning, museum liking, and user satisfaction. Error bars are also included.

Finally, to test the mediation hypotheses, we first inspected the effect of the information tool on the alleged mediator, i.e., flow. The analysis of variance shows that participants in the virtual tour condition experience significantly more flow (M = 0.621, SE = .219) than those in the written guide condition do (M = -0.509, SE = .214, t = 3.688, p < .001). Having assessed the first portion of the indirect effect, we then employed a MANCOVA model, including the information tool as the independent variables, the flow variable as a covariate, and learning, user satisfaction, museum liking, and visit intention as DVs. It turned out that both the information tool (Wilks' λ = .833, F = 7.987, p < .001) and flow (Wilks' λ = .329, F = 65.204, p < .001) significantly influence the DVs. More specifically, the effect of the information tool on the DVs decreases when flow is included as a covariate within the model, as indicated by the Wilks' λ of the visit support tool being lower in this MANCOVA model than in the original MANOVA (i.e., model 1 and model 3 in Tab. 2). This indicates that flow may function as a mediator of the relationship between information tools and at least one of the DVs.

By employing the percentile method to compute nonparametric bootstrapped confidence intervals, we verified that, out of the DVs, user satisfaction was indirectly influenced by the information tool because of the mediational role played by the flow experience. More specifically, flow fully mediated the relationship between information tools and user satisfaction, since the average direct effect (ADE) was not statistically significant, while the average casual mediation effect (ACME) was estimated to be .511 (p < .001).

Research limitations. *The research is still in progress, and the second study is ongoing (data have been collected and are now being analysed). We are still analysing the moderation role of museum reputation. Future research could explore the application and impact of similar tools in other museum contexts and examine how different VR design elements, such as interactivity and storytelling, influence the user visitor experience, particularly learning outcomes and the propensity to visit. A long-term, qualitative study on the effects of VR experiences on overall engagement and knowledge retention would also provide valuable insights, helping to evaluate the relationship between initial satisfaction and enduring impact.*

Managerial implications. *This study highlights the potential of VR tools, particularly VTs, compared to traditional informational tools, in enhancing the museum experience by fostering visitor satisfaction and engagement through increased flow. However, the limited impact of the VT on other aspects, such as learning, museum linking and intention to visit, raises questions about the role of VR tools as "pre-visit" tools or incentives for physical visits. While VR tools like VTs can serve as bridges between cultural institutions and remote or hesitant audiences, they are not able to really improve accessibility and increase the likelihood of future physical visits by offering engaging previews. This limitation underscores the risk of immersive experiences becoming "substitutes" for actual visits rather than an incentive to visit.*

In this scenario, the role of the place where the destination is located should also be considered - if it is known or not by potential visitors.

Therefore, cultural institutions should re-consider their communication strategies and specifically the role played by VR tools, balancing technological innovations with learning and emotional needs and reconsidering the use of traditional information tools in addition to the quality of VR-based experiences. From a managerial perspective, in contexts where audience engagement and attention levels may be limited, caution is needed in applying VTs, as they may overwhelm or disengage users rather than enhance the experience.

Originality of the paper. *Differently from prior studies, this paper aims at analysing the use of VR technologies outside of a museum and its multiple customer-centric outcomes, such as learning, satisfaction, liking, and visit intention. Specifically, our interest is in assessing the differential effect of VTs as compared with traditional written guides. This study advances the literature on this topic by showing that the positive effects of virtual tour guides are limited, especially when compared with traditional written guides, questioning the need to put efforts and resources into developing such tools within the museal context.*

Key words: *virtual reality; museum information tools; satisfaction; museum liking; learning; willingness to visit.*

Twin transition and museum ecosystem: a governance model to enable the digital and sustainable transformation

LEA IAIA[1] VERONICA SCUOTTO[2] LUCA MATTEO ZAGNI[3] MONICA FAIT[4] MARCO PIRONTI[5]

Abstract[6]

The twin transition has emerged as a key paradigm within European Union policies to address contemporary economic, environmental, and technological challenges. Digital innovation ecosystems play a crucial role in driving this transition due to their capability to foster collaboration, accelerate technological development, and embed sustainable practices. While prior studies have explored the twin transition in manufacturing sector and SMEs, its application within the museum industry remains underexplored.

Museums as hubs of cultural preservation and education present an ideal context for exploring the twin transition. By integrating immersive technologies (e.g. augmented reality -AR- and virtual reality -VR-), museums can simultaneously enhance visitor engagement and operational efficiency even reducing their environmental footprint. As part of the digital innovation ecosystems, it is interesting to investigate the governance, scalability, and the alignment of diverse stakeholders in the museum industry. In turn, the research aims to offer a comprehensive understanding of how the governance model and the collaborative dynamics among actors in digital innovation ecosystems can facilitate the twin transition. It investigates the characteristics of a governance model that facilitate the twin transition of digital innovation ecosystems in the museum sector, focusing on their role in aligning diverse stakeholders' purposes, needs and practices so as to achieve digital and sustainability transformation objectives. An instrumental case study method on the 5G4C.A.P.10100 project, a government-funded initiative led by the University of Turin in collaboration with research institutions, technology providers, museums, and public authorities is applied. The project leverages emerging technologies-such as AR, mixed reality (MR), and non-fungible tokens (NFTs)-to enhance visitor engagement and operational efficiency while supporting sustainability goals.

Empirical data collection is in progress through 20 in-depth interviews with key stakeholders, including representatives from research institutions, technology companies, museums, and local authorities. The semi-structured interview format allows for flexibility in exploring governance mechanisms while ensuring consistency with research objectives. The study employed projective techniques to examine strategic goal setting, coordination processes, and stakeholder interdependencies. A pilot phase was conducted to refine the interview protocol and increase the reliability of the research.

The study will contribute to providing theoretical, managerial, and social implications. Theoretically, it runs insights into governance frameworks that enable the twin transition in digital innovation ecosystems, emphasizing collaboration, knowledge sharing, and value co-creation. From a managerial perspective, the research offers practical guidance for project leaders and ecosystem managers in implementing governance models that foster innovation, sustainability, and scalable solutions. Socially, the study highlights how digital innovation ecosystems can enhance accessibility to cultural heritage, promote inclusivity, and support sustainable museum practices.

While the research is based on a single case study, it lays the foundation for further exploration of governance models in digital innovation ecosystems across different sectors. Future studies could employ comparative analyses to validate

and refine the proposed framework. The originality of this research lies in its focus on the twin transition within the museum sector, offering new perspectives on governance and sustainability in cultural institutions.

Framing of the research. *The European Union has identified the "twin transition" as a key framework for tackling modern economic, environmental, and technological challenges, while simultaneously embedding digital advancements within sustainability strategies (European Commission, 2019). Recent studies explore different dimensions, such as, among others, the use of the Internet of Things (IoT) to improve operational sustainability in manufacturing companies (Rejeb et al., 2022) to facilitate the circular economy; the impact of digital technologies on eco-innovation in companies and the crucial role of digital transformation in promoting sustainable practices (Montresor & Vezzani, 2023); the business models for SMEs in the era of the twin transition, between leadership and sustainability (Gallina et al., 2024).*

The success of the twin transition depends on the development of multidisciplinary skills that combine resilience, digital technologies and specialised technical skills (Trevisan et al., 2024). Innovation ecosystems are central to driving the twin transition, a synchronised advancement of digitalisation and sustainability, by leveraging their unique characteristics and structural dynamics (Dal Mas et al., 2024). This collaborative environment accelerates technological development and integrates sustainable practices, making innovation ecosystems critical in addressing the dual challenges of digital and sustainable transformation (Tripathi et al., 2024).

One of the key strengths of innovation ecosystems is their ability to foster value co-creation through hybrid organisational models (Adner & Kapoor, 2010; Dodgson et al., 2013; Granstrand & Holgersson, 2020). These models bring together technological advances and market-driven solutions, enabling the development of products and services that are aligned with sustainability goals. The emphasis on digital innovation further supports this by creating platforms and networks that facilitate real-time interaction and resource optimisation. In addition, the dynamic structure of innovation ecosystems supports the iterative transformation process (Breslin et al., 2021). From this point of view, ecosystems provide pathways for industries and regions to navigate the complexities of the twin transition, providing a framework for specialised growth and co-evolution among so various ecosystem participants.

However, the realisation of the twin transition goals in digital innovation ecosystems is possible under a proper governance. Governance in digital innovation ecosystems manages interactions between actors, shapes decision-making processes and either facilitates or hinders innovation (Sjödin et al., 2024), and it is is directly responsible for achieving results through a path built on an appropriate balance between collaboration and competition (Primario et al., 2024).

Effective governance aligns diverse actors through coordination mechanisms, mutual trust, and clearly defined roles, enabling the collective pursuit of common goals (Hoffmann et al., 2023). Among the governance models, the laissez-faire governance model relies on minimal regulation, allowing the natural dynamics of the ecosystem to drive innovation. This model reflects self-organising networks in which actors operate autonomously, fostering spontaneous interactions and emergent outcomes (Könnölä et al., 2021). In contrast, the top-down governance model emphasises centralised control, with a dominant entity, such as a platform owner, defining rules and standards to ensure coordination across the ecosystem. This model ensures a high degree of coordination, but risks limiting the autonomy and diversity of ecosystem participants (Jacobides et al., 2018). Conversely, bottom-up governance models promote decentralisation and encourage collective decision-making and inclusivity. Closely linked to collaborative governance, this model thrives on horizontal cooperation and the active engagement of all actors (Mei et al., 2022). Among the main models discussed, the orchestration model, which is often led by a central actor or facilitator such as a university or technology hub, helps to mitigate power asymmetries and conflicts of interest and ensures the operation of the ecosystem (Wegner & Verschoore, 2022; Santos et al., 2022). Orchestrators facilitate collaboration by setting common standards, facilitating communication, and aligning the contributions of diverse participants (Santos et al., 2022). For example, orchestrators can act as platforms that unite stakeholders, enable co-creation of value, and address local or global challenges. Leadership in these ecosystems often combines top-down guidance with bottom-up participation, creating a balance that enhances adaptability and fosters multilateral conversations. This hybrid approach empowers actors to co-create the architecture of the ecosystem while benefiting from centralised coordination (Mei et al., 2022). It also involves managing criticalities, especially emergencies, as firms must navigate complex alliances and dependencies to build platforms that can support long-term innovation (Pushpananthan & Elmquist, 2022). Despite the models examined, existing research suggests that governance, scalability and stakeholder coordination remain key challenges that have not been sufficiently addressed (Shim et al., 2020; Sun et al., 2022). Additionally, the mechanisms that facilitate collaboration within these ecosystems require further investigation to maximize their advantages (Santos et al., 2023; Ferreira et al., 2023).

The twin transition is particularly relevant in the museum sector, as the integration of digital and green transitions in this sector promotes the adoption of digital technologies to increase operational efficiency, enhance visitor experience and support sustainable practices (Zhang et al., 2022). The twin transitions of museums have been embraced with different focuses and strategies, especially during and after the COVID-19 pandemic (Massari et al., 2024). These strategies have recently evolved and expanded towards a phygital approach - combining physical and digital elements (Iandolo et al., 2022), while increasing accessibility, as seen in examples such as "The Other Renaissance" at the National Archaeological Museum of Crotone (Balzani et al., 2024) and the Museo Egizio in Turin (Aulisio & Pereno, 2024). Immersive technologies such as virtual reality, augmented reality and the metaverse offer interactive experiences to a

wider audience (Iaia et al., 2024; Pironti et al, 2024; Longo & Faraci, 2023). These innovations also reduce the environmental impact of physical exhibitions, including visitor travel and exhibition set-up (Aulisio & Pereno, 2024). For example, virtual access to specific artworks eliminates the need to transport works to geographically distant exhibitions, thereby minimising environmental impact (Falk & Dierking, 2016). In addition, advanced digital systems optimise the use of energy and materials, contributing to greener museum practices.

Purpose of the paper. *The twin transition paradigm requires organisational and managerial skills to reimagine the museum offer and adapt governance models within its ecosystem (Reiman et al., 2021; Rehman et al., 2023). Although previous studies have focused on governance approaches in the management of innovation ecosystems, their role in digital innovation ecosystems is still lacking (Mei et al., 2022) and is essential to uncover their full potential.*

This study investigates the governance model in digital innovation ecosystems that enables the realisation of twin transition objectives, connecting different stakeholders with a common goal. The aim is to explore which and how the governance model facilitates the alignment of different actors to achieve digitalisation and sustainability goals in the museum sector.

Thus, the research question is: How does the governance model foster collaboration and innovation among actors belonging to digital innovation ecosystems?

Methodology. *This study adopts a qualitative research approach to examine the governance structures that support digital innovation ecosystems in achieving the goals of twin transition, with a particular focus on the museum sector. Using an instrumental case study method (Stake, 2013; Yin, 2009), the research explores a real-world phenomenon within its contextual setting to provide an in-depth, multifaceted understanding.*

The study regards a government-funded project led by the University of Turin in collaboration with research institutions, communication companies, start-ups and other stakeholders. The initiative aimed to revolutionise the museum experience by integrating emerging technologies such as augmented reality (AR), mixed reality (MR) and non-fungible tokens (NFTs) to enhance visitor engagement. Through an analysis of the 5G4C.A.P.10100 project, the research explores how governance frameworks facilitate stakeholder collaboration and promote both digital transformation and sustainability. Given the exploratory nature of the study, a qualitative approach is well suited to capturing the complexity of governance interactions in digital innovation ecosystems through understanding participants' experiences, identifying patterns and generating theoretical insights (Creswell & Poth, 2013).

To gather empirical data, the research team is conducting 20 in-depth interviews with key stakeholders, including representatives from research institutions, technology providers, museum staff and public authorities. These interviews provide different perspectives on governance mechanisms. The semi-structured format allowed for flexibility in exploring relevant themes while maintaining consistency with the research objectives. The study used projective techniques to address issues such as strategic goal setting, coordination processes, and the roles and interdependencies of ecosystem actors (Donoghue, 2010). To increase the accuracy of the research, a pilot test with an early questionnaire and a small number of volunteers helped to refine the interview protocol.

For data analysis, the study followed Yin's (2013) three-step process of (a) analysing individual interviews and transcripts, (b) identifying recurring themes, and (c) comparing themes across cases. Each transcript was treated as a distinct unit to capture personal experiences and emerging trends. The coding process was open-ended and flexible, rather than constrained by pre-defined categories (Huberman & Miles, 1994). Initial coding was carried out by the first author, while subsequent stages involved collaborative thematic aggregation by the research team. To ensure consistency and accuracy, the team reviewed a portion of the material to confirm the reliability of the coding process.

The twin transition setting: the museum ecosystem and the 5G4C.A.P.10100 project

The project aims to provide a first experiment to move the museum ecosystem towards the twin transitions of increasing operational efficiency, improving visitor experience and supporting sustainable practices. Each step of the project delivers a digital artefact that increase the usability of the museum's content both online and offline, enhance the museum and the territory's heritage, and give life to a narrative that generate greater user engagement and involvement. At the end of this process, the assemblage of innovative, immersive, replicable and adaptive experiences promote the digital and green transition of the museum ecosystem, with social and economic implications. A narrative thread connects the experiences and use cases presented here, the commemoration of Ayrton Senna on the thirtieth anniversary of his death, enabled by a technological thread, the adoption of emerging technologies.

Partners from different sectors formed the ecosystem, including the ICxT Interdepartmental Innovation Centre, the Department of Computer Science of the University of Turin and the University of Turin: virtual, augmented and mixed reality research area, LINKS Foundation; telecommunications, TIM SpA; museum, National Automobile Museum of Turin, ETT SpA; startups in NFT, AI and Metaverse technologies, such as Carbonlab Srl, AnotheReality Srl; communication, such as Tree Srl; and Formula 1, such as the Imola International Autodrome "Enzo and Dino Ferrari"; and public institutions, such as the City of Turin and Turin City Lab.

The project included three experiences (from this, the C.A.P. acronym):

- *Circuito - in English, circuit/racetrack. The Circuito experience focused on VR and immersive content production, allowing users to explore in 3DOF (degrees of freedom) through 360-degree videos and images.*
- *Auto -Car-. The Auto experience offered users a 6DOF exploration of futuristic cars recreated using 3D technology, allowing them to navigate virtual environments such as cities or outdoor scenarios.*

- *Pilota -Pilot-. The Pilota experience introduced 'Futura', an AR-based virtual guide that tells the story of motor racing in MR mode through notable cars from the National Automobile Museum's collection. Two additional avatars, 'Arduino' and 'Professor', complemented the experience by explaining the technologies used in the project and outlining its objectives, partnerships and progress.*

There are also two other use cases:

- *the Museum Experiential Wallet, which allows users to collect NFT tokens linked to the storytelling of the 5G4C.A.P10100 project.*
- *the Metamuseum, a repository of all project content in an immersive 3D environment, accessible via VR headsets or PC desktops. This virtual space serves as a permanent or temporary exhibition, combining content about Ayrton Senna with material sourced globally and produced using emerging technologies.*

Each experience starts from the digitisation of museum or partner artefacts - for example, the Automobile Museum and the Imola Autodrome. Several actors have created and published the digital outputs, which have been enhanced in terms of technology and content by other actors. All experiences are alternatively available from smartphone, PC and/or VR/MR viewers to increase the level of interaction and immersion.

Results. *The expected results of the case study concern the theoretical, managerial and social implications of the research.*

The theoretical implications will contribute to the governance models able to facilitate the twin transition in digital innovation ecosystems, also highlighting the internal dynamics between actors and their different roles, while promoting collaboration, knowledge sharing and scalable solutions (Shim et al., 2020; Hoffmann et al., 2023). This could highlight how digital ecosystems enable value co-creation and innovation through their capabilities (Granstrand & Holgersson, 2020; Zhang et al., 2023), which is a crucial aspect and could have further implications for addressing the technological and organisational challenges of the twin transition (Jacobides et al., 2018; Hoffmann et al., 2023). Such implications are also relevant to the field of cultural industries, where there is a need for further research advances in the elicitation of an effective governance model, particularly in the direction of a twin transition (Zhang et al., 2022).

From a managerial perspective, the empirical analysis will provide valuable guidance for project leaders and ecosystem managers seeking to implement governance models for digital innovation ecosystems while promoting innovation, sustainability and shared outcomes. The approaches outlined will provide practical frameworks for navigating the complexities of digital innovation ecosystems and facilitating the twin transition. Indeed, the expected outcomes will identify governance approaches that facilitate stakeholder relationship management while enabling the scalability of digital innovation ecosystems in the museum sector. This will also suggest if and which governance model for twin transition principles facilitates the achievement of successful ecosystem outcomes and broader cultural innovation.

The expected social impacts relate to how digital innovation ecosystems can improve accessibility to cultural heritage, promote inclusivity and contribute to sustainability goals. This is based on the platforms enhancing social sustainability by expanding accessibility and inclusivity, providing flexible and diverse exhibitions that foster international interactivity, and creating increasingly engaging visitor experiences (Hao & Wang, 2024).

Research limitations. *This study presents a governance framework for implementing the twin transition within digital innovation ecosystems in the museum sector. Although based on a single case, it serves as a first step towards a deeper understanding of the issue. Future research could extend this work by conducting comparative analyses across different sectors, in order to further validate and enhance the proposed model.*

Originality of the paper. *The novelty of the research lies in the importance of addressing the twin transition in the museum ecosystem. It seeks to understand which governance and relational models can address this pathway and its outcomes in terms of environmental, cultural, social and economic sustainability within the museum industry.*

Key words: *digital museum innovation ecosystem, twin transition, governance model, digitalization, green transition, sustainability*

Social Media and Smart Cities: Cultural Proximity as a Key to Digital Engagement

FILIPPO MARCHESANI[1] GINEVRA TESTA[2] KAMEL BEN YOUSSEF[3]

Abstract

Smart cities increasingly use social media as an urban marketing tool for tourism promotion and stakeholder engagement. However, how cities adapt their digital strategies and adopt social media to engage intra-national (national) and inter-national (foreign) users remains under-explored.

This study examines the role of social media responsiveness in shaping engagement with these distinct publics, considering cultural proximity as a key factor influencing digital interactions. Using a longitudinal panel of 18 Italian cities (2010-2024), we assess the diversification of social media adoption through the Herfindahl index, while controlling for urban and economic characteristics.

The results show that greater social media responsiveness is associated with greater engagement of both user groups, although the dynamics of engagement vary. Intranational users tend to interact more with city content, while international users face additional linguistic and cultural barriers, despite the role of digital platforms in facilitating global reach.

Integrating insights from smart city marketing, destination branding and digital governance, this study provides theoretical contributions and practical applications on how cities can optimise digital communication strategies to improve tourism flows, strengthen relationships with stakeholders and reinforce urban attractiveness. Several recommendations for managers and politicians in the sector can be drawn from this to optimise digital strategies in terms of tourist attractiveness and stakeholder involvement to encourage the participation of the various parties involved.

Framing of the research. *Smart cities represent a strong interconnection between technological, economic, social, cultural and tourist activities (Vanolo, 2014). The continuous transformation of smart cities has pushed managers to adopt a vision of entrepreneurial urban planning whereby it is important to achieve certain criteria of inclusivity, sustainability and efficiency (Kummitha, 2018). In addition to pursuing these objectives, it is also important to develop effective marketing strategies to promote urban development, the attractiveness of cities as tourist destinations and the involvement of stakeholders (Christofi et al., 2021; Coca-Stefaniak, 2019, 2021).*

Thanks to social media, urban marketing has evolved considerably, enabling dialogue with different audiences and improving urban visibility (Christofi et al., 2021; Marchesani, Masciarelli, & Ceci, 2024). In particular, the interactive nature of social media facilitates two-way communication that allows cities to dialogue with different targets, receiving feedback aimed at improving urban services and policies concerning the alignment of public needs (Buhalis & Law, 2008; Molinillo et al., 2019). Therefore, social media platforms have profoundly transformed urban communication by offering different opportunities for branding, engagement and interaction (Fernández-Cavia et al., 2016; Hays et al., 2013; Molinillo et al., 2019; Sano et al., 2024).

Using these digital tools, a city can benefit from destination marketing, enhancing the attractiveness of a city, for example, by promoting cultural, historical and infrastructural assets for residents and visitors (De noni et al., 2014). Destination marketing is often linked to events or seasonal factors (Goffi & Cucculelli, 2019). While existing research has explored the role of social media in tourism promotion, how cities adopt their digital strategies to cater to their main target audiences, both national and international, is still little explored. Regarding the international audience, linguistic and cultural barriers strongly influence communication. While national tourists share the same language and culture as the city, international visitors face information asymmetries that social media could help to overcome (Gretzel et al., 2006).

This study aims to explore how smart cities use social media to engage their national (intra-national) and international (inter-national) audiences in different ways. Therefore, the study examines whether greater responsiveness to social media trends increases the engagement of these two groups, considering cultural proximity as a moderator of digital interactions.

RQ: Does the responsiveness of cities to social media trends have a different impact on national (intra-national) versus international (inter-national) audience engagement?

Purpose of the paper. *The study aims to examine the role of social media responsiveness in shaping the engagement of the two audiences considered, assessing cultural proximity as a key factor capable of shaping digital interactions. According to Kiráľová & Pavlíceka (2015), social media can increase the competitiveness of a destination by raising awareness among a global audience. Social media favours tourism promotion (Mao et al., 2019) and destination branding (Fernández-Cavia et al., 2016; Huerta-Álvarez et al., 2020). Effective destination marketing must be aligned with useful strategic objectives and consistent with all stakeholders (Christofi et al., 2021), whether they are national or international tourists, and it is essential to respond to the needs and requirements of multiple stakeholders (Wall & Mathieson, 2006; Xiao, 2013). A crucial element that differentiates national tourists from international tourists is cultural proximity, i.e. diversity in terms of language, traditions and shared values of a destination (Berry, 1979). The greater the cultural proximity, the more familiarity there will be with the destination, which increases the satisfaction of the tourist experience and favours a positive image of the destination (Richardson & Crompton, 1988).*

From these considerations, the following hypotheses emerge:

H1: The higher the responsiveness to social media issues, the greater the interaction with intra-national tourists.

H2: The higher the responsiveness to social media trends, the greater the interaction with international tourists.

Domestic tourists are residents of a specific region who travel to visit nearby cultural and tourist attractions.

Domestic tourists are residents of a specific region who travel to visit nearby cultural and tourist attractions, but in places other than their hometown. Effective marketing strategies are essential to attract and meet the needs of local tourists (Hughes & Allen, 2005). The more a city responds to the needs and preferences of local tourists, the more mutually beneficial the interactions become (Aladwani, 2015). In this way, domestic tourists can play an active role in the development of smart cities (Braun et al., 2013; Molinillo et al., 2019).

However, considering the deep globalisation, cities are trying to address an international tourist audience. Social media, thanks to the multiplicity of information shared, can encourage foreign tourists to visit a city to get to know it better. Therefore, cities are increasingly seeking to engage not only local stakeholders, such as local tourists, but also foreign tourists (Hudson & Thal, 2013). A destination's engagement with tourists can positively influence tourist behaviour (Tse & Tung, 2022) by increasing interaction, improving the experience and co-creating value (Kumar & Kaushik, 2020). The involvement of and attention to tourists' needs could favour and feed their advocacy role towards the destination (Lever et al., 2021), leading to the spread of positive word of mouth (WoM) to the rest of the public (Trunfio et al., 2019). However, although many factors attract international tourists, their level of involvement can be hindered by, for example, linguistic, cultural and regulatory diversity, as well as the uncertainty that surrounds an unknown and previously unvisited place. Therefore, foreign tourists may be less involved in city life due to their cultural distance and lack of knowledge of the local language and traditions. Social media can help overcome this potential uncertainty (Gretzel et al., 2006; Yang et al., 2019). Internet accessibility and use play a crucial role in overcoming the barriers dictated by cultural distance that often hinder tourist flows to some countries, as these platforms offer a possibility for intercultural communication (Marcoccia 2012). Social media and the Internet therefore provide tourists with easy access to a vast amount of information that facilitates cultural adaptation, thus reducing the uncertainty and perceived risk of an unknown culture (Money & Crotts 2003). Based on the previous discussion, we believe that communication and involvement of tourists can be facilitated by social media, which can help overcome the uncertainty and barriers typical of cultural distance (Gretzel et al., 2006). The more the city adapts and responds to the needs of international tourists, the more positive effects can be obtained for the city, including international tourists as active and crucial subjects in the development of the smart city (Harrigan et al., 2017; Kumar & Kaushik, 2020; Leung & Bai, 2013; Tse & Tung, 2022).

Methodology. *The study to answer the research question adopts a longitudinal panel composed of 18 Italian cities over 14 years, from 2010 to 2023. The evaluation of the cities' responsiveness to social media trends is carried out using the Herfindahl index, which allows us to examine changes in the adoption of digital platforms and the effects on public engagement. Italy is a country where tourism is increasingly oriented towards small destinations (Goffi & Cucculelli, 2019).*

The data used in this study comes from primary (Wayback Archive and official websites) and secondary (national and international databases) sources. The data considered in this panel allowed us to test and validate our hypotheses considering various characteristics of the city and different levels of digital, economic and urban development, in line with the literature on urban studies (Glaeser, 2000; Holmes et al., 2000; Marchesani et al., 2023). Regarding the variables related to social media (platforms and internal and international users), we focused exclusively on the platforms officially listed on each city's website. The dependent variables in this study represent (i) intra-national users and (ii) inter-national users. Intra-national users are defined as those residing in Italy, while international users are defined as those residing outside of Italy. The independent variable of this study, Social Media Responsiveness (SMR), evaluates the extent to which cities adopt new and trendy social media platforms over time. Specifically, it tracks the annual adoption of different platforms by each city. To quantify this data, we created a binary indicator for each platform, assigning a value of 1 if the platform was actively implemented by the city each year and 0 otherwise. This approach

allows us to follow the evolution of each city's digital engagement strategies. Data for this variable was collected retrospectively using the Wayback Machine (https://archive.org).

To further analyse the concentration of platform adoption, we calculated the Herfindahl-Hirschman Index (HHI) for the annual adoption of social media in each city. The HHI provides a measure of the diversity (or lack thereof) of platforms used by each city, serving as an indicator of a city's adaptability to evolving social media trends. Lower HHI values indicate a more diversified approach, where cities utilise a range of platforms to reach different audiences. Conversely, higher HHI values reflect a concentrated strategy, with cities focusing on a smaller number of more established platforms and a narrower audience. To aid interpretation within our model, we have reversed the HHI values: higher values now indicate greater social media heterogeneity (a wider range of social media platforms), while lower values indicate greater homogeneity (fewer more established platforms).

In addition, we included urban variables such as population, GDP, city size and city development to account for potential bias due to city-specific characteristics within the studied relationship, in line with the literature on urban agglomerations (Glaeser, 2000; Holmes et al., 2000). Considering the technological nature of the phenomenon, we also analysed the cities' public investments in R&D. Finally, given the continuous interaction with the external environment, we included the number of airports as a proxy for the cities' openness (Gambardella et al., 2009). The inclusion of these variables allows us to circumscribe the phenomenon and reduce the potential biases deriving from specific city attributes. To test our hypotheses, we applied the Generalised Least Squares (GLS) estimation method with a dependent variable delayed by one year to consider potential autocorrelation and address endogeneity issues. The GLS method was chosen for its robustness in dealing with panel data with heteroscedasticity and autocorrelation between units, guaranteeing consistent and efficient parameter estimates (Bai et al., 2021; Bamati & Raoofi, 2020). To validate the use of the GLS model in our analysis, we applied several diagnostic tests to ensure robustness and address potential model specification problems (Baum et al., 2003). The study used the Wald Chi² test to assess the joint significance of the explanatory variables, Moran's I test to detect spatial autocorrelation in the residuals, and Hausman test to confirm the suitability of the GLS compared to alternative specifications such as fixed-effects and random-effects models (Debarsy, 2012). In addition, we tested for multicollinearity among the independent variables, confirming that none of the correlations represented a problem (Jaccard et al., 1990).

Results. *The findings of this study provide preliminary evidence regarding the relationship between social media responsiveness and digital engagement among intra-national and inter-national audiences. The analysis suggests that a higher degree of responsiveness to social media dynamics is associated with increased engagement across both user groups, albeit with varying degrees of intensity. This result supports the hypothesis that cities that actively adapt their digital strategies to emerging trends in online platforms foster a more interactive and participatory environment, particularly among national audiences. Concerning intra-national users, the results indicate that cities exhibiting a greater level of social media responsiveness tend to experience a significant increase in digital engagement. This finding aligns with prior research emphasizing the role of digital communication in reinforcing local participation and strengthening community interaction. The ability of cities to promptly integrate new digital tools and engage in dynamic interactions appears to facilitate deeper connections with local stakeholders, thereby enhancing urban branding and fostering a sense of local belonging. These findings lend support to the hypothesis that higher social media responsiveness translates into stronger engagement among domestic users, reinforcing the notion that timely, interactive, and citizen-centered digital strategies enhance the digital presence of cities within national boundaries. Regarding inter-national audiences, the results similarly indicate a positive relationship between social media responsiveness and engagement. However, the magnitude of this effect appears to be lower than that observed for domestic users. This suggests that while a proactive approach to social media trends contributes to increased visibility and interaction among foreign users, additional factors may influence their digital engagement. Elements such as linguistic accessibility, cultural familiarity, and targeted marketing efforts likely play a crucial role in shaping how international audiences interact with urban digital content. These insights support the hypothesis that social media responsiveness enhances engagement among international tourists but also highlight the need for complementary strategies to mitigate cultural and informational asymmetries that may limit their participation.*

Beyond social media responsiveness, the analysis underscores the influence of several urban characteristics on digital engagement. Larger cities, characterized by greater institutional capacity and technological resources, tend to exhibit higher levels of interaction among both domestic and foreign users. Similarly, economic prosperity, measured through indicators of city development and GDP per capita, is associated with increased digital engagement, suggesting that municipalities with stronger economic foundations may allocate more resources to digital infrastructure and marketing initiatives. Additionally, factors such as tourism inflows, the presence of major events, and global connectivity through transport infrastructure contribute to shaping the patterns of online interaction, reinforcing the idea that urban attractiveness and accessibility are key determinants of digital participation.

These preliminary findings provide insights into the evolving role of social media in urban marketing and destination branding. They suggest that while responsiveness to digital trends is a critical enabler of engagement, particularly within national markets, international audiences may require more tailored strategies to overcome linguistic and cultural barriers.

Research limitations. *Despite its contributions, this study has several limitations. First, the analysis is confined to the Italian context, which, while offering valuable insights, limits the generalizability of the findings to other geographical*

areas. Future research should extend the scope to other countries to explore potential differences arising from economic, social, and cultural contexts. Second, the sample of cities could be expanded to include a broader range of urban centers, differentiating between small and large destinations. This would allow for a more nuanced understanding of how city size influences digital engagement and stakeholder interactions, particularly about tourism attractiveness and urban marketing strategies. Third, this study does not account for generational differences among tourists, which could significantly affect engagement patterns. Future research should examine how digital responsiveness varies in its impact on different age groups, as younger generations might engage differently with urban digital platforms compared to older tourists.

Moreover, this study primarily focuses on social media responsiveness but does not explicitly consider the role of platform-specific algorithms, advertising strategies, or user-generated content in shaping engagement. Future investigations could incorporate these dimensions to assess the interplay between organic and paid digital strategies in driving user interaction. Finally, the study does not analyze the long-term effects of social media responsiveness on urban attractiveness and economic development. A more extensive longitudinal approach could provide deeper insights into how sustained digital engagement translates into tangible benefits for cities, such as increased tourism flows, investment attraction, and stakeholder collaboration.

Managerial implications. *The study offers various managerial implications for destination marketing managers, identifying the tools with which to communicate with different audiences and stakeholders, whether they are international or national tourists. These are valuable insights that can enable smart cities to develop digital strategies that can create greater involvement of the various stakeholders and improve the promotion of a destination to tourists. Taking cultural proximity into account is an essential aspect of shaping digital strategies so that they are effective for different tourist targets. These insights into smart city marketing, destination branding and digital governance can be particularly valuable for optimising digital communication strategies to encourage greater tourist flows, improve interaction with different stakeholders and increase urban attractiveness. Local policy makers could understand which strategies can make cities more attractive, both for residents and visitors, improving their reputation at a national and international level (Boivin & Tanguay, 2019; Jan & Beesau, 2010) and increasing their competitiveness as tourist destinations (Goffi & Cucculelli, 2019).*

Originality of the paper. *The originality of the study lies in the perspective with which social media are analysed as tools capable of conveying strategies that can involve the public more in the cultural, tourist and social activities carried out by smart cities. Social media allows for a degree of interaction and involvement with international tourists, overcoming the barriers dictated by cultural and linguistic distance that could represent an obstacle for this target group of consumers who may consider a foreign city particularly risky and uncertain. The study therefore adopts a dual perspective, analysing both the national and international public, highlighting differences and similarities within them.*

Key words: *social media; urban marketing; smart cities; cultural proximity; Italy; digital engagement*

Film-induced tourism: the influence of "My brilliant friend" TV series on tourist perceptions

SIMONE LUONGO[1] FABIANA SEPE[2] ELEONORA NAPOLANO[3]
GIOVANNA DEL GAUDIO[4] ELENA LUPOLO[5]

Abstract

This study investigates the impact of the TV series "My Brilliant Friend" on tourists perceptions in film-induced tourism. By leveraging the Theory of Planned Behavior (TPB), alongside novel constructs such as nostalgia and authenticity-seeking behavior, the research examines how on-screen depictions influence tourists' emotions, attitudes and travel intentions. The study adopts a Partial Least Squares Structural Equation Modeling (PLS-SEM) to analyze data collected via an online survey from fans of the series. Preliminary findings suggest that film-induced tourism enhances destination awareness, emotional engagement and motivation to visit, but also raises concerns regarding authenticity and potential misrepresentation. This research contributes to the broader discourse on destination marketing and management, offering valuable insights for policymakers and tourism stakeholders.

Framing of the research. *The use of landscapes in cinema is deeply intertwined with audience perception and cultural heritage dissemination. Cinematic landscapes serve as semiotic devices, encoding cultural values, traditions and identities within visual narratives (Connell, 2012; Shambu 2019). This interaction between film and viewer underscores the importance of destination marketing and management in tourism, as film-induced tourism is not merely a byproduct of media influence but a structured process where cultural heritage is interpreted and shared.*

By engaging with a location through audiovisual storytelling, the audience form preconceptions about a place before physically experiencing it, reinforcing or altering its perceived identity (Eppler & Burkhard, 2007; Nieto-Ferrando et al., 2023).

Film-induced tourism is a multifaceted phenomenon encompassing various subcategories such as cinematic tourism, media tourism and symbolic pilgrimage (Karpovich, 2010). These different conceptualizations highlight the varying degrees to which filmic representations influence tourists' motivations.

Accordingly, some visitors seek an immersive cinematic experience, tracing the steps of their favourite characters, while others engage with the destination's historical and cultural layers beyond the screen. The ethnographic imagination associated with film locations allows viewers to experience places vicariously, influencing their travel behaviors and expectations (Trifuoggi & Sielo, 2023).

Additionally, contemporary research emphasizes the role of virtual communities in film-induced tourism. Online platforms, fan forums and social media channels provide spaces where users exchange travel tips, discuss representations of places, and validate or contest the authenticity of portrayed locations (Kim & Kim, 2020).

This research builds upon these concepts, exploring how "My Brilliant Friend" functions as a catalyst for cultural knowledge and destination image formation. By examining the interplay between cinematic representation and tourist behavior, this study contributes to the growing discourse on film-induced tourism and cultural identity construction.

This work in progress is positioned within the interdisciplinary fields of film-induced tourism and behavioral psychology. Film-induced tourism has been widely recognized as a powerful force in shaping tourists' perceptions and influencing travel behavior (Beeton, 2005; Hudson & Ritchie, 2006). The depiction of places in cinema and television plays a crucial role in constructing destination images and fostering emotional connections with viewers (Connell, 2012).

By integrating the Theory of Planned Behavior (TPB) (Ajzen, 1991) with constructs such as nostalgia (Kim et al., 2019) and authenticity-seeking behavior (Lee et al., 2020), this research bridges the gap between media studies and tourism behavior analysis. In particular, the study focuses on the representation of Naples in "My Brilliant Friend" and

its effects on tourists' emotions and intentions. The research also acknowledges the risks associated with an over-commercialized portrayal of destinations, which may lead to visitor dissatisfaction due to potential discrepancies between the mediated image and reality (Karpovich, 2010).

The study contributes to the existing literature by emphasizing the dynamic interaction between audiovisual representations, tourist perceptions and intention to visit the destination.

Purpose of the paper. *This study aims to examine how the TV series "My Brilliant Friend" influences tourists' emotions, perceptions and intentions regarding Naples. It explores how the series shapes viewers' perceptions of the city as a tourist destination, considering the power of audiovisual media in constructing destination images (Hudson & Ritchie, 2006). Additionally, it investigates the role of nostalgia in fostering emotional connections with the locations depicted, acknowledging its influence on travel motivation and personal experiences (Kim et al., 2019; Song et al., 2024). The study also considers authenticity-seeking behavior, assessing how tourists evaluate and expect real-life experiences to align with their mediated impressions (Lee et al., 2020).*

Beyond analyzing tourist behavior, the research examines the broader implications of film-induced tourism for destination management. In particular, it evaluates how cinematic portrayals can contribute to sustainable tourism development and cultural preservation while also identifying risks associated with the over-commercialization of a location's image (Saltik et al., 2011). By integrating perspectives from tourism studies and behavioral psychology, this study provides valuable insights for destination marketers and policymakers seeking to optimize media-based tourism strategies while maintaining the authenticity of the places represented (Quintal & Phau, 2015).

The proliferation of online communities has transformed the way potential visitors access and interpret information about a destination. The digital sharing through forums, travel blogs and fan pages creates an online environment where perceptions of authenticity and nostalgia are continuously negotiated (Souza et al., 2020). By analyzing these digital interactions, this study highlights how online discourse influences tourists' pre-visit expectations and post-visit reflections, reinforcing the significance of virtual engagement in shaping destination reputation.

The TPB provides a structured framework for understanding how exposure to a TV series influences tourists' behavioral intentions (Ajzen, 1991), but additional constructs such as nostalgia (Kim et al., 2019) and authenticity-seeking behavior (Lee et al., 2020) enrich the analysis by considering the emotional and cultural dimensions of travel motivation.

Therefore, this study seeks to expand the TPB framework by demonstrating how cultural narratives embedded in audiovisual content generate emotional connections that drive travel decisions.

Additionally, the role of cinematic nostalgia in enhancing a sense of familiarity with a destination is a crucial aspect of this research. Films and TV series often create emotional touchpoints with audiences, leading to the formation of an affective bond between the viewer and the depicted location (Frow, 1991). This phenomenon is particularly relevant when exploring "My Brilliant Friend", as its setting in Naples evokes both personal nostalgia (viewers recalling past visits or cultural ties) and mediated nostalgia (viewers longing for an imagined past inspired by the series) (Raymond et al., 2011). By analyzing these dimensions, the study sheds light on how nostalgia-driven tourism influences the construction of a destination's identity and perceived authenticity.

Ultimately, this research does not merely examine tourists' behavioral intentions but also considers how audiovisual media contribute to digital engagement, and destination meaning-making. These findings are relevant for destination marketers, tourism boards and cultural stakeholders aiming to optimize film tourism strategies while preserving the integrity and authenticity of the places represented on screen.

Methodology. *The study employs a quantitative research approach using Partial Least Squares (PLS), a variance-based method for Structural Equation Modeling (SEM) that is particularly useful for analyzing complex relationships between latent variables (Hair et al., 2014). This methodology allows for the examination of tourists' behavioral intentions and perceptions by integrating constructs from the TPB (Ajzen, 1991) along with novel dimensions such as nostalgia (Kim et al., 2019) and authenticity-seeking behavior (Lee et al., 2020).*

To collect data, an online survey was administered via Google Forms between March and June 2024. The survey targeted members of "My Brilliant Friend" fan groups on Facebook, ensuring engagement from individuals with prior exposure to the series.

Participants were required to confirm whether they had watched the series and visited Naples before proceeding with the questionnaire.

The survey was structured into three sections: an introductory part analyzing the development of movie tourism in Naples, a second section comprising 18 items measured on a seven-point Likert scale (Podsakoff et al., 2003) and a final section capturing demographic data and interest in Naples-related tourism activities.

A total of 520 responses were collected, but after screening for incomplete answers and participants who had neither watched the series nor visited Naples, the final sample consisted of 451 respondents.

The sample size met the statistical power requirements suggested by Cohen (1988) and Green (1991), confirming its adequacy for PLS-SEM analysis. Data were processed using Smart-PLS software, allowing for an in-depth assessment of the relationships between latent constructs and tourist behavior.

This methodological framework provides a robust foundation for understanding the impact of audiovisual media on destination image, nostalgia-driven tourism and the authenticity expectations of visitors.

The choice of an online survey as the primary data collection method was driven by the need to reach a geographically diverse audience, particularly international viewers of "My Brilliant Friend". Given the global reach of the series, a

digital approach ensured the inclusion of respondents who may have been influenced by the show but had varying degrees of prior exposure to Naples.

To minimize potential biases, the survey was carefully structured to ensure a comprehensive assessment of participants' experiences and perceptions. The questionnaire began with an introductory section that examined respondents' awareness of film-induced tourism and their general views on "My Brilliant Friend" and its portrayal of Naples. This was followed by a section designed to measure behavioral constructs using a seven-point Likert scale, based on established methodologies in TPB-based tourism research. The final part of the survey focused on collecting demographic information, including gender, age, nationality, and interest in participating in Naples-themed events.

Before its full distribution, the survey was pre-tested with a sample of 50 respondents to evaluate clarity, internal consistency and the validity of measurement items (Podsakoff et al., 2003).

Based on the feedback received, minor adjustments were made to improve question wording and ensure alignment with the study's objectives. This pilot phase strengthened the reliability of the instrument and reduced the risk of misinterpretation among participants.

Given the reliance on self-reported data, particular attention was paid to controlling for potential biases in responses. To address common method variance (CMV), the study employed Harman's single-factor test, a widely recognized statistical technique used to detect distortions caused by common method bias (Podsakoff et al., 2003). The test results confirmed that no single factor accounted for a majority of the variance, indicating that self-reporting bias did not significantly impact the dataset.

The final dataset consisted of 451 valid responses, meeting the recommended sample size for PLS-SEM analysis (Cohen, 1988; Green, 1991). This ensured that the study met the statistical power threshold required for robust model estimation and hypothesis testing. By leveraging these methodological rigor techniques, the research provides a reliable and in-depth analysis of the relationship between cinematic representation, nostalgia, authenticity, and tourist decision-making.

Results. *The preliminary findings confirm the significant influence of audiovisual media on tourists' perceptions and travel intentions. The analysis demonstrates that "My Brilliant Friend" has played a crucial role in shaping the image of Naples as a cultural and historical destination, reinforcing its appeal among international audiences.*

The portrayal of the city in the series evokes strong emotional responses, particularly nostalgia, which emerges as a key factor in motivating visits (Kim et al., 2019; Song et al., 2024). Viewers develop an attachment to the locations depicted, leading them to seek a tangible connection with the settings they have seen on screen.

The study further highlights the impact of authenticity-seeking behavior on tourists' expectations and satisfaction (Lee et al., 2020). Respondents who perceived Naples as authentically represented in the series were more likely to express a strong intention to visit.

However, discrepancies between cinematic portrayals and real-life experiences can lead to dissatisfaction, emphasizing the importance of balanced destination marketing strategies (Karpovich, 2010).

Quantitative analysis using PLS-SEM reveals significant relationships between TPB constructs (attitude, subjective norms and perceived behavioral control) and tourists' intentions to visit Naples.

Additionally, nostalgia and authenticity-seeking behavior exhibit positive correlations with travel motivation, reinforcing the idea that emotional and experiential factors drive film-induced tourism (Quintal & Phau, 2015).

The preliminary findings reinforce the increasing significance of audiovisual media in shaping perceptions of tourist destinations.

The representation of Naples in "My Brilliant Friend" has played a pivotal role in constructing an image of the city as a rich cultural and historical destination, influencing both domestic and international audiences (Hudson & Ritchie, 2006). Viewers who had not previously considered Naples as a travel destination reported heightened interest in visiting, demonstrating how exposure to audiovisual narratives can shift perceptions and create new tourism demand.

One of the key findings of the study is the role of nostalgia as an emotional driver in tourist decision-making. The series' setting, infused with evocative depictions of Naples' post-war neighborhoods, narrow alleys and vibrant street life, resonated deeply with audiences, triggering nostalgia both for personal memories and for an imagined past constructed through cinematic storytelling (Kim et al., 2019; Song et al., 2024).

Respondents who reported a strong emotional connection to the series were more likely to express an intention to visit Naples. This supports existing literature on the influence of media nostalgia in driving tourism motivation (Frow, 1991; Raymond et al., 2011).

Furthermore, the study highlights the importance of authenticity-seeking behavior in film-induced tourism. Respondents who perceived the portrayal of Naples in "My Brilliant Friend" as authentic were significantly more inclined to visit.

Elements such as language, architecture and cultural traditions depicted in the series contributed to this perception, reinforcing the idea that tourists value realism in media representations (Lee et al., 2020).

Some respondents noted concerns that Naples, as presented in the series, might differ from its current reality, aligning with previous research warning against the over-commercialization of film tourism sites (Karpovich, 2010).

The preliminary results further support the role of attitudes, subjective norms and perceived behavioral control in predicting tourist behavior.

Positive attitudes toward Naples, influenced by the emotional resonance of the series, emerged as the strongest predictor of intention to visit.

Subjective norms, such as peer and family influence, also played a role, with many respondents expressing interest in visiting Naples because friends or social circles had also watched the series and expressed enthusiasm for the destination.

Perceived behavioral control, particularly related to accessibility and safety, was found to be an important factor in decision-making, reinforcing findings from previous studies on destination choice (Quintal & Phau, 2015).

An additional interesting aspect that emerged from the responses is the influence of virtual engagement and online communities in reinforcing destination interest. Many respondents had previously participated in online discussions about "My Brilliant Friend" or had read travel recommendations based on the series before considering a visit. This supports existing literature on the role of digital communities in tourism behavior.

Tourists who actively engaged with fan communities were more likely to report a strong desire to visit, demonstrating that online discourse serves as an extension of the cinematic experience (Du et al., 2020; Lao et al., 2023).

Overall, the preliminary results of this study indicate that film-induced tourism extends beyond mere location exposure and involves a complex interplay of emotional connection, perceived authenticity and behavioral intent.

Research limitations. *While the study provides valuable insights into the relationship between film-induced tourism and destination perception, several limitations should be acknowledged. First, the research relies on self-reported data collected through an online survey, which may be subject to response bias and social desirability effects (Podsakoff et al., 2003).*

Participants' recollections and interpretations of "My Brilliant Friend" may have influenced their responses, potentially affecting the accuracy of their stated intentions and perceptions.

Second, the sample consists primarily of individuals who are already engaged with the TV series through fan communities, which may not fully represent the broader tourist population. This targeted sampling approach, while ensuring that respondents had prior exposure to the series, limits the generalizability of the findings to all visitors to Naples. Therefore, future research could expand the scope by incorporating a more diverse audience, including those with no prior knowledge of the series.

Third, the study focuses on a single case Naples as depicted in "My Brilliant Friend", which restricts the applicability of the findings to other film-induced tourism destinations. The success of the TV series has benefited the image of Naples as a destination. However, this is not solely influenced by the popularity of the series but also by other factors that have not been analyzed in this study, as they fall outside the scope of the research.

Finally, while the study employs a robust statistical approach using PLS-SEM, the cross-sectional nature of the data collection prevents an assessment of long-term changes in tourists' perceptions and behaviors over time (Hair et al., 2014). A longitudinal study could provide deeper insights into how media representations influence travel decisions in the long run.

Despite these limitations, the study contributes to the growing body of literature on film-induced tourism and offers a strong foundation for future research on media influence, nostalgia-driven travel, and authenticity-seeking behavior.

Managerial implications. *The preliminary findings of the study underscore the necessity for destination managers and tourism marketers to develop strategic approaches that maximize the benefits of film-induced tourism while preserving the authenticity of the location.*

Given the strong emotional engagement generated by "My Brilliant Friend", marketing strategies should not only promote filming locations but also curate experiences that align with the expectations of nostalgia-driven tourists. Tourists drawn to Naples through the series are likely seeking cultural depth and emotional resonance, rather than simply visiting a list of filming locations. To enhance visitor satisfaction, destination managers can design immersive, story-driven tours that integrate historical context, literary connections and local narratives, ensuring that tourists engage meaningfully with the city's identity (Lee et al., 2020).

A key aspect of film tourism management is the balance between commercialization and authenticity. While cinematic exposure can significantly boost tourist interest, overly commercialized strategies risk distorting visitor expectations (Karpovich, 2010).

A careful approach should be adopted when incorporating "My Brilliant Friend" into tourism branding. Instead of artificially reconstructing the series' settings, tourism boards should focus on highlighting authentic elements of Neapolitan culture, architecture and traditions that align with the show's portrayal. Collaborations with local historians, writers, and cultural institutions could help create guided experiences that maintain a balance between fictional representation and historical reality.

Moreover, fan communities play a crucial role in disseminating travel-related information and shaping perceptions of authenticity (Han & Bae, 2022). Destination managers should engage with these virtual communities by curating high-quality digital content, such as interactive maps of filming locations, behind-the-scenes insights and user-generated storytelling initiatives. By leveraging social media and online platforms, tourism stakeholders can co-create content with fans, fostering organic engagement and enhancing the perceived credibility of information.

Another managerial implication concerns the potential economic and social impact of film tourism on local communities. Increased visitor flows to "My Brilliant Friend"-related locations could lead to both opportunities and challenges. On the one hand, small businesses, local artisans and hospitality firms stand to benefit from heightened tourism demand. On the other hand, there is the risk of gentrification and overcrowding in areas that may not have the infrastructure to handle a surge in tourists (Leotta, 2020).

To mitigate these risks, tourism planners should adopt sustainable strategies, such as spatial distribution of tourist flows, encouraging visits to less frequented but culturally significant sites. By diversifying the tourism offer, it is possible to prevent excessive concentration in specific neighborhoods while promoting a broader and more sustainable economic impact.

Furthermore, when a series goes viral, the widespread sharing on social media platforms can influence both the perception of the destination and tourists' intention to visit (Qiu et al., 2024). By analyzing social media trends and online travel reviews, tourism boards can anticipate demand patterns and adapt their strategies accordingly.

Finally, the collaboration between the film industry and tourism sector presents significant opportunities for mutually beneficial partnerships. Local tourism boards can engage with producers, writers and cultural institutions to create film-linked promotional campaigns, exhibitions and themed cultural festivals. These initiatives not only enhance destination branding but also contribute to the preservation and valorization of cultural heritage.

By addressing these managerial considerations, destination stakeholders can maximize the long-term sustainability of film-induced tourism, ensuring that visitor engagement is emotionally meaningful, economically beneficial and culturally respectful.

Originality of the paper. *This work in progress research makes a unique contribution to the field of film-induced tourism by integrating behavioral psychology and destination marketing to examine the impact of "My Brilliant Friend" on tourists' perceptions and travel intentions. Unlike previous research that primarily focuses on destination image formation through film, this work extends the discussion by incorporating constructs such as nostalgia and authenticity-seeking behavior, providing a more nuanced understanding of tourists' emotional engagement with cinematic representations (Kim et al., 2019; Lee et al., 2020).*

A key element of originality lies in the application of an extended model of the TPB to analyze how media exposure influences tourists' decision-making processes (Ajzen, 1991).

By complementing TPB with additional psychological constructs, this study bridges the gap between media influence and consumer behavior, offering a broader theoretical perspective on film tourism (Quintal & Phau, 2015). The use of PLS-SEM also distinguishes this research, as it provides an advanced methodological approach to understanding complex relationships between tourist perceptions, emotions and behavioral intentions (Hair et al., 2014).

Furthermore, the study offers a critical reflection on the risks of over-commercializing film-induced tourism destinations. While previous studies have emphasized the positive economic impact of media-driven tourism, this research highlights the potential drawbacks of artificial destination marketing, which can create unrealistic visitor expectations and lead to dissatisfaction (Karpovich, 2010).

By addressing the balance between media representation and authenticity, the study contributes to a more sustainable approach to film tourism development.

Another innovative aspect is the focus on digital communities. By analyzing how online fan groups engage with the series and share information about Naples, this study underscores the importance of virtual networks in shaping destination perception (Eppler & Burkhard, 2007; Pan et al., 2021).

Finally, this research advances the discussion on film-induced tourism by combining theoretical, methodological and managerial perspectives, offering insights that are both academically significant and practically relevant for destination marketers and tourism policymakers.

Key words: *Film-induced tourism; Theory of Planned Behavior; Authenticity; Nostalgia; PLS-SEM.*

Virtual Reality and Tourism: A Literature Review

LORENZO SAPONARO[1] MARCO PICHIERRI[2]

Abstract

The virtual reality (VR) technology represents a recent innovation in the tourism field and scholars already highlighted it may have a notable impact on the future of the tourism industry (Tussyadiah et al., 2018). Despite an increasing interest in terms of publications, literature on the applications of VR in tourism appears still fragmented.
To address this issue and identify relevant research themes, this paper carries out a systematic literature review to order and synthesize existing contributions on the theme. Based on the PRISMA approach, a sample of 43 articles (published from 2004 onwards) was identified and organized into five possible clusters: Virtual Reality & Tourism Experience; Cultural Heritage & Virtual Tourism; VR Marketing & Consumer Behavior; VR Adoption & Technological Challenges; Emerging Technological Trends in VR for Tourism. Based on the review, the paper also provides some theoretical and managerial implications.

Framing of the research. *The rapid development of technologies has increased scholars' interest in Virtual Reality (VR), defined as the use of a computer-generated three-dimensional virtual environment to recreate real spaces (Guttentag, 2010). Indeed, some authors (Moro et al., 2019) already pointed out the growing number of published studies on this topic. However, the interest toward this technology also draws the attention of managers, companies, consumers and policymakers, thanks to its capacity to virtually recreate real objects, enabling users to immerse in artificial environments (Yung & Khoo-Lattimore, 2019).*

Compared to other technologies, VR may enhance the sense of presence and the degree of immersion in tourism sites (Bogicevic et al., 2019), and it is also economically, socially and sustainable (Sharma et al., 2024). These advantages induced researchers to investigate the possibility that VR could replace or complement tourism, becoming a sustainable substitute for visiting cultural and tourism sites (Sharma et al., 2024). The Covid-19 pandemic influenced the adoption and use of VR in tourism: specifically, in times of crisis, new technologies create opportunities to develop new markets (Shen et al., 2023), and the social distancing norms enabled VR to become quickly perceived as a substitute for travelling (Sarkady et al., 2020). The increasing interest in VR depends also on the fact that it is considered as an effective marketing tool which provides immersive experience and evokes emotions (Kieanwatana & Vongvit, 2024). Furthermore, within the virtual experience, this technology contributes to generating imagination, memory and attachment (Ji et al. 2023). Recent reports affirm that VR's industry, specifically the consumer VR market, is going to reach 18 billion U.S. dollars in 2025 (Statista, 2024), which could highlight the potential (but crucial) role of this technologies for the tourism market. To further confirm the growth of this technology, Statista (2025) foresees that the global extended reality market, which includes also VR, will reach 41.8 billion U.S. dollars in 2028.

While VR has been widely studied (Korkut & Surer, 2023), the existing literature appears quite fragmented (Bretos et al., 2024) and needs to be organized to understand the direction in which this argument evolves. Furthermore, literature on the theme is growing, not only in terms of interest, but also in terms of numbers, and literature review efforts may help scholars and practitioners to summarize extant knowledge on the topic. Cultural tourism, as a branch of tourism, may be particularly affected by VR. Moro et al. (2019) studied the developments of extended realities in tourism field from 2000 to 2018, finding the word "Cultural" 269 times in their review, with an increasing trend in terms of number of publications in last years - a trend also confirmed by Wei (2019). In addition, several scholars (for instance, Jung & tom Dieck, 2017) report that the use of VR in cultural tourism may support the co-creation of value for the tourism industry.

Purpose of the paper. *Research on virtual tourism has grown in recent years, due to increasing attention that scholars devoted to this theme (Moro et al., 2019; Wei, 2019). However, to date the existing literature on this topic is quite fragmented, probably due to the fact that the novelty of the research area determines rapid advancements. To help scholars fill this gap, the present paper offers a preliminary overview of current knowledge on VR in cultural tourism, trying to examine the main developments in this research area.*

By analyzing the existing literature, this paper aims to review the existing literature about virtual tourism (with a particular focus on cultural tourism), offering a theoretical and practical guide on this topic for scholars and

companies. Furthermore, the present study attempts to provide a preliminary guide to summarize current knowledge on the argument, offering a scheme which identifies five groups (clusters) of contributions. Finally, the paper proposes insights for future research, and theoretical and managerial implications.

Methodology. *For this study, a semi-systematic literature review was conducted to identify relevant themes and propose an overview of the extant research on VR and tourism (cf. Snyder, 2019). The article search was conducted based on the PRISMA approach (Moher et al., 2015). Articles were searched through Google Scholar, identifying peer-reviewed manuscripts published from 2004 onwards, using the keyword "tourism" and the term "Virtual Reality" in the article title. We considered articles published in journals that had the words "Management", "Culture", "Marketing" or "Tourism" in their titles. In this way, an initial sample of 201 papers were selected: respectively, 7 records were identified in Journals that had "Culture" in the title, 100 in Journals with the term "Tourism", 33 in "Marketing" Journals, 61 in "Management" Journals. Then, we screened the number of selected papers using inclusion and exclusion criteria: we considered only journals edited by well-known international publishers (i.e., Elsevier, Emerald, Taylor&Francis, Wiley, Sage, Springer), and book chapters and conference proceedings were excluded from the sample. Then, after reading the titles and abstracts, we excluded articles that didn't deal with the purpose of the research. Finally, we checked the presence of duplicates articles. The final sample was composed of 43 articles. A cross-validation of the search results using a different database (i.e., Web of Science) did not point out relevant differences.*

The time distribution of the articles is displayed in Figure 1.

Fig. 1: Time distribution of the identified articles

Results. *A thematic analysis (based on the articles' keywords) was conducted in order to identify possible literature clusters. This grouping procedure allowed to put together articles with similar or common themes related to the virtual reality domain. In this way, 5 different clusters were identified.*

1) The first cluster has been labeled "Virtual Reality & Tourism Experience" and includes articles dealing with the role of VR in shaping tourism experiences, including engagement, satisfaction and marketing applications. In this group, Wei et al. (2023) analyzed the role of gamification on fatigue and satisfaction, showing that gamification experience had a significant effect on tourism fatigue and satisfaction. Furthermore, they revealed that tourist satisfaction was significantly affected by several aspects of gamification (i.e., challenge, feedback, reward, and leaderboard). Yuan & Hong (2024), instead, examined the relationship between VR presence, VR enjoyment, flow, and how these elements impact the behavioral intention and the tourism experience. Results show that there was a positive relationship between VR presence and flow, that tourism experience and VR enjoyment were positively affected by VR presence, and that tourism experience had a positive effect on travel intention and recommendation intention. Kim and Hall (2019) sought to understand the effect of consumers' hedonics behaviors on continued use of information technology, analyzing the relationship between perceived easiness, perceived usefulness, perceived enjoyment, flow state and subjective well-being. Moreover, the authors added the moderating role of visit and non-visit groups to the destination shown in VR. Results revealed significant relationships between usefulness and flow state and between perceived enjoyment and flow state. Furthermore, continued use and subjective well-being were impacted by flow state, with subjective well-being influencing continued use. Finally, Sharma et al. (2024) conducted a quasi-experimental study to understand how and whether VR tourism may be the virtual and sustainable substitute of physical tourism. Results showed that technology embodiment (the capability to enhance user immersion by synchronizing real and virtual actions) positively influences authenticity, with these 2 variables positively impacting satisfaction.

2) The second cluster (labeled "Cultural Heritage & Virtual Tourism") is composed of articles investigating how VR is applied to cultural heritage sites and how it may enhance visitors' connection to historical and cultural heritage. Pantelidis et al. (2024) employed a mixed-methods approach to explore how VR experiences can strengthen tourists' place attachment in rural destinations. Findings show that the overall aesthetic experience of the site in VR had the biggest effect on the feeling of presence and the destination accessibility. This last variable influenced memories and presence, which in turn impacted loyalty. Atzeni et al. (2022) investigated the role of object-based authenticity and existential authenticity in non-immersive virtual heritage tour. The study suggested that both existential and object-based authenticity influence visitors' affective response to the experience. Furthermore, the study reports that cognitive response has a fundamental role in influencing visitors' emotional response, attachment to VR, satisfaction and intention to visit the site. Guttentag (2010) conducted a conceptual analysis to examine the potential impact of VR across six key areas in tourism: planning and management, marketing, entertainment, education, accessibility, and heritage preservation. The author highlighted several advantages of VR, particularly its virtual "nature", which enhances accessibility for individuals with disabilities and enables virtual visits to remote or otherwise inaccessible sites. VR was also identified as a valuable tool for heritage preservation and promotion, for inspiring real visits through virtual previews, and for education, offering immersive and information-rich environments. Lastly, Gao et al. (2022) explored the perception of authenticity of VR tourism, defined as an emotional and unique experience, proposing a theoretical framework. The framework shows that, after an inductive and deductive data analysis, 3 main themes resulted: objective authenticity, postmodernist authenticity and existential authenticity. For each main theme different kinds of VR are preferred; for objective authenticity, holographic photography VR is preferred, for postmodernist authenticity, computer-generated 3D environment VR is preferred and for existential authenticity, both holographic photography and computer-generated environment are important.

3) The third cluster (labeled "VR Marketing & Consumer Behavior") focuses on how VR is used in tourism marketing and consumer engagement strategies. Kostyk et al. (2024) investigated the mechanism of memory in consumer-brand experiences. The experiment was articulated into two moments (T1 and T2). During T1 participants were asked to experience the VR tour and to respond to a questionnaire, in T2, instead, after 3 weeks, participants were subjected to the same questionnaire. Through three studies the authors showed that episodic memory accuracy is lower at T2 than T1, semantic memory accuracy had no differences between the 2 periods and the name of the brand was remembered by 63% of T1 participants and became higher in T2 with 82% of respondents. Study 2 revealed that participants didn't feel cybersickness during the experience. Moreover, they had more accurate episodic memories at T1. Real-life users were more confident at T1, but in T2, VR users became more confident than others. To describe de experience, the words "nice", "fun", "interesting", "enriching", "impressive" were used. The study also showed that there was similarity between real-life experience and VR experience, and that the level of interactivity influences the ability to recall episodes experienced during the VR tour. Tussyadiah et al. (2018) aimed to understand whether the sense of presence may have consequences or effects on post-VR attitude change toward the destination and intention to visit. The study revealed a significant positive effect of the sense of presence on enjoyment, which in turn has, together with presence, positive effects on attitude change. Moreover, visit intention is impacted by attitude change. Bretos et al. (2024) conducted a comparative literature review to understand how scholars distinguished the role and the use of VR and AR. A conceptual framework that synthesizes variables from both technologies was built. The articles were classified into six contexts (destination, memory tourism, hotel, museum, theme park and tourism), with the authors noticing a development in recent years regarding methodologies and theories used. Qualitative methods and conceptual papers are mostly used for AR, and quantitative ones are more frequent for VR. Therefore, the study proposes an agenda for future research in order to guide the development of VR and AR research in tourism. Similarly, Beck et al. (2019) conducted a literature review, outlining the state of the art of VR research in tourism, classifying the outcomes in 3 levels of technology immersion: i) non-immersive, defined as "displays synthetic or 360-degree real-life captured content on a conventional (computer) screen" (Beck et al., 2019, p. 592); ii) semi-immersive, similar to the non-immersive, it has the possibility to project onto large screen monitor; iii) fully-immersive VR that completely isolates the user from the real life.

4) The fourth cluster ("VR Adoption & Technological Challenges") examines barriers to VR adoption, resistance and behavioral factors influencing VR acceptance. Shen et al. (2022) attempted to understand which are these factors and how much they influence the acceptance of AR and VR, investigating the relationship between perceived usefulness, perceived ease-of-use, hedonic motivation (which is related to enjoyment and playfulness), perceived price value and behavioral intention of using VR/AR for learning aims. Results show that perceived usefulness is positively associated with student's attitude toward virtual learning, which in turn is positively related to hedonic motivation. Moreover, a positive relationship between perceived price value and student's attitude was found. Students' behavioral intention to use AR/VR in education is positively influenced by their attitude towards the use of digital learning environments. Cham et al. (2024) examined the impact of barriers in senior tourists' (55 years and above) resistance, defined as the incapacity to acknowledge the values of innovation, and skepticism to use VR in tourism. Moreover, they attempted to understand if resistance and skepticism might influence the users' non-adoption intention. Technical barriers (perceived risk, defined as the uncertainties associated with the use of VR (Coldham & Cook, 2017), perceived complexity which is the perceived difficulties to adopt and comprehend VR, perceived incompatibility that is the discrepancy between VR benefits and the users' expectations) and psychological barriers (technological anxiety

understood as the sense of worry using VR technology, inertia is defined as senior tourists' tendency to undertake substantial efforts to keep the status quo of the existing decision and lifestyle (Cimperman et al., 2016), lack of human interaction) were considered. Results show that perceived risk, perceived incompatibility, technological anxiety, inertia and lack of human interaction are positively associated with resistance and skepticism. Resistance and skepticism to use VR in tourism lead to the non-adoption. Elkhwesky et al. (2024), instead, analyzed users' intention to use VR in tourism and the possibility to pay for electronic word-of-mouth of Gen-Y (users aged between 28 and 41) and Gen-Z (aged between 17 and 27) from Egypt in relation to travel fear for wars, pandemics and terrorism, environmental impact of tourism and technology anxiety. The mediating role of venturesomeness, defined as the willingness to try something new, was also studied. Results revealed that users' travel fear, environmental impact of tourism positively impact intention to use VR in tourism. On the other hand, technological anxiety influenced negatively the intention to use VR in tourism. Moreover, consumers' intention to use VR in tourism has a significant and positive impact both on the willingness to pay a premium price, and on electronic word-of-mouth. Finally, the moderating effect of consumers' venturesomeness doesn't impact on the intention to use VR in tourism. Zhu et al. (2024) examined the willingness to adopt VR tourism in terms of richness of quantity (multiple vs. fewer) and dynamics (dynamic vs. static) of virtual social cues, through the analysis of the relationships among interactivity, vividness, parasocial interaction, mental imagery. Furthermore, imagination (high vs. low) was used as moderating variable. Results show that mental imagery is significantly impacted by virtual social cues. Regarding the different scenarios, the second (with multiple virtual social cues) (vs. first; with few virtual social cues) shows stronger mental imagery, which in turn is even stronger in the third (dynamic virtual social cue) scenario. The second scenario had strong vitality and parasocial interaction. Static virtual social cues had less interactive and parasocial interactions, so the dynamic had more interactivity and parasocial interactions.

5) Finally, the last cluster ("Emerging Technological Trends in VR for Tourism") is composed of studies on future tourism technologies and emerging trends like Metaverse, augmented reality (AR), which, using computer-generated images, enable users to facilitate real-world interactions (Soltani Nejad et al., 2022) and mixed reality. Fan et al. (2022) constructed a meta-analytic framework to understand the core characteristics of AR/VR in tourism, the moderating variables that may influence the operating mechanism of AR/VR tourism applications and tourists' responses based on the core variables. Results show that presence, understood as the set of immersion, telepresence, interactivity, vividness, leads to behavioral intention, attachment, flow, affective engagement, satisfaction and positive attitude toward destination. Moreover, presence positively influences perceived ease of use and perceived enjoyment. About simulation type, presentation mode turned out to be better than 360-degree videos. Prior visitation has a negative impact on AR/VR in tourism. Social interaction influences positively AR/VR in tourism. Experience type has no significant effect on AR/VR in tourism. Bec et al. (2021) considered second chance tourism, a new approach that gives a "second life" to tourism and destinations, attractions and sites. The authors sought to explore the efficacy of creating tourism experiences in destinations and sites that have succumbed to over-tourism, a phenomenon referred to destinations which have excessive flows of tourists and that can bring negative effects. To this purpose, the paper explains the importance of virtual and mixed reality to preserve heritage. Nam et al. (2024), instead, investigated the mediating role of utilitarian, understood as usefulness of information and, hedonic aspects, understood as enjoyment, on satisfaction with VR, which, according to the authors, is the key for metaverse technology. The authors found that system quality, which refers to the ease of use of a system, and authenticity are positively associated with both enjoyment and usefulness of information, moreover, presence is positively associated with enjoyment, but not with usefulness of information. Results show that system quality and authenticity are positively associated with both enjoyment and usefulness of information, furthermore, presence is positively associated with enjoyment, but not with usefulness of information. Finally, enjoyment and usefulness of information are positively associated with satisfaction. Lastly, Zhu et al. (2023) investigated the impact of mental imagery on tourist telepresence, and satisfaction and the effect of VR vividness on tourist telepresence and satisfaction. Results showed that mental imagery positively predicts tourist telepresence and satisfaction; and that vividness positively predicts tourist telepresence and satisfaction. Telepresence positively predicts tourist satisfaction, which, in turn, positively predicts visit intention. The authors used for their study a non-immersive experience, considered part of the metaverse technology capable of affecting tourism visit intention.

Research limitations. *This work presents some limits. Some limitations are related to the research process: based on the adopted exclusion and inclusion criteria, we only included English article published by well-known publishers; moreover, we conducted the research using only Google Scholar and a limited set of keywords in the article title. Furthermore, another limitation may be that we selected articles considering a limited set of Journals in the management and tourism area.*

Theoretical and managerial implications. *From a theoretical perspective, this paper contributes to the literature by providing a summary of the current study of this technology in tourism. Furthermore, it offers a less fragmented overview of the research field, attempting to support future researchers in gaining an outline and expand existing theories in cultural tourism field, consumer behavior and technology adoption.*

From a practical point of view, this work offers marketers insights into VR tourism experience and its facets. Among others, it underscores the role and the influence of this experience on tourists (Wei et al., 2023), and, more important, the possible use of VR tourism as a virtual and sustainable substitute of physical tourism (Sharma et al., 2024). As

highlighted by Fan et al. (2022), extended realities may be a substitute, or may enrich the touristic experience, becoming tools to attract new target, and increasing the visit intention also in metaverse environments.

The review also suggests that the adoption of VR in cultural tourism may be used as a marketing tool in pre-purchase phase, to influence the visit intention (Bec et al., 2021), purchase phase, enhancing customer experience (Kim & Hall, 2019), and in the post-purchase to recall memories (Kostyk et al., 2024). Moreover, managers may consider extant literature to obtain an overview of technological challenges and how VR adoption can be enhanced (for instance, Shen et al. 2022, investigated factors that influence the acceptance of VR).

Originality of the paper. *In attempting to summarize extant literature on VR and tourism, this paper offers a preliminary (but practical) guide for scholars and managers. By identifying five possible literature clusters ("Virtual Reality & Tourism Experiences"; "Cultural Heritage & Virtual Tourism"; VR Marketing & Consumer Behavior"; "VR Adoption & Technological Challenges"; "Emerging Technological Trends in VR for Tourism") the paper offers a useful tool to understand in which way the research on the topic is advancing.*

Keywords: *Virtual reality; tourism experience; cultural heritage; virtual tourism; tourism marketing; tourism management.*

Acknowledgement. This work has been conducted within the *REVeRT* (*Relaunching cultural and heritage Experiences through Virtual Reality Tourism*) project, funded by the PRIN 2022 call of the Italian Ministry of University and Research.

Lean Six Sigma for a Sustainable Customer-Driven Procurement Model in Tourism: A Case Study Analysis

RAFFAELE TARDIO[1] ANTON STRAETEMANS[2·]

Abstract

This paper investigates the managerial and economic sustainable implementation of the Lean Six Sigma (LSS) framework within the tourism industry. LSS is a strategy that merges Lean principles with Six Sigma methodologies, specifically aimed at boosting operational efficiency and enhancing customer satisfaction. The voice of the customer elevates the consumer to a key player who initiates the demand in which the LSS framework helps facilitate sustainable supplier relationships in booking service agencies. A qualitative approach focused on the Golden Moments Worldwide Ltd. case study has been applied. This digital platform facilitates experience-driven tourism booking services within the Italian market analysis. This is backed by the theoretical framework of previous studies closely related to the model created in this paper to enhance the current operational approach further. This study presents a new structured model based on observations for businesses aiming to improve customer experiences while enhancing operational efficiency and managerial sustainability through a new model-driven decision-making. The insights obtained aim to contribute to academic literature and influence industry practices, underscoring the importance of LSS beyond traditional sectors and setting the stage for future research on sustainable human-centered and customer-focused service optimization in tourism.

Key words: *Tourism Management; Lean Six Sigma; Lean Management; Customer Centricity, Sustainable Service Procurement; Sustainable management approach.*

Framing of the research. *Krafcik (1988) initially introduced the Lean Production (LP) philosophy, which was later popularized by Womack et al. (1990). Drawing its routes within the Toyota Production System (TPS). Lean aims to eliminate non-value-adding activities and enhance process efficiency through structured waste reduction techniques (Ohno, 1988; Spear & Bowen, 1999). Lean achieves this through its value stream mapping, flow, pull, perfection, and value and is used to minimize waste and reduce bottlenecks aimed at increasing the efficiency and creating higher value for consumers and suppliers (Womack & Jones, 2003). Bill Smith developed a methodology that could complement these principles. In the mid-1980s, Motorola developed Six Sigma, a data-driven approach to reduce process variation and defects (Pyzdek & Keller, 2014). Six Sigma is grounded in this statistical analysis of processes through the DMAIC framework (Define, Measure, Analyze, Improve, Control) using statistical tools like capability analysis, control charts, and root cause analysis to drive improvements (Pyzdek & Keller, 2014). These methodologies combined to create Lean Six Sigma (LSS). Integrating lean and Six Sigma aspects. Lean aims to generate operational efficiency, while Six Sigma uses a statistical backbone to operationalize and improve organizational performance (Snee, 2010; Pepper & Spedding, 2010).*

With the original application in mind for both Lean and Six Sigma principles, there has been noticeable expansion outside the manufacturing domain, with these principles progressively becoming a more integrated part of service industries (Lancaster, 2011; Andrés-López et al., 2015), including healthcare, finance, and education. One of the fields that has emerged is tourism, which is where our focus lies. A viable sector for LSS integration due to the increased complexity of customer-driven approaches and service dynamics (Foris et al., 2020; Almomani et al., 2023; Avalos-Rolando et al., 2022). The LSS Management approach aims to support demand-driven logistics, customer customization, and flexible resource allocation. Key indicators that increasingly characterise the tourism industry. These principles could provide the competitive edge required in the increasingly entangled global tourism landscape (Bhuiyan & Wahab, 2018; Perdomo-Verdecia et al., 2022). The tourism ecosystem is increasingly under pressure to improve service quality, reduce waste, and ensure sustainability (Tatiyanatakul & Chindaprasert, 2024). LSS can position itself as the promising solution. The tools used by LSS, such as Just-in-Time (Otamendi, 2011), Kaizen (Waaje, 2025), and Poka-Yoka, can be used to prevent errors and align services with dynamic customer expectations if appropriately integrated.

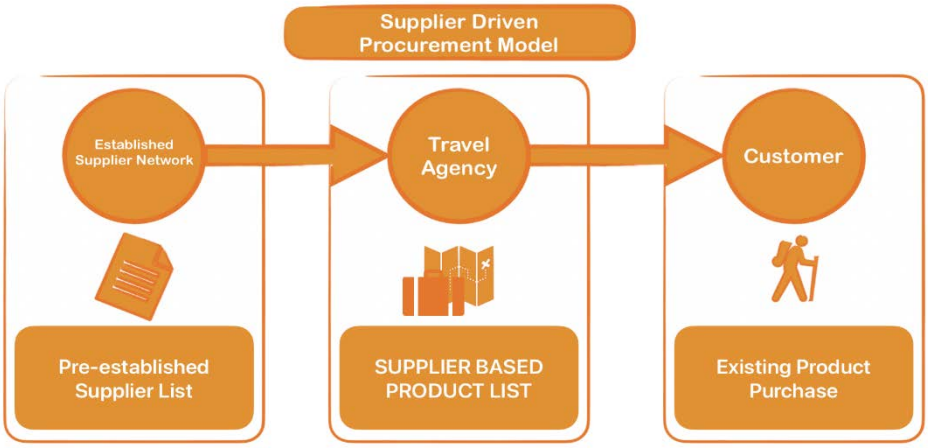
DOI 10.7433/SRECP.SP.2025.01

Despite the potential and growth in interest, the integration of Lean Six Sigma in tourism remains limited and fragmented. The focus is often allocated to destination management (Foris et al., 2020) or high-level strategic planning (Zhang et al., 2009). There is a gap in the empirical studies that analyze the implementation of LSS in booking service agencies. Integration within procurement, customer personalization, and service curation is exceptionally scarce. At the same time, authors such as Khalaf (2024) and Mesut Ülen (2020) have discussed LSS strategies in the context of tourism service settings. Their insights are often connected to the potential application of LSS tools within the broader business model, with a clear gap in customer-oriented procurement, especially within the travel and booking agency sector. This academic gap presents the need to understand how LSS tools can be systematically and sustainably applied in tourism service procurement and customer-centered model design. This research path is reinforced by the relevant benefits that LSS could provide. Presenting the capacity to shift from a traditional supply-led structure to customer-pull models that enhance customization, reduce service lead times, and build agile supplier networks (Jones & Womack, 2003; Avalos-Rolando et al., 2022).

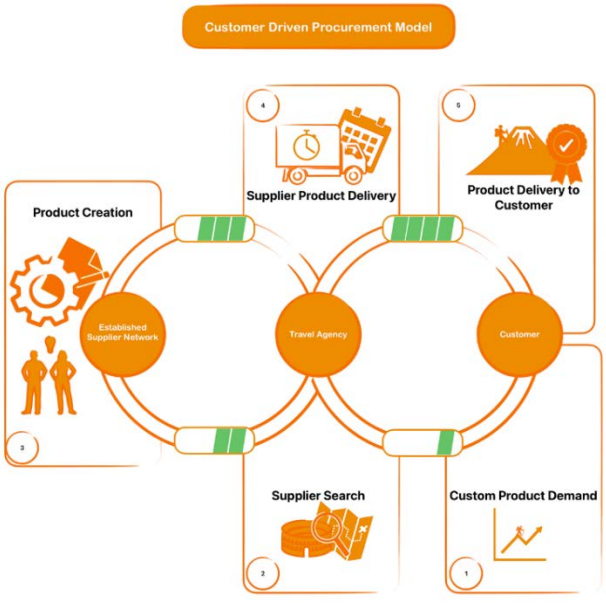
This paper aims to respond to the existing gap by doing an operational analysis of the application of LSS in a tourism booking agency. Golden Moments Worldwide LTD is in the process of integrating these methodologies within its Italian market for operational testing of the new management approach. The research explores how LSS tools such as DMAIC, Just-in-Time, and kaizen are used. Operationalising continuous improvement cycles that aim to support the transition from a rigid, supplier-centric procurement model to a flexible, customer-driven one. By analysing Lean and Six Sigma principles academically and in practice, the study aims to contribute to academic literature and tourism management practice.



Purpose of the paper. *This paper focuses on developing and analyzing the LSS application in an empirical business context. This management method has found a broad and constant development of interest in the scientific literature and has seen several applications in various industrial sectors, with recent wider adoption in the service sectors, and limited application within the tourism sector. This paper aims to develop an LSS customer-driven procurement model to address the limited empirical research within tourism procurement. The goal is to assess how LSS can support operational sustainability, customer-centric design, and decision-making through the analysis and observations of the Italian market branch of our case study. The case study will be centered around Golden Moments and its integration process of LSS tools and principles to observe if these tools can be sustainably implemented to shift from supply-led to demand-driven procurement. This study aims to propose a replicable model linking the empirical and theoretical findings of LSS to customer-led service innovation. This research seeks to understand if the LSS approach can be adequately applied in tourism, particularly for tourism booking agencies, with an extra lens on managerial transformation. The integration process of Golden Moments Worldwide Ltd's Italian market has been crucial to explore the possibilities within LSS, outlining the structure of the model, and understanding the operational-managerial approach. This analysis finally aims to develop a sustainable procurement model capable of presenting the incidence occurring on the operational and management processes when lean management thinking is applied for the acquisition and booking of tourist services.*

Methodology. *This research employed qualitative methods at various stages, including interpretation from internal observation, semi-structured interviews, and analysis of the operational processes of the case study over time, supplementing significant desk research. The semi-structured interviews are being conducted with Golden Moments' CEO and co-founder, Steven Cheatle. He played a critical role in enabling the implementation of LSS in the Italian market. The first interview has been conducted once so far, with planned interviews along the way, which aim to involve other market managers, as GM is in the process of integrating the LSS tools further. Internal observation of the head of the Italian market, Raffaele Tardio, led to a detailed qualitative analysis of observed operational and managerial shifts. These participatory observations enabled the empirical study of operational changes as LSS tools are progressively introduced. Golden Moments operates in 14 European countries as a booking agency. The Italian market is the most active and requires an operational shift to align with the highly variable customer expectations and demand. Its goal is always to exceed customer expectations. Driven by innovation, GM aimed to develop a model that could operate sustainably in the tourism industry. Therefore, this case study has provided the basis for operational observations and implementation of theoretical desk research, which helped formulate the model proposed in the paper.*

Based on these operational observations and desk research, a structured model has been created. As a work in progress that aims to develop in the future, the research path will also move on by collecting quantitative data and submitting questionnaires to Golden Moments employees. The data is still being developed, and the model is currently based on internal participatory observations, as mentioned before, and is therefore exploratory. These research methods were employed to bridge the aforementioned gap of limited application of procurement models linked to the LSS side of the operations.



Results. *The non-LSS supplier-driven procurement model operated on the following methodology. The supplier network consisted of an established network that generated submissions of supplied experiences curated to be displayed on the website. These Partnerships were formally solidified through contracts. These contracts formed the basis of the company's offering. These experiences were given as a pre-set product list from which customers could purchase their experiences. This operational approach revealed several inefficiencies prioritizing supply-side stability over demand-side responsiveness. This model resulted in a rigid service structure that showed its inflexibility. The agency's role was limited to operating as an administrative intermediary, not a strategic key stakeholder within the procurement process. This inflexibility was further noted in the static relations. This leads to limited real-time customization or client input. Experiences became outdated or were misaligned with suppliers' or customers' preferences.*

Fig: I: Old Procurement model

The new procurement model presented in the figure below and suggested in the paper has been developed based on internal observations of the operational integration process of LSS. While not fully integrated and operationalized, management has seen a significant shift to a managerially sustainable and customer-driven approach. The customer is the key player who initiates the demand. This initiation set the procurement process in motion. The agent is the key operator of that process. The agent aligns the optimal supplier for the consumer with the given budget and timing to meet the customer's needs. Once aligned with the most optimal supplier on the service concept, it can then be curated through the agency's intermediation between the supplier and the consumer. It is handed to the supplier to create the service in demand. The Supplier provides the necessary information to the agency, which, as an intermediary, finalizes the service to deliver to the customer for their experience. This experience can be added to the catalog for future sales and reference.

Figure II: New Procurement Model

The upper figure (Figure II) shows the new procurement model, which emphasizes a shift from a supplier-driven procurement model to a customer-driven approach. The change in approach aims to shift from a push to a pull methodology, working towards achieving a lean-oriented approach (Jones, 2003). The original procurement method relied on an established network of suppliers who provided pre-determined services under rigid contracts. This meant there was a prioritization of inventory availability over customization, limiting the flexibility and responsiveness of the booking service agency. Such an inflexible approach potentially hinders long-term, sustainable service creation and procurement.

The new customer-driven procurement model operates on demand-driven principles. Customers initiate requests, prompting the agency to search for suppliers who meet their requirements (S. Cheatle, 2025). The consumer becomes a Prosumer who actively shapes the service through engaging in a co-designed experience and using feedback aimed at

enhancing the created value for the customer. This transformation of the consumer to a prosumer reinforces and aligns with lean principles. Removing bottlenecks (Flow), eliminating inactive suppliers, acting only on demand, improving resource allocation (Waste Elimination), and increasing customer value creation as the experience is tailored to their needs (Womack & Jones, 2003). Feedback loops and service personalization enhance responsiveness, reduce resource waste, and allow the agency to develop dynamic supplier relations that support long-term trust and adaptability (Niezgoda, 2013). The move from fixed contracts toward a flexible, on-demand supplier base. Aimed at fostering dynamic partnerships and enhancing adaptability. This approach encourages a fluid relationship that bolsters trust and long-term value creation for all parties aiming to develop a sustainable supplier network from a managerial and economic perspective.

Six Sigma tools, such as the DMAIC framework (Define, Measure, Analyze, Improve, Control), have operated as a key guide to process redesign. Golden Moments is in the middle of operationalizing and further enhancing the process. Having defined the problems during the Define phase, identified the process rigidity and low customization rates as key problems, the current measure phase is in progress. With the restructuring of supplier onboarding, selection optimization, and error reduction strategies being implemented during these phases, we expect to see the optimization of procurement accuracy by aiming to minimize defects and improve supplier performance (Pyzdek, 2014). The combination of both these methodologies ensures a seamless procurement process, enhancing service quality while maintaining sustainable operational efficiency.

Due to the shift to an LSS approach within Golden Moments, a transition can be noted from rigid supplier relations to agile procurement strategies that prioritize customer experience, drive long-term value creation, and continue developing long-term supplier relationships as long as each stakeholder gains an advantage by participating within the network. These developments helped us create the model framework that will be further enhanced, implemented, and tested within Golden Moments.

Table I: Golden Moments Model Comparison

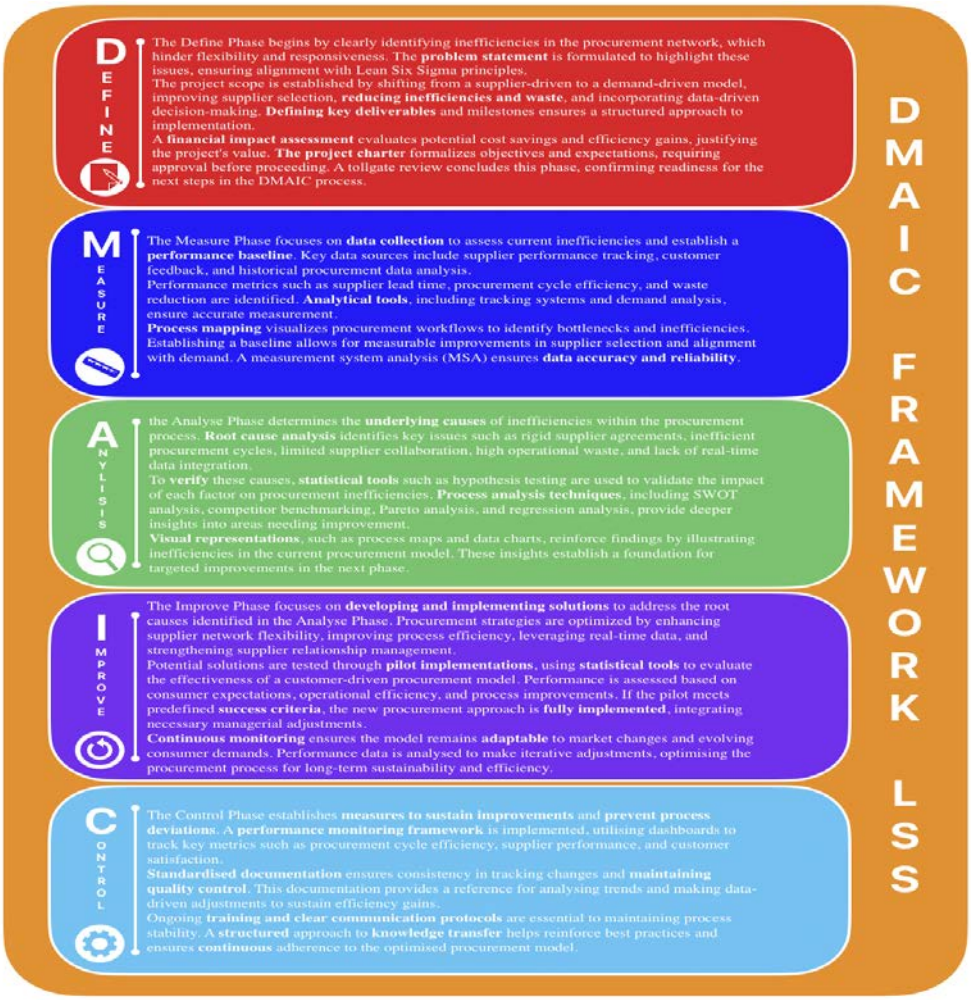
Golden Moments	Old Model	New Model
Suppliers	Established Supplier Network	Flexible Supplier Network
	Potential Inactive Suppliers *(waste)*	Active On-demand Suppliers
Pricings	Rigid Pricing	Dynamic Budget Pricing
	Supplier Driven Pricing	Agency Driven Pricing
Product	Established Product List	Personalized Product On-Demand
Management	Product Oriented Management Approach *(Push)*	Customer Oriented Management Approach *(Pull)*
Tools	Pre-stock Control System	JIT, Poka Yoka, Kaizen
	Contract life cycle Orientated	DMAIC
Contract	✓	✗
Lean	✗	✓
Six Sigma	✗	✓
Pre-Set Product	✓	✗
Custom Product	✗	✓
Customer Satisfaction	✓	✓
Supplier Network	✓	✓
Dynamic Supplier	✗	✓
Avoid Waste	✗	✓
Dynamic pricing	✗	✓

Golden Moments relied on a network of suppliers contracted to deliver services. Usually, the supplier approached Golden Moments to be on the product list. This creates an established expectation of the benefits the service will provide to both parties. In practice, however, this has led to inactive suppliers who made contractual agreements binding them to deliver a service even when the demand was too low to justify the original deal. This unbalanced status between the stakeholders strains a potential relationship due to the clients' highly variable and flexible demand and the inflexible agreement.

The agreements ensured the service supply was stable, as this predetermined the packaged service on offer from Golden Moments, making it less flexible to changing consumer demands but guaranteeing supply. This guarantee was further reinforced by a rigid price the supplier set, as the agency had less bargaining power due to a lack of immediate consumer demand. This hindered potential sales of the agency, but in the future, it might hurt suppliers due to the low agreed sales prices that could not contractually react to extreme events like COVID-19.

The new flexible approach empowers both the consumer and the supplier. Customers initiate the demand, and suppliers respond on an on-demand basis. The consumer acts as a prosumer, integral to their experience. The agency dynamically selects the most suitable supplier on a case-by-case basis enabling enhanced matching and improved negotiation leverage based on active demand (Niezgoda, 2013). This structure establishes a win-win scenario, fostering trust, responsiveness, and sustainable supply management. By curating adaptable packages based on customer

parameters such as location, time, budget, and experience type (Weerakoon, 2023), the agency facilitates deeper information exchange and improved long-term supplier collaboration.



Golden Moments' operational management approach has shifted from service-oriented to customer-oriented. This change in approach focuses on a pull methodology instead of a push methodology. The strategic shift emphasizes customer value and engagement, prioritizing customer needs and creating collaborative value. This shift supports a sustainable relationship with suppliers and customers, and through active collaboration, a sustainable supply of custom products, where all parties will enter a win-win scenario. This can be facilitated through a digital platform, which Edvardsson and Tronvoll (2020) argue can facilitate stakeholder cooperation, where this new form of stakeholder interaction could occur.

The old system relied on a steady supply of experiences fostered through contracts, with offerings oriented around the contract's life cycle. A pre-stock control system approach ensured that there were always offerings on the website.

Golden Moments is in the process of integrating Lean and Six Sigma methodologies and aims to apply the model suggested within the paper to achieve the transition, optimizing its processes to deliver high-quality, sustainable, customizable products efficiently. The principles and tools further explored in this paper are as follows: Just-in-time (JIT) ensures that services and supplier engagement occur only when a customer initiates a request, reducing waste associated with inactive suppliers and excess inventory. Aligning supplier selection with immediate demand, the model aims to minimize unnecessary commitments and enhance operational flexibility (Otamendi, 2011). Poka-Yoka aims to use mistake-proofing mechanisms to prevent service execution errors. Supplier performance and customer experience inconsistencies will be reduced by embedding quality checks. The model seeks to ensure seamless and reliable service delivery (Waaje, 2025).

The culture of continuous improvement, known as Kaizen, is implemented within Golden Moments to foster adaptability and continuously improve its dynamic supplier network. The application of continuous improvement in the procurement model aims to allow Golden Moments to adapt dynamically to the customer-oriented demand and be flexible in its supplier network. It eliminates waste by continuously evaluating and testing its supplier network. It creates qualitative relations within its network of suppliers, shifting it towards optimal resource allocation to meet customers' expectations and operate sustainably, allowing the model to refine processes based on customer feedback data and evolving market conditions. This improvement model enhances efficiency and customer satisfaction (Waaje, 2025).

Figure III: DMAIC Procurement Model

The upper figure (Figure III) shows the potential implementation of DMAIC in the procurement model, enhancing projects. The framework helps set project guidelines and achievable, concrete goals for the team. Standardizing such projects helps management monitor progress. Enabling structured problem-solving and ensuring process optimization management through a data-driven approach, the framework aims to allow golden moments to enhance service accuracy, supplier performance, and long-term value creation on a customer-driven model that aims to achieve sustainable data-driven procurement (Pyzdek, 2014). Golden Moments seeks to foster a dynamic and efficient service ecosystem through these tools, reinforcing its commitment to customer-centric innovation, supplier collaboration, and operational excellence as it progresses through integrating the tools within the LSS toolbox. The model shows potential applications and future research based on the performance of the integration of LSS in the Golden Moments, a customer-oriented model.

Research limitations. *This qualitative study has potential limitations. This paper currently represents a work in progress whose result could be better supported and validated over time by collecting a wider range of quantitative data at Golden Moments Worldwide Ltd. Furthermore, the effect estimates in the model are based on interventional and prospective internal observational studies conducted by some of the writers. They are therefore subject to human biases and confounding that might have impacted the model setup and estimates. In addition to this, it would be interesting to evaluate how an increasingly conscious application of the proposed and now structured model for Golden Moments could eventually lead to further growth in the economic performance of the business in the years to come. Moreover, only the Italian market department has been considered in this study. So, in the future, it will be relevant to extend the analysis to all the European and global markets active within the business. Besides, to prove on a longer term the validity and effectiveness of the model obtained as a result of the analysis developed in this paper, it would be appropriate to verify how the application on other case studies of travel agencies and various tourism businesses can influence their economic sustainability and impact their profit performance over time. So, it is possible to consider this work as a step in a research path that is in progress and that can be further developed in the future.*

Managerial implications. *Considering tourism as an economic activity linked with services and the third sector, it can be concluded that it differs from other activities in terms of its specific elements, particular managerial dynamics, and the characteristics that compose the business field. This makes the sector, which operates and evolves on multiple levels and dimensions, a complex area to analyze and structure from a management perspective (Andjelic and Ilic 2022). The research results of this work and the analysis of the Golden Moments Worldwide Ltd case study lead to the expression of a transformation in the management of the company's operational processes. The result is the development of a new sustainable model, no longer driven primarily by the service supply chain, but mainly focused on constructing a service in line with customer demand and client needs. This new model is structured following the insertion and application of strong lean management thinking in the company's operational flow and some principles of the LSS method. The latest model proposes a standardized but, simultaneously, circular and multidirectional structure, which actively involves all stakeholders in creating and developing the tourism product that is finally delivered to the market. The new managerial perspective leads to the need for a fluid and non-static managerial approach that must consider the point of view of all the subjects involved in the process. Therefore, transitioning from a supply-oriented model to a customer-oriented model involves setting up a process management that is open to modifications, changes, and corrections in progress and ready to provide a rapid and just-in-time response to customer demand. Furthermore, the new model aims to keep the supply network active and manage dynamic relationships with suppliers and customers.*

Originality of the paper. *This paper investigates the potential impact of LSS in the tourism sector, an area that has been relatively underexplored compared to its traditional application in the manufacturing industry. The adaptation of LSS in tourism, particularly the transformation from a supplier-driven to a sustainable customer-driven business model, can significantly contribute to academic literature and industry practice, inspiring new avenues of research and practice. The study distinguishes itself by providing a lens into the practical application of the case-study-based analysis of Golden Moments Worldwide Ltd. It provides insights into how LSS tools can drive operational and managerial shifts in tourism service procurement and booking processes. The difference between this paper and previous studies is its shift in focus, which focuses on the theoretical applications of LSS. It integrates a real-world qualitative approach to assess how LSS principles reshape business workflows, stakeholder relations, and customer satisfaction through a managerial sustainable approach.*

This research paper looks into the potential application of Lean Six Sigma tools and creates a procurement model based on an analysis of Golden Moments' operations. It demonstrates a transition from a push-based supplier model to a pull-based customer-driven system, enhancing efficiency, flexibility, and long-term supplier relationships and voice of the customer. This case represents a significant transition from LSS's application beyond its conventional industrial domain. It offers actionable insights for other tourism businesses looking to improve service customization, reduce waste, and optimize operational decision-making with a sustainable management approach. So, customer demand information collection and the dynamic Golden Moments supplier network database help create an effective and sustainable new procurement flow for the firm. The digital communication process applied on the platform is also a key to obtaining sustainable and functional relationships between stakeholders.

By combining theoretical insights with a business case study, this paper extends the scope of LSS applications and provides a framework for future research and industry adoption. This marks a critical step in bringing management science and real-world tourism sector transformations and opens up exciting avenues for future research and industry adoption.

Leveraging Visitor Satisfaction to Enhance cultural Sites Management: Fresh Insights from Bourbon Heritage

FABIO GRECO[1] AMELIA NAPOLITANO[2] LAURA CLEMENTE[3] GESUALDA IODICE[4] FRANCESCO BIFULCO[5]

Abstract

This study explores visitor satisfaction with regard to the Bourbon cultural heritage sites in Campania, adopting a mixed-methods approach to assess key dimensions of the visitor experience. Through preliminary interviews with site visitors, the research applies an expectancy-disconfirmation framework to analyze the relationship between perceived quality and importance attributed by audiences. Findings reveal significant appreciation for the cultural and historical value of the sites, while identifying critical gaps in infrastructure, digital accessibility, and post-visit engagement. In particular, mismatches between visitor expectations and actual service delivery emerge, especially in areas such as online communication and complementary services. Demographic and behavioral insights highlight a growing interest in thematic experiences and personalized itineraries, underlining the need for adaptive and visitor-centered management strategies. By integrating satisfaction metrics with site management considerations, this study contributes to the advancement of cultural tourism research and offers a foundation for future initiatives in destination management and sustainable cultural development in Southern Italy.

Framing of the research. *Tourism is one of the sectors that significantly contributes to a country's economic development, together with the many industries connected to it (Wang et al., 2017). Within this broader framework, cultural tourism represents a strategic pillar of the global tourism economy. In Southern Italy, Bourbon heritage sites represent an underexploited yet high-potential resource for cultural tourism enhancement. Despite their historical and cultural relevance, these sites remain marginal in traditional tourist itineraries, limiting their visibility and integration into wider heritage circuits. In this context, understanding visitor satisfaction emerges as a valuable tool for unlocking their potential. Rather than providing definitive answers, preliminary evidence from visitor experience analysis can reveal areas of strength and weakness, offering useful insights for shaping more effective local destination management strategies (Greco et al., 2024). In particular, the perceived quality of the visit-shaped by both the content offered and individual expectations-plays a crucial role in the overall experience. Adopting a visitor-centered approach to managing cultural heritage, even in its early stages, can serve as a lever for future planning aimed at more inclusive, engaging, and sustainable development of heritage-based tourism.*

Visitor Satisfaction in Cultural Heritage

A strategic emphasis on visitor satisfaction depends on the quality of interactions with cultural heritage (Fyall, Garrod, & Wang, 2012) and aligns with broader efforts to enhance the attractiveness and accessibility (Napolitano & Bifulco, 2024; Cerdan Chiscano & Jiménez-Zarco, 2021) of heritage sites, transforming them into pivotal elements of the cultural identity and tourism economy. The expectation-disconfirmation theory provides an effective theoretical framework for assessing visitor satisfaction by comparing pre-visit expectations with actual experiences (Clemons & Woodruff, 1992). Applied to cultural heritage sites, this approach links satisfaction to factors such as the quality of the attraction, its state of preservation, and its perceived cultural value (Huh, 2002). A key determinant of overall satisfaction is the quality of the visitor experience. In this regard, a study conducted in the historic center of Macau identified four primary dimensions - experiential quality, perceived value, heritage image, and satisfaction - which significantly influence tourists' behavioral intentions (Chen & Chen, 2010).

Place attachment also plays a crucial role in fostering visitor satisfaction and encouraging sustainable tourism behavior. Buonincontri et al. (2017) developed a conceptual model integrating heritage experiences, emotional connections to the site, and sustainability, emphasizing how affective bonds can enhance the cultural value of heritage sites and encourage repeat visits. Similarly, Beeho and Prentice (1996) highlight the importance of understanding both the emotional and cognitive responses of visitors to develop customer-oriented marketing and planning strategies. In line with this perspective, De Rojas and Camarero (2007) propose a model that combines cognitive and affective approaches to satisfaction, underscoring the pivotal role of emotions in shaping visitor experiences.

Even if Nicolais (2023) has initiated research on enhancing Bourbon sites, with a particular focus on sustainability efforts at the Real Sito di Carditello, the current body of literature reveals a significant gap in the application of multidimensional visitor satisfaction assessments to Bourbon heritage sites, as well as in the evaluation of place attachment. This lack of empirical studies underscores the need for comprehensive analyses to fully understand the potential of these sites as cultural tourism destinations, facilitating the development of targeted and sustainable valorization strategies. Future investigations should prioritize tailored satisfaction assessments and foster collaboration with local stakeholders. Adopting a systematic strategy could strengthen the role of Bourbon heritage sites within Italy's cultural tourism sector, ensuring a balance between visitor experience and heritage conservation.

Grasping Perceived Quality and Attributed Importance to Inform Destination Management Strategies

Cultural tourist satisfaction is a multifaceted concept that goes beyond the perceived quality of the services provided. The literature emphasizes the importance of considering both the quality of services and the value attributed by visitors based on their individual priorities (Mariapina & Della Lucia, 2019). Some scholar identify key factors influencing overall satisfaction and confirm that it is shaped by a variety of service quality elements, each with varying degrees of relevance. Cultural experiences significantly impact satisfaction, as the perception of the quality of cultural services is crucial in determining tourist satisfaction levels. Furthermore, the cultural context and perceived authenticity play a significant role in overall satisfaction, as tourists are increasingly drawn to authentic and meaningful experiences (Domínguez-Quintero et al., 2020). The perceived quality of public cultural and tourism services positively affects the quality of life of visitors, highlighting how the importance attributed to these services plays a critical role in overall satisfaction. Additionally, the perception of safety during visits to cultural sites directly impacts satisfaction, as visitors value experiences that provide comfort and tranquility. The emotional impact of the experience plays a crucial role in tourist satisfaction. The competence of tour guides also significantly influences satisfaction, as visitors place great importance on the quality of interaction and the knowledge provided during the tour (Huang et al., 2010; Fyall et al., 2012; Kara et al., 2023; Karacaoğlu, 2024). To accurately assess cultural tourist satisfaction, it is essential to consider both the service quality and the importance of key aspects of the experience. This approach helps refine offerings, improve satisfaction, and encourage repeat visits. Analyzing service expectations and gaps can further enhance the design of the tourist experience.

Purpose of the paper. *The primary objective of this exploratory study is to examine emerging patterns from preliminary visitor experiences at Bourbon heritage sites in Naples, with the goal of informing local destination management strategies. By identifying key factors that influence visitor satisfaction, the study aims to provide insights into how addressing specific strengths and weaknesses-such as the appreciation of cultural content, infrastructural gaps, limited digital accessibility, and insufficient post-visit engagement-can improve the positioning of Bourbon heritage sites within a broader destination management framework. This research integrates visitor feedback with managerial implications, laying the groundwork for future projects focused on fostering sustainable, visitor-centered development in the context of local cultural tourism.*

RQ: "Which emerging patterns from preliminary visitor experiences at Bourbon heritage sites can inform local management approaches?"

Methodology. *This research focuses on prominent, historically authentic Bourbon heritage attractions located in Naples, selected for their cultural significance and potential to represent the broader network of Bourbon destinations in Campania. A qualitative approach was adopted to explore visitor satisfaction. Preliminary interviews were conducted with visitors on-site to gather insights into key dimensions of the visitor experience, using an expectancy-disconfirmation framework to compare perceived quality with the importance attributed to various service aspects. While these initial findings are not yet exhaustive, they offer valuable insights that can guide further, more structured investigations.*

This approach provides a structured framework to understand visitor expectations and identify areas for improvement in service delivery, aligning with previous studies that have explored Experiential Quality and its impact on engagement in cultural heritage (Chen and Chen, 2010; Buonincontri et al., 2017). The analysis considers both physical and digital aspects of the visitor journey, recognizing the growing role of digital engagement in shaping pre-visit expectations and post-visit experiences. Data were gathered using a Likert scale (ranging from 1 to 5), a standard tool in customer satisfaction studies, which allowed respondents to articulate their perceptions of quality and the significance of different aspects of their visits. This approach yields a comprehensive understanding of visitor experiences and their satisfaction levels.

This study adopts a qualitative perspective to assess visitor satisfaction at Bourbon heritage sites. This methodological framework combines structured surveys with an expectancy- disconfirmation model, which measures satisfaction by analyzing the gap between perceived quality and the importance attributed to various aspects of the visitor experience. By applying this approach, the study provides a comprehensive understanding of visitor expectations and areas requiring service improvements, aligning with existing research on experiential quality and cultural engagement, which enables a holistic analysis of both subjective and objective aspects of the visitor experience, providing valuable insights for improving service delivery and enhancing the overall visitor experience at Bourbon heritage sites.

Results. *By assessing visitor satisfaction at Bourbon heritage sites using the aforementioned methodological framework, the study revealed a series of key findings.*

Findings indicate that both sites are highly appreciated for their cultural offerings, such as exhibitions and artifacts, yet notable gaps exist in accessibility, supplementary services, and post-visit engagement. For what concerns the first site, online information availability and digital post-visit support receive lower satisfaction ratings compared to their perceived importance, suggesting the need for enhanced pre-visit communication and sustained interaction after the visit. Accessibility also presents a challenge, as it scores lower in perceived quality than in attributed importance, indicating that visitors expect a more seamless experience. Complementary services, including online booking and ticketing, receive mixed evaluations, reflecting the necessity of further optimization to improve ease of access.

Similarly, the second site demonstrates strong performance in core cultural experiences but faces significant shortcomings in digital engagement, which rank among the lowest-rated dimensions of visitor satisfaction. Additional services are particularly underwhelming, with a significant negative satisfaction index, highlighting the need for investment in visitor amenities.

The study also emphasizes the growing role of digital engagement in shaping both pre-visit expectations and post-visit experiences. Visitors increasingly rely on online information before their visit and expect continued interaction through digital platforms afterward. The analysis highlights that improving these aspects, along with accessibility and complementary services, will be essential for aligning visitor experiences with their expectations. Implementing targeted service enhancements, such as better online resources, expanded amenities, and interactive feedback mechanisms, could contribute to higher satisfaction levels, fostering repeat visits and reinforcing the long-term attractiveness of these cultural heritage sites. Moreover, strengthening digital post-visit engagement strategies could enhance visitor loyalty and encourage deeper interaction with the cultural institutions beyond the physical visit.

Implications. *By analyzing satisfaction-related dimensions across multiple aspects of the visitor experience, this exploratory study highlights key areas in need of targeted improvement-most notably, accessibility, online communication, and complementary services. These preliminary findings provide useful indications that can inform the design of future strategies in local destination management for cultural heritage.*

From a theoretical standpoint, the results reinforce the importance of deepening our understanding of visitor expectations and experiential dynamics within the context of heritage tourism. In particular, the data suggest a growing relevance of digital engagement and information accessibility, dimensions that may not yet be fully integrated into existing theoretical frameworks (Iodice & Bifulco, 2024; Chen & Chen, 2010). Furthermore, the study draws attention to the emotional dimension of the visitor experience, underscoring how affective connections to heritage sites contribute to overall satisfaction and future loyalty. Although prior research has emphasized immersive technologies as drivers of engagement, the current evidence suggests that digital communication and post-visit interaction remain underdeveloped in the case of Bourbon heritage sites. This points to the need for further studies on digital heritage strategies and their role in long-term visitor engagement (Clemente & Bifulco, 2023; Apollonio et al., 2019).

From a managerial perspective, the data reveals significant gaps between visitors' expectations and the perceived quality of online information available before the visit. Enhancing digital channels to offer more transparent, intuitive, and accessible content could improve the planning phase and align visitor expectations with the actual site experience (Della Lucia et al., 2023; Kara et al., 2023; Russo & Van der Borg, 2002; Fyall et al., 2012). Moreover, strengthening complementary services-such as food offerings, digital ticketing systems, and initiatives to maintain contact with visitors after their visit-could improve both the comfort and the memorability of the experience, ultimately fostering stronger emotional bonds with the site (Presenza et al., 2024; Karacaoğlu, 2024).

The study also identifies a clear interest in more interactive and personalized forms of engagement, including thematic tours and educational activities. Expanding these formats, and embedding them within broader, itinerary-based tourism frameworks, could significantly contribute to increasing visitor involvement and satisfaction (Ford, 2020).

Taken together, these insights-although preliminary-underscore how the analysis of visitor satisfaction can serve as a strategic lever to guide future research and inform the development of more adaptive, sustainable, and visitor-centered destination management practices in the cultural heritage sector.

Research limitation. *While this study offers preliminary insights into visitor satisfaction at Bourbon heritage sites, several limitations should be acknowledged in light of its exploratory nature. The research is based on an initial set of interviews conducted at a limited number of sites, which, although valuable for identifying key satisfaction dimensions, does not yet allow for broad generalization across the wider network of Bourbon cultural locations. Expanding the investigation to include a more diverse range of heritage sites would enhance the robustness of the findings and provide more representative inputs for shaping future destination management strategies.*

Moreover, the reliance on structured interviews and self-reported data, while effective for capturing visitor perceptions, may be subject to certain biases, such as social desirability or memory distortion. Future research could benefit from integrating complementary methods, such as observational studies or real-time visitor tracking, to triangulate and validate the insights gathered.

Another consideration is the cross-sectional design of the study, which offers a snapshot of visitor satisfaction at a specific moment in time. Longitudinal approaches could better capture the evolution of expectations and experiences, providing a more dynamic understanding of how service improvements influence satisfaction over time.

Finally, as digital engagement becomes increasingly central to the cultural tourism experience, there is a need to explore more innovative and responsive methodologies to evaluate its impact. Developing tools to assess digital interactions, before and after the visit, would help capture their role in shaping visitor perceptions more accurately.

Overall, these limitations underscore the importance of scaling up the analysis to build a more comprehensive and actionable foundation for future research and for the development of destination management practices tailored to the specific needs of Bourbon heritage tourism.

Originality of the paper. *The originality of this work lies in several key aspects.*

The study proposes an innovative model of itinerant tourism, connecting Bourbon heritage sites through thematic narratives and integrated visitor experiences. This approach aims not only to increase the visibility of these sites but also to position them as strategic resources within regional tourism development. Furthermore, the study emphasizes the growing role of digital interaction in the visitor experience, highlighting the need to enhance virtual touchpoints both before and after the visit. By expanding digital platforms to support clear communication and effective planning, the study suggests improving the overall visitor engagement. Lastly, the research suggests reinforcing ancillary services, such as resting areas, dining options, and post-visit engagement opportunities, by enhancing the visitor experience with personalized itineraries, interactive content, and post-visit activities. This approach could foster a deeper cultural connection and encourage repeat visits. Lastly, the study contributes to improving local destination management practices by positioning visitor satisfaction analysis as a strategic lever for rethinking and enhancing cultural heritage tourism management practices, promoting sustainable development focused on the visitor. These aspects provide a fresh perspective for enhancing Bourbon heritage tourism, going beyond traditional analyses and focusing on integrated and innovative management strategies.

Tackling Grand Challenges: the role of Collective Action in preserving the Mediterranean coastal ecosystem

SARA TESSITORE[1] EDOARDO BIGOLIN[2] DUCCIO TOSI[3] NATALIA GUSMEROTTI[4]
FRANCESCO TESTA[5]

Abstract

Grand Challenges like climate change and biodiversity loss require collective multistakeholder actions. Addressing these complex issues involves overcoming normative value differences among stakeholders. This paper investigates the use of rhetoric to pursue meta-consensus as a mean to foster collaboration, trust, and shared governance, creating sustainable solutions and aligning diverse stakeholder objectives for effective collective action. The paper presents the preliminary results of stakeholder analysis and engagement in two Mediterranean sites to propose nature-based solutions enhancing coastal resilience to climate change. Findings highlight differences among stakeholders through mapping, prioritization, and engagement activities, aiding navigation towards meta-consensus and effective collaboration. By understanding stakeholders' perceptions and encouraging them to impersonate others, we can better address conflicts and foster mutual acknowledgment.

Framing of the research. *Complex challenges like climate change, ecological degradation, social inequality and public health came to be known as Grand Challenges (Ferraro et al., 2015; George et al., 2016; Gümüsay et al., 2020). Grand Challenges can be defined as specific barriers that, if removed, would solve significant societal problems with a high likelihood of global impact through widespread implementation (George et al., 2016). These challenges are generally global, affecting large populations (George et al., 2016; Ferraro et al., 2015) and are inherently complex, involving multiple factors, high uncertainty, and temporal non-linearities (Ferraro et al., 2015; George et al., 2016; Bridoux and Stoelhorst, 2022; Lants et al., 2024). Grand Challenges are usually urgent, requiring prompt solutions to prevent further harm and create long-term solutions (Bridoux and Stoelhorst, 2022). Among the main contemporary Grand Challenges the "triple planetary crisis" - referring to climate change, biodiversity loss, and pollution - is considered one of the greatest challenges that human societies have ever faced (Passarelli et al., 2021). Coastal ecosystems are affected by the triple planetary crisis. These ecosystems play a crucial role for socio-economic wealth and provide crucial services to mitigate the impacts of climate change (Reed et al., 2022). However, they are under increasing stress from pollution, overdevelopment, and climate impacts, which include rising sea levels and intensifying storms.*

Such complex challenges generate competition among people priorities (Passarelli et al., 2021). Indeed, different stakeholders prioritize time and profit returns differently (Passarelli et al., 2021; WEF, 2023). For example, economic actors prefer to forego long term investments for climate adaptation in favour of short term returns, while social acotrs and civil society recognise the need for long term investments, provided they do not have interest in short term returns. Investing in sustainability and ecological restoration requires a trade-off between short term economic returns in favour of collective long-term benefits (WEF, 2023). This conflict is then value-laden because it entails reconciling economic imperatives with ethical obligations (Bowen and Heath, 2005) or local needs with global obligations (Potz, 2004), addressing priorities' diversity among people (Gümüsay et al., 2020; Schwoon et al., 2024). These factors, along with normative value differences, affect the importance and urgency stakeholders attach to the challenge, which stimulate slowdowns, uncertainties, and non-optimal solutions (Lantz et al., 2024).

The inhomogeneity among people perspectives exacerbates the intrinsic temporal uncertainty, non-linearity of non-human agents' behavior (Lantz et al., 2024). Such complexity makes pivotal navigating diversity within collective actions combining various sectors, governments, businesses, academia, and non-profit organizations (Ferraro et al., 2016).

Conflicts can be harnessed as catalysts for better outcomes, bringing different perspectives and improving problem solving through reciprocal acknowledgment, stimulating knowledge sharing, drive innovation, and promote sustainable development (George et al., 2016; Bridoux and Stoelhorst, 2022). As for all Grand Challenges, preserving the costal ecosystem cannot be addressed by a single agent (Ferraro et al., 2015; Bridoux and Stoelhorst, 2022). Management studies recognize the need for collective multistakeholder actions to address grand societal challenges (Arenas et al., 2020; Ferraro et al., 2015), as innovative responses to such challenges (Moog et al., 2015).

The success of these collective actions requires coordination, active collaboration, trust, reciprocity, shared governance and leadership toward a common goal (Bridoux and Stoelhorst, 2022). Thus, designing collective action involves developing common ground among stakeholders, creating a shared perspective, and overcoming normative value differences (Ferraro et al., 2018; Lantz et al., 2024). A solid branch of research focuses on establishing common ground using rhetoric as a mean to shape public discourse, to trigger institutional change, and to stimulate social cohesion motivating action (Burke, 1969). Indeed, rhetoric harnesses the fundamental role of language in shaping individual and collective reality, redefining how the world is interpreted and experienced (Hassan and Prasad, 2025).

Rhetoric can help build common ground among stakeholders about ecosystem-based solutions for coastal ecosystems degradation. Indeed, rhetoric shapes identity through narratives and symbols, framing roles and capabilities (Spaneth and Urbano, 2025). It can redefine cognitive categories or introduce new ones, thus reframing social dynamics influencing public perception and the category itself (Lee and Stiruk, 2025). This aligns to a better collective framing of time and nature which, through scientifically robust framing, can help the convergence of normative values stimulating trust among actors. Ultimately, the rhetoric exercise nurtures legitimacy (Hassan and Prasad, 2025; Erkama and Vaara, 2010), that sparks from the sense of urgency and appropriateness of actions (Lants et al., 2024).

Among the techniques to harness rhetoric to create common ground among stakeholders, the concept of meta-consensus was born to overcome the barriers of normative values differences and develop common solutions (Schwoon et al., 2024). Meta-consensus is achieved through the creation of common ground as "the set of presuppositions that actors, as a result of their ongoing sensemaking and interaction with others, take to be true-and believe their partners also take to be true" (Cornelissen and Werner, 2014). To this purpose, meta-consensus starts from making actors accept to take part in the dialogue, allowing them to enter a safe space of equal confrontation and share a first common purpose (Ferraro et al., 2018). A second step seeks to shift the rhetoric perspective from the substantive to the procedural level, harnessing a participatory architecture approach (Ferraro et al., 2015). To this purpose, a fundamental leading figure are the designated bridging stakeholders, helping participants to agree on basic dialogue rules. (Ferraro et al., 2018; Schwoon, 2024). Achieving meta-consensus then allows a shift from procedural to substantive communication to design common solutions (Schwoon, 2024). Despite this workflow being hard to run in real life, it is an ideal optimal aspiration (Ferraro et al., 2018) and has shown to be promising in structured engagement processes, provided the right emphasis on the role of the bridging stakeholders (Schwoon, 2024).

Successful cases applying meta-consensus seek to focus on stakeholder diversity and the set up of clear communication mechanisms to the purpose of letting different view emerge for reciprocal acknowledgment. (Schwoon, 2024). This process favours to the alignment of objectives and the balancing of goals and priorities, which constitute the backbone of the common ground at the base of collective action.

Purpose of the paper. *Focusing on two pilot sites in the Mediterranean area, where stakeholders must cooperate to address climate change and its impacts on the coast, provides a unique opportunity to examine how divergences, conflicts, and different priorities are reconciled through meta-consensus.*

Taking advantage of this context, the present work and its follow-up, seek to explore the research gaps in literature about meta-consensus for collective action. Despite its potential, several gaps remains, comprising (i) how contextual factors, such as stakeholder compositions and power dynamics, influence the formation of meta-consensus, (ii) how trust, built through meta consensus, translates into sustained collaboration; and (iii) how employing experimental methods enable to test and generalise meta-consensus (Lantz et al., 2024; Schwoon et al., 2024).

Methodology. *Context: The research is developed in the context of the European project AMMIRARE financed by Interreg Italia Francia Marittimo in 2024. The project aims at preserving the coastal ecosystem in Mediterranean area from climate change impacts. Facing the climate change effects AMMIRARE will test nature-based solutions (NbS) -as defined in UNFCCC COP27- in two pilot sites to preserve coastal health. But the implementation of these solutions requires the consensus of the local stakeholders such as companies, sports organisations, institutions. The project pilot sites are the Municipality of Cecina in Tuscany and the Marine Protected areas of Portofino in Portofino. These are two of the most Italian tourist sites. Cecina and Portofino manage the climate change impacts from over twenty years. Coastal erosion and extreme events threaten the fragility of these territories. Cecina and the surrounding area host around 115,000 tourists every year from different Italian regions (Chamber of Commerce north-west,2023). The main impact on Cecina's coast concerns the phenomenon of erosion, which has caused the shoreline to recede by more than 100 metres since 1938. Additionally, the municipality and the local enterprises should manage the presence of seagrasses Posidonia Oceanica whose benefits for the ecosystem and the local economy are scarcely perceived by the community (Ruiz-Frau et al.2018). Portofino hosts around 150.000 tourist yearly (Liguria Region 2024) and is one of the main Italian destination from European and American tourists. Portofino offers various activities: yachting, diving, sport and professional fishing represent a significant economic induced activity. Among the main negative effects of climate change are unusually strong sea storms and the introduction of alien species that may compete for colonisation of the substrate.*

For the cited reasons these sites represent a research opportunity to test the collective action initiatives to achieve a meta-consensus about the solutions aimed at improving the coastal resilience to climate change.

Method: Narrative analysis is the qualitative method adopted to achieve the research purpose. In the context of social sciences, narrative research is both a data gathering and interpretive or analytical framework (Ntinda, 2019).
Snowball sampling (Parker et al. 2019) methodology is applied to identify the local stakeholder to engage.

Data collection: The research is built upon close collaboration between the research team with key managers of Tuscany and Liguria Regions, local municipalities and administrations. We used different types of sources to triangulate our findings using cross-checks (Eisenhardt, 1989; Yin, 2003).

The following data sources have been used in this research:

Secondary data sources: Regarding the context analysis and the stakeholder to involve, we started by collecting information through desk research based on various sources, either directly or indirectly related to the pilot sites. Among other things, these sources included the municipalities and marine protected area websites, chamber of commerce annual reports and dataset, tourist operators guide, environmental reports (for instance "Atlante delle coste" published by ISPRA in 2023), five newspaper articles, scientific articles. An extensive amount of materials was either produced or collected by the research team to analyse the health of the two pilot sites and identify stakeholders to involve.

Observations: Observation in field is one of the main sources for collective action development and allows to assess the process of learning and knowledge to achieve meta- consensus.
To collect observational data, researchers enacted diverse observer roles throughout the project. Observational data were collected in the following settings and involved all research team: (i) during technical project meetings; (ii) during in site visits; (iii) during the workshop and other engagement events.

Interviews: The interviews, which provided qualitative information, began in the early months of the project. Regular interviews conducted for each pilot site, involving multiple stakeholders. The interviews were conducted partly in person and partly online and lasted an average of 45 minutes each. Two interviews were completed, registered and drafted in a report.

Totally, from 2024 to 2025, research team attended 10 meetings including two in site visits with around 150 pages of report (table n.1).

Process description: The team held four technical project meetings involving the components of both the Tyrrhenian pilot cases, plus a national representative between March 2024 and March 2025. The purpose to introduce the project and ensure alignment among the partners throughout the project.
A preliminary collection of data within the pilot cases served to describe the context. For both cases, a first introductory meeting was followed by an interview and a site visit. This process was conducted between March and July 2024, involving the respective regional authorities, the local municipalities, the national parks/protected areas representatives and the scientific partners. By constructing the pilot cases context, the team was able to compile a list of relevant local stakeholders, selected and classified following the criteria by Mitchell et al., 1997 to identify salience of each in relation to the respective coastal ecosystem. The list was later validated and expanded through a subsequent meeting with local partners between July and September 2024.
Subsequently, the team engaged the selected stakeholders set in both pilot cases in structured workshops designed to gather their sentiments and opinions within the frame of the project between December 2024 and March 2025.

Data analysis: By coding the interviews and the feedback from the workshops and meeting, we investigated the main stakeholders' misalignments to overcome for an effective collective action. Through axial coding aggregate dimensions emerged, which have been triangulated with the secondary data collected. The aggregate dimensions represent the issues on which the misalignment between stakeholders is greatest and on which engagement actions need to be focused.

Table n. 1 List of collected data (observation and interviews)

Territorial context	Data	Meeting topic	Setting for observation data	Involved Stakeholder	mode
Tyrrhenian area	21-22 March 2024	technical project meetings	Project progress sharing	5 regional institutions 6 scientific project partners 2 national parks 1 national institution	In person
	3 July 2024	technical project meetings	Project progress sharing	5 regional institutions 6 scientific project partners 2 national parks 1 national institution	In person
	3 December 2024	technical project meetings	Project progress sharing	5 regional institutions 6 scientific project partners 2 national parks 1 national institution	On line
	11 March 2025	technical project meetings	Project progress sharing	5 regional institutions 6 scientific project partners 2 national parks 1 national institution	In person
Cecina pilot site	5 March 2024	technical project meetings	First local project meeting	Tuscany Region, Cecina Municipality, research team	In person
	18 April 2024	in site visits	Technical project presentation	Turscany Region, Cecina Municipality, Municipality consultants, research team, National institution, 2 universities	In person
	30 July 2024	interview (45 minutes)	Context description and stakeholder list sharing	Cecina Municipality, research team	On line
	10 December 2024	participative workshop	Collection of Stakeholder perception	Turscany Region, Cecina Municipality, Municipality consultants, research team, 14 stakeholders	In person
Portofino pilot site	08 May 2024	technical project meetings	First project presentation	Liguria Region, Marine Protected area, research team	On line
	16 July 2024	technical project meetings	Context analysis	Liguria Region, Marine Protected area, research team	On line
	19 September 2024	Interview (45 minutes) and in site visit (1 day)	Context description and stakeholder list sharing	Liguria Region, Marine Protected area, research team	In person
	5 March 2025	participative workshop	Collection of Stakeholder perception	Liguria Region, Marine Protected area, research team, 18 stakeholders	On line

Results. *In the very beginning, the team analyzed local pilot cases and identified stakeholders, categorizing them into policymakers, economic activities and industry associations, scientific entities, NGOs and other associations. (tab. n.2 a-b) During the stakeholder mapping process, the team conducted some field visits and repeated contacts with the purpose of better understanding pilot cases, territorial complexity and contextualise stakeholders' claims. Despite some differences among the cases, similar stakeholders share similar claims.*

Table n.2a Stakeholder mapping results. Portofino pilot case.

Policymakers		Economic activities		Scientific bodies	NGO/associations			Total
Local and regional authorities	Resources management authorities	Industry associations	Unions		Environmental/ cultural associations	Foundations	Volounteer organisations	
6	3	18	2	5	19	3	4	60
9		20		5	26			60

Local and regional authorities	Resources management authorities	Industry associations	Unions	Economic activities		Environmental/ cultural associations	Foundations	Volounteer organisations	
2	5	5	2	7	1	1	0	1	24
7		14			1	2			24

The Portofino case stands out for having twice the participation compared to the Cecina case, primarily due to the significant involvement of NGOs and associations. This was expected, given the complexity of the Portofino territory and insights gathered from in-situ interviews. The Portofino pilot case includes a Marine Protected Area, established due to strong advocacy from local diving groups. Unlike Cecina's underwater morphology, Portofino offers extensive habitats

for marine species, providing a unique experience for divers. This complexity and fragility have led to the emergence of several local environmental groups and a strong research ecosystem.

Another difference between the two case studies is the tourism industry. In Portofino, it is mainly constituted by high-spending visitors, whereas Cecina has a more diverse clientele. Consequently, greater tension is observed in Portofino due to the clash between structured environmental awareness and the demands of a high-quality, high-expectation tourism industry. In fact, during in-situ discussions, the Marine Protected Area representative mentioned that conflicts with local beach clubs are often significant. Highlighting this contrast is one of our primary objectives to design the correct leverages and achieve meta-consensus.

After stakeholders were mapped, they were classified according to their salience using criteria based on power, legitimacy, and urgency. A final score rating defined the saliency of each stakeholder as high, medium, low, or none (see tab 3.a-b).

Tab. 3a. Stakeholder classification results. Portofino case

Salience	Policymaker and institutions	Economic activities	Research bodies	NGO/associations	Total
High	6	15	0	25	46
Medium	3	4	3	1	11
Low	0	0	3	0	3
Total	9	19	6	26	60

Tab 3b Stakeholder classification results. Cecina case

Salience	Policymaker and Institutions	Economic activities	Research bodies	NGO/associations	Total
High	4	10	0	2	16
Medium	2	2	1	0	5
Low	1	1	0	0	2
None	0	1	0	0	1
Total	7	14	1	2	24

Generally, we assessed that institutions gain salience because of their coercive power and territorial management responsibility, economic activities gain legitimacy from their physical exposure to natural events which increase their vulnerability. NGO/associations and Research bodies acquire saliency because of their legitimacy, provided that their existence and action are justified by their mission to protect the natural ecosystem and its recognition by society.

The engagement activities gathered a total of 190 comments in the frame of the Cecina pilot case, and 34 comments in the Portofino pilot case. After the two engagement events, responses were recorded, aggregated and refined. We asserted that the comments, both positive and negative, mainly regarded the following aggregated dimensions: Environmental aspects, Social/cultural aspects, Political-administrative aspects, Economic Aspects, Technical aspects. The main findings for each stakeholder group are hereafter identified.

Entrepreneurs and beach club managers have the imperative of maintaining high quality of service and revenue, which sometimes conflicts with other actors and aspects of sustainability. During the engagement process, economic actors showed trust in the effectiveness of solutions for their specific purposes, but contrasting opinions emerged on the economic impacts. The greatest fears are about aesthetic impacts and the reduction of "marketable" space on the shores. Especially from the aesthetic perspective, results are contrasting; some fear that providing a more natural-looking experience may conflict with tourists' expectations, leading to negative economic impacts, while others think that this renewed look would improve the landscape. One economic actor expressed the following opinions about a NbS in the Cecina case: "(this solution) is effective to protect the shoreline from storm surges" but "the presence of natural waste and Posidonia seagrass represents a problem of beach usability for the beach industry." This ambiguity was retrieved also in other stakeholder categories, especially among institutions and civil society (though the latter mainly shows a positive stance).

Institutions and local authorities are interested in preserving the areas and their economic profitability, but they aim to harness the issue to maintain their political power. Some municipalities expressed fear because the solutions are "not attractive for tourism" and provide a "neglected beach appearance". The fear of reduced space and the unattractiveness of a natural-looking beach was shared by other stakeholders. They also fear putting the burden of maintenance costs on beach clubs, probably fearing a political backlash. Nonetheless, institutions and authorities are unanimously confident that these solutions are effective and can increase global environmental quality because they provide defense while reconstructing a habitat lost to erosion.

Scientific bodies and research centers deeply understand the need for ecosystem preservation and consider the intervention a valuable scientific hub to conduct research and collect valuable information, following the streams of ongoing coastal ecosystem monitoring projects. Scientific and technical bodies also share concerns about the required competencies and means for managing solutions, citing "maintenance costs" and the "need for maintenance" as disadvantages.

Non-governmental bodies and associations push for the realization of the actions. Aside from their moral obligations toward ecosystem preservation, sport associations, diving centers, and other related bodies think that their activities would benefit from the interventions, along with helping in their missions of spreading the culture of attachment to the natural landscape. They share with scientific bodies the concern that beach clubs may show disinterest and antipathy towards proposed solutions, fearing that the beach economy will struggle to understand the benefits of these actions. Additionally, there is a worry that civil society will not grasp their purpose initially. Local institutions also emphasized the need to increase awareness of the solutions' benefits.

Contrary to the fears of economic actors and associations, beach users and coastal residents generally have a positive attitude and think that a more natural look would improve the landscape's attractiveness and economic revenues. They are confident that these solutions would improve the cultural stance for sustainability and environmental preservation. Among local communities and beach users, there is a shared feeling that solutions may bring the co-benefits of increased value and attractiveness of a natural-looking beach. Some think that the increase in beach attractiveness may improve the overall quality of life.

Given stakeholders' personal aspirations, inviting them to impersonate other stakeholders in the second round of engagement allowed for developing a novel perspective on reciprocal acknowledgment. Among our results, we assessed a shared understanding of the fears of economic actors. Indeed, there is a division concerning the aesthetic impact on beach attractiveness, despite the majority having a positive stance. Many think that a reduction in the available shore for beach clubs may be a problem for the local economy. On the contrary, there is mild optimism about the positive cultural impact on environmental awareness that may increase economic value.

Our initial results show a preliminary divergence in perspectives. It emerged a significant contrast between the positions held by those benefiting from the status quo and those advocating for change. Local authorities and economic players show scepticism for potential losses in economic income and political support. Conversely, associations and scientific bodies strive to implement the solutions, driven by a combination of moral obligations, material objectives, or the real potential for scientific research on nature-based solutions. These initial divergence highlights how each group's opinions are intertwined with the primary goals, laying the groundwork for understanding the dynamics of consensus formation.

During the second round, initial signs of convergence could be noticed, as the actors started to mildly acknowledge the positions of those with opposing views, testifying the emergence of meta-consensus. This gradual softening of stances through iterative dialogues encourages the participants to reframe their position, making meta-consensus a higher-tier agreement that evolves through continuous interaction and reflective debate.

Overall, all the actors agree that the solutions would be effective to preserve the ecosystem and show a positive attitude towards their realisation. Yet, some significant differences persist. Economic actors and institutions fear that the unusual shoreline appearance would discourage tourists, while beach users seem not to be bothered by this aspect. It is worth noting that the aesthetic aspect is the most ambiguous due to conflicting comments even within the same category. Similarly, while institutions fear that beach clubs may be unfairly burdened by managing and maintaining solutions (likely due to political backlash), scientific bodies consider realization and maintenance a difficult task, so they consider it crucial to conduct awareness campaigns aimed at economic actors and civil society.

Recognising the dynamicity of meta-consensus provides new insights into stakeholder engagement. By designing structured engagement processes to stimulate acceptability and focused on clarifying contentious issues - such as the aesthetic result and impact on the tourism economy, the burden of maintenance responsibilities - it is possible to promote a strong consolidation of viewpoints. By means of this, meta-consensus balances competing interests as long as facilitating a sustainable collective action.

Research limitations. *The study is based on preliminary results from two pilot cases located on the west coast of the Italian peninsula, which limits the variety of territorial and socio-economic contexts, whereas the process could be replicated in other European territories in the Mediterranean area. Consequently, the main limitations are related to the limited temporal scale and geographical scope of the study, as well as inherent biases from participants' understanding of the rules and expertise in the specific field. The current work focuses on applying the same framework to other pilot cases to provide stronger results and allow for comparability. The research progress is still ongoing, and many other research activities will be implemented. Further developments for the study could emerge from a multi-site analysis and a broader, more varied involvement of stakeholders.*

Managerial implications. *Through our work, we were able to frame stakeholders' differences and aspirations within the context of the applied nature-based solutions in the project. By focusing on mapping stakeholders, studying territorial complexity, and engaging with them, we were able to understand how different actors react to the application of various selected nature-based solutions. We acknowledge that different stakeholders have varying perceptions, influenced by their inherent objectives and nature. Additionally, we recognize that when stakeholders impersonate other actors, they somewhat acknowledge each other, showing similar stances. This is promising for the process of meta-consensus.*

These results can bring insightful managerial implications. Conducting a thorough stakeholder screening and relating it to territorial complexity can provide a clear image of advisable actions and potential caveats. Interfacing with stakeholders allows for deeply understanding their stances, aspirations, and fears, highlighting potential contrasts and conflicts that may hinder the successful application of an action. Conversely, encouraging stakeholders to impersonate other actors helps understanding how they acknowledge each other, emphasizing the barriers to be overcome to achieve

meta-consensus. This process helps to achieve legitimacy, it educates and empowers stakeholders, encourages dialogue, and allows for designing highly effective and least regrettable solutions.

Originality of the paper. *This paper explores meta-consensus in marine coastal ecosystem preservation. Building meta-consensus starts with understanding people's feelings, opinions, and priorities to foster trust, legitimacy, and collaboration. The paper's originality lies in designing a stakeholder engagement process aimed at developing meta-consensus for NbS implementation. The main objective was to understand differing views and their causes to design a strategy for navigating differences and building meta-consensus.*

The focus was on mapping stakeholders, the complexity of the territories, and their challenges and objectives. This involved framing pilot cases and iterative interactions, such as in-situ interviews, to develop a deep understanding of each case. Stakeholder engagement activities aimed to grasp stakeholders' thoughts and feelings on proposed solutions, confronting them with their roles and aspirations. Highlighting contrasts and differences among stakeholders is a key challenge in establishing meta-consensus, which is a significant contribution of this work.

Further development of this approach will contribute to the literature on meta-consensus and the challenges of overcoming conflicts in collective actions for ecosystem preservation, by constructing a balanced view among stakeholders' priorities and their reciprocal acknowledgment.

Key words: *Collective actions, grand challenges, meta-consensus, nature-based solutions, stakeholder engagement*

Knowledge-Driven Innovation in Tourism SMEs: A Systematic Literature Review

ANDREA VINCIS[1] CINZIA DESSÌ[2]

Abstract

Research on innovation in small and medium-sized enterprises (SMEs) within the tourism sector is increasingly recognised as relevant among scholars. This paper explores these concepts through the lens of knowledge, which acts as a vital driver for tourism innovation processes. The intersection of absorptive capacity (ACAP) and organisational learning (OL) is highlighted as an effective method for managing external knowledge (EK). This paper emphasises that the existing literature in this domain remains disjointed, thereby underscoring the necessity for further investigation to augment the comprehension of the subject matter. This study adds to the discourse on tourism innovation by conducting a Systematic Literature Review (SLR) with narrative synthesis to examine how scholars interpret ACAP and OL, their respective roles, and how these knowledge-related concepts foster innovation by exploiting EK. Research gaps are identified, and potential future research directions are suggested within the distinct context of tourism SMEs.

Framing of the research. *Tourism is a fundamental driver of global economic growth, cultural exchange, and social development. As one of the largest industries in the world, which has established its significance as a productive sector, particularly over the past 40 years, it plays a significant role in contributing to GDP (López-Bonilla & López-Bonilla, 2021) in both developed and developing countries (e.g. Holzner, 2011). While tourism displays the typical characteristics of a services sector, its distinctive traits render it a unique phenomenon that diverges from the definition of the traditional economic sector (e.g. Camisón & Monfort-Mir, 2012; Williams & Shaw, 2011). Indeed, it consists of dispersed activities across time, space, and nature that must be dynamically integrated and coordinated among distant participants in physical, organisational, and cognitive aspects (Aldebert et al., 2011). Moreover, it is fundamentally customer-driven, with customers viewed as prosumers who act as both producers and consumers (Pikkemaat et al., 2018).*

Tourism is also a turbulent, dynamic and ever-changing sector in which innovation plays a crucial role as a driver for the global competitive standing of businesses and destinations, by helping them to adapt to a constantly changing world, and continue delivering appealing customer services (e.g. Camisón & Monfort-Mir, 2012; Hall & Williams, 2008; Hjalager, 2002). Considerable research has investigated several aspects of innovation, including, among others, types (e.g. Camisón & Monfort-Mir, 2012; Hjalager, 2010), technological applications (Buhalis & Law, 2008), collaborative innovation forms (e.g. Marasco et al., 2018; Novelli et al., 2006), and barriers (e.g. Hall & Williams, 2008), further enhancing the understanding of its complex nature. Despite the growing evidence that innovation is a crucial competitive driver, this remains an unresolved issue among tourism companies, as noted in the literature (e.g. Camisón & Monfort-Mir, 2012; Hall & Williams, 2008; Hjalager, 2010).

SMEs exhibit unique characteristics related to their form, informality in relationships and activities, internal resources, and managerial approaches (Woods & Joyce, 2003). Unlike large companies, SMEs can operate efficiently while managing organisational costs and possess the potential to forge strong connections with their customers, utilising proximity that enables them to adapt to their needs swiftly (Keskin, 2006).

In the tourism sector, SMEs represent roughly 80% of the entrepreneurial landscape (UNTWO, 2022); this underscores the importance and intricacy of research in this field. Importantly, there is a sustained emphasis on niche markets (e.g. Middleton & Clarke, 2001) where tourism SMEs flourish, capitalising on these segments to achieve competitive advantages and maintain their operations over time. However, while they enjoy greater flexibility and agility than larger companies, they face ongoing challenges to maintain market competitiveness due to limitations in capital, research and development (R&D), and human resources (Novelli et al., 2006; Thomas et al., 2011).

The Role of Knowledge. EK refers to information, expertise, and insights that originate outside an organisation and can be leveraged to enhance innovation, decision-making, and overall competitiveness. It may originate from different sources, such as customers, competitors, suppliers, and industry networks. It may also stem from universities, research institutions, government agencies, patents, publications, industry reports, partnerships, and online communities, among others. This aligns EK with the Open Systems Theory (Katz & Kahn, 1966), which conceptualises organisations as

dynamic entities that constantly engage with their external environment. Considering this dynamism, Hjalager (2002) states that knowledge bases are the foundation for change and innovation processes, influencing how system boundaries evolve. These system boundaries are not fixed but shift over time alongside the development of knowledge bases (Hjalager, 2002).

EK prerogatives are evident in innovation, tourism, and SMEs. EK drives innovation by exposing firms to novel ideas and practices. Fagerberg et al. (2006) found that in the innovation literature, firms depend heavily on external sources rather than looking internally. Nonaka et al. (2001) claim that knowledge networks become crucial to sustaining a long-term competitive edge by generating new knowledge and advancing innovation.

EK plays a vital role in dynamic industries like tourism (Thomas & Wood, 2015; Williams & Shaw, 2011) where firms must quickly adapt to changing consumer preferences, technological advancements, and market trends. Mina et al. (2014) found that service firms adopt open innovation systems, investing minimally in internal R&D while depending on suppliers, customers, and business networks.

SMEs often face challenges in terms of fragmented activities, resource access constraints, and a scarcity of expertise that can hinder their ability to innovate (Cooper, 2006; Thomas et al., 2011). Consequently, EK results are vital for SMEs to overcome resource constraints, foster innovation, and maintain a competitive edge (e.g. Hall & Williams, 2008; Hjalager, 2010; Thomas et al., 2011). Moreover, given the limited knowledge base due to their size, SMES need to be able to exploit external sources of knowledge (e.g. Desouza & Awazu, 2006; Grandinetti, 2016) and specifically external networks, as an input to both knowledge and innovation (Rogers, 2004).

However, generally firms may struggle to absorb or transfer knowledge due to its tacit nature (Shaw & Williams, 2009) and their insufficient expertise or rigid organisational structures. Additionally, not all EK is immediately beneficial for the firm; it needs to be filtered and adjusted for its particular context; while it can be properly assimilated and is available, there may be various reasons why it remains unused (Davenport & Prusak, 1998). This poses specific challenges for tourism SMEs in utilising EK.

The confluence of ACAP, innovation, and the context of SMEs presents a unique area of inquiry within organisational and tourism studies. The construct of ACAP has garnered significant attention within organisational research, emerging as one of the most significant concepts in recent decades (Lane et al., 2006), as a central theme in discussions of innovation, knowledge management, and strategic competitiveness (Thomas & Wood, 2015; Zahra & George, 2002). Defined as the firm's "ability to recognise the value of new information, assimilate it, and apply it to commercial ends" (Cohen & Levinthal, 1990, p. 128), ACAP is not merely a passive reception of knowledge, but an active and dynamic process (Cohen & Levinthal, 1990; Thomas & Wood, 2015). The initial conceptualisation of ACAP has been refined and extended by subsequent scholars, who have emphasised the dynamic and multi-faceted nature of ACAP (Sun & Anderson, 2010; Thomas & Wood, 2015; Todorova & Durisin, 2007; Zahra & George, 2002). Zahra and George (2002) characterise ACAP as a dynamic capability, highlighting an organisation's capacity to adapt its core competencies according to evolving environmental requirements. This viewpoint emphasises ACAP's significance as a resource for navigating variable market conditions and maintaining a competitive edge, enabling firms to implement strategic transformations (Nieves & Haller, 2014; Sun & Anderson, 2010). Zahra and George (2002) proposed four dimensions of ACAP (acquisition, assimilation, transformation, and exploitation), offer a nuanced perspective by distinguishing between potential absorptive capacity (PACAP) and realised absorptive capacity (RACAP). PACAP encompasses a firm's ability to acquire and assimilate new knowledge, which involves scanning the external environment, identifying relevant information, and understanding its potential value (Valentina & Passiante, 2009). RACAP focuses on the transformation and exploitation of knowledge. Exploitation primarily relates to the ability to innovate, specifically transforming knowledge into new products or processes (Binder, 2019; Zahra & George, 2002). The relevance of ACAP as a means to effectively absorb EK and a critical driver of innovation has been broadly recognised (Awad & Ghaziri, 2008; Cohen & Levinthal, 1990; Sun & Anderson, 2010; Thomas & Wood, 2014; Todorova & Durisin, 2007; Zahra & George, 2002). Costa and Monteiro (2016) highlight that merely acquiring knowledge does not drive innovation, as innovative outcomes significantly improve when knowledge acquisition is paired with absorption capacity and knowledge sharing. Various factors, including market conditions, the type of knowledge being integrated, and the firm's capacity to safeguard its intellectual property, can all affect how effectively ACAP leads to concrete innovation results (Sun & Anderson, 2010; Thomas & Wood, 2014).

These conditions are typical of the continually evolving tourism sector. Tourism organisations, especially SMEs, significantly depend on EK sources to foster innovation (Thomas & Wood, 2015). In contrast to larger companies that have specialised R&D teams, tourism SMEs typically rely on external connections-like suppliers, customers, and business networks-to obtain innovative ideas and practices (Grandinetti, 2016). Given the tourism industry's unique characteristics and the specific traits of SMEs, a distinctive context for ACAP and peculiar modalities in capturing knowledge and its absorption and utilisation are required (Thomas & Wood, 2015). This resonates with broader conversations about the reification of ACAP, as researchers warn against applying the concept without considering its specific context. Lane et al. (2006) argue that ACAP has been overly simplified, as researchers frequently treat the construct superficially. They suggest numerous studies have not effectively represented ACAP's dynamic and complex nature, often depending on limited metrics like R&D spending instead of considering learning and knowledge dimensions.

Building and sustaining ACAP is essential for a firm's long-term survival and success because it can enhance, complement, or redirect the firm's knowledge base (Thomas & Wood, 2014). This is particularly important for SMEs,

which frequently deal with resource constraints by strategically forming external partnerships that foster innovation. Respect, trust, and reliability are crucial to this development (Grandinetti, 2016).

OL is a critical process that enables firms to adapt, innovate, and remain competitive in dynamic business environments. In their seminal work, Argyris and Schön (1978) argued that OL goes beyond individual learning, explaining that it is a complex and evolving process involving the entire organisation and necessitating structures, systems, and an ability to adapt and react to a changing environment. Similarly, Sun and Anderson (2010) emphasise that learning processes occur at individual, group and organisational levels. The centrality of the concept of learning led Senge (1990) to introduce the term "learning organisation", and over the years, the relationship between learning and knowledge has gained significance, and in one of the various conceptualisations, Garvin (1993, p. 80) defined a learning organisation as "an organisation skilled in creating, acquiring, and transferring knowledge and at modifying its behaviour to reflect new knowledge and insights."

The OL conception then shifted from a closed process viewpoint, confined to the organisation's boundaries, to an open process perspective, where the significance of the firm's external environment has become relevant. Subsequent ideas, including the dynamic capability view and knowledge management, significantly shaped and enhanced the concept of OL as an open process (Vera et al., 2011). In this scenario, considering dynamic capabilities as a company's capacity to adjust to environmental demands by modifying its resources that create value (Teece, 2007; Vera et al., 2011), Sun and Anderson (2010) extend the dynamic capability perspective to ACAP as a distinct type of OL that relates to an organisation's interaction with EK. Also, Lane et al. (2006) consider ACAP related to a company's essential learning process, confirming the conceptual affinity between the two constructs. In addition, the concept of dynamic capability allows for the consideration of OL as an essential tool for the strategic renewal of organisations amid ongoing changes (e.g. Crossan et al., 1999), innovation (e.g. Cohen & Levinthal, 1990; Nonaka & Takeuchi, 1995), performance and competitive advantage (e.g. Abdollahi et al., 2023).

In their seminal work, Argyris and Schön (1978) developed a foundational OL framework containing three different learning constructs describing different depths of learning within an organisation: single-loop learning, double-loop learning, and deutero-learning. Their concept strengthens the link between OL and innovation. Single-loop learning involves focusing on efficiency and problem-solving within established routines and policies; organisations detect and correct errors without challenging their underlying assumptions. This is coherent with the concept of incremental innovation (March, 1991). Double-loop learning involves a deeper analysis of organisational practices by challenging the underlying assumptions, values, and norms; rather than simply fixing errors, organisations reconsider the validity of their current processes, which is coherent with radical innovation (Fiol & Lyles, 1985). Finally, Deutero-Learning (Bateson, 1972) or "learning to learn", refers to organisations' focus on how they learn to enhance their capacity for continuous adaptation and innovation. This process involves cultivating a culture of learning where employees are encouraged to experiment, share knowledge, and improve decision-making, which is coherent with continuous learning.

OL is a relatively new aspect of tourism research (Ghaderi & Paraskevas, 2022). Abdollahi et al. (2023) affirm that tourism organisations should be based on knowledge, and OL tools are essential for enhancing their competitive advantage and ensuring customer satisfaction. Knowledge-and consequently learning-derived from external sources as networks are crucial for OL and should form the foundation, particularly in the highly competitive tourism industry, which relies on interdependent businesses (Novelli et al., 2006).

Purpose of the paper. *The concepts of EK, ACAP, and OL are functionally interconnected and require a thorough understanding of their dynamics. However, the existing literature rarely addresses these concepts together in the context of innovation in tourism SMEs, resulting in a fragmented and limited representation. Given this fragmented representation, this study aims to recompose it by analysing the intersection of these knowledge-related concepts, advancing the theoretical understanding of how tourism SMEs utilise knowledge to innovate. Moreover, this study aims to clarify how scholars consider these concepts in their studies and identify gaps and future research directions. Based on the aforementioned points, the following research questions guide this study: How do absorptive capacity, organisational learning and external knowledge influence innovation in small and medium-sized enterprises within the tourism industry?*

Methodology. *To answer the research question, a systematic literature review (SLR) is conducted to synthesise research on ACAP, OL and EK for innovation in tourism SMEs to ensure an objective, transparent, and replicable procedure (Tranfield et al., 2003). The PRISMA protocol (Page et al., 2021) serves as a guiding tool for implementing the SLR. The work is organised along the following stages: identification of keywords, data collection and quality assessment, data synthesis.*

Leading keywords are identified starting from the three research pillars, innovation, tourism, and SMEs, and the three knowledge-related concepts of external knowledge, absorptive capacity, and organisational learning. After a selection based on prior studies, 55 synonyms were added for each leading keyword (e.g., dynamic capacities for ACAP, learning orientation for OL, knowledge transfer for EK, small firms for SMEs, Hospitality and Tourism Management for tourism). This inclusion was necessary due to the vast diversity of terminology found in a previous literature assessment.

Data were collected by searching three databases, WoS, Scopus and EBSCOhost, combining keywords with boolean "AND" and "OR", in order to include always the three leading keywords regarding the research pillars and at least one of the three knowledge-related keywords and their synonyms. The search was performed in titles, abstracts, and keywords

of all types of documents, with no restriction concerning the publication year, but a restriction to items in the English language. A total number of 154 items was found.

The quality assessment consisted of two screening stages, adopting exclusion criteria. In the first screen, titles and abstracts of the 154 items were analysed, and the selection was made by excluding duplicate items, and also books, conference papers, conference reviews, corrections, editorials, erratum, notes, proceeding papers, short surveys, and articles not published in peer-reviewed journals. Moreover, the exclusion criteria were applied to those items that did not meet the primary focus in innovation, tourism and SMEs. The second screen focused on in-depth reading and a final decision about including an article in the analysis. The exclusion criteria pertained to the presence and relevance of ACAP, OL, and EK perspectives; indeed, the fragmented depiction of these three knowledge-related concepts necessitates a comprehensive analysis that includes both explicit and implicit references to them in the papers screened. A manual search in the Q1-level journals in tourism research was used in order to include relevant articles not covered by the process but considered valuable for a comprehensive understanding of the knowledge dimensions considered in the context investigated. At the end of these stages, 75 articles were admitted to data synthesis. The relatively small sample of articles under synthesis is largely due to the specific focus on innovation in an already narrow path, such as that of tourism SMEs.

The articles included in the data analysis are currently undergoing a narrative synthesis to highlight key themes and conceptual relationships between the constructs considered. The analysis is performed using NVivo software.

Results. *Some preliminary findings from the ongoing analysis are expected to be unveiled. One of the findings is likely to be the fragmented nature of existing research. While all three concepts are fundamental to innovation, they are often examined in isolation rather than as interconnected components of a systemic framework. This lack of integration suggests that a more holistic approach could enhance the understanding of how knowledge is acquired, transformed, and leveraged within tourism SMEs.*

Additionally, the literature emphasises the link between knowledge and firm performance, frequently positioning innovation as a mediating variable. This perspective highlights the importance of innovation as a conduit through which knowledge absorption and learning translate into competitive advantage. However, it also suggests that alternative or complementary conceptualisations-such as the mechanisms which explain the linkage between knowledge and innovation-may be underexplored.

Another observation is the prevalence of quantitative studies in the field. While quantitative analyses provide valuable empirical validation, they may overlook the depth and contextual nuances that qualitative approaches could offer, particularly in understanding the processes and mechanisms behind EK, ACAP, and OL in fostering innovation. This methodological imbalance calls for further exploration through qualitative or mixed-methods research to capture the experiential and strategic dimensions of knowledge integration.

Finally, a notable share of contributions to this body of research originates from non-tourism journals, accounting for approximately 45% of the relevant literature. This indicates that discussions on knowledge absorption and learning extend beyond the tourism field, drawing from broader management, innovation, and organisational theory perspectives. While this cross-disciplinary engagement enriches the theoretical foundations, it also raises questions about the extent to which tourism-specific dynamics are adequately addressed.

Research limitations. *The study encounters several limitations. First, it exclusively focuses on peer-reviewed academic journal articles. Second, relevant articles may be overlooked during the literature search and subsequent refinements. A third limitation pertains to the keywords used in the search process; given the variety of terms and synonyms associated with the key concepts, this may lead to issues of comprehensiveness. Finally, the subjective nature of evaluating the presence and relevance of ACAP, OL, and EK perspectives in the articles examined and their nuanced terminology can result in some exclusions and inclusions being open to question.*

Managerial implications. *This research provides important insights at the intra-organisational level, encouraging owners and managers to integrate the knowledge-based concepts of ACAP and OL into their innovation strategies by effectively transforming EK. This integration can subsequently be converted into internal business strategies that involve employees, including recruitment and human resource management practices. However, this can be particularly challenging in the tourism industry, which is characterised by high turnover rates and rapid changes that prompt SMEs to adapt swiftly to a dynamic environment but can hinder their capacity to innovate.*

At the inter-organisational level, possessing a systemic view of EK, ACAP, and OL can assist tourism SMEs practitioners in effectively managing their relationships with external stakeholders, including customers, suppliers, competitors, institutions, and network participation. This may enhance their innovation capability by improving their supply chain management and customer engagement.

Originality of the paper. *The paper emphasises SMEs' relevance and unique characteristics in operating in the tourism sector. It highlights the necessity for further research on innovation at a SME level, as most existing studies focus on large firms. By highlighting the fragmented nature of existing research on how tourism SMEs utilise knowledge to foster innovation, the paper timely calls for a systematic consideration of the intersection of EK, ACAP, and OL, an underexplored research field. To the authors' knowledge, this is the first attempt to systematically review the integration of EK, ACAP, and OL within the research field of innovation in tourism SMEs.*

Key words: *innovation; tourism SMEs; external knowledge; absorptive capacity; organisational learning; literature review*

Does the eco-entrepreneur exist in Italian hospitality? Some evidence from the tourism sector

GINEVRA TESTA[1] SIMONE SPLENDIANI[2] LUCA GIRALDI[3] CHIARA MENCARELLI[4]

Abstract. *This study investigates the eco-entrepreneur in the hospitality industry in Italy, examining the characteristics that allow this figure to be identified and the motivations, practices, impacts, opportunities, and challenges that eco-entrepreneurs encounter along their path.*

The research adopts a multiple case study methodology to explore the topic holistically, focusing explicitly on six small businesses in the Italian hospitality sector located in regions in northern and central Italy. The primary data collected through semi-structured interviews was coded using NVivo 14 software to code the textual data and extract valuable information. The primary data was triangulated with secondary data from company websites, communications on the Booking online platform and more. The six cases analysed were selected as structures certified as sustainable by Booking, as they had obtained green certifications from certifying bodies.

The results highlighted some essential characteristics for identifying the eco-entrepreneur, namely his commitment arising from personal awareness and lifestyle. These aspects encourage eco-entrepreneurs to commit to conserving natural resources, efficient waste management and promoting local products, for example, by supporting local suppliers. This commitment shows results regarding corporate image, reputation and customer trust, even if the economic benefits remain difficult to measure and unclear concerning the various initiatives implemented. A long-term goal of eco-entrepreneurs is to achieve a high level of employee and public involvement, which can help them achieve important strategic objectives such as competitiveness and resilience. However, eco-entrepreneurs face challenges like high investment costs, a complex regulatory landscape, and the need to raise consumer awareness.

The study guides hotel operators in adopting and developing green and socially responsible initiatives in their local area. It also indicates potential actions for politicians to simplify the complex process of environmental and regulatory certification, simplify, standardise, and encourage collaboration between the various parties involved.

This research aims to contribute to eco-entrepreneurship in the Italian tourism sector, a particularly interesting context to explore considering the high tourist flow and the prevalence of small accommodations. Thanks to their small size and flexibility, these businesses could proactively pursue such transformations. The study offers many points for reflection that could be expanded and explored in more depth in the future in other industries, sectors and countries, developing comparisons with economic, social, cultural and political contexts different from the Italian one to understand what characteristics the eco-entrepreneur has elsewhere.

Framing of the research. *In the tourism sector, environmental issues are attracting increasing attention, especially with the rise of public awareness regarding sustainability and ecological responsibility. Society and local communities are putting increasing pressure on the tourism sector, particularly the hotel industry, to integrate environmental considerations into business activities (Anci, 2017). This growing pressure and interest have given rise to eco-entrepreneurship, which combines the principles of entrepreneurship with ecological aspirations (Anci, 2017), bringing about a convergence between environmental sustainability and economic growth. Green entrepreneurs are catalysts for adopting environmentally friendly and responsible practices (Thompson et al., 2017). By aligning business initiatives with sustainability objectives, these actors help promote healthy economic growth while safeguarding the heritage of the regions in which they operate (Gast et al., 2017). According to Kainrath (2009), three elements are central in shaping eco-entrepreneurship initiatives: eco-innovation, eco-commitment and eco-opportunity. Eco-innovation focuses on designing creative solutions to ecological problems (Gast et al., 2017). Eco-commitment means integrating sustainability into core operations (Schaltegger, 2002). Eco-opportunity means recognising and capitalising on environmental opportunities so that they align with business goals (Schaltegger & Petersen, 2001). Thompson et al. (2018) also highlight*

DOI 10.7433/SRECP.SP.2025.01

some traits that lead to identifying a successful eco-entrepreneur in the tourism sector: stakeholder engagement, i.e., a participatory approach that ensures initiatives reflect society's aspirations (Thompson et al., 2017); revenue generation, an aspect that leads to sustaining and replicating implemented green practices (Gast et al., 2017); environmental education, i.e., environmental awareness to foster a collective ethic of sustainability to make informed decisions about resource use (Thompson et al., 2017); and finally, prevention of over-tourism, i.e., managing visitor flows to avoid ecological degradation and cultural disruption (Thompson et al., 2018). Therefore, creating robust eco-entrepreneurship within the tourism sector requires an integration of the core principles of sustainability, an ongoing commitment to the environment, the strategic pursuit of innovation and market opportunities, and the ability to translate eco-values into effective management practices. Tourism eco-entrepreneurs can promote economic growth and environmental and social benefits, ultimately contributing to the resilience and sustainability of travel destinations (Gast et al., 2017; Schaltegger, 2002; Thompson et al., 2017).

Despite various opportunities, eco-entrepreneurs need to know how to address various barriers and obstacles along this process, such as consumer environmental awareness (Linnanen, 2002). An aspect that requires considerable cultural and behavioural change that can lead consumers to purchase goods that may have higher initial costs but offer long-term environmental benefits (Gast et al., 2017; Pastakia, 2002). In addition to environmental awareness, another critical barrier Linnanen (2002) highlighted is the difficulty of attracting funding. Eco-startups typically require significant upfront investments in technology, innovation, and research and development (R&D) but often have slower or lower returns in the short term (Gibbs, 2006; Lordkipanidze et al., 2005). Thus, eco-entrepreneurship has many barriers, e.g., finance, consumer perception, regulation, and general market inertia. Overcoming these barriers can lead eco-entrepreneurs to reshape current production and consumption systems to pursue a more sustainable and socially equitable economic landscape. Eco-entrepreneurship is both a catalyst for creative disruption and an illustration of the possible synergy between ecological responsibility and commercial viability.

Purpose of the paper. *The research aims to identify the characteristics that make the eco-entrepreneur identifiable and enrich existing theories on eco-entrepreneurship. Not only that, but it also aims to analyse the obstacles and barriers that it faces during eco-entrepreneurial activity. The research question, therefore, could be structured as follows:*

RQ: What are the typical characteristics of eco-entrepreneurs in Italy, and what are the main obstacles they face during their business activities?

To answer this research question, the study adopts an exploratory methodology, namely multiple case studies, and conducts a subsequent content analysis of the interviews using NVivo 14 software. The sample of subjects interviewed includes entrepreneurs from 6 Italian accommodation facilities. Therefore, the manuscript addresses several key research objectives: to identify the characteristics and motivations of eco-entrepreneurs in the Italian hospitality sector, examine the sustainable practices they adopt, evaluate the results, and highlight the main challenges and opportunities emerging.

The study, which also aims to enrich the body of empirical evidence, provides valuable insights into how eco-entrepreneurs can contribute to achieving objectives that are much broader than just economic return, such as the development of sustainable tourism support for the local area and long-term economic resilience. Therefore, the study provides relevant recommendations for tourism entrepreneurs and policymakers to create an environment where it is easier to implement such initiatives through consistent and streamlined regulation.

Methodology. *To achieve the exploratory objective of the research, the study adopts a methodology based on the analysis of multiple cases that allows us to go into depth on a phenomenon (Dooley, 2002; Yin, 2013). The study of various cases is a methodology widely adopted in tourism literature (Buhalis & Amaranggana, 2014). This methodology appears suitable for studying complex topics such as innovative strategies, sustainability practices, and complex tourism offers involving different stakeholders, all of which fall under the definition of eco-entrepreneurship (Tasci et al., 2020).*

The study focuses on Italy because of its rich heritage and high influx of tourists. Italy, therefore, represents a unique context for examining ecological entrepreneurship, especially considering the evident prevalence of small businesses within the Italian tourism market, characterised by great agility and ability to adapt to new market demands (Lordkipanidze et al., 2005). These characteristics can put small businesses in a unique position, able to influence even the largest organisations in the sector (Lordkipanidze et al., 2005). For these reasons, the hospitality sector in Italy, with its vast network of small and medium-sized enterprises, represents the perfect context in which to study how entrepreneurs integrate sustainable practices into their businesses.

The sample was identified using the purposive sample method and through a combination of inclusion and exclusion criteria. Only those accommodation establishments that have obtained recognition from the OTA Booking platform as attentive to sustainability were included. All hotel chains were excluded precisely to focus attention on small and medium-sized businesses where the entrepreneurial figure is particularly relevant. From 2024, accommodation facilities that meet the sustainability criteria of the Booking platform must have obtained a sustainability certification[5] (such as Green Key,

https://www.gstcouncil.org/gstc-criteria/gstc-industry-criteria-for-hotels/
https://environment.ec.europa.eu/publications/tourist-accommodation-user-manual_en

Green Pearls, GSTC and EU Ecolabel) from a certifying body. The sample included 32 facilities, 6 of which were available for the interview.

Before proceeding with the interviews, a focus group was conducted with seven experts in the sector, which allowed us to explore the peculiarities of the topic in depth and to draw up an interview protocol based not only on the reference literature but also on essential insights that emerged from practice.

The facilities interviewed are in different northern and central Italian regions and were founded between 1995 and 2021. The facilities included in the sample differ in terms of size and number of rooms, ranging from 6 to 50 rooms. This is an interesting aspect in terms of providing greater variety in terms of management and relative complexity. The certifications obtained from the interviews are diverse, including GSCT, EU Ecolabel, Green Pearls and Green Key. The majority of key informants interviewed were female and belonged to a middle-aged group (40 to 55 years old).

The study involved six semi-structured interviews with open-ended questions with the key informants of each selected company, i.e., the entrepreneurial figure, to discuss their vision and motivation in depth. The interviews were conducted using the Microsoft Teams platform, recorded, and transcribed with the consent of the interviewees. They lasted, on average, about 40 minutes and were conducted between December 2024 and February 2025.

The interview protocol included open-ended questions to explore the following topics: 1) Motivation and entrepreneurial vision; 2) Adoption of sustainable practices; 3) Impact and results of these initiatives; and 4) Challenges and opportunities for eco-entrepreneurs.

Secondary data, collected from published material on websites and other communication channels, was triangulated with the primary data to learn more about the organisations interviewed. The interviews were analysed using content analysis with NVivo 14 software, a method that allows for the reproducible and systematic coding of large volumes of extensive textual data (Krippendorff, 2018). The coding was carried out using an inductive and manual approach, and all the authors were operationally involved, only discussing with each other in case of disagreement.

Results. *The findings reveal the multiple environmental and social practices implemented by eco-entrepreneurs, the expected results, the opportunities and challenges arising from these initiatives, and the motivations that led these entrepreneurs to take this path. Among the practices most dear to eco-entrepreneurs are all the initiatives aimed at conserving the crucial and scarce natural resources of the territory in which they operate, such as water or energy, with the aim of* "turning every waste product into a resource*" (Company A).*

The reasons that push an entrepreneur to become an eco-entrepreneur mainly derive from a personal commitment, a marked sensitivity to the theme, the lifestyle led, and the education transmitted by one's family regarding values. In addition to this personal commitment, there is also the desire to contribute to the conservation of the resources and heritage of one's land to preserve its traditions and authenticity, as supported by company A: "For me, sustainability is not only environmental sustainability but sustainability as an entrepreneur and as a human being living in the territory*" and from company D,* "Saving water also highlights the attention to the territory, which, as we know, is a big problem, especially in our region. This is very important because our region is, unfortunately, one of the regions that has faced a lot of droughts in recent years... It's the least we should do, especially considering that in our region, all the structures are old; therefore, it is not easy to find structures with a low environmental impact. Therefore, the drive towards eco-entrepreneurship does not come from a market-driven push, but from a personal and inner motivation to actively contribute to reducing the environmental impact and improving the impact on society and the local community through their activities*". In this sense, the companies support the local area by purchasing products from local suppliers, supporting local companies and promoting sustainable mobility for employees and tourists (Companies A, C and F).*

In terms of results, the main objective is to increase the involvement of consumers and employees in pursuing a common mission. Communication on social media and other platforms regarding the practices and commitment adopted by the businesses fulfils this objective of promoting greater involvement but also contributes to greater credibility and corporate reputation. Communicating this commitment increases the value of the product offered, increasing the trust of the parties involved. Economic results, such as savings and income, are more difficult to evaluate than company initiatives.

Among the opportunities that emerged is the possibility of collaborating with experts, as stated by company B: "I collaborate with experts, people who are dedicated solely and exclusively to understanding all the legislation and everything that needs to be done for sustainability*" but also the extensive use of technology as a tool for monitoring consumption, for example through home automation technology, which, as company F argues,* "introduces a concept of data monitoring especially in our sector where there is little data collection and no sharing of data".

However, the multiple difficulties and obstacles that eco-entrepreneurs encounter along the way are related to the extensive time required to obtain certifications, the structural limitations that make it more challenging to transform old accommodation facilities into sustainable ones, the problematic evaluation of economic return and the need to overcome high investments, complex bureaucracy and poorly unified regulations. Therefore, considerable efforts are still needed to involve staff and the public in learning and education.

Discussion. *The results show that some of the distinctive characteristics of eco-entrepreneurs are their commitment and their strong desire to preserve the local heritage in which they operate, aspects that emerge as elements that guide the direction of eco-entrepreneurs in Italian accommodations. This confirms what is suggested by Anci (2017), who argues that eco-entrepreneurs are motivated by a mixture of ecological aspirations aimed at community well-being. Thus, such personal motivations significantly shape entrepreneurial goals (Schaltegger, 2002).*

Eco-entrepreneurs act by adopting multiple sustainable practices, such as conserving scarce natural resources, managing waste, and promoting local products and activities (Thompson et al., 2018). In addition, an interesting aspect is technology that falls under eco-innovation, as defined by Kainrath (2009), with, for example, the use of renewable energy or home automation for increased monitoring of consumption data. Additional initiatives include those related to encouraging sustainable mobility among consumers and employees.

The results of such initiatives include improved reputation and greater consumer and employee involvement. As Schaltegger (2002) and Mananda (2024) indicate, transparent and clear communication of sustainable practices helps build credibility and trust, elevating the perceived value and quality of ecotourism services. However, the economic benefits remain ambiguous and challenging to quantify, reflecting Linnanen's (2002) observation about non-financial success metrics prevalent among eco-entrepreneurs. Aquino et al. (2018) noted that educational impact on consumers and staff by promoting greater sensitivity to environmental issues can lead to socio-cultural benefits in the long run.

Thus, all six companies can be defined as "green companies", as Isaak (2002) defines "green companies" as they have become sustainable along their growth and development path and have been deeply influenced by the founder's personal experiences, family or friendship networks. Finally, they are all driven by challenging certification-related environmental projects (Schaltegger, 2002). These are, therefore, accomodation facilities guided by the work of eco-entrepreneurs who have nevertheless had to face various challenges and obstacles associated with the high initial investment costs, the complex regulations that require a lot of time to be adequately understood, the difficulty of quantifying the economic returns of these initiatives precisely, and the need to educate consumers and their employees due to a lack of awareness in terms of sustainability in Italy. These obstacles confirm the broader barriers to eco-entrepreneurship, discussed in the literature, about the Italian landscape (Linnanen, 2002; Lordkipanidze et al., 2005; Gast et al., 2017).

Research limitations. *The study, however, is not without limitations. First, the number of cases could be amplified, and second, the number of cases could also be expanded beyond Italian territory to identify differences between economic, political, social, and cultural contexts. The eco-entrepreneur could take on different connotations depending on the area in which he operates his business. The regulatory framework of various countries could favour or hinder the activities of eco-entrepreneurs. Moreover, in some European markets, consumers may have reached a higher level of environmental awareness than in Italy today. As well as investigating the role of eco-entrepreneurship in other industries and sectors. Future studies could also conduct a longitudinal analysis to emphasise the crucial steps eco-entrepreneurs must take to ensure their business growth, perhaps highlighting evolutionary stages of increasing commitment towards sustainability, moving from initiatives that do not require significant commitments and investments to much more costly and demanding sustainable initiatives and practices. Detailed studies that assess contextual differences and inform targeted policy actions are essential for the greater effectiveness of eco-entrepreneurship initiatives.*

Managerial implications. *The study offers several managerial implications as it outlines several valuable pointers for tourism managers of small accommodation establishments on conveying their commitment to sustainability and society externally. By communicating within and outside the organisation, their responsibility and sensitivity to environmental issues, eco-entrepreneurs can achieve greater involvement of both their staff and their consumers, facilitating the pursuit of a common goal. One aspect that emerges as crucial is precisely that of educating consumers to adopt responsible practices even during a vacation, or educating employees in enacting all those behaviours aimed at preserving valuable natural land resources. Thus, the research provides useful insights into how such eco-business initiatives can help advance broader goals of sustainable tourism development. The role of policymakers is essential in fostering a uniform and cohesive regulation apt to unify the efforts of the realities, making it a shared commitment of the whole community, lowering the difficulties and obstacles related to complex regulation. The complexity of certification procedures and the large investments required represent a significant challenge for companies with green motivation but limited resources in terms of finance and personnel. In addition to potential difficulties, the study highlights how the strong motivations of eco-entrepreneurs could also help in the formation and sharing of a "green" entrepreneurial culture that will expand over time. The lack of such a widespread green culture in society is often overcome by compliance with environmental certification requirements, which guide entrepreneurs in making strategic decisions and taking concrete actions that lead them to transform their businesses into green businesses.*

Originality of the paper. *This study proves to be profoundly original in that it contributes to the development and enrichment of the literature on tourism eco-entrepreneurship, not from the perspective of the public, widely debated in the literature, but by exploring this phenomenon from the perspective of the entrepreneurial figure and organisations. In particular, the study focuses on the existence of the eco-entrepreneur in Italian hospitality and the identification of its characteristic traits. The study focuses on the Italian hospitality industry, deeply characterised by substantial tourist flows and small-medium hotel realities, often family-run, which might be particularly disadvantaged compared to significant realities due to scarce skills, limited financial resources and ancient facilities at their disposal. However, with their small size, such businesses prove nimble and flexible in adopting new environmental practices that can better follow the latest market trends and the pressures of the community and society in which they reside. These realities, precisely because of their history, competitiveness and structure, could represent valid examples for large tourist organisations in the hospitality sector.*

Key words: *eco-entrepreneur; sustainable tourism; green hospitality; small business; multiple case studies; Italy*

Sharing economy e ospitalità: sfida o opportunità? Analisi del rapporto di sostituibilità tra imprese alberghiere e affitti brevi

ROBERTA MINAZZI[1] DANIELE GRECHI[2] MICHELA SEGATO[3] MARTINA DENTI[4]

Abstract
Negli ultimi decenni, la sharing economy ha acquisito un ruolo sempre più rilevante all'interno del sistema economico tradizionale, favorendo la condivisione di beni e servizi attraverso piattaforme online. La diffusione di questo modello ha avuto un impatto significativo sul settore turistico, introducendo nuove dinamiche competitive e alimentando il dibattito sull'esistenza di un effetto di sostituzione tra le strutture alberghiere tradizionali e gli alloggi in affitto gestiti in forma imprenditoriale. Il presente studio analizza proprio questo fenomeno nell'area del Lago di Como, dove si è registrata una crescita di queste strutture ricettive in modo piuttosto rilevante nel corso dell'ultimo decennio. In particolare, l'obiettivo è identificare le categorie alberghiere maggiormente influenzate dalla concorrenza degli affitti a breve termine e individuare i principali fattori che guidano la scelta dei turisti tra queste due tipologie di sistemazione. Dal punto di vista metodologico, l'indagine è stata avviata attraverso la somministrazione di un questionario a un campione di 104 individui. I risultati evidenziano la presenza di un effetto di sostituzione limitato alle strutture alberghiere di fascia medio-bassa. Inoltre, emergono come fattori chiave di attrattività degli affitti a breve termine la convenienza economica e la posizione strategica, sottolineando la necessità per alcuni operatori alberghieri di adottare strategie di differenziazione mirate.

Framing of the research. *Negli ultimi due decenni, la sharing economy ha trasformato profondamente il modo in cui beni e servizi vengono prodotti, distribuiti e consumati (Botsman e Rogers, 2010). Seppur rappresenti una pratica nata nel passato, la sharing economy è diventata più recentemente, grazie allo sviluppo delle nuove tecnologie (Buhalis e Law, 2008; Buhalis e Leung 2018), un modello di business particolarmente sviluppato in vari settori (Belk, 2014), incluso il turismo (Tussyadiah e Pesonen, 2016). In particolare, lo sviluppo di piattaforme online quali Online Travel Agencies (OTAs) e meta search websites (Toh et al. 2011) hanno modificato la struttura della distribuzione turistica con particolare riferimento all'offerta di alloggi turistici, anche non alberghieri, aumentandone l'accessibilità e la visibilità (Minazzi 2017; Mauri et al., 2018; Eurostat, 2024), nonché generando nuove dinamiche competitive. Nello specifico settore dell'ospitalità, alcuni studi dimostrano che uno dei prevalenti operatori della sharing economy, Airbnb, rappresenta un concorrente soprattutto per gli hotel di fascia medio-bassa (Zervas et al., 2017; Guttentag e Smith, 2017). Inoltre, alcuni studi dimostrano che gli host che rientrano nella sfera dei professionisti (professional hosts), ossia con più di una proprietà, competono direttamente con le imprese alberghiere e necessitano in tal caso di una regolamentazione specifica rispetto ai non-professional hosts (Marchi e Parekh, 2015). Si può affermare dunque che può esistere un rapporto di sostituibilità tra operatori della sharing economy e ospitalità alberghiera (Mody et al., 2017).*

Nonostante la condivisione (intesa come l'uso, l'occupazione o il godimento congiunto di risorse), abbia radici antiche (Schor e Fitzmaurice, 2015), essa è diventata oggetto di dibattito solo a partire dalla seconda metà del XX secolo, raggiungendo la sua massima crescita (intesa come numero di pubblicazioni scientifiche sul tema) nel 2017. Da allora, la sua espansione è stata continua e si prevede che proseguirà nei prossimi anni (Hossain, 2020). Nonostante la copiosa letteratura dedicata alla sharing economy (Botsman e Rogers, 2010; John, 2013; Richardson, 2015; Cheng, 2016; Basselier et al., 2018; Birinci et al., 2018; Yeganeh, 2021), la sua definizione rimane oggetto di dibattito in ambito accademico. Trovarne una condivisa risulta, infatti, particolarmente complesso vista la dinamicità del concetto e la varietà degli attori coinvolti (Herbert e Collin-Lachaud, 2017). Tuttavia, mediante un'analisi comparativa delle varie definizioni proposte dalla letteratura si notano alcuni punti in comune: l'uso di piattaforme online collaborative che agiscono da intermediarie, la presenza di beni o servizi condivisibili e il coinvolgimento di due parti, un fornitore e un consumatore. Anche se risulta difficile trovare una definizione condivisa da tutti gli studiosi, molti concordano su quella di Muñoz e Cohen (2016: p 21), che definisce la sharing economy come "a socio-economic system enabling an

DOI 10.7433/SRECP.SP.2025.01

intermediated set of exchanges of goods and services between individuals and organizations which aim to increase efficiency and optimization of sub-utilized resources in society."

Se ci concentriamo sul settore turistico-ricettivo l'espansione incontrollata di alloggi turistici, però, specialmente nelle zone residenziali, ha sollevato numerose preoccupazioni in diversi paesi, soprattutto nelle maggiori destinazioni turistiche a causa dell'impatto che questo fenomeno può avere sul territorio con particolare riferimento al tema della sostenibilità (Martin, 2016). Si pensi al fenomeno dell'overtourism (Peeters et al., 2018; Nunkoo et al., 2019). In particolare, l'ascesa di piattaforme come Airbnb ha scosso l'industria ricettiva tradizionale, generando un contesto competitivo che minaccia la stabilità economica delle strutture alberghiere più tradizionali. L'impatto di tale fenomeno è stato oggetto di vari studi, i cui risultati, tuttavia, non sono univoci: mentre alcuni autori hanno evidenziato un marcato effetto di sostituzione tra Airbnb e le strutture alberghiere tradizionali (Zervas et al., 2017; Neeser, 2015; Dogru et al., 2020), altri sostengono che tale sostituibilità è limitata a specifiche categorie di hotel (Guttentag e Smith, 2017; Lin et al., 2024). Alcuni studi, invece, negano l'esistenza di una competizione significativa tra i due settori (Choi et al., 2015; Qiu et al., 2020).

Un ulteriore interessante aspetto di indagine è rappresentato dalla percezione del turista, indagando il suo processo di scelta del servizio turistico per comprendere le ragioni che spingono i turisti a preferire formule di sharing economy. In letteratura, vari studi analizzano le motivazioni dei turisti che conducono alla scelta di formule di sharing economy (Davidson et al., 2018, Hossain, 2020). Le principali sono: il vantaggio economico (prezzo), la maggiore flessibilità, l'autenticità dell'esperienza e un maggior senso di comunità rispetto alle formule tradizionali (Guttentag, 2016, Tussyadiah e Pesonen, 2016). Nowak et al. (2015) effettuano uno studio su utenti di Airbnb negli Stati Uniti ed Europa e identifica i cinque seguenti fattori determinanti la scelta di tale servizio: il prezzo competitivo, la posizione, l'esperienza autentica, la disponibilità all'interno dell'alloggio di una cucina e l'unicità dell'alloggio stesso. Anche se l'aspetto di convenienza economica risulta prevalente (Murillo et al. 2017) anche l'aspetto sociale, ossia entrare in contatto con persone nuove, ricopre per alcuni studi un certo ruolo (Liang et al. 2017).

Purpose of the paper. *Il presente studio analizza l'intensità del rapporto di sostituibilità esistente fra imprese alberghiere e alloggi gestiti in forma imprenditoriale (case vacanza, affitti brevi) rese più accessibili dai portali di sharing economy. Risulta interessante comprendere quali siano le categorie alberghiere maggiormente colpite dal fenomeno. Inoltre, l'analisi si concentra anche sulla percezione del turista, indagando il suo processo di scelta del servizio turistico. In particolare, il paper si propone di studiare i criteri e i fattori che influenzano il comportamento dei turisti tra la scelta di alloggi in affitto gestiti in forma imprenditoriale e strutture alberghiere tradizionali. L'analisi si propone di contribuire alla letteratura sul tema della sharing economy che, seppur presenta un numero elevato di pubblicazioni, ancora rileva un certo dibattito soprattutto sul tema del rapporto e della competizione con le strutture di accommodation più tradizionali. Parallelamente, la ricerca mira a fornire una migliore comprensione dei vantaggi competitivi che caratterizzano le piattaforme di sharing economy nel settore turistico. In particolare, dopo aver analizzato la letteratura legata al fenomeno della sharing economy nel settore turistico e l'evoluzione degli affitti turistici a breve termine, si discuteranno i risultati dell'indagine svolta sul campo relativa alle scelte dei turisti.*

Come contesto di applicazione e di analisi di questo studio è stata selezionata l'area del Lago di Como, in quanto rappresenta un caso particolarmente interessante per l'esame delle dinamiche competitive nel settore turistico. L'analisi dei dati ISTAT evidenzia un andamento crescente nel numero di strutture ricettive nell'area nel 2023, che mostrano una crescita del 124,65%, passando da 1.002 (2013) a ben 2.251 (2023) trainate dall'aumento degli affitti brevi. Infatti, un'analisi più dettagliata dei dati mostra una dinamica differente per hotel e case vacanza (affitti brevi): se da un lato tra il 2013 e il 2023 si è registrata una diminuzione degli hotel presenti sul territorio (-23%), dall'altro si è assisto a una crescita significativa dei cosiddetti affitti brevi (+893.88%).

Alla luce di quanto precedentemente illustrato, il paper si propone quindi di indagare le seguenti domande di ricerca:

***RQ1**: In quale misura è possibile identificare un effetto di sostituzione tra le strutture ricettive alberghiere tradizionali e gli alloggi in affitto gestiti in formula imprenditoriale (case vacanza, affitti brevi), analizzando le preferenze espresse dalla domanda turistica?*

***RQ2**: Quali segmenti specifici del comparto alberghiero risultano maggiormente interessati al fenomeno di sostituzione?*

***RQ3**: Quali motivazioni influenzano significativamente la propensione dei consumatori a selezionare sistemazioni alternative rispetto all'offerta alberghiera convenzionale?*

Methodology. *L'indagine è stata condotta mediante la somministrazione di un questionario rivolto a turisti che nel periodo di riferimento (12 maggio - 31 agosto 2024) hanno soggiornato in alloggi gestiti in forma imprenditoriale nell'area del Lago di Como. Questo metodo di ricerca rappresenta uno strumento utile per l'analisi dei problemi sociali ed è stato ampiamente utilizzato in studi precedenti (Valli, 2017). Il questionario è stato diffuso attraverso una combinazione di codici QR e copie cartacee, anche grazie all'aiuto di host della zona, associazioni di guide turistiche e uffici di informazione turistica (InfoPoints) nei principali centri attorno al lago e presso i terminal dei traghetti. Inoltre, i questionari sono stati consegnati direttamente ai turisti in luoghi di interesse strategici. I dati raccolti sono stati analizzati utilizzando metodi di statistica descrittiva, allo scopo di ottenere una chiara rappresentazione del profilo dei*

rispondenti. Questo approccio permette di esaminare in dettaglio le caratteristiche sociodemografiche e comportamentali dei partecipanti, fornendo una base solida per ulteriori analisi volte a comprendere meglio il fenomeno.

Il questionario è composto da quattro sezioni. La prima parte è dedicata all'analisi delle caratteristiche sociodemografiche dei partecipanti allo scopo di delinearne il profilo. La seconda sezione è focalizzata sull'analisi del comportamento di viaggio del campione, partendo da domande di carattere generale relative alle abitudini di viaggio e concludendo con domande più specifiche riguardanti la vacanza in corso al momento della compilazione. La terza parte, invece, è mirata a comprendere in modo più approfondito la percezione dei turisti riguardo all'esistenza di una potenziale sostituibilità tra le strutture alberghiere tradizionali e le opzioni di alloggio non alberghiere. La quarta ed ultima sezione dell'indagine è stata concepita con l'obiettivo di identificare i fattori che hanno maggiormente influenzato la decisione finale dei turisti nella scelta della struttura di alloggio. Tale analisi ha permesso di individuare i fattori competitivi che favoriscono la scelta di Airbnb rispetto agli hotel tradizionali. Al tal fine è stata impiegata una scala di motivazioni composta da 15 elementi, articolati in 5 dimensioni teoriche: prezzo, attributi funzionali, autenticità e unicità locale, novità, ed ethos della sharing economy (Guttentag, 2016). La valutazione di ciascun elemento è stata condotta tramite una scala Likert a cinque punti, dove 1 indicava "Fortemente in disaccordo" e 5 "Fortemente d'accordo".

Results. *Il questionario proposto è stato completato da un totale di 104 partecipanti (54 di uomini e 50 donne). Il campione è composto, per circa la metà dei partecipanti, da soggetti con un'età compresa tra i 19 e i 29 anni e, per la restante parte, in prevalenza da turisti fino ai 49 anni. Considerando il grado di istruzione si evince che il 44% è almeno laureato triennale. Inoltre, una porzione significativa dei partecipanti (75%) risulta occupata e, passando al livello di reddito dichiarato, emerge che 58 rispondenti (55%) hanno dichiarato un valore superiore a 30.000€ annui. Si tratta di un turista con motivazione prevalentemente leisure (90%) che proviene principalmente dalla Germania (15%), Francia e Paesi Bassi (12%) e Italia (11%)[5]. La maggior parte viaggia in compagnia (coppia il 60% e amici il 25%) e si trattiene presso la località per 2 o 3 notti (50%). Buona parte degli intervistati afferma di utilizzare frequentemente Airbnb nelle proprie scelte di viaggio (34% da 1 a 3 volte, 26% da 4 a 6) e 23% oltre 10.*

Con riferimento all'analisi della pianificazione del loro soggiorno, la maggioranza dei partecipanti ha dichiarato di aver preso in considerazione simultaneamente sia strutture alberghiere che extra-alberghiere, mentre solo il 28% si è concentrato esclusivamente sulla seconda categoria. Per rispondere alla RQ1 è stato richiesto agli intervistati di valutare su una scala Likert da 1 a 5 il livello di intercambiabilità percepita tra strutture alberghiere e alloggi gestiti in forma imprenditoriale, come Airbnb. Inoltre, è stato loro chiesto di indicare quale sarebbe stata la loro scelta di alloggio più probabile in assenza alloggi presenti su Airbnb e servizi analoghi nella zona (RQ2). Come si può osservare nella seguente tabella (Tabella 1), è possibile identificare un certo grado di sostituibilità tra le due alternative poiché la maggioranza delle risposte si è concentrata tra 3 e 5, con una forte predominanza del 4 (circa il 43%).

Tab. 1: Effetto sostituzione nella scelta dell'alloggio

Caratteristiche	%	n
Durante il processo di prenotazione hai considerato…		
Sia hotel che sistemazioni non alberghiere	72,12%	75
Solo sistemazioni non alberghiere	27,89%	29
Grado di sostituzione tra Airbnb e hotel		
1 basso	0,96%	1
2	6,73%	7
3	28,85%	30
4	42,31%	44
5 alto	19,23%	20
Scelta di alloggio più probabile se Airbnb e altri servizi simili non esistessero		
Non avrei fatto il viaggio	0,96%	1
Amici o familiari	0,96%	1
Ostello	5,77%	6
B&B	21,15%	22
Hotel economici	33,65%	35
Hotel di media categoria	31,73%	33
Hotel di alta categoria	0,96%	1
Hotel di lusso	2,88%	3

Circa due terzi dei partecipanti ha dichiarato che in assenza di Airbnb o simili, avrebbe scelto una struttura alberghiera in sostituzione, in particolare un budget hotel e un hotel di fascia media (2-3 stelle). Il 21,15% degli intervistati avrebbe invece comunque considerato i Bed & Breakfast come potenziale alternativa, rendendoli la terza scelta più popolare. In conclusione, i risultati di questa prima parte di studio suggeriscono che, secondo la percezione dei turisti, esiste un grado di sostituibilità parziale tra strutture alberghiere e affitti a breve termine (RQ1) e che tale sostituibilità risulta più accentuata per le strutture di fascia medio-bassa (RQ2).

[5] Sono inoltre presenti rispondenti da altri 22 paesi, tra i quali Gran Bretagna, Stati Uniti, Polonia e Belgio.

Infine, sono state indagate le motivazioni che conducono il turista a scegliere una formula di alloggio come la casa vacanza e l'affitto breve. La motivazione prevalente risulta essere legata alla convenienza economica (3,89) seguita dalla posizione (3,73) e dalla flessibilità dell'offerta (3,5). Anche l'accesso ai servizi domestici e la disponibilità di maggiore spazio sono stati considerati elementi importanti nella scelta dell'alloggio, invece l'"atmosfera familiare" offerta dagli affitti a breve termine ha esercitato un'influenza minore sul processo decisionale, con una distribuzione equilibrata delle risposte tra disaccordo, neutralità e accordo. Anche l'interazione con l'host, ossia la possibilità di ricevere informazioni e consigli utili, ha esercitato minore importanza sulle scelte dei partecipanti. Questo si collega anche alla ricerca di autenticità, sia nelle esperienze da vivere che nella possibilità di interagire con la popolazione locale, che ha esercitato un'influenza limitata sulle scelte dei partecipanti con un punteggio medio di 3,08 su 5.

Non risultano quindi particolarmente rilevanti per i turisti intervistati le dimensioni relative alle esperienze e alla possibilità di avere una maggiore personalizzazione del soggiorno. Un ultimo aspetto analizzato è la sostenibilità della sharing economy che non si è dimostrato un fattore rilevante nella scelta dei partecipanti di Airbnb rispetto agli hotel tradizionali. Infine, un fattore emerso dai rispondenti è l'apprezzamento dei turisti nei confronti delle informazioni aggregate fornite da Airbnb, che riescono in modo grafico e immediato a dare una panoramica completa dell'alloggio scelto o desiderato.

Possiamo quindi concludere che il turista leisure che visita il Lago di Como, con particolare riferimento ai giovani adulti con un livello alto di istruzione, sceglie Airbnb prevalentemente per la sua convenienza economica, seguita dalla flessibilità e dall'ampiezza dell'offerta e dalla posizione strategica dei suoi alloggi. Al contrario, fattori quali l'innovatività della piattaforma, i suoi valori fondanti quali l'autenticità, l'interazione con la comunità locale e il suo minore impatto ambientale non hanno esercitato un'influenza significativa sulle scelte dei turisti, confermando in parte quanto affermato da ricerche precedenti (RQ3). Si conferma un rapporto di sostituibilità fra imprese alberghiere tradizionali e affitti brevi (RQ1) specialmente per le strutture economiche e di fascia medio-bassa (RQ2).

Research limitations. *Il presente studio presenta alcune limitazioni metodologiche. In primo luogo, l'analisi si trova ancora in una fase esplorativa. Le principali criticità riguardano la numerosità del campione e l'ambito geografico della raccolta dati, circoscritto alla regione del Lago di Como. Tale delimitazione territoriale, sebbene permetta un'analisi approfondita del contesto locale, impedisce una generalizzazione dei risultati a scale più ampie. Per il futuro l'obiettivo sarà quello di estendere la somministrazione del questionario a livello nazionale e internazionale per poter avere una base dati più corposa. Grazie a questo sarà possibile anche implementare metodologie più sofisticate di analisi statistica inferenziale che consentiranno di elaborare i dati raccolti con maggiore precisione e di individuare correlazioni significative tra le variabili esaminate.*

Managerial implications. *I risultati dello studio presentano rilevanti implicazioni manageriali per i gestori delle imprese alberghiere e per i gestori degli alloggi turistici, nonché per gli altri operatori delle destinazioni turistiche. Comprendere l'entità della competizione esistente con le strutture ricettive non tradizionali risulta di particolare importanza, in particolare per identificare quali siano le categorie alberghiere più esposte a tale rischio: così facendo sarà possibile sviluppare adeguate strategie di differenziazione, cercando di valorizzare i propri elementi distintivi allo scopo di acquisire nuovi potenziali clienti, specialmente coloro che manifestano interesse per entrambe le tipologie di alloggi. I gestori degli alloggi vacanza in affitto possono trarre spunto per comprendere come cercare di sviluppare la clientela potenziale per il futuro. Inoltre, tenendo in considerazione la rapida diffusione degli affitti a breve termine, e gli impatti che questi possono avere sulla destinazione (si pensi per esempio all'overtourism) la presente ricerca sottolinea anche l'importanza di una maggiore regolamentazione a livello distrettuale. Se la motivazione del turista è legata ai minori costi rispetto che alla ricerca di autenticità e di rapporto con la comunità viene meno l'idea iniziale della sharing economy e si apre la strada ai professional hosts che a maggiore ragione si pongono in competizione con le strutture ricettive a tutti i livelli. La cooperazione e il dialogo tra le amministrazioni comunali, le associazioni di categoria del settore alberghiero e degli host di affitti a breve termine si configurano come elementi cruciali per l'elaborazione di normative efficaci e la gestione delle potenziali problematiche derivanti dalla complessa interazione di interessi e libertà coinvolti. In tali riflessioni sono coinvolti tutti gli stakeholder del territorio (es. trasporto, attrazioni) che possono utilizzare queste informazioni per orientare le proprie politiche di sviluppo.*

Originality of the paper. *Lo studio contribuisce agli studi sul tema della sharing economy con particolare riferimento al rapporto di sostituibilità e quindi alle dinamiche competitive esistenti fra imprese alberghiere tradizionali e alloggi gestiti in forma imprenditoriale (affitti brevi). Anche se la letteratura scientifica sul tema della sharing economy è particolarmente corposa, questo argomento risulta ancora molto dibattuto e presenta risultati contrastanti. Risulta quindi utile continuare nello studio del fenomeno per comprenderlo al meglio e offrire maggiori strumenti ai manager del settore turistico. In particolare, lo studio conferma gli studi di Zervas et al. (2017), Neeser (2015) e Dogru et al. (2020), che sostengono l'esistenza di un forte rapporto di sostituibilità fra hotel e alloggi vacanza in affitto, con particolare riferimento a specifiche categorie di hotel (Guttentag e Smith, 2017; Lin et al., 2024) di fascia media ed economica. Infine, rispetto ad altri studi, il presente lavoro si concentra sull'analisi diretta del processo di scelta del turista, analizzandone anche le motivazioni che portano alla scelta di Airbnb. I risultati supportano alcuni studi che avevano rilevato il vantaggio economico e la flessibilità dell'offerta (Guttentag 2016, Tussyadiah e Pesonen, 2016 Murillo et al. 2017) come importanti fattori di scelta di Airbnb. Non sono invece ritenute importanti altre motivazioni legate all'autenticità dell'esperienza, alla interazione con la comunità locale e, in generale, all'aspetto sociale che invece riscontrato da altri autori (Liang et al. 2017).*

Key words: *sharing economy; hotel; hospitality; effetto di sostituzione; affitti brevi.*

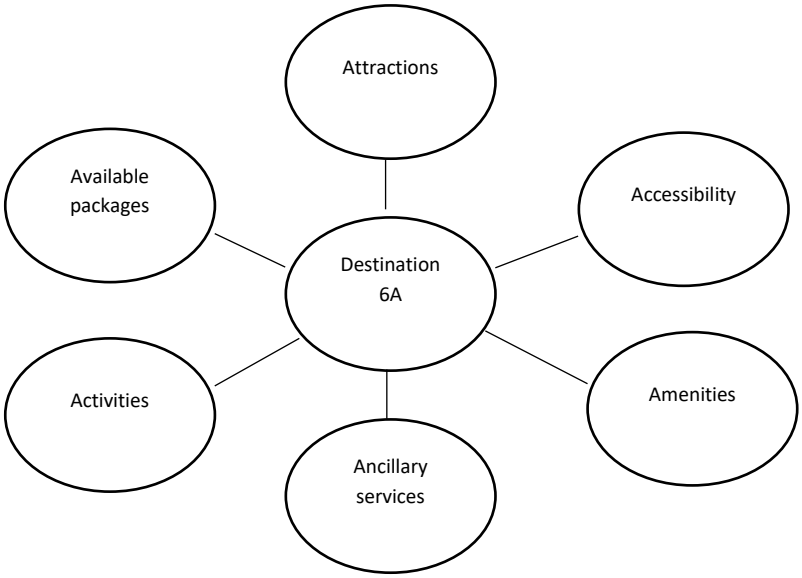
Exploring change in tourism systems: a qualitative study on hospitality operators and the new Salerno airport's impact on destination management

STEFANIA DENISE ESCOBAR[1] MARA NORMANDO[2] CHRISTOPHER GAFFNEY[3]

Abstract

Changes in destination accessibility can trigger shifts in a tourism system, requiring management strategies and strategic alliances to turn these changes into competitive assets. Such changes may pose challenges without proper management, negatively affecting a destination's attractiveness. This paper adopts a case study approach to examine tourism system change following the opening of Salerno Costa D'Amalfi Airport in July 2024. This event marks an opportunity to enhance the destination's appeal and strengthen its economic base. While Salerno has traditionally been secondary to renowned neighbouring destinations like Naples and the Amalfi Coast, the new airport infrastructure offers a chance to redefine its competitive positioning in regional and international markets. However, this change also affects tourism employment, services, and seasonality. This study will explore hospitality owners, managers and hosts' perceptions of change through the theoretical lens of the tourism competitiveness six A's framework. Preliminary findings suggest that stakeholders perceive improved accessibility as a first step towards an ecosystem change that can tackle urgent issues such as seasonality, low levels of stable tourism employment, and overdependence on specific tourism segments. Indeed, the new airport could lead to a new network of services benefiting tourists and residents and turn Salerno into a hub for tourists and neighbouring regions suffering from accessibility issues. The new airport could enhance Salerno's attractiveness to new tourism segments such as sports and business tourism if guided by new amenities and ancillary services like working spaces, fairs, exhibitions, and cultural and business events. However, findings suggest that it is crucial to have a proper inclusive tourism strategy guided by tourism stakeholders capable of identifying the most suitable strategies to pursue based on the territory's main challenges. Without the involvement of local tourism stakeholders, there is the risk of encountering challenges that affect the tourism ecosystem, such as a deregulated increase in tourism accommodation, a lack of intermodal connectivity and the development of attractions that do not value the local culture and economy.



Framing of the research. *Tourism destinations' competitiveness relies on many factors to enhance their attractiveness. Accessibility in terms of transportation to the destination (Buhalis, 2000) is a key component that influences destination management strategies (Campa et al., 2016; Cavallaro et al., 2020). Being destinations part of tourism systems (Moreira et al., 2021), changes to the accessibility of a destination may have implications for a wide array of stakeholders inside and outside the tourism system. Therefore, changes in destination accessibility need proactive and strategic management (McLoughlin et al., 2023) to avoid challenges related to a deregulated increase in tourism flows that can damage destination resources and inhabitants (Tsaur et al., 2018). Indeed, suppose tourism is considered a mere economic activity. In that case, it becomes difficult to address the sector's current and potential impact on resources, infrastructures and inhabitants, which have social, economic and environmental implications (Postma et al., 2017). Indeed, many destinations suffer from tourism because of poor management, aggravating existing challenges (Tsaur et al., 2018; Aall & Koens, 2019; Adie et al., 2020; Escobar & Margherita, 2024). To this end, Gil-Garcia et al. (2015) report the need for "intergovernmental, interagency, and inter-sectoral networks" to collaborate among multiple actors of a tourism system.*

To analyse local stakeholders' perception of the infrastructural changes to the destination's accessibility, this study will adopt the six A framework as a lens (Figure 1).

Fig. 1: Six A's of a Destination (based on Buhalis, 2000)

This framework describes destination structure as having six components (Buhalis, 2000; Neuhofer et al., 2012; Boes et al., 2016; Başer et al., 2019; Lee et al., 2020): (1) Attractions, which can be natural (e.g., mountains), artificial (e.g., amusement parks), or cultural (e.g., music festivals); (2) Accessibility, referring to the entire transportation network within the destination, including available routes, existing terminals, and sufficient public transportation options; (3) Amenities, which encompass all services that ensure a comfortable stay, such as accommodation, dining, and recreational activities; (4) Available packages, which are service bundles offered by intermediaries to highlight specific unique features of a destination; (5) Activities, which include all available experiences at the destination that primarily attract tourists; and (6) Ancillary services, which refer to everyday services not explicitly intended for tourists, like banks, postal services, and hospitals. To enhance destination competitiveness, it is essential for destinations to integrate all stakeholders in a collaborative co-creation process.

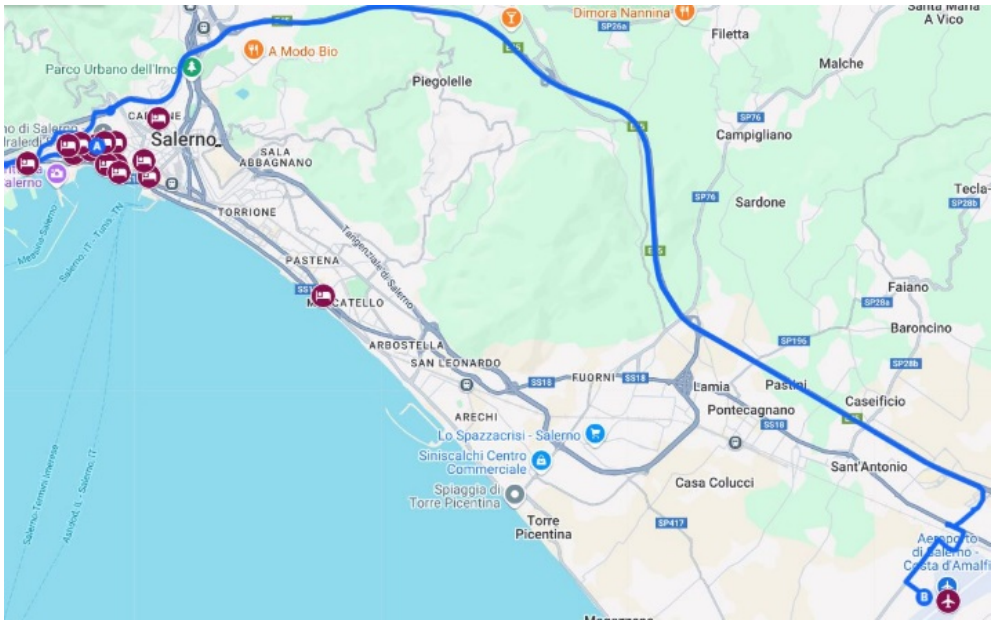
Purpose of the paper. *This study will explore the implications for destination competitiveness of changes in destination accessibility through the case of the newly developed Salerno Costa D'Amalfi Airport (opened in July 2024) to unveil the perceived impact of this change on the local tourism industry. Guided by this purpose, we aim to answer the following research questions:*

RQ1 What are the perceptions of hospitality owners, managers and hosts regarding the impact of the new Salerno airport on the city's tourism potential?

Methodology. This *study adopts an exploratory qualitative research design to investigate the impact of the opening of the Salerno Costa D'Amalfi Airport on the city of Salerno as a tourist destination from the perspective of hospitality owners, managers and hosts. This research will focus on the subjective experiences and perspectives of this segment of the tourism ecosystem. Qualitative research is particularly suited for exploring the complexity of social phenomena, such as destination management and tourism development, where quantitative approaches may fail to capture underlying motivations, perceptions, and the nuances of interpersonal and community dynamics (Creswell, 2016).*

To comprehensively understand the multifaceted impacts of the airport, the study will employ semi-structured interviews as its primary data collection method, and the participants will be chosen through convenience sampling (Etikan et al., 2016). Such interviews will effectively uncover personal motivations, perceptions of change, and anticipated consequences related to the airport's development. In terms of sampling, this working paper includes interviews to 15 respondents. However, this sample will be further expanded to ensure data saturation. Interviews were conducted online and were analysed through content analysis.

The qualitative approach captures the intricate motivations, perceptions, and interpersonal dynamics that quantitative methods might overlook. Ultimately, this research aims to contribute to a deeper understanding of how changes in a tourism system in the form of infrastructural developments influence a destination's economic trajectory and social landscape.



Results. *We conducted fifteen semi-structured interviews (Table 1) with local tourism stakeholders of Salerno.*

Tab. 1: Interviewees information

	Interviewee	*Type of tourism accommodation*	*Years of experience in the tourism industry*	*Role*
1	*Petite Maison Salerno*	*Guesthouse*	*2*	*Host*
2	*Home47*	*Bed & Breakfast*	*10*	*Host*
3	*Il Soffione Home* *Il Soffione centro storico*	*Bed & Breakfast and Guesthouse*	*7*	*Owner and Manager*
4	*Gli Archi dei Diavoli*	*Bed & Breakfast*	*5*	*Owner and Manager*
5	*VelAmare*	*Bed & Breakfast*	*9*	*Owner and Manager*
6	*Le Petit Bougainville/* *La Maison Bouganville*	*Guest house*	*11*	*Owner and Manager*
7	*Casa Vacanza il Duomo*	*Guesthouse*	*18*	*Host*
8	*Salerno Sea View*	*Bed & Breakfast*	*10*	*Owner and Manager*
9	*B&B Les Lumières*	*Bed and Breakfast*	*3*	*Owner and Manager*
10	*B&B Portanova*	*Bed & Breakfast*	*7*	*Owner and Manager*
11	*B&B Il Campanile*	*Bed & Breakfast*	*9*	*Owner and Manager*
12	*A Casa di Adri*	*Guesthouse*	*9*	*Owner and Manager*
13	*Qui si*	*Bed and Breakfast*	*4*	*Manager*
14	*Tyrrenium Salerno* *Dimora Francesca*	*Bed and Breakfast and Guesthouse*	*9*	*Owner and Manager*
15	*Santi e Saraceni rooms/* *La Suite della Principessa*	*Bed and Breakfast*	*3*	*Owner and Manager*

These tourism stakeholders are hospitality owners or managers of tourism accommodations (Bed &Breakfasts or Guesthouses) located in the city centre of Salerno or neighbouring smaller towns still part of Salerno (figure 1).

Fig. 1: The geographical positioning of the tourism accommodations included in this study and the new airport's location.

Preliminary results (summarised in Table 2) show that changes in destination accessibility can influence ecosystem changes: indeed, the boat and ferry services previously available only during high season remain open also in low season.

Tab. 2: Results summarised

Destination Dimension	*Before Airport*	*After Airport*
Accessibility	*Seasonal transportation*	*Intermodal year-round services which benefit both tourists and residents.*
Amenities	*Seasonal amenities*	*Tourism stakeholders also offer services during the low season that benefit tourists and residents.*
Attractions, activities and available packages	*The main attraction is "Luci d'Artista", visited mainly by residents and domestic tourists*	*In addition to "Luci d'Artista", other cultural attractions are being developed around the main event to offer a more integrated tourism offer.*
Ancillary services	*Ancillary services available for the population*	*With an increase in tourism flows and activities present at the destination, the need for new integrated ancillary services might arise to satisfy the demands of a higher temporary and permanent population.*

With an increase in tourism flow, there might be a need for new integrated ancillary services (Buhalis, 2000) to satisfy the demands of a higher temporary and permanent population. In addition, potential changes in tourism flow might lead to planning to expand the offer of attractions, packages and activities in terms of cultural events to offer tourists an enhanced experience.

Yet, the hosts interviewed considered that these changes would happen only through a cohesive strategy that must be guided by the DMO in a joint effort with municipalities and with the involvement of the tourism ecosystem. Indeed, all hosts interviewed in this research reported that the news about the opening of Salerno airport was retrieved from newspaper articles or social media, as there were no communications from the municipality regarding the project development and opening date. Therefore, hosts had to rapidly adjust their services to the new opening regarding the information provided to tourists and a new rise in tourism offers that leads to higher competition.

The city of Salerno is at a turning point in its tourism development thanks to the airport infrastructure, but is also facing challenges related to seasonality and competition with nearby, more established destinations.

Given the new accessibility and the city's strategic location, between the Amalfi Coast and Naples, the mice and business tourism segment may choose Salerno as a base for business retreats, remote work, fairs, and events.

In terms of attractions, interviewee 3 states, "attractions will potentially be planned for a bigger audience in terms of tourism segments, consequently increasing the number of attractions for a bigger market". Attractions in the destination will likely need to change both in terms of the quantity of attractions available for tourists and in terms of quality. Indeed, as explained by interviewee 5, "Salerno needs first to assess its value as a tourist city before building new attractions, as this can influence the quality of the attractions developed". Some attractions are already being developed: according to interviewee 2, "there are already projects for the improvements of beaches in the area of Torrione that can make those beaches a new attraction for Salerno and possibly boost beach tourism". Therefore, the development of the new airport could potentially contribute to identifying new attractions that can satisfy a larger and possibly more diversified tourism demand and be a tool for improving and revitalising current attractions. Indeed, interviewee 6 explains that "since the airport, some attractions like local markets by the seaside of local artisans, chocolate festival were restored" but also "it is the first time that the municipality brings to Salerno a famous painting for a temporary art exhibition which is important because the city has a very low amount of art exhibits". In addition, interviewee 2 stresses that "a greater tourist influx could encourage investments in cultural events and festivals, strengthening initiatives such as Luci d'Artista and Salerno Letteratura, making the city more attractive".

In terms of amenities, interviewees report that since the airport, there has been a dramatic increase in the number of amenities available for tourists in different parts of the city of Salerno, with the highest increase in the area of the airport that has been revitalised. The kind of accommodations is also changing, indeed, as explained by interviewee 3, many new tourism accommodations have as their target tourism segment couples and one-night guests. However, this sudden increase in tourism accommodations led to challenges in the tourism ecosystem of Salerno as expressed by interviewee 6 "They have opened so many B&Bs and holiday rentals that competition is fierce. In the low season, it is difficult to have guests, before you had a few more guests, now you don't". Therefore, the development of the airport led to challenges for the current tourism system. In terms of other services, interviewees reported that since the airport's opening, previously nonexistent services, such as luggage storage facilities, have now been available in the city. Indeed, interviewee 6 explains how "before the airport, apps like radical storage had very limited coverage".

With regards to the available packages, the perception of how the airport might be influencing and will influence the available packages at the destinations raises a main concern among the interviewees that relates to the capacity of Salerno to receive and manage new tourism flow as it is considered a crucial factor that can influence the development and success of new packages at the destination. Indeed, as explained by interviewee 4, "packages have been available in Salerno for some time now but very limited to a specific high-end tourism segment" and therefore, the development of new packages depends on the ability of Salerno to develop a cohesive tourism strategy that maps current and potential areas of tourism attractiveness. Particularly, Salerno needs to analyse which kind of tourism experiences are present in the destination and how these experiences can be connected to offer packages to tourists landing at Salerno Airport. Indeed, a wider offer, according to interviewees, can secure Salerno as a tourist hub for the region.

Some new packages are already emerging, such as boat tours combined with gastronomic experiences and day visits to neighbouring destinations (e.g. Capri, Paestum). However, most interviewees consider that the development of packages is still in its infancy.

In terms of ancillary services, some changes have been reported by the interviewees since the opening of the airport: Interviewees 3 and 2 report that since the airport opening, there has been an increase in shopping malls, car rentals and car sharing. In addition, the interviewee added an increase in candy shops, street food, coffee shops that sell products for international customers, and ethnic restaurants. According to interviewees 5 and 8, ancillary services should increase, and the personnel should be trained to interact with international customers. This change should start with the municipality offering, for example, English courses for local business owners to overcome potential linguistic barriers and enhance the tourist experience. Finally, interviewees 3 and 9 suggest that major changes will more likely occur in 2027 with the opening of a multimodal transport station that will link the airport with Salerno's subway and high-speed trains. Indeed, the new infrastructural development will potentially help to boost the development of new shopping malls, co-working spaces, banks and clinics, given the new connectivity.

In terms of perceived changes in tourism activities since the airport opening, interviewees are hopeful that an increase in tourism flow will bring new tourism segments interested in a variety of activities such as sports tourism, business

tourism, which can increase business events, exhibitions and business fairs that could boost the local economy tackling seasonality. Yet, activities must be connected in terms of transportation and scheduling to enhance the overnight stays. However, interviewee 9 claims, "Something is moving due to the will of a few, but I don't see a structured system guiding the change, " showing the need for a cohesive tourism strategy to guide the ecosystem change. This is confirmed by interviewee 7, who states how the number and quality of activities "[…]will depend on the territory's ability to organise and offer quality experiences."

Finally, in terms of accessibility to the destination, Salerno has shown signs of improvement since the airport's opening. Indeed, interviewees 6 and 4 report that seasonal services such as ferries, which are a crucial means of transportation for tourists and locals to connect Salerno with the Amalfi Coast, this year stayed active during low season, which enhanced greatly the accessibility and interconnectedness of Salerno with neighbouring destinations that are famous tourist destinations such as Capri.

In addition, the airport connects Salerno with neighbouring regions such as Calabria and Basilicata, which lack transportation infrastructure. The connection with this region can open Salerno to become a hub for international tourists aiming to visit these regions suffering from low accessibility, as well as for domestic tourists from these regions. Finally, the intramodality of the new airport station will allow for enhanced accessibility to the destination and develop the touristic potential of neighbouring areas.

In conclusion, the new airport has the potential to boost Salerno's appeal to emerging tourism markets, including sports and business tourism, especially if supported by new facilities and complementary services such as co-working spaces, trade fairs, exhibitions, and cultural or corporate events. However, research highlights the need for a well-structured, inclusive tourism strategy led by industry stakeholders who can identify the most effective approaches based on the region's key challenges. Without the active participation of local tourism players, there is a risk of issues that could disrupt the tourism ecosystem, such as uncontrolled growth in accommodation facilities, inadequate intermodal connectivity, and the development of attractions that fail to enhance local culture and economy.

Research limitations. *This research comes with some limitations. Being a qualitative case study, the findings are not intended to be generalised but rather to provide an in-depth exploration of the specific context of the Salerno tourism system following the opening of the new airport. Future studies could expand the sample of cases to identify potential similarities and differences in how changes in destination accessibility impact tourism dynamics. This study focuses exclusively on the perspectives of hospitality operators, specifically bed & breakfast and guest house owners and managers. While their insights are valuable in assessing the direct effects on the hospitality sector, they represent only a subset of the broader tourism ecosystem. To develop a more comprehensive understanding of the implications of the airport's opening, future research should incorporate the perspectives of additional key local stakeholders, including policymakers, destination managers, travel agents, restaurateurs, and local entrepreneurs. Their insights could offer a deeper understanding of governance strategies, infrastructure challenges, and the wider economic and social impacts of increased accessibility. Expanding the range of stakeholders involved would facilitate a more holistic analysis of how infrastructural changes influence destination management and competitiveness, ultimately contributing to a more effective and sustainable approach to tourism development.*

Managerial implications. *Destination management organisations (DMOs) and city managers can use this study as a valuable tool to better understand strategic and proactive change management in tourism destinations. The findings highlight the crucial role of accessibility in shaping a destination's competitiveness and emphasise the need for coordinated efforts among various stakeholders to maximise the benefits of new infrastructure development. A key implication of this research is the importance of stakeholder involvement in strategic planning. The perspectives of hospitality stakeholders reveal that the lack of direct communication and coordination between local authorities and tourism businesses can hinder effective adaptation to infrastructural changes.*

In particular, it is necessary to actively involve hospitality operators in decision-making processes related to the competitive positioning of Salerno, which can now count on a new advantage linked to accessibility. The new airport opens up diverse tourist segments, such as business, sports and cultural tourism, that require tailored services and targeted value propositions. B&BS and holiday homes could rethink their offer by including co-working spaces, flexible check-in/check-out services for travelling professionals, or thematic stays linked to local events and festivals.

To make this transition effective, city managers should create structured dialogue platforms that facilitate continuous interaction between policymakers, tourism operators, transport providers and other key players in the local economy. This would enable more informed decision-making and the development of integrated strategies that align infrastructure improvements with sustainable tourism growth.

Increasing the intermodality and usability of the destination in the low season also makes it possible to create joint tourism packages. Hospitality operators should collaborate with transport providers and agencies to offer integrated packages, such as overnight stays + ferry tours, food and wine experiences or guided tours to neighbouring sites (e.g. Amalfi Coast, Paestum, Pompeii). This enriches the visitor experience and helps to lengthen the average stay and counteract seasonality.

The study also suggests that increased accessibility alone does not automatically translate into positive tourism development. DMOs and city managers must anticipate potential challenges, such as uncontrolled growth in accommodation supply, seasonal fluctuations in demand and the need to improve intermodal transport connections.

In this regard, we suggest the adoption of public policies that regulate the growth of short-term tourist rentals and promote quality standards for accommodation facilities. Training courses could be activated to improve the professionalism of operators, such as English language courses and seminars on digital marketing. Finally, creating a shared platform for real-time updates on infrastructural developments and tourist flows is recommended so that local operators can adapt their operational strategies on time.

Originality of the paper. *This research will contribute to the academic discourse on destination management by providing a real-world case study on the impact of new infrastructure in a medium-sized Italian city. In particular, it examines the initial effects of Salerno's Amalfi Coast Airport, newly opened and operational for less than a year, making this study one of the first academic contributions to explore its implications for the local tourism ecosystem. Preliminary findings offer valuable insights informing local policies and broader theoretical frameworks related to destination development, competitiveness, stakeholder collaboration, and tourism management. This study expands the current knowledge on the role of airports as facilitators of tourism ecosystem change that have been analysed with a more quantitative lens (Marchesani et al., 2023), providing a nuanced qualitative perspective. Indeed, by capturing the perspectives of hospitality operators at this early stage of infrastructural change, such as the opening of a new airport, the study sheds light on the immediate opportunities and challenges faced by the sector, providing a basis for future research on the long-term evolution of tourism dynamics in the area. This case study enriches the literature on accessibility and tourism by emphasising the importance of proactive and strategic management (McLoughlin & Hanrahan, 2023) to make the most of the benefits of new transport infrastructures. At the same time, it highlights the need to prevent potential risks, such as unregulated accommodation growth, and the risk of destination saturation and overtourism phenomena.*

Action research on hotel guests' sustainable behaviour

ANNA IRIMIÁS[1] ARIEL MITEV[2] LÍVIA PINTÉR-SZABÓ[3]

Abstract

This study explores the factors that influence four-star hotel guests' decisions regarding the utilisation of room cleaning services on a daily basis. Utilising the concept of 'warm-glow', this research investigates tourists' actual behaviour in a hotel setting. The investigation was conducted over an 18-month period and is underpinned by a rigorous evidence-based approach. The findings of this action research provide novel insights into the dynamics of leadership and front desk interactions, and their role in overcoming barriers to the success of the programme. The findings of this research, coupled with the outcomes of a binary logistic regression analysis, offer a comprehensive insight into the factors that influence tourists' decisions. These results can be utilised by hotel managers to seamlessly implement their own green programmes.

Framing of the research. *Hotels and other types of accommodation account for 2% of the 5% of global CO2 emissions from the tourism sector. Daily cleaning hotel rooms is one of the problems. It is estimated that estimated that daily room cleaning uses 'some 35 litres of water, 100 ml of chemicals, and 1.5 kWh of electricity in a four-star hotel (Knezevic-Cvelbar, Grün and Dolnicar, 2021). Management research has extensively examined the methods through which tourism enterprises adopt sustainability practices (Buffa et al., 2019). In the context of the hospitality industry, hotels have increasingly recognized the importance of implementing sustainable strategies to reduce their environmental impact. Notable approaches include energy-efficient technologies, waste reduction programs, and water conservation initiatives (Dolnicar, Knezevic-Cvelbar and Grün, 2019). Additionally, hotels are increasingly engaging in social sustainability by promoting local culture and sourcing products from local suppliers to support the community (Cozzio et al. 2024). It is evident that hotels' sustainable and green programmes can be regarded as a robust strategy, voluntarily initiated by the management or compelled by legal norms and regulations that oblige firms to implement sustainable activities (Tran, Nguyen and Nguyen, 2025). In both cases, green programmes can be regarded as an opportunity for companies to deepen their relationships with key stakeholders, whilst concomitantly reducing costs for the company itself (Franco, Caroli and Del Chiappa, 2021). However, as Abrate, Pera and Quinton (2020) argued the way consumers evaluate environmental policies has been overlooked. Their study investigated how consumers assess hotels' environmental policies and whether such an evaluation influences their overall satisfaction. Their study employed a unique source of data from a hotel chain's internal platform and analysed 84,470 consumers' reviews. They also addressed the specific review items dedicated to sustainability in popular open online review platforms. There is a lack of understanding whether tourists are willing to skip room cleaning for charity, thus showing prosocial behaviour while on holiday.*

According to social psychologists (e.g. Fiske, 2018), prosocial behaviour is determined by dispositions on the one hand and by situations on the other. According to the former explanation, prosocial behaviour is primarily shaped by upbringing, i.e. the more prosocial elements a parent incorporates into the socialisation process of children, the more likely they are to respond with helpful behaviour in the situation of a person in distress, i.e. to become a prosocial person. According to the other approach, prosocial behaviours are a function of how the individual interprets the situation, as an emergency or not, and of the costs to the helper of intervening in the situation (Bierhoff, 2002). Social psychologists also define prosocial behaviour and its subtypes and manifestations in terms of the underlying motivation of intentionality, which typically differ only in nuances, which is why the literature mostly treats the concept of altruism and prosocial behaviour as synonymous.

Participation in activities that benefit the common good has been demonstrated to engender a sense of moral satisfaction in individuals (Andreoni, 1990). This phenomenon, termed the 'theory of warm glow', posits that people derive intrinsic happiness from contributing to social and environmental causes. In the context of tourism, this theory can be applied to sustainable travel practices, where tourists feel a sense of fulfilment by choosing eco-friendly accommodations or engaging in responsible tourism activities that support local communities and preserve natural

resources (Li et al. 2023; Taegoo et al. 2025). The warm glow effect has been demonstrated to enhance the experiences of tourists and to foster a positive impact on the destinations they visit (Lv et al. 2024).

Purpose of the paper. *This short paper seeks to contribute to the debate on tourists' sustainable behaviour in accommodation services by drawing on the theory of warm glow and using participatory action research in a four-star hotel in an urban destination. The aim is to explore the sustainable behaviour of tourists in a hotel environment and whether tourists support the charity program of the hotel. Impulsive prosocial behaviours, such as the spontaneous act of giving to individuals or charitable organizations, are here examined. Based on quantitative data collected over 1.5 years on tourists' adherence to the sustainable program, this short paper attempts to answer the following research questions:*

RQ_1: What kind of factors influence tourists' decisions to skip daily room cleaning?

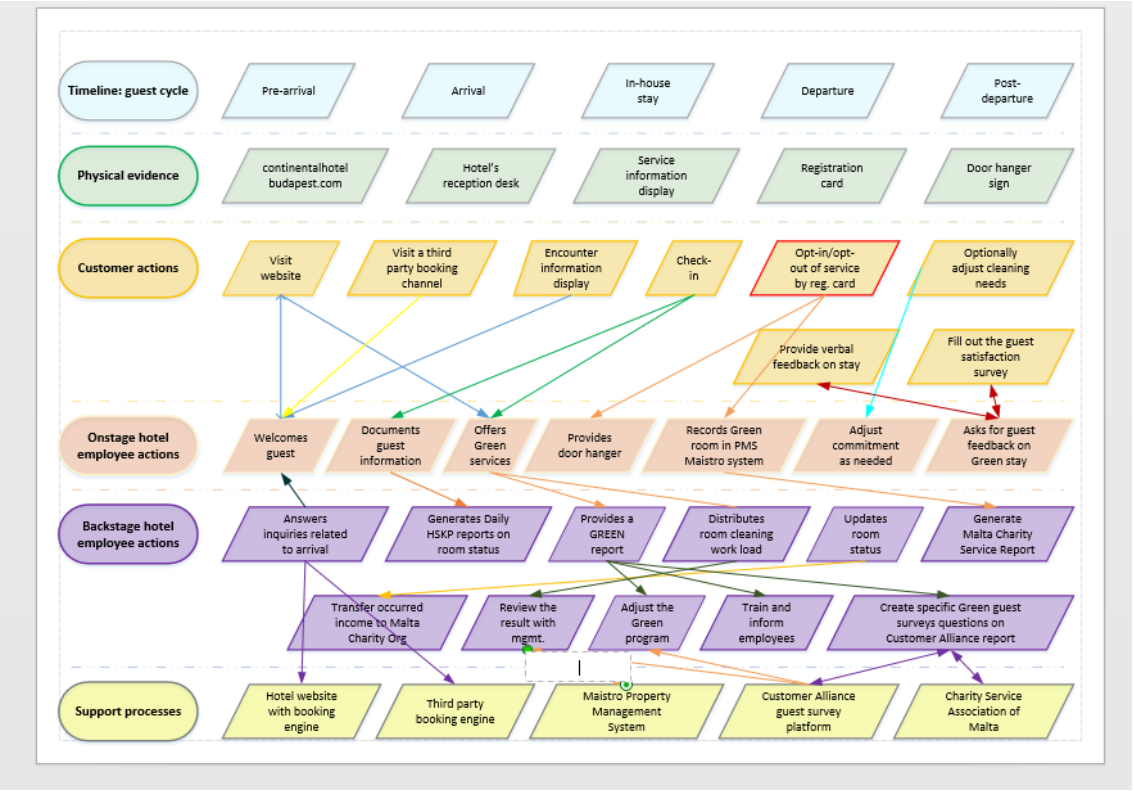
RQ_2: How can the hotel management increase the tourists' warm glow and doing good?

Methodology. *For this study we employed participatory action research methodology. Participatory action research (PAR) in management is a collaborative research methodology that emphasises the active involvement of stakeholders in the research process (Bradbury, 2010). As mentioned before, PAR seeks to address real-world issues by integrating reflection, action and learning among participants. The PAR methodology is predicated on the notion that the world can be understood and improved through its modification. The fundamental principle underpinning this method is the collective and self-reflective inquiry undertaken by researchers and participants, with the objective of enhancing the practices in which they engage and the situations in which they find themselves (Adelman, 1993). The reflective process is inextricably linked to action, influenced by an understanding of history and the local context, and embedded in social relationships. The researcher is not merely an observer, but rather an agent of change involved in the programme planning and monitoring. This method is characterised by its cyclical process of planning, acting/implementing, observing, and reflecting, which allows for continuous feedback and adaptation of strategies. The overarching objective of PAR is to cogenerate actionable knowledge, that is, knowledge that enables organisational actors to implement their intentions. By empowering employees and stakeholders through their involvement in decision-making and problem-solving activities, PAR enhances organisational effectiveness.*

Our participatory action research lasted four years, we started with regular field visits in the hotel and discussed the hotel management aim to launch a green program. Staff members such as the marketing manager, the head of housekeeping, the receptionists and the hotel's general manager were all informed about the research and were interviewed. Data gathering on tourists' behaviour was conducted for 1.5 years and ended in September 2024. Four-star superior, the Continental Hotel is in the Jewish District of Budapest (Hungary), one of the most popular quarters among tourists. The Hungaria Bath opened in 1827. The building, which during the following years also hosted a theatre and a movie hall, was run as a hotel until 1970. It was then abandoned for decades, before being bought and renovated by the Zeina group, reopening in 2010 with 272 rooms. We collected data from more than 64,000 tourists accommodated in the hotel, and our research objective was to explore the different factors that influenced tourists' decisions to skip daily room cleaning. Binary logistic regression was used to analyse the data, considering four factors (management actions, weather, length of stay, demographics) that influence guest compliance with the green program. Our findings provide a novel insight into the key role of committed hotel management in successfully implementing green program.

Results. *To analyse the factors influencing the likelihood of participation in the sustainability program, binary logistic regression was employed. The research, conducted over 1.5 years, identified four main categories of factors through discussions, consultations, and field observations. These categories include management actions, weather conditions, hotel stay characteristics, and demographic variables. The analysis aimed to test the probability of a guest's participation in the program, coded as 0 (No) or 1 (Yes), based on these predictor variables. Binary logistic regression, an advanced form of linear regression for binary outcomes, was utilized for this purpose. The significance of these factors in determining the likelihood of participation in the sustainability program lies in their influence on guests' behaviours and decisions. Effective management strategies can encourage guests to participate by promoting awareness and providing incentives. Clear communication about the program's benefits and the hotel's commitment to sustainability can significantly impact guests' willingness to join. The weather can influence guests' choices and preferences. For instance, during adverse weather conditions, guests might be more inclined to stay indoors and engage with hotel initiatives. In both the management interview and the study by Dolnicar et al (2019), the impact of weather conditions on participation in the sustainability programme was identified as a key factor. The model developed to assess this relationship incorporated the most significant weather variables, namely daily rainfall and maximum temperature, given the anticipated decrease in willingness to engage with the programme.*

The length and nature of a guest's stay can affect their participation. Longer stays provide more opportunities for guests to learn about and engage in the program, while the type of stay (leisure or business) may also play a role in their willingness to participate. Demographic factors such as age and country of origin can shape guests' attitudes towards sustainability and charitable activities. Understanding these variables helps tailor the program to appeal to a broader audience and increase participation rates. The chi-square test result indicates that our model is a significant improvement in fit relative to an intercept-only model, $\chi^2(14) = 1592.109$, $p<.001$. The Hosmer and Lemeshow test (a global fit test) is not statistically significant [$\chi^2(8) = 8.994$, $p=.343$], indicating adequate fit of the model. The results were also commented and discussed both with the hotel manager and the receptionists as part of the participatory action research. In fact, the interview snippets further outline the challenges the sustainability program had to overcome:



"Our guests who stay with us for a night or two really love being able to enjoy all the hotel has to offer. And of course, those who stay for longer can really relax and explore the city, or just chill in their room. But we do have guests who are in there quite a lot, and they expect their room to be cleaned", (Receptionist_1)

At the programme's initiation, promotional materials are disseminated; however, the reception appears to lack a sense of the programme's significance. This was similar to Peng and Lee's (2019) findings. Instead, receptionist perceived the programme as an additional obligation, and they are not adequately prepared to communicate the programme effectively. After four months, management draws lessons from initial experience to reinvigorate programme, the steps were discussed with the researchers and new interventions were planned following the guidelines of the participatory action research method. As the next quote shows, the hotel was proud of their sustainability program, even if tourists' adherence was not high.

"It's clear that the higher the percentage, the better, but we've only just launched the sustainability program 3 months ago, so it's still in its initial stage. I'm sure we could further develop it, but I think the 2% is a great start", (Interview with the hotel general manager_2023)

Between September and November 2023, the number of participants in the programme dropped dramatically, with a shift in the mix between conferences and corporate events, adherence to the program further decreased. At this point, the decline appeared to be unstoppable, with an indicative drop in the number of participants. In order to identify the pitfalls, we revised the program implementation. During the field research we elaborated a service blueprint to identify and manage the service encounters and to promote the hotel's sustainability program (Figure 1).

Fig. 1: Service blueprint elaborated to identify the pitfalls in implementing the programme

Source: the authors' own elaboration

From January 2024, the researchers in close collaboration with the hotel management, redesigned the sustainability programme and proposed a specific training session for the front desk. For those who were proposing the sustainable programme several benefits and awards were offered. An immediate positive effect was seen as a consequence of such interventions and from the second half of January there was a significant spike in guests' adherence numbers. This result provided evidence of the fruitfulness of the participatory action research method and its cyclical process of planning, acting/implementing, observing, and reflecting, which helped to adapt a different strategy when challenges were identified. At check-in, as shown in Figure 1, guests were offered the opportunity to opt-in or opt-out of the service, and those who opted in were given the registration card and door hanger. The service blueprint revealed that there was no follow up with guests who participated in the hotel's sustainability programme and their 'warm glow' feeling was not kept 'heated' by the hotel staff. As the hotel operations manager recalled in the next quote, the process was not easy.

"In 2024, when we had such a nice increase in guest compliance, it was because we redesigned it. We also did training and you [the researchers] also helped us to improve the communication of the programme. We gave the front desk a script, a script on how to explain the programme to the guests. You helped us a lot with that because you came up with

the idea that we should somehow reward our staff for promoting this initiative. The front desk staff got interested and then it really took off", (Interview with the hotel operation manager_2024)

In the four-star hotel where the study was conducted, it was found that 1.5 kWh of electricity and 100 ml of chemicals are used for each room that is cleaned. It can therefore be concluded that the adoption of this intervention on a wide scale has the potential to contribute substantially to a reduction in the environmental harm caused by tourism. This study demonstrates that an impulsive stimulus aiming to modify tourists' behaviour can be an effective strategy in the process of enhancing the environmental sustainability of hotels. As social psychologists (Bierhoff, 2002; Fiske, 2018) have shown, pro-social behaviour is a function of how an individual interprets a situation, and this is key in tourism and hospitality where tourists have a very short time to decide, for example, whether or not to skip the daily room cleaning. In order to answer the RQ_1, the study showed that the factors that influence tourists' decisions to skip daily room cleaning are diverse and the country of origin, being used to sustainable initiatives in tourism and hospitality and the weather conditions play a significant role.

Overall, skipping daily room cleaning for charity can increase tourists' warm glow feelings. Still, we must acknowledge that guests' adherence to the program stayed limited during the 1.5 years of participatory action research. The service blueprint and the interviews with the hotel management and staff allow us to respond to the RQ_2. The hotel management -if committed to the sustainable programme (and also aims to reduce the costs of housekeeping)- can increase tourists' warm glow by incentivising the members of the staff in promoting the programme. The goals and the achieved results of the sustainability programme should be communicated at the check-out to give feedback to participants and to stimulate their warm glow feeling.

The unique feature of this programme was that guests who participated did not receive any compensation for skipping the room cleaning. The hotel's sustainability programme was kept alive by intensive management intervention, with specific steps introduced at least every three months, otherwise the number of participants would have gradually declined after the first management impulse. A novelty of this research is that the hotel management was in constant discussion with the research team about which elements of the programme could be changed to make it more effective.

Research limitations. *In this research, the destination type was not a consideration. The participatory action research was conducted in an urban destination; therefore, the results cannot be generalised. In comparison to other destination types (natural sites, rural areas), urban destinations and four-star hotels present a less vulnerable environment. Consequently, tourists may be less sensitive to environmental concerns than others who have selected a different destination type and accommodation service. Therefore, future research should consider environmental awareness and other accommodation types in a rural or mountain tourism destinations and whether 'warm glow' can be induced in a different way to stimulate tourists to behave more pro-environmentally.*

Managerial implications. *The action research findings provide useful and concrete steps for hotel management and other tourism service providers to implement and manage a green program that is capable of stimulating tourists to behave in a more sustainable way in the long term. As part of our action research, we have formulated several specific managerial implications that can be leveraged by hotel hotels and accommodation services in urban settings. In our case, it appears that the sustainability programme is not adequately communicated within the hotel's channels. It is neither mentioned in the mission statement nor made visible on the website. This oversight necessitates a concerted effort from management to maintain the program's functionality, especially during periods when momentum may wane. Guests have a limited time to decide whether to participate in the programme. As hotels and innovative tourism service providers continue to establish voluntary green programs, our findings can be used in any situation where the management goals are honourable but face different barriers that need to be overcome. In the contemporary context, where hotels utilise digital platforms to communicate their environmental commitment through the adoption of sustainability programmes and to provide guests with the opportunity to access pertinent information to reduce their carbon footprint, it is imperative to utilise these digital platforms to showcase success and achievements in this domain.*

Originality of the paper. *This short paper contributes to the debate on tourists' sustainable behaviour in accommodation services by drawing on 'warm glow' and the use of PAR. Hotel guests were invited to join a sustainability program by opting out of daily room cleaning, with the hotel contributing €1 per room per night to a charitable organization. According to the economics literature, the act of giving is often seen as selfish and impurely altruistic. The concept of 'warm glow,' as proposed by Andreoni (1990), refers to the enjoyable sensation experienced when performing a good deed. Data of more than 64.000 guests collected for 1.5 years evidenced the factors that impact tourists' decision making in hotels. The participatory action research helped to create actionable knowledge and bridged the gap between theory and practice.*

Key words: *four-star hotel, sustainable behaviour, participatory action research, warm glow theory, sustainability program, binary logistic regression*

A-RIES: un modello adattivo per la rigenerazione del patrimonio

MICHELA TOUSSAN[1] LUCA QUAGLIERI[2] DILETTA PILOCA[3] BERNARDINO QUATTROCIOCCHI[4]

Abstract

La gestione del patrimonio culturale richiede un approccio integrato che concili tutela, valorizzazione e sostenibilità economica. Il presente studio propone il modello A-RIES (Adaptive Regeneration Index for Effective Strategies) come framework innovativo per la rigenerazione del patrimonio culturale, superando le rigidità dei modelli tradizionali attraverso un sistema adattivo e data-driven (McAfee et al., 2012, Provost, F. et al., 2013, Witten et al., 2016). L'integrazione di metodi multicriteriali, quali Analytic Hierarchy Process (AHP) e Technique for Order Preference by Similarity to Ideal Solution (TOPSIS), consente di ottimizzare i processi decisionali, riducendo la soggettività nelle scelte strategiche. A-RIES si distingue per la capacità di adattarsi a contesti normativi ed economici eterogenei, promuovendo una governance partecipativa che coinvolge attivamente stakeholder pubblici e privati. Il modello incorpora inoltre principi di economia circolare, favorendo il riuso adattivo del patrimonio edilizio e l'adozione di strategie finanziarie sostenibili. L'analisi empirica condotta sul caso studio dello Scugnizzo Liberato dimostra l'efficacia di A-RIES nel migliorare la sostenibilità e la resilienza dei progetti di rigenerazione culturale. Tuttavia, il framework presenta alcune limitazioni, tra cui la necessità di una validazione su scala più ampia e il rischio di soggettività nell'assegnazione dei pesi decisionali. L'integrazione di strumenti di machine learning e l'adozione di tecniche di valutazione più avanzate potrebbero rafforzare la robustezza del modello, ampliandone l'applicabilità a diversi contesti territoriali. I risultati dello studio offrono un contributo significativo alla letteratura sulla gestione del patrimonio culturale, proponendo un modello scalabile e replicabile che coniuga innovazione gestionale, sostenibilità e valorizzazione sociale.

Framing of the research. *La gestione del patrimonio culturale si configura come un processo complesso e multidimensionale, che deve conciliare la tutela dei beni con la loro valorizzazione e sostenibilità economica. In questo contesto, la rigenerazione urbana rappresenta uno strumento essenziale per ridare vita a spazi dismessi e beni culturali inutilizzati, promuovendo modelli di governance integrata e strategie di sviluppo sostenibile. La crescente attenzione verso il riuso adattivo del patrimonio culturale testimonia un cambio di paradigma nella gestione di questi beni, orientato non solo alla conservazione, ma anche alla creazione di valore economico e sociale (Kulshrestha & Srivastava, 2025, Milella F., 2024, Fusco Girard et al., 2021).*

Tuttavia, i modelli di gestione attualmente in uso presentano significativi limiti e criticità. L'approccio prevalentemente burocratico e gerarchico adottato dalle istituzioni pubbliche ostacola l'implementazione di strategie dinamiche e flessibili (Daniel et al.,2024). La rigidità normativa, la lentezza dei processi decisionali e la frammentazione delle competenze tra diversi livelli di governo spesso ritardano l'attuazione di interventi di rigenerazione, limitandone l'efficacia. A ciò si aggiunge una cronica carenza di risorse finanziarie, che rende difficile la manutenzione ordinaria e straordinaria dei beni culturali, favorendo il loro degrado progressivo (Wang & Fouseki, 2025). L'assenza di un coordinamento centralizzato tra enti pubblici e la mancata armonizzazione delle normative a livello locale, nazionale ed europeo aggravano ulteriormente le difficoltà operative, riducendo l'efficienza delle politiche di gestione.

Un ulteriore problema è rappresentato dalla scarsa integrazione tra settore pubblico e privato. Sebbene strumenti come il Partenariato Pubblico-Privato (PPP) e il Partenariato Speciale Pubblico-Privato (PSPP) abbiano dimostrato un potenziale significativo (Moliterni, 2019; Smith, 2020), la loro applicazione è spesso ostacolata da normative inadeguate e da una diffusa mancanza di competenze gestionali specifiche (Baarveld et al., 2018, Boniotti, C., 2019, Boniotti C., 2023, Bosco et al., 2023, Rossitti et al., 2021). Inoltre, il coinvolgimento della società civile rimane limitato, con una partecipazione spesso simbolica piuttosto che realmente influente nei processi decisionali (Guediri & Bouchemal, 2024, Baarvel et al. 2018, Boniotti C., 2019, Bosco et al.,2023, Cerreta et al., 2020, Doroz-Turek M., 2019, Kountouri et al., 2018, Oppio et al., 2017, Rosetti et al., 2022, Rosetti et al., 2022).). Questo fenomeno è particolarmente evidente nelle aree periferiche e nei piccoli centri urbani, dove le comunità locali potrebbero svolgere un ruolo cruciale nella valorizzazione del patrimonio, ma vengono escluse dai processi decisionali per mancanza di strumenti e risorse

adeguati (Council of Europe, 2005, Oppio et al., 2017 Kountouri et al., 2018, Cerreta et al., 2020, De Gregorio et al. 2020, Doroz-Turek, M. 2019, Fava, F., 2021, Gravagnuolo et al., 2021, Pickerill, T., 2021, Imperiale, F. 2022, Rosetti et al. 2022).

Dal punto di vista operativo, le strategie di gestione attuali raramente adottano strumenti innovativi di analisi e monitoraggio. L'assenza di un sistema strutturato di valutazione degli impatti economici, sociali e ambientali porta a decisioni inefficaci e scarsamente sostenibili nel lungo periodo. L'uso limitato di tecnologie digitali e big data nella pianificazione e nel controllo delle strategie di valorizzazione (McAfee et al., 2012, Witten et al., 2016) costituisce un'ulteriore debolezza del sistema. Le metodologie di valutazione attualmente impiegate si basano su parametri tradizionali, spesso inadeguati per catturare la complessità delle dinamiche di rigenerazione urbana e di gestione del patrimonio culturale (Salerno, E., 2020, Bottero et al., 2019, Cucco et al., 2023, Dabbene et al., 2022, Della Spina et al., 2021 e 2023, Guccio et al. 2017, Nocca et al., 2022, Oppio et al., 2017, Torrieri et al., 2019). La mancanza di una standardizzazione nelle metriche di impatto impedisce inoltre un confronto efficace tra diversi progetti, limitando la possibilità di replicare le best practices su scala nazionale e internazionale (Kriswandwitanaya & Nurussobah, 2024).

Un altro aspetto critico è la difficoltà di accesso ai finanziamenti (Baarveld et al., 2018, Boniotti, C., 2019, Boniotti C., 2023, Bosco et al., 2023, Rossitti et al., 2021). Le politiche di finanziamento per la conservazione e la valorizzazione del patrimonio sono spesso frammentarie e legate a bandi pubblici che non garantiscono continuità nel tempo (Jawabreh et al., 2024). La dipendenza da fondi pubblici limita la capacità di pianificazione a lungo termine, mentre l'assenza di incentivi strutturali per gli investitori privati riduce l'attrattività di progetti di rigenerazione urbana. Inoltre, i modelli di business attuali non sempre riescono a garantire un equilibrio tra sostenibilità economica e tutela del patrimonio, con il rischio di subordinare gli obiettivi culturali a logiche di mero profitto (Stamatoudi & Roussos, 2024).

La ricerca si inserisce in questo dibattito contribuendo alla letteratura sulla gestione del patrimonio culturale e della rigenerazione urbana, proponendo un modello replicabile in diversi contesti territoriali e scalabile in funzione delle specifiche esigenze locali. La ricerca intende fornire evidenze empiriche sull'efficacia di un approccio basato sull'analisi multicriterio per supportare le decisioni strategiche, con l'obiettivo di migliorare la sostenibilità e l'efficienza dei progetti di rigenerazione urbana.

Purpose of the paper. *Il presente studio intende dimostrare come il Framework A-RIES possa costituire una soluzione innovativa alle criticità che caratterizzano i modelli tradizionali di gestione del patrimonio culturale. L'analisi si sviluppa a partire dalla constatazione che le strategie attualmente adottate risultano spesso inefficaci nell'affrontare la complessità dei processi di valorizzazione e rigenerazione urbana dei beni culturali (Wei et al., 2025). Tali inefficienze derivano principalmente da vincoli normativi stringenti, da processi decisionali frammentati, da una governance poco strutturata e da un accesso limitato alle risorse finanziarie. A-RIES si propone dunque come un modello adattivo, in grado di rispondere a queste criticità attraverso un approccio basato sull'analisi multicriterio e sulla gestione flessibile delle risorse (Park & Kang, 2025).*

La struttura del framework si fonda sull'integrazione di tre livelli di determinanti che influenzano le decisioni strategiche: quelle stabili, relative agli aspetti normativi e finanziari; quelle dinamiche, che comprendono le evoluzioni delle politiche pubbliche e le trasformazioni del contesto economico; e quelle funzionali, che includono strumenti operativi e indicatori di performance (Guediri & Bouchemal, 2024). L'interazione tra questi elementi consente di sviluppare strategie di intervento capaci di adattarsi ai contesti territoriali di riferimento, superando la rigidità dei modelli gestionali tradizionali. La possibilità di calibrare le strategie in funzione delle esigenze locali rappresenta un elemento distintivo di A-RIES, che si configura come un sistema di gestione orientato alla sostenibilità e alla valorizzazione equilibrata del patrimonio culturale (Chakraborty & Ji, 2024).

Un aspetto centrale del framework riguarda l'adozione di strumenti di valutazione ex-ante ed ex-post, che permettono di verificare l'efficacia degli interventi nel tempo e di adattare le strategie gestionali sulla base delle nuove esigenze emergenti. Questo meccanismo di monitoraggio continuo consente di superare la frammentarietà delle attuali metodologie di pianificazione, spesso caratterizzate da approcci rigidi e scarsamente adattivi. La capacità di individuare in maniera tempestiva le eventuali criticità e di correggere le strategie in corso d'opera rappresenta un fattore chiave per garantire una gestione più efficiente e sostenibile dei beni culturali (Ruban L., 2024).

Oltre all'aspetto tecnico-operativo, A-RIES introduce un modello di governance che favorisce il coinvolgimento attivo di una pluralità di attori, tra cui istituzioni pubbliche, investitori privati e società civile. L'integrazione di strumenti di co-progettazione consente di superare le barriere che spesso limitano la collaborazione tra i diversi stakeholder, promuovendo una visione condivisa della rigenerazione urbana e della gestione del patrimonio culturale (Imnadze & Vardosanidze, 2024). La partecipazione della comunità locale nei processi decisionali risulta particolarmente rilevante in quanto contribuisce a garantire una maggiore accettabilità sociale degli interventi e a rafforzare il senso di appartenenza al patrimonio culturale.

L'obiettivo principale dello studio è quello di valutare l'efficacia di A-RIES rispetto ai modelli tradizionali attraverso un'analisi teorica e un caso studio applicato. L'indagine si concentra sull'identificazione delle inefficienze gestionali attualmente riscontrabili nel settore della rigenerazione urbana e sulla capacità del framework di risolvere tali problematiche mediante un approccio più integrato e adattivo. L'analisi empirica permette di misurare i benefici derivanti dall'adozione di A-RIES in termini di sostenibilità economica e sociale, efficienza gestionale e maggiore coinvolgimento degli stakeholder.

Attraverso questa prospettiva, lo studio intende offrire un contributo significativo alla letteratura accademica sulla gestione del patrimonio culturale, evidenziando il potenziale di un modello replicabile e scalabile che possa essere

applicato in contesti territoriali diversi. L'adozione del framework non solo garantisce un miglioramento nella pianificazione degli interventi di rigenerazione urbana, ma promuove anche una gestione più consapevole e sostenibile delle risorse, contribuendo alla creazione di ecosistemi urbani più resilienti e inclusivi.

Methodology. *L'approccio metodologico adottato nello studio si basa sull'analisi della struttura del Framework A-RIES, che rappresenta un sistema decisionale avanzato per la gestione del patrimonio culturale. Il modello combina metodologie di ottimizzazione con tecniche di analisi multicriterio al fine di selezionare strategie di rigenerazione urbana e valorizzazione del patrimonio che siano efficienti e sostenibili. La struttura metodologica del framework si articola in quattro fasi principali, ognuna delle quali consente di migliorare la capacità di analisi e di adattamento alle variabili contestuali.*

La prima fase consiste nella definizione e nella raccolta dei parametri fondamentali per la valutazione delle strategie gestionali. In questa fase, vengono classificati i principali fattori che influenzano il processo decisionale, suddivisi in determinanti stabili, dinamiche e funzionali. Vengono inoltre identificati gli indicatori chiave di performance (KPI) e raccolti dati quantitativi e qualitativi provenienti dal contesto di riferimento. Questo passaggio è essenziale per garantire una base di analisi coerente e per strutturare il modello in modo che possa adattarsi alle specificità territoriali e normative. L'affidabilità dei dati raccolti è un aspetto cruciale in questa fase, in quanto le decisioni strategiche devono essere supportate da informazioni aggiornate e rappresentative della realtà operativa.

Successivamente, la metodologia prevede un processo di normalizzazione e ponderazione delle variabili raccolte. Attraverso tecniche matematiche avanzate, viene garantita la comparabilità dei dati, riducendo le distorsioni legate a differenti unità di misura e scale di valutazione. Per attribuire un peso relativo a ciascun fattore, il framework utilizza il metodo Analytic Hierarchy Process (AHP) (Darko et al., 2019), che permette di determinare l'importanza di ciascuna variabile in relazione agli obiettivi strategici della gestione del patrimonio. Questo passaggio consente di strutturare le informazioni in maniera gerarchica, facilitando la successiva fase di valutazione. La metodologia AHP si basa sulla decomposizione del problema decisionale in una struttura gerarchica e sull'assegnazione di pesi ai diversi criteri attraverso un processo di comparazione a coppie, che garantisce una maggiore obiettività nelle scelte strategiche.

Il terzo livello metodologico si concentra sull'analisi multicriterio e sulla selezione delle strategie ottimali. In questa fase, il framework adotta l'Indice di Efficacia Strategica (IES), un parametro che misura la capacità di una strategia di avvicinarsi alla soluzione ideale, calcolato come segue:

$$IES_i \; \frac{d_i^+ - d_i^-}{d_i^+ + d_i^-}$$

Dove d_i^+ rappresenta la distanza della strategia i dalla soluzione ideale positiva e d_i^- indica la distanza dalla soluzione ideale negativa. Il metodo TOPSIS (Technique for Order Preference by Similarity to Ideal Solution) viene utilizzato per ordinare le alternative disponibili in funzione della loro vicinanza alla soluzione ottimale teorica. Questo approccio permette di individuare la strategia più efficace rispetto agli obiettivi prefissati, garantendo al tempo stesso una valutazione comparativa delle diverse opzioni disponibili. L'adozione del metodo TOPSIS si rivela particolarmente efficace nel contesto della gestione del patrimonio culturale, poiché consente di considerare simultaneamente una molteplicità di fattori decisionali e di ottenere un ranking delle alternative basato su un criterio di ottimizzazione globale.

L'IES assume valori compresi tra 0 e 1, dove, un valore vicino a 1 indica una strategia altamente efficace, ovvero una gestione che si avvicina alla soluzione ideale. In questo caso, il modello di gestione del patrimonio culturale risulta ben strutturato, con elevata stabilità normativa, capacità di adattamento alle variabili economiche e strumenti operativi efficienti. Invece, un valore vicino a 0 indica una strategia poco efficace, ovvero una gestione che si avvicina alla soluzione peggiore. In questo caso, il sistema presenta gravi criticità, come instabilità normativa, scarsa sostenibilità finanziaria, bassa capacità di adattamento e mancanza di strumenti di monitoraggio. Pertanto, un valore moderato (tra 0.5 e 0.7) suggerisce che la gestione presenta elementi positivi ma anche criticità da migliorare.

L'ultima fase del modello riguarda la simulazione e l'adattamento delle strategie nel tempo. Il framework prevede un monitoraggio costante delle determinanti dinamiche, come l'evoluzione delle politiche pubbliche, le variazioni normative e le fluttuazioni economiche. L'algoritmo di A-RIES include una funzione di adattamento dinamico che aggiorna i parametri del modello in base ai mutamenti del contesto. Inoltre, viene considerata una funzione specifica di gestione del rischio e delle risorse economiche, formalizzata nella seguente equazione:

$$A - RIES = arg\ arg\ (IES_i * W_a + A(D_t) + F(R))$$

Dove Wa rappresenta il peso delle determinanti stabili, $A(D_t)$ è la funzione di adattamento che tiene conto delle variabili dinamiche e F(R) è la funzione di gestione del rischio e delle risorse economiche.

Questo approccio consente di calibrare le strategie in funzione della disponibilità finanziaria e delle condizioni di mercato, rendendo il modello flessibile e reattivo ai cambiamenti del contesto. L'adattabilità di A-RIES permette di ridurre l'incertezza associata agli investimenti nel settore del patrimonio culturale, garantendo una maggiore efficienza nell'allocazione delle risorse disponibili.

L'interpretazione dei risultati della formula A-RIES assume valori positivi, dove valori elevanti indicano uno scenario ottimale, valutando il modello di gestione del patrimonio culturale come sostenibile e replicabile. Viceversa, se il valore

è prossimo allo zero, il modello indica uno scenario critico, valutando il modello di gestione del patrimonio culturale come fragile, inefficacie e difficilmente replicabile.

Results. *Il caso studio dello Scugnizzo Liberato a Napoli rappresenta un esempio emblematico di riuso adattivo del patrimonio culturale, caratterizzato da un forte coinvolgimento della comunità locale e da un modello di governance innovativo. Situato all'interno di un ex complesso ecclesiastico, il progetto si fonda sulla logica del "commoning" e sul riconoscimento del bene come "bene comune urbano d'uso civico" da parte del Comune di Napoli. Questa configurazione giuridica ha permesso alla comunità locale di assumere un ruolo attivo nella gestione e nella valorizzazione dello spazio, favorendo la sperimentazione di modelli di economia alternativa, la produzione culturale indipendente e forme di mutualismo sociale (Fava F., 2021).*

L'analisi del caso studio è stata condotta attraverso l'applicazione del Framework A-RIES, con l'obiettivo di valutare l'efficacia della strategia adottata in termini di sostenibilità economica, governance partecipativa e capacità di adattamento nel tempo. Il modello ha considerato tre macro-categorie di determinanti: stabili, dinamiche e funzionali. Le determinanti stabili, tra cui il riconoscimento giuridico come bene comune e la governance basata sul Partenariato Pubblico-Privato-Persone (P4), hanno fornito un quadro strutturale solido per la gestione dell'iniziativa. Le determinanti dinamiche, come l'evoluzione normativa e le fluttuazioni economiche, hanno evidenziato la capacità del modello di rispondere ai mutamenti del contesto attraverso strategie di auto-sostenibilità e adattamento delle pratiche gestionali. Le determinanti funzionali, tra cui gli strumenti di monitoraggio e le strategie di pianificazione, hanno consentito di misurare e ottimizzare l'impatto delle attività svolte, migliorando la resilienza complessiva dell'iniziativa.

L'assegnazione dei pesi alle diverse categorie di determinanti è avvenuta attraverso il metodo Analytic Hierarchy Process (AHP), che ha permesso di quantificare l'importanza relativa di ciascun elemento rispetto agli obiettivi generali di sostenibilità e rigenerazione del patrimonio culturale. Il peso attribuito alle determinanti stabili è stato pari a 0.72, sottolineando il ruolo cruciale della governance e della solidità istituzionale nella gestione del bene. Il valore delle determinanti dinamiche è stato fissato a 0.45, riflettendo le difficoltà legate alla capacità del modello di rispondere ai mutamenti normativi ed economici. Infine, il peso delle determinanti funzionali è risultato essere di 0.38, evidenziando la necessità di strumenti più strutturati per la pianificazione e il monitoraggio delle performance gestionali ed economiche.

L'applicazione del Framework A-RIES al caso dello Scugnizzo Liberato ha fornito un valore complessivo dell'A-RIES Unico pari a 1.634[5]. Per assicurare confrontabilità tra casi, il valore dell'ARIES Unico, deve essere espresso su scala normalizzata o mediante un modello aggregato coerente. La formula prevista per l'ARIES Unico combina l'ARIES Totale (efficacia strategica cumulativa), l'IES media (TOPSIS) (efficacia strategica relativa) e le Interazioni dinamiche (adattabilità strategica). Questo risultato indica una performance moderata (secondo il range 0-1 basso, 1-2 moderato, 2-3 alto) con aspetti positivi legati alla governance e al riconoscimento giuridico del bene, ma anche con limiti strutturali relativi alla gestione finanziaria e alla capacità di adattamento dinamico. Le determinanti stabili hanno ottenuto un punteggio di 0.823, confermando la solidità istituzionale del modello e l'importanza della governance partecipativa. Le determinanti dinamiche hanno riportato un valore di 0.591, evidenziando difficoltà nella risposta ai cambiamenti normativi ed economici. Le determinanti funzionali hanno ottenuto il punteggio più basso, pari a 0.523, riflettendo la carenza di strumenti avanzati di gestione e monitoraggio finanziario.

L'analisi della funzione di ottimizzazione A-RIES ha permesso di individuare ulteriori criticità e punti di forza del modello gestionale. La governance si conferma come l'elemento più solido del progetto, con un peso di 0.72. Tuttavia, la capacità di adattamento ai cambiamenti normativi ed economici, rappresentata dal valore della funzione di adattamento dinamico A(Dt), è risultata pari a 0.45, indicando una limitata reattività del modello. Inoltre, il valore della funzione di gestione del rischio e delle risorse economiche F(R) è stato di 0.38, evidenziando la mancanza di una strategia finanziaria strutturata, elemento che potrebbe compromettere la sostenibilità a lungo termine dell'iniziativa.

Un'analisi più approfondita dei dati raccolti ha evidenziato che, sebbene la governance partecipativa costituisca una risorsa fondamentale per la stabilità del modello, la mancanza di un piano economico a lungo termine limita la capacità del progetto di consolidarsi. La dipendenza da risorse volontarie e da meccanismi di autofinanziamento si traduce in un'incertezza operativa che impedisce di sviluppare strategie di investimento e di espansione più strutturate. L'assenza di un sistema di monitoraggio finanziario continuo rende inoltre difficile valutare l'impatto economico delle attività realizzate e individuare soluzioni per ottimizzare la gestione delle risorse disponibili.

Il confronto con modelli di gestione di patrimoni culturali simili ha evidenziato che i progetti di rigenerazione urbana di maggior successo si basano su una diversificazione delle fonti di finanziamento, includendo contributi pubblici, fondi europei e partnership con il settore privato. Lo Scugnizzo Liberato, invece, si affida principalmente a un modello di autogestione con finanziamenti limitati, il che costituisce un rischio significativo per la sostenibilità dell'iniziativa nel lungo periodo.

L'analisi ha inoltre rivelato che la partecipazione attiva della comunità locale ha rappresentato un elemento chiave nella gestione del bene, contribuendo a creare un forte senso di appartenenza e a garantire la continuità delle attività. Tuttavia, la gestione informale delle risorse finanziarie e la mancanza di strumenti di pianificazione avanzati limitano la possibilità di scalabilità del progetto. In questo contesto, l'introduzione di strumenti di gestione più strutturati potrebbe rafforzare la capacità del modello di rispondere in modo più efficace alle sfide economiche e normative future.

[5] Il valore dell'ARIES Unico è calcolato come combinazione delle tre componenti del modello: ARIES Totale, IES media (normalizzata tramite TOPSIS) e Interazioni dinamiche.

L'interpretazione di questi risultati conferma che il modello gestionale dello Scugnizzo Liberato presenta punti di forza significativi in termini di governance e stabilità istituzionale, ma al tempo stesso mette in luce carenze nel sistema di gestione economica e nella capacità di adattamento strategico. Sebbene la governance partecipativa abbia garantito la continuità del progetto, la dipendenza da finanziamenti non strutturati e da contributi volontari rappresenta un fattore di vulnerabilità. La sostenibilità nel lungo periodo potrebbe essere compromessa dall'assenza di un modello finanziario strutturato e dalla mancanza di strumenti di monitoraggio avanzati.

Nel complesso, i risultati ottenuti suggeriscono che il caso dello Scugnizzo Liberato rappresenta un esempio virtuoso di rigenerazione urbana e valorizzazione del patrimonio culturale attraverso un approccio basato sulla partecipazione e sull'innovazione sociale. Tuttavia, affinché il modello possa essere replicato con successo in altri contesti, è necessario rafforzare le componenti finanziarie e istituzionali, garantendo maggiore stabilità alle strategie di gestione e aumentando le capacità di adattamento alle sfide future. L'applicazione del Framework A-RIES ha consentito di individuare punti di forza e criticità del modello, offrendo spunti per il miglioramento delle pratiche di governance e per la definizione di strategie più efficaci di valorizzazione del patrimonio culturale.

Research limitations. *Nonostante i risultati positivi, il modello A-RIES presenta alcune limitazioni che ne condizionano l'applicabilità e la robustezza. La validazione su scala più ampia rimane una sfida, poiché il modello è stato testato su un singolo caso studio, rendendo necessaria un'estensione a contesti geografici e normativi differenti per verificarne la replicabilità e l'adattabilità (European Commission, 2019; UNESCO, 2020). Un altro limite riguarda l'analisi predittiva, che potrebbe essere migliorata mediante l'integrazione di strumenti di machine learning, ottimizzando la valutazione strategica e adattando dinamicamente il modello ai cambiamenti di contesto (Liu et al., 2023; Paiola, 2018). Inoltre, l'applicazione di A-RIES in territori con governance meno strutturata potrebbe incontrare ostacoli legati alla carenza di dati affidabili, alla limitata capacità amministrativa e alla difficoltà di coinvolgimento degli stakeholder privati, richiedendo un adattamento del framework a sistemi decisionali semplificati (Smith, 2020). Infine, un aspetto critico riguarda la soggettività nella definizione dei pesi e delle ponderazioni nei metodi multicriteriali AHP e TOPSIS, che potrebbe introdurre bias nelle decisioni. Per mitigare questo problema, si suggerisce l'impiego di tecniche come l'Entropy Weighting Method, la fuzzy logic e l'analisi di sensitività, al fine di migliorare l'oggettività e l'affidabilità del modello (Saaty, 2008; Shannon, 1948; Saltelli et al., 2008). Questi sviluppi potrebbero rafforzare la capacità del modello di supportare decisioni più robuste e adattabili a contesti complessi.*

Managerial implications. *L'implementazione del modello A-RIES introduce un approccio gestionale innovativo per la rigenerazione del patrimonio culturale, superando le rigidità dei modelli tradizionali grazie a un framework adattivo e basato su dati. Questo sistema consente di ottimizzare l'allocazione delle risorse pubbliche, migliorare la trasparenza decisionale e facilitare l'accesso ai finanziamenti europei, favorendo una governance più efficace e partecipativa (Girard, 2020; Fusco Girard, 2021). Per il settore privato, A-RIES riduce l'incertezza sugli investimenti attraverso modelli predittivi, identificando opportunità di business e incentivando partenariati pubblico-privati, con ricadute positive in termini di corporate social responsibility e valorizzazione economica dei progetti di rigenerazione (Paiola, 2018; Moliterni, 2019). Le comunità locali traggono vantaggio dall'integrazione di processi di co-design e co-gestione, favorendo l'inclusione sociale e la sostenibilità economica degli interventi, mentre l'adozione di metriche per il capitale sociale consente di valutare gli impatti sul benessere collettivo (Ostrom, 1990; UNESCO, 2020). Inoltre, il modello incorpora strategie di economia circolare (Gianfrate et al., 2020, Fusco Girard, L., 2021), riducendo l'impronta ecologica dei progetti e promuovendo il riuso adattivo del patrimonio esistente, con effetti positivi sia dal punto di vista ambientale che economico (Fusco Girard, 2021). A-RIES rappresenta dunque un sistema integrato per la gestione del patrimonio culturale, in grado di coniugare efficienza operativa, sostenibilità finanziaria e ambientale, innovazione gestionale e valorizzazione sociale.*

Originality of the paper. *Il modello A-RIES (Adaptive Regeneration Index for Effective Strategies) introduce un framework decisionale dinamico, adattivo e multidimensionale per la rigenerazione del patrimonio culturale, superando le rigidità dei modelli tradizionali. La sua innovazione risiede nell'integrazione di un approccio multicriteriale quantitativo (AHP-TOPSIS) con una governance adattiva, consentendo l'aggiornamento continuo delle strategie sulla base di dati dinamici e scenari previsionali (Saaty, 2008; Fusco Girard, 2021; Liu et al., 2023). L'applicazione combinata di AHP per la ponderazione dei criteri e di TOPSIS per l'ottimizzazione delle strategie riduce la soggettività decisionale, offrendo un supporto strutturato ai processi di rigenerazione (Hwang & Yoon, 1981; Ostrom, 1990).Elemento distintivo del modello è il coinvolgimento attivo degli stakeholder attraverso un paradigma di governance partecipativa, che integra comunità locali, enti pubblici e investitori privati nel processo decisionale. L'adozione di piattaforme di open governance, meccanismi di co-progettazione e strumenti di monitoraggio degli impatti sociali migliora l'accettabilità e la sostenibilità delle strategie di rigenerazione (Kohtamäki et al., 2019; Imperiale, 2022).A-RIES innova inoltre la gestione del patrimonio culturale applicando i principi dell'economia circolare, promuovendo il riuso adattivo degli edifici storici, modelli di finanziamento sostenibili basati su partenariati pubblico-privati e l'integrazione di materiali eco-compatibili nella progettazione (Girard, 2020; Moliterni, 2019; European Commission, 2019). Questa prospettiva supera la dicotomia tra conservazione e valorizzazione, delineando un approccio resiliente e sostenibile alla rigenerazione del patrimonio.*

Key words: *Rigenerazione urbana, patrimonio culturale, AHP-TOPSIS, governance partecipativa, economia circolare, sostenibilità.*

Tertiarization & Sustainability. New challenges for management in the Digital Era

Can digitalization foster Social Inclusion? Evidences from Italy and Switzerland

FEDERICO MERTOLI[1] CARMELA ELITA SCHILLACI[2] JOSÉ MANUEL ALONSO[3]

Abstract

The study examines the impact of digitalization on social inclusion, focusing on Italy's significant investment in digital transformation under the Next Generation EU program. Using a Difference-in-Differences approach with treatment intensity, we compare Italian regions with high digital investments to Swiss regions that have not implemented similar policies. The results show that digitalization reduces the rate of people "At Risk of Poverty or Social Exclusion", "People in Households with Very Low Labor Market Participation", and "Unemployment". Adopting Amartya Sen's Capability Approach, this paper analyzes the conditions necessary to maximize the effectiveness of these investments in promoting social inclusion.

Framing of the research. *In recent years, governments and international organizations have increasingly embraced digital transformation, integrating digital technologies into public administration to enhance efficiency, accessibility, and citizen engagement (Mora et al., 2021; Padeiro et al., 2021; Stolterman & Fors, 2004). This shift aims not only to modernize public services by making them more transparent and user-centric but also to streamline administrative procedures and optimize resource management (Adjei-Bamfo et al., 2019; De Boer, 2021; Faulkner et al., 2019; Ramaprasad et al., 2017).*

Recognizing the strategic importance of digitalization, the European Union has placed it at the core of its Next Generation EU program, a 750 billion euro recovery plan designed to support economic and social resilience. As part of this initiative, each member state was required to allocate at least 20% of its national recovery and resilience plan (NRRP) to digital transformation (European Commission, 2021). Italy has played a leading role in this effort, committing over 48 billion euros, the highest investment among EU countries, to modernizing its digital infrastructure and public services. While these investments are expected to improve governance and economic performance, their ability to reduce social exclusion remains a critical and underexplored issue.

Social exclusion, broadly defined as the condition in which individuals or groups face barriers that limit their full participation in economic, social, and civic life (Rawal, 2008), is a persistent challenge that digitalization is often seen as a tool to address. However, simply introducing digital tools does not automatically foster inclusion, what matters is whether individuals can effectively use them to enhance their lives. To understand this dynamic, this study adopts Amartya Sen's Capability Approach (1999), which shifts the focus from the mere availability of resources to an individual's ability to transform them into meaningful opportunities. From this perspective, digitalization is not just about expanding technological access; rather, it is a means to empower individuals by removing structural barriers and enabling them to participate more fully in society (Hildebrand et al., 2019; Sen, 1999).

Through this lens, digitalization can promote social inclusion in multiple ways. First, it improves access to essential services, particularly for marginalized communities. E-government platforms simplify bureaucratic procedures, ensuring that citizens, especially those in remote areas or with mobility limitations, can interact with public institutions more efficiently and access critical services such as tax administration, social benefits, and legal documentation without facing physical or bureaucratic obstacles (Houwen, 2011; Jacobson, 2016; Toboso, 2011). Similarly, telemedicine and digital healthcare solutions help bridge health disparities by offering remote medical consultations, making healthcare more accessible for those who might otherwise be excluded due to distance or economic constraints (Nikou et al., 2020).

Beyond improving service access, digitalization also fosters economic inclusion by enabling participation in the labor market. The rise of remote work, digital job platforms, and online training programs reduces dependency on physical proximity to employment opportunities, allowing individuals in disadvantaged areas or with mobility constraints to integrate into the workforce more effectively (Andersson et al., 2022; Morte-Nadal & Esteban-Navarro, 2022). Additionally, digital platforms facilitate lifelong learning and upskilling, helping individuals enhance their employability and adapt to an evolving labor market (Toboso, 2011).

At the societal level, digital tools enhance civic engagement and institutional trust by increasing transparency and participatory governance. Open government initiatives and online engagement platforms provide citizens with greater access to information and decision-making processes, strengthening democratic participation, particularly among marginalized groups (Marsman, 2022; Gandini & Gandini, 2016). The availability of digital tools such as Voting Advice Applications (VAA) and participatory budgeting platforms fosters a sense of political inclusion, ensuring that diverse voices are heard in public discourse (Dobija et al., 2023; Fleischer & Carstens, 2022).

However, while digitalization has the potential to promote inclusion, its effects are not universally positive. Several studies highlight that it can, in some cases, exacerbate existing inequalities if certain groups, such as low-income individuals, the elderly, or those with limited digital literacy, lack the necessary skills or resources to navigate digital platforms (Adamczyk & Betlej, 2021; Buchert et al., 2023; Schou & Pors, 2018). Furthermore, the increasing reliance on algorithmic decision-making raises concerns about involuntary discrimination, as biases in automated systems may disproportionately disadvantage individuals from lower socio-economic backgrounds (Kwiliński et al., 2020; Ranchordás, 2022). These contrasting perspectives suggest that while digitalization holds promise as an inclusion-enhancing tool, its effectiveness depends on how it is implemented and whether complementary policies address existing digital divides.

This study seeks to clarify this debate by providing empirical evidence on the relationship between digitalization and social inclusion. By comparing Italian regions that have significantly invested in digitalization with Swiss regions that have not implemented similar policies, this research applies a Difference-in-Differences (DiD) approach with treatment intensity to assess how digital investments impact key exclusion indicators. By integrating the Capability Approach into this framework, this study also aims to provide a conceptual contribution by identifying the conditions needed to maximize the impact of digital investments in reducing social exclusion.

Purpose of the paper. *This study aims to assess whether and to what extent digitalization can reduce social exclusion by expanding individuals' capabilities and improving their access to essential services, economic opportunities, and civic participation. By examining the role of digital transformation in fostering inclusion, this research seeks to identify the key conditions under which digital policies can effectively bridge social inequalities and contribute to a more equitable society.*

To this end, the study tests the following research hypothesis:

***RH:** The digitalization of public services reduces social exclusion.*

Methodology. *To examine whether digitalization policy is related to a reduction in social exclusion, we compare levels of social inclusion in Italy and Switzerland, adopting the Difference-in-Differences (DiD) methodological approach. This method is widely used in social sciences for causal inference and evaluation of public policies (Fredriksson and Oliveira, 2019; Furquim et al., 2019). It allows to compare changes over time between a treatment group and a control group, attributing the observed "differences in differences" to the effect of the implemented policy (Stuart et al., 2014).*

Italy, being the European country with the highest investment in digitalization policies, represents a case of "natural experiment". To estimate the causal effects of this intervention, the Italian areas will be considered as the "treatment group", while the Swiss ones, where similar policies have not been implemented, will serve as the "control group", setting 2021 as the treatment year, i.e. the year in which the investments were made. To ensure maximum comparability between the two countries, the analysis is conducted at the regional level. For Italy, only the northern regions are included in the analysis (rather than the entire country), since they share similar demographic and socioeconomic characteristics to the Swiss ones, which are considered as a whole. This approach increases the precision of our estimates of the effects of digitalization policies.

Furthermore, to deepen the analysis, we take into account the intensity of investments in the different Italian regions. Indeed, as highlighted by the report of the Agency for Digital Italy (AGID), investment levels vary significantly across the country, which in turn affects the effectiveness of digitalization initiatives. Therefore, we extend the DiD model to incorporate treatment intensity and change the perspective from a simple binary approach to one that also considers continuous treatments or variable levels of exposure (Callaway et al., 2021). This adaptation allows for a more careful comparison of effects between groups with different levels of exposure, enriching the causal framework (Callaway et al., 2021; Hersche & Moor, 2020; Yanagi, 2022). It then becomes possible not only to measure the average effect of digitalization on social inclusion, but also to estimate its incremental effect at higher levels of investment. The developed methodology is therefore able to determine whether higher investments lead to higher benefits, ensuring a comprehensive view of the intensive impacts of digitalization on social inclusion.

The model structure is defined as follows:

$$y_{it} = \alpha_{it} + \delta_t + \beta\,(TI_{it} * d_t) + \varepsilon_{it}$$

The dependent variable "y_{it}" represents the outcome of social exclusion, given region "i" and year "t". The model also includes a regional fixed effect "α_{it}" that captures stable and unobservable characteristics relevant to each region (such as pre-existing structural differences) that may influence levels of social inclusion independently of digital

investment. We consider a temporal fixed effect "δ_t" to account for year-specific variation and to capture phenomena common to all regions, such as national economic or political fluctuations, that may influence social inclusion independently of digital investments.

The coefficient "β" measures the effect of treatment intensity in the post-intervention period and describes how social inclusion changes for each additional unit of investment per capita.

Treatment intensity ("TI_{it}") instead represents the level of digital investment in region "i" in year "t", while the variable "d_t" is equal to 1 in the years following the implementation of the digitalization funds (after 2021) and 0 for the previous years, thus distinguishing the effects observed before and after the start of the treatment. Finally, the error term "ε_{it}" captures all the random factors that influence the outcome but are not explicitly included in the model, varying across regions and years and capturing the unexplained part of the variability.

To assess the levels of social exclusion, we selected three key indicators identified in the literature, capable of capturing different dimensions of the phenomenon and providing an overall view of socio-economic conditions (Atkinson et al., 2002; Giambona & Vassallo, 2014). The data used are public and provided by Eurostat and Ardeco, and they have been summarized in Tab.1.

The first indicator is "At risk of poverty or social exclusion (AROPE)", which combines monetary poverty, material deprivation and low participation in the labor market (Atkinson & Marlier, 2010). This data offers a broad and integrated perspective, useful for understanding economic difficulties and barriers to inclusion, helping to measure the overall level.

The second indicator is the "Percentage of people in households with very low labor market participation", which measures the percentage of individuals belonging to households with reduced work activity. Such families, according to the literature, are particularly vulnerable to social exclusion (Ward & Özdemir, 2013).

Finally, we consider the "Unemployment rate for the population aged 15 to 74", a central variable to measure social inclusion, since the lack of work often promotes social isolation and marginalization (Gallie, 1999).

Tab. 1: Descriptive statistics for Social Exclusion

	Switzerland			Norh of Italy		
	Obs.	Mean	S.D.	Obs.	Mean	S.D.
Social exclusion indicators						
At Risk of Poverty or Social Exclusion	63	19.34	5.83	81	14.85	3.90
People in Households with Very Low Labor Market Participation	63	5.69	2.1	81	5.43	2.21
Unemployment	63	4.76	1.60	81	6.19	1.88

Source: our elaboration

Results. *The results of our DiD analyses are presented in Tab. 2, which reports estimates for three key indicators of social exclusion. Overall, the results suggest that regions that have undertaken digitalization policies have experienced a reduction in social esclusion outcomes compared to untreated regions. Starting with the effect of digitalization on "At Risk of Poverty or Social Exclusion", the DiD estimates indicate that digitalization policies are associated with a reduction in the share of individuals at risk of poverty or social exclusion by approximately 1.624 (95% CI [-3.113, -0.1345]). This result is statistically significant, supporting the hypothesis that digitalization investments contribute to a decline in social exclusion.*

When examining labor market participation, the results indicate a possible reduction in the share of people in households with very low labor market participation, with an estimated coefficient of -0.324 (95% CI [-1.686, 1.039])

Turning to the impact on unemployment, the results show a significant association between digitalization investments and lower unemployment rates. The estimated coefficient for unemployment is -1.328 (95% CI [-1.675, -0.980]), and the effect is statistically significant.

Tab. 2: Difference-in-differences estimates

	Social Exclusion		
	At Risk of Poverty or Social Exclusion	**People in Households with Very Low Labor Market Participation**	**Unemployment**
D estimate	-1.624	-.324	-1.328
	[-3.113, -.134]	[-1.686, 1.039]	[-1.675, -.980]

Time effects	Yes	Yes	Yes

Source: our elaboration

Tab. 3 presents estimates based on treatment intensity, further confirming that higher levels of digitalization investments are associated with reductions in social exclusion indicators. The effect of digitalization intensity on the risk

of poverty or social exclusion is estimated at -0.086 (95% CI [-0.162, -0.0106]), with statistical significance, suggesting that the extent of digitalization investment plays a meaningful role in reducing social exclusion.

For labor market participation, the estimated coefficient is -0.017 (95% CI [-0.093, 0.059]).

The estimates for unemployment show a consistent and significant effect of digitalization intensity. The coefficient is -0.071 (95% CI [-0.087, -0.054]), and the effect is statistically significant, providing further evidence that digitalization contributes to reducing unemployment.

Tab. 3: Treatment intensity estimates

	Social Exclusion		
	At Risk of Poverty or Social Exclusion	**People in Households with Very Low Labor Market Participation**	**Unemployment**
Treatment intensity	-.086	-.017	-.071
	[-.162, -.011]	[-.093, .059]	[-.087, -.054]

Unit effects	Yes	Yes	Yes
Time effects	Yes	Yes	Yes

Source: our elaboration

All models include unit and time fixed effects, allowing us to control for time-invariant and region-specific characteristics.

Research limitations. *This study presents some limitations that should be acknowledged. First, the reference period of the analysis may be relatively short, potentially limiting the ability to capture the long-term effects of digitalization policies on social inclusion. Digital transformation is a complex process that unfolds over time, and its full impact may only become evident in the longer run. Second, the study relies exclusively on quantitative indicators, which, while providing robust empirical evidence, may overlook qualitative aspects that could offer a deeper understanding of the mechanisms driving digital inclusion. Future research could address these limitations by extending the observation period and integrating qualitative methods, such as interviews or case studies, to complement the quantitative findings and provide richer insights for shaping more effective public policies.*

Managerial implications. *The findings of this study contribute to the growing body of literature examining the relationship between the digitalization of public services and social inclusion. In particular, the results provide empirical evidence that Italian regions with higher investments in digital technologies have experienced a reduction in social exclusion. However, the effectiveness of these investments depends on how they are allocated, as digital transformation alone is not sufficient to promote inclusion.*

According to Amartya Sen's Capability Approach (1999), access to digital technologies must be accompanied by the necessary tools and skills to enable individuals to fully exploit their potential. Without this support, digitalization risks reinforcing existing inequalities and widening the digital divide rather than reducing it. In this regard, Thijssen and Van Dooren (2016) highlight that certain digital platforms tend to favor younger populations, unintentionally creating barriers for older individuals and thereby exacerbating generational disparities. To address these challenges, policymakers should prioritize investments in digital literacy programs for vulnerable groups and in ICT infrastructures that ensure equitable access to digital services (Okunola et al., 2017; Petrović et al., 2012).

Moreover, consistent with the theoretical framework adopted in this study, Berg et al. (2020) emphasize that citizens' engagement with digital processes is not solely dependent on technology availability but also requires effective communication and inclusive strategies. In regions characterized by low digital literacy, users may prefer traditional service delivery channels, making a multi-channel approach essential. For instance, combining mobile platforms, websites, and physical access points can facilitate a smoother digital transition and prevent exclusion (Rodriguez Müller et al., 2021; Sharma and Mishra, 2017). Consequently, regions with lower levels of digital skills could benefit from hybrid solutions that integrate both digital and offline services.

Beyond access and usability, for digitalization to have a meaningful impact on social inclusion, individuals must be able to translate digital technologies into tangible economic and social benefits (Colding et al., 2024; Bose, 2016). This highlights the importance of an enabling environment where digital tools can be effectively leveraged. Such an environment requires robust technological infrastructure, widespread digital literacy, and inclusive service design to ensure that digital transformation fosters an equitable and inclusive society (Britz et al., 2013; Hillerbrand et al., 2019).

Originality of the paper. *This study provides a novel contribution to the literature by adopting a Difference-in-Differences methodology with treatment intensity, an approach that enhances the ability to establish causal relationships between digitalization investments and social inclusion. While previous studies have explored the impact of digital transformation on social outcomes, most have relied on descriptive or cross-sectional analyses, limiting their explanatory power. By integrating treatment intensity, this study moves beyond the traditional binary distinction between digitalized and non-digitalized regions, offering a more precise understanding of how varying levels of investment influence social exclusion.*

From a theoretical standpoint, this study also advances the discussion by applying Amartya Sen's Capability Approach (1999) to digitalization policies. The analyses suggest that while digital access is a necessary condition for

inclusion, it must be accompanied by enabling factors such as digital literacy programs, inclusive service design, and targeted policies to prevent the exacerbation of social inequalities.

By addressing these gaps, this study contributes both methodologically and conceptually to the academic debate on the social impact of digitalization strategies.

Keywords: *Digitalization, Social Inclusion, Difference-in-Differences, Public Services, EU Next Generation.*

Declaration: This is a work-in-progress.

"A Systematic Literature Review on The Impact of AI, Innovation, and Digitalisation on Airport Passenger Experience"

CARLO RICCARDO RAGGI[1]

Abstract

This study examines how AI, digitalisation, and innovation are transforming the passenger experience in airports. The paper conducts a systematic review of 32 academic articles to identify key technological developments, such as biometric check-ins, AI-enabled services, and IoT applications, that are reshaping the airport customer journey. These innovations aim to improve efficiency, reduce wait times, and enhance personalization. However, their adoption also presents challenges, including data privacy concerns, cybersecurity risks, and regulatory inconsistencies. The findings are organised into thematic areas-biometric technology, AI-driven personalisation, touchless travel, baggage handling, data-driven flow management, and sustainability-to provide a structured understanding of current trends and barriers. The paper offers insights for practitioners and policymakers seeking to enhance passenger experience through effective and ethically responsible digital transformation.

Framing of the research. *The airport industry is experiencing a profound transformation, largely driven by the rise of digital technologies, Artificial Intelligence (AI), and an urgent need to improve operational efficiency and passenger satisfaction. This shift comes at a time when global air travel demand is rapidly expanding, passenger traffic is expected to exceed 10 billion by 2050 (Statista), and travellers are increasingly expecting smooth, personalized, and safe journeys. This evolution isn't new. As early as 2004, scholars like Buhalis anticipated that technological innovation would become a central force in the success of future airport ecosystems. Since then, advances in AI, data analytics, biometric systems, and the Internet of Things (IoT) have begun to reshape how airports operate-both behind the scenes and at passenger-facing touchpoints (Jiang et al., 2023; Halpern et al., 2021). Today, AI supports predictive analytics and personalization, helping airports anticipate passenger needs and deliver targeted services. Digitalisation enables real-time information flow, from mobile wayfinding tools to automated check-ins, while biometric technologies accelerate security and boarding processes. These changes not only improve efficiency and reduce wait times and congestion (Heracleous & Wirtz, 2006), but also contribute to creating more seamless and emotionally satisfying experiences (Chen et al., 2015; Holz et al., 2023). At the same time, these technologies introduce new tensions and challenges. Concerns about data privacy, algorithmic bias, cybersecurity vulnerabilities, and digital exclusion continue to surface, particularly as personal data becomes more integral to airport operations (Morosan, 2012; Milbredt et al., 2022; Mwesiumo et al., 2023). Moreover, not all travellers are equally comfortable with automation-many prefer human interaction, especially those who are less tech-savvy or who face accessibility barriers (Petrie et al., 2014; Castro et al., 2010). For airport operators, the stakes are high. Embracing innovation is no longer optional, it's a competitive necessity. Beyond improving the flow of passengers, these technologies enable airports to strengthen their non-aeronautical revenue streams, support environmental goals, and differentiate themselves in a fast-changing market (Pereira et al., 2021; Weisser, 2024). But to fully unlock these benefits, airports must take a strategic and ethically grounded approach to digital transformation. In this context, the present study seeks to understand how AI, innovation, and digitalisation are shaping the modern airport passenger experience. Drawing on a systematic literature review of recent academic research, the paper identifies key technologies and application areas, while highlighting both the benefits and the critical challenges associated with their implementation.*

Purpose of the paper. *This paper investigates the transformative role of Artificial Intelligence (AI), digitalisation, and innovation in shaping the airport passenger experience. Through a systematic review of 32 peer-reviewed academic articles, the study explores how these technologies are being implemented across various stages of the passenger journey-from check-in and security to baggage handling and boarding.*

The goal is to map the key trends, applications, and implications of these innovations on operational efficiency, service quality, emotional engagement, and passenger satisfaction. In particular, the study highlights how biometric systems, IoT infrastructures, AI-powered personalization, and touchless solutions contribute to streamlining airport processes and enhancing comfort and safety. Beyond identifying functional benefits, the paper also explores ethical, regulatory, and experiential challenges-such as data privacy concerns, cybersecurity vulnerabilities, and digital exclusion-which may hinder successful adoption. Special attention is given to the post-pandemic context, where hygiene, speed, and personalization have become central to traveller expectations.

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

By offering a structured synthesis of current knowledge, the paper supports airport operators, technology providers, and policymakers in making informed, inclusive, and future-oriented decisions about digital transformation in aviation

Methodology. *The study is based on a Systematic literature review, guided by defined criteria for the inclusion of relevant research materials. These criteria include considerations such as language, topical relevance, keyword alignment, and the overall quality and substantive content of the materials used. To begin the literature search, the Scopus.com server was accessed in December 2024. To delineate the scope of the field investigation, keywords closely related to the central theme of the research were used. The search string adopted was: ("Innovation" OR "Artificial intelligence" OR "AI" or "Digital*") AND ("Aviation" OR "Air Transport" OR "Air Transportation" OR "Airport" OR "Airport operation*" OR "Airport marketing") AND ("Passenger Experience" OR "Customer Satisfaction" OR "Service Quality" OR "Safety" OR "Security" OR "Operational Efficiency" OR "Touchpoint" OR "Customer experience" OR "Customer").*

The use of the logical operator "AND" between two keywords mandated the presence of both terms in each retrieved item, while the use of "OR" indicated that either one or both keywords would feature in the retrieved articles.

The criteria of the results were selecting scientific contributions in English, given the prevalence of English-language publications in the field. Furthermore, the search was delimited to the disciplinary domains of "Business, Management and Accounting" and "Economics, Econometrics and Finance" to ensure relevance and coherence with the research focus. The initial search on Scopus returned 327 results. After applying disciplinary filters, 185 articles remained. Among these, only articles published in top-tier academic journals, specifically those listed as "ANVUR Classe A", or highly relevant niche journals in the aviation and digital innovation domains, were considered for further analysis. A careful reading of titles, abstracts, and keywords led to a selection of 77 articles relevant to the research scope. These were then read in full and, 45 were excluded due to insufficient alignment with the study's focus, resulting in a final selection of 32 articles closely related to the research topic.

In line with best practices for systematic reviews, the selection process was conducted following the PRISMA 2020 guidelines (Page et al., 2021). This approach ensured a clear and replicable methodology, articulated across four phases: identification of records, screening based on titles and abstracts, eligibility through full-text assessment, and final inclusion of relevant contributions.

- *Identification: 327 records were retrieved from Scopus.*
- *Screening: After applying disciplinary filters, 185 records remained. Of these, 108 were excluded after reviewing titles, keywords, and abstracts.*
- *Eligibility: 77 full-text articles were assessed for eligibility. 45 were excluded due to limited relevance to the research question.*
- *Inclusion: 32 peer-reviewed articles were selected for the final analysis.*

PRISMA Flow Diagram

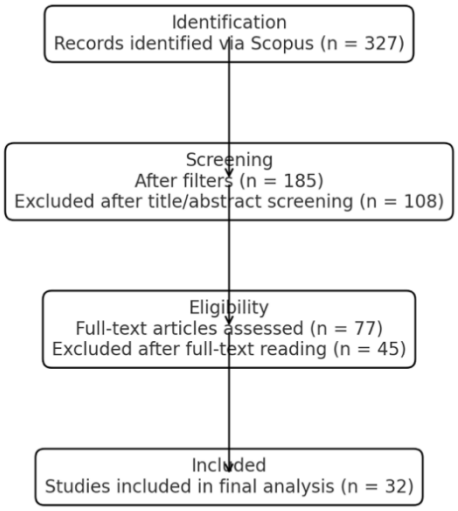

Figure 1 PRISMA Flow Diagram illustrating the selection process of academic articles included in the systematic literature review. From an initial set of 327 records retrieved from Scopus, a final sample of 32 peer-reviewed studies was selected following screening and eligibility assessment.

Results. *The integration of Artificial Intelligence (AI), innovation, and digitalisation has profoundly transformed the passenger experience in the aviation industry. These technologies have not only streamlined operational processes but also enhanced the overall journey for passengers, making it faster, safer, and more personalized (Birkebak M. & Kipp D., 2020). This section synthesises findings from 32 articles to explore how AI, innovation, and digitalisation impact passenger experience across various stages of the journey. Interestingly, the reviewed studies were predominantly*

conducted in the U.S.A., Germany, and the U.K. and a steady growth in publications over the past decade, peaking in 2024, reflects the increasing academic attention to this emerging topic. The results are organised into thematic clusters, each addressing a specific dimension of the passenger experience, from check-in and security to baggage handling and sustainability. By examining these themes, this section highlights the transformative potential of these technologies while addressing the challenges that must be overcome to ensure their successful adoption.

Biometric Technology: Streamlining the Passenger Journey

Biometric technology has emerged as a cornerstone of modern airport management, significantly enhancing the efficiency (Miyamoto, 2023) and security of passenger processing. Studies consistently highlight that biometric systems, such as facial recognition, voice recognition, and fingerprint scanning, reduce wait times and streamline check-in, security, and boarding processes (Negri et al., 2019; Cornacchia et al., 2020). For instance, Negri et al. (2019) found that 82.94% of passengers expressed willingness to adopt biometric check-in systems, citing time efficiency and ease of use as key drivers of acceptance. Similarly, Cornacchia et al. (2020) demonstrated that voice biometrics at Milano Linate Airport were well-received, with passengers appreciating the system's ability to prevent unauthorised access while maintaining operational efficiency. However, the adoption of biometric technology is not without challenges. Privacy concerns remain a significant barrier, as passengers worry about how their biometric data is stored and used (Morosan, 2012; Duman, 2019). Morosan (2012) found that while perceived usefulness and security were strong predictors of adoption, privacy concerns and legal uncertainties around data ownership hindered widespread acceptance. Duman's (2019) experiment at Helsinki Airport further highlighted this tension, revealing that while passengers rated the ease of use of facial recognition technology highly (4.75/5), safety ratings for data submission were lower (4.1/5). These findings underscore the importance of transparent data handling policies and clear communication to build passenger trust. The integration of biometric technology also raises questions about the balance between automation and human interaction. Duman (2019) emphasised the value of a "machine + human" approach, where technology enhances rather than replaces human interaction. This approach not only improves efficiency but also ensures that passengers feel comfortable and supported throughout their journey. For instance, staff at Helsinki Airport reported that the system was "easy to use, fast, and reliable," suggesting that human oversight can mitigate potential issues and enhance the overall passenger experience.

AI-Driven Personalisation: Enhancing Emotional Engagement

AI has transformed customer service in airports by providing personalised and efficient solutions that cater to individual passenger needs. AI-powered tools, such as chatbots, virtual assistants, and personalised recommendation systems, have become integral to the modern passenger experience. Ku (2024) examined the role of AI services in enhancing customer service competencies, finding that passengers who perceived AI services as warm, empathetic, and friendly were more likely to feel emotionally connected to the service. Holz (2023) similarly found that emotionally intelligent AI interactions had a measurable impact on passenger satisfaction, particularly in stressful contexts such a flight delays or missed connections. His study emphasized that even small cues of empathy and warmth in AI interfaces could strengthen trust and engagement. This emotional connection directly influenced their satisfaction and willingness to continue using AI services. Zaoui et al. (2024) highlighted the use of AI chatbots and virtual assistants in providing real-time information and personalised recommendations. These tools reduce passenger stress by offering timely updates and tailored services, such as gate changes or dining options. For example, AI-driven systems can analyse a passenger's travel history and preferences to suggest relevant retail or dining options, enhancing the overall travel experience (Gould, 2019). The study also noted that AI-driven personalisation enhances passenger loyalty by creating a more engaging and satisfying journey. Moreover, AI-powered systems can predict passenger needs and proactively address potential issues understanding passenger emotional behaviour (Hinterholzer & Garcia-Alonso, 2018). For instance, AI can analyse flight data to anticipate delays and automatically rebook passengers on alternative flights, reducing stress and inconvenience. This proactive approach not only improves operational efficiency but also enhances passenger satisfaction by demonstrating a commitment to customer care. Inversini (2017) explored the role of mobile devices in shaping the passenger experience, noting that passengers rely heavily on digital tools for tasks such as checking travel documents, luggage requirements, and transportation arrangements. AI-powered mobile apps can provide personalised recommendations and real-time updates, further enhancing the passenger experience.

Digitalisation and Touchless Travel: Restoring Confidence in the Post-Pandemic Era

The COVID-19 pandemic accelerated the adoption of touchless technologies, which have since become a cornerstone of the passenger experience. IoT-enabled touchless processes, such as contactless check-in, boarding, and health monitoring, have restored passenger confidence by reducing physical contact and enhancing hygiene. Chand et al. (2024) identified these technologies as critical for rebuilding trust in air travel, particularly in the post-pandemic era. Touchless interactions have become an expected standard in the modern travel experience, and airports that fail to adopt these technologies risk losing customer confidence. Weisser (2024) reinforced this by showing that while touchless technologies significantly improved passenger's perceptions of hygiene and convenience, many travellers were unsure how their personal data, particularly health related, was being handled. This highlights the importance of clearly communicating privacy protocols to maintain trust in digital systems. Macnaughton (2022) highlighted the role of indoor air quality (IAQ) monitoring in restoring passenger confidence. A survey revealed that 67% of respondents would feel safer in airports with visible IAQ monitoring. This technology not only addresses health concerns but also enhances the overall passenger experience by creating a more comfortable and reassuring environment. Additionally, smart glass technology

was found to improve passenger comfort by regulating temperature and reducing glare, contributing to a healthier and more pleasant travel environment. The shift towards touchless travel has also driven innovations in passenger flow management. For example, automated boarding gates and self-service kiosks reduce the need for physical interaction with staff, allowing passengers to complete processes independently and efficiently. These technologies not only enhance safety but also improve the overall travel experience by reducing wait times and streamlining processes. Yildiz, Aydemir, and Kurnaz (2024) detailed the comprehensive deployment of IoT at Istanbul Airport, where 107 LoRaWAN IoT gateways were installed to monitor energy usage, water management, and operational processes. This IoT infrastructure enabled real-time data collection and analysis, improving operational efficiency and passenger services; IoT sensors monitored the status of 18,000 passenger outlets and 62 electric buggies, ensuring that amenities were functional and available, directly contributing to passenger satisfaction.

Innovations in Baggage Handling: Reducing Stress and Improving Efficiency

Baggage handling is a critical aspect of the passenger experience, and innovations in this area have significantly improved satisfaction. Singh (2023) found that technologies like RFID and GPS-enabled bag tags reduce mishandled luggage and improve tracking accuracy. Automated baggage systems, such as cross-belt sortation systems, minimise delays and operational disruptions, ensuring a smoother passenger journey. The COVID-19 pandemic exacerbated challenges in baggage handling due to manpower shortages, emphasising the need for automation and contactless processes. Automated systems not only enhance efficiency but also reduce passenger stress by ensuring timely and accurate baggage delivery. For example, RFID-enabled bag tags allow passengers to track their luggage in real-time, providing peace of mind and reducing anxiety about lost or delayed bags. Rauch and Hen (2024) highlighted the implementation of ApronAI at Ljubljana Airport, an AI-powered system that monitors aircraft turnaround processes in real-time. This system proactively identifies delays and inefficiencies, enabling immediate intervention to reduce ground delays. The study noted that ApronAI's predictive algorithms demonstrated high accuracy, contributing to long-term operational improvements and sustainability goals by reducing fuel consumption and CO_2 emissions.

Data-Driven Passenger Flow: Optimising the Journey

Big data and AI have transformed passenger flow management by enabling predictive analytics and real-time decision-making (Ørsted, 2019). Malik (2023) detailed how Phoenix Sky Harbor International Airport used data from 57 systems to optimise passenger flow and capacity management. By creating detailed passenger arrival profiles, the airport could predict congestion and proactively manage terminal spaces, reducing bottlenecks and wait times. Similarly, Papagiannopoulos (2018) demonstrated how advanced data analytics could be used not only to predict congestion but also to segment passengers by behaviour and service need. This allowed for more adaptive crowd control and better alignment of staffing with actual passenger demands. Zaoui et al. (2024) highlighted the use of machine learning models to forecast passenger behaviour and optimise resource allocation. Such predictive tools allow for proactive resource allocation, ensuring a smoother and more efficient journey. For example, AI can analyse historical data to predict peak travel times and allocate staff and resources, accordingly, reducing delays and improving the overall travel experience. Poulsen, Motaghiani, and Kolind (2022) provided a case study of Copenhagen Airport's transition to a data-driven IT platform, which enabled real-time data capture and analysis. This platform improved decision-making for flight operations and resource allocation, enhancing the passenger journey through personalised services and sustainable growth.

Sustainability and Health-Focused Innovations: Aligning with Passenger Values

Sustainability initiatives have become increasingly important in enhancing the passenger experience. Pereira et al. (2021) identified sustainable growth and environmental focus as key drivers of innovation in aviation. Technologies like sustainable aviation fuels (SAF) and electric aircraft reduce carbon emissions and noise levels, aligning with passenger values.

Macnaughton (2022) highlighted the role of environmental sensing and smart glass technology in improving passenger health and comfort. Smart glass, for example, enhances sleep duration and cognitive performance while contributing to natural disinfection through UV-filtered daylight. These innovations not only improve passenger comfort but also demonstrate a commitment to sustainability and health, enhancing the overall travel experience. Jiang, Tran, and Williams (2023) explored the role of machine learning and mixed reality in promoting sustainability. Machine learning applications in predictive maintenance and autonomous systems have reduced fuel consumption and operational costs, while mixed reality has enhanced training efficiency and maintenance accuracy, contributing to long-term sustainability.

Challenges and Barriers to Adoption

Despite the benefits, several challenges hinder the adoption of AI, innovation, and digitalisation in aviation. Milbredt et al. (2022) highlighted cybersecurity risks as a significant concern, particularly for systems involving biometric data. The study emphasised the need for advanced security measures to protect sensitive data and ensure system resilience. Morosan (2012) and Cornacchia et al. (2020) identified privacy concerns as a major barrier to the adoption of biometric systems. Passengers expressed fears about data misuse and unauthorised access, underscoring the need for transparent data handling policies. Inversini (2017) noted that some passengers prefer traditional processes over technology-driven solutions, particularly older travellers or those with limited technological familiarity. This resistance highlights the importance of balancing innovation with user preferences. Mwesiumo et al. (2023) found that perceived benefits, such as convenience and personalised offers, are crucial for overcoming privacy concerns. Passengers are more willing to share

personal data if they perceive clear value in the exchange, emphasising the importance of designing user-friendly digital services that transparently communicate benefits.

Research limitations. *Despite providing a comprehensive analysis of AI, innovation, and digitalisation in passenger experience, this study has certain limitations. First, the research is based on existing literature, which may not fully capture emerging trends and real-time industry developments. As aviation technology evolves rapidly, newer solutions may surpass the findings presented in this review. Additionally, this study primarily draws insights from airports in developed economies, where digitalisation initiatives are more advanced. The adoption of AI-driven passenger experience enhancements may differ in developing regions due to resource limitations, regulatory barriers, or varying passenger expectations. Future research should include empirical case studies and primary data collection to examine passenger perceptions and the effectiveness of AI-driven solutions in different geographical contexts.*

Managerial implications. *The findings of this study offer significant insights for airport operators, technology providers, and policymakers focused on improving passenger experience. AI-powered automation, biometric check-ins, and real-time data analytics provide an opportunity for airports to reduce congestion, improve security measures, and enhance overall traveller convenience. Personalized passenger engagement through AI-driven platforms allows airports to offer tailored services, dynamic pricing for airport amenities, and customized notifications for flight updates and terminal navigation. IoT-enabled environmental monitoring systems contribute to passenger comfort by optimizing lighting, air quality, and crowd management, creating a more pleasant airport experience. However, for successful adoption, airports must address concerns related to privacy, cybersecurity, and data governance. Regulatory frameworks should ensure ethical AI usage, transparent data collection practices, and robust cybersecurity strategies to protect passenger information. Moreover, investment in staff training and passenger awareness initiatives can ease the transition toward AI-enhanced processes (Newbold, 2019). By embracing AI, innovation, and digitalisation, airports can create passenger-centric environments that optimize convenience, security, and satisfaction, reinforcing their competitiveness in an evolving aviation landscape.*

Originality of the paper. *This paper contributes to the existing body of knowledge by providing a comprehensive and structured review of AI, innovation, and digitalisation within the context of passenger experience at airports. While previous studies have examined individual technological applications, this research synthesizes multiple dimensions of digital transformation to offer a holistic perspective. The originality of this study lies in its systematic approach to analysing both the benefits and challenges associated with AI-driven passenger experience enhancements. Unlike prior studies which mainly focus on technological feasibility, this paper emphasizes managerial, regulatory, and ethical considerations that influence the adoption and success of these innovations. Furthermore, it bridges the gap between theoretical research and practical applications by providing actionable insights for airport operators, policymakers, and technology developers. By integrating recent findings, evaluating the impact of emerging digital trends, and identifying key challenges, this study advances the discourse on how AI and digitalisation can be effectively harnessed to transform passenger experiences in the aviation industry. Future research can build on this foundation by conducting empirical studies, exploring regional variations in adoption, and assessing the long-term effects of AI-driven airport innovations.*

Key words*: AI, Digitalisation, Innovation, Passenger Experience, Airports, Aviation.*

Link between digital technologies and Sustainable Development Goals in service businesses: a systematic literature review

CORRADO DE CRISTOFARO[1] ORLANDO TROISI[2] GENNARO MAIONE[3] MARA GRIMALDI[4]

Abstract

The Sustainable Development Goals (SDGs) promoted by the United Nations provide a framework to promote balanced development that considers environmental, social and economic sustainability (Trane et al., 2023; Sabbagh et al., 2023). Progress towards the achievement of the SDGs must be analyzed considering the downsizing of the industrial sector in favor of the growth of the tertiary sector, also as a result of the development of digital technologies.

The aim of this work is to provide a systematization of knowledge on the link between digital technologies and the achievement of the SDGs for companies in the tertiary sector. To achieve the research objective, we used a systematic literature review, a methodology that allowed us to conceptualize the existing theory on the topic.

The results of this work highlight the central role of digital technologies in promoting the achievement of the SDGs for tertiary sector companies. They also highlight the elements to be paid attention to in the application of digital technologies functional to the achievement of the SDGs in tertiary sector firms. Future research should further investigate the ways in which these technologies can be implemented effectively, analyzing challenges and opportunities related to their diffusion.

Framing of the research. *Tertiarization is a process, typical of advanced economies, which consists in the progressive lower incidence of the industrial sector on the formation of Gross domestic product (GDP) and employment, to the advantage of the tertiary sector, in particular the advanced one which includes services to production and businesses, characterized by the continuous development of information and computer technologies.*

The structural change of the economy in favor of the tertiary sector is much studied by scholars especially in relation to the consequences it produces from an environmental point of view, a consequence of a growing sensitivity to the issues of environmental sustainability and awareness of the need to reduce greenhouse gas emissions in order to reach the environmental objectives set by the various national and supranational regulations on the matter.

In literature, the service sector is sometimes considered less harmful to the environment than the primary and secondary sectors. In this regard, Romm (1999) and Lange (2020) consider digital technologies and tertiarization as instrumental to achieving the decoupling between economic growth and energy consumption. In economic theory, the non-materiality of services explains their lower negative impact on the environment and their lower energy consumption compared to industry (Fourcroy et al., 2012; Arrow et al., 1995; Bernardini et al., 1993). Gadrey (2010), on the contrary, tends to consider tertiarization not necessarily positive for the environment. Developed countries are generally characterized by an economy dominated by services and a high demand for energy. Camara (2022), in assessing the environmental impact of tertiarization, makes a distinction between absolute and relative tertiarization, defining the former as more harmful to the environment.

Firms in the tertiary sector, as well as those in the primary and secondary sectors, are forced to face the important challenge of achieving a balance between environmental, social and economic sustainability (Ciasullo et al., 2017; Sachs, 2012). The growing sensitivity towards the issues of environmental, social and economic sustainability, thanks to the commitment of national and supranational institutions, has led to the definition of the 2030 Agenda which represents an action program divided into 17 objectives whose achievement is aimed at promoting sustainable development for all (Trane et al., 2023). The Sustainable Development Goals (SDGs) of the 2030 Agenda were introduced for the first time in 2015 to outline a trajectory to follow for a more sustainable future for all.

From a managerial point of view, the Sustainable Development Goals of the 2030 Agenda must be incorporated into the corporate strategy in order to move more quickly towards the achievement of the SDGs (Troisi et al., 2019; Troisi et al., 2022; Oppenheim et al., 2017). It follows that the progressively greater influence on GDP and employment of service

firms, compared to those in the primary and secondary sectors, must be investigated not only by considering the environmental consequences but by analyzing the impact on all the SDGs, which provide a global framework for each actor that pursues the balance between social, economic and environmental sustainability.

Purpose of the paper. *Tertiarization is a process driven by technological innovation as well as by the evolution of demand. A context characterized by a growing attention to sustainable development issues makes the analysis of the contribution of digital technologies to the sustainable development of companies in the tertiary sector of central importance.*

Camara (2022) and Fourcroy (2012) analyzed the link between tertiarization and sustainable transition. In particular, the relationship between the structural change of the economy, the use of digital technologies and the level of energy consumption of companies was investigated.

To our knowledge, there are no systematic reviews that offer a theoretical systematization on the link between digital technologies and SDGs for tertiary sector firms. This study aims to fill this gap in the literature by analyzing the link between tertiarization and sustainable development goals and investigating the contribution of digital technologies to the sustainable development of tertiary sector firms.

The research questions this work answers are the following:

RQ 1: *What is the current state of knowledge on the link between tertiarization and the SDGs of the 2030 Agenda in the digital age?*

RQ 2: *What is the link between digital technologies and the sustainable development of tertiary sector firms?*

RQ 3: *What could be the future directions of research on sustainable tertiarization and on the link between digital technologies and sustainable development of tertiary sector firms?*

Methodology. *This study uses a systematic literature review. This methodology allows us to address phenomena that are not fully understood, identify problems, themes, patterns, and assist in the conceptualization of theory by guiding future research directions (Massaro et al., 2016; Troisi et al., 2023).*

Preferred Reporting Items for Systematic review and Meta Analysis (PRISMA) 2020 protocol, a rigorous guideline for reporting systematic reviews, was applied.

The bibliographic search was conducted on January 15, 2025 on the Web of Science (WoS) database. The search was performed by using the Boolean expression: "tertiarization OR tertiarisation OR tertiary OR "service industr" AND "sustainab*" AND "digital*". The use of the asterisk (*) allowed a greater completeness of the result provided by the bibliographic search, allowing the inclusion of documents containing variants of the words "industry", "sustainable" and "digital". A filter was used to allow the inclusion of only studies written in English and no exclusion criteria for documents were defined based on publication date rather than document type.*

The studies extracted from the bibliographic search were subjected to a careful manual screening to assess their suitability for inclusion in the analysis or alternatively to be eliminated from the dataset. The scanning was carried out first by reading the title and abstract and then by reading the whole document. The screening of the articles was performed by the authors, who worked autonomously.

Results. *This section provides the results of the analysis of 66 articles focused on the link between digital technologies and sustainable development of tertiary sector enterprises.*

The bibliographic search originally produced 146 documents. The titles and abstracts of 146 articles were examined. Following the screening, 61 documents were excluded as they were not consistent with the research objective. 85 articles potentially eligible for inclusion, after reading the titles and abstracts, were subjected to a full reading. The documents included in the study are 66 (Fig. 1).

From the analysis of the temporal distribution of the studies, it emerged that the scientific production has registered a significant increase since 2016 (Fig. 2). The reason is twofold: firstly, it must be considered that tertiarization as a phenomenon of structural change in the economy is rather recent; secondly, it should be highlighted that only in recent years there has been a growing sensitivity in sustainable development, also as a consequence of the regulatory commitment of national and supranational authorities[5].

The analysis revealed a significant growth in citations from 2020 onwards (Fig. 3). The most influential article is that of Lange et al. (2020), with 574 citations, aimed at investigating the effect of digitalization on energy consumption, followed by the article of Yip et al. (2018), with 190 citations, relating to the analysis of sustainable business models of firms active in the banking services sector. The third most cited article is that of Gregurec et al. (2021), with 105 citations, where an analysis was carried out relating to the technologies most closely monitored by service firms to respond to the challenges posed by Covid-19.

Table 1 shows the ten articles in the sample that obtained the highest number of citations. These results demonstrate that the advent of the pandemic has contributed significantly to the development of research on the topic of the application of digital technologies to tertiary sector firms also due to the need to conceptualize some drivers to address social changes in times of uncertainty (Gregurec et al., 2021).

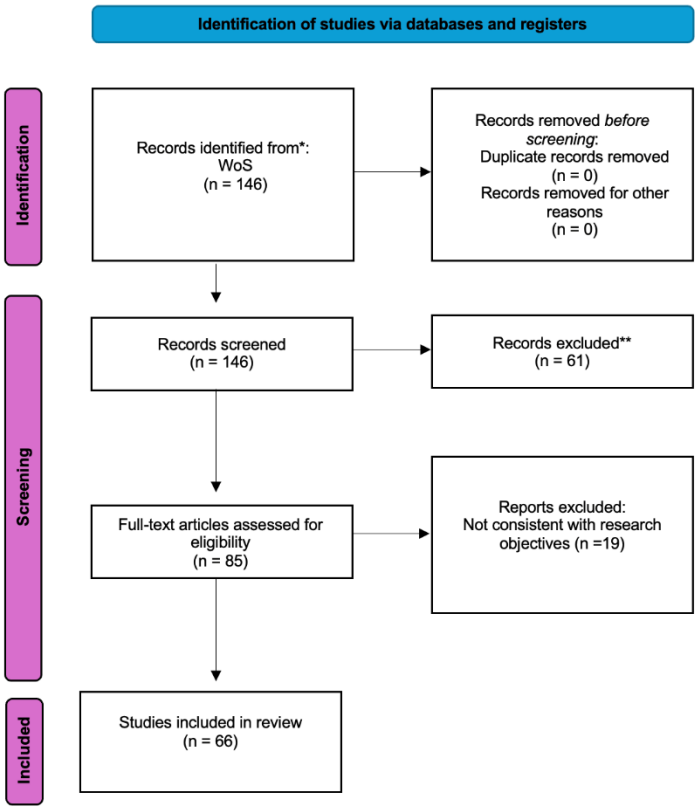

Table 1 also indicates the number of citations per year (CPY), which is given by the ratio between the number of citations and the time elapsed between its publication and the end of the analysis period.

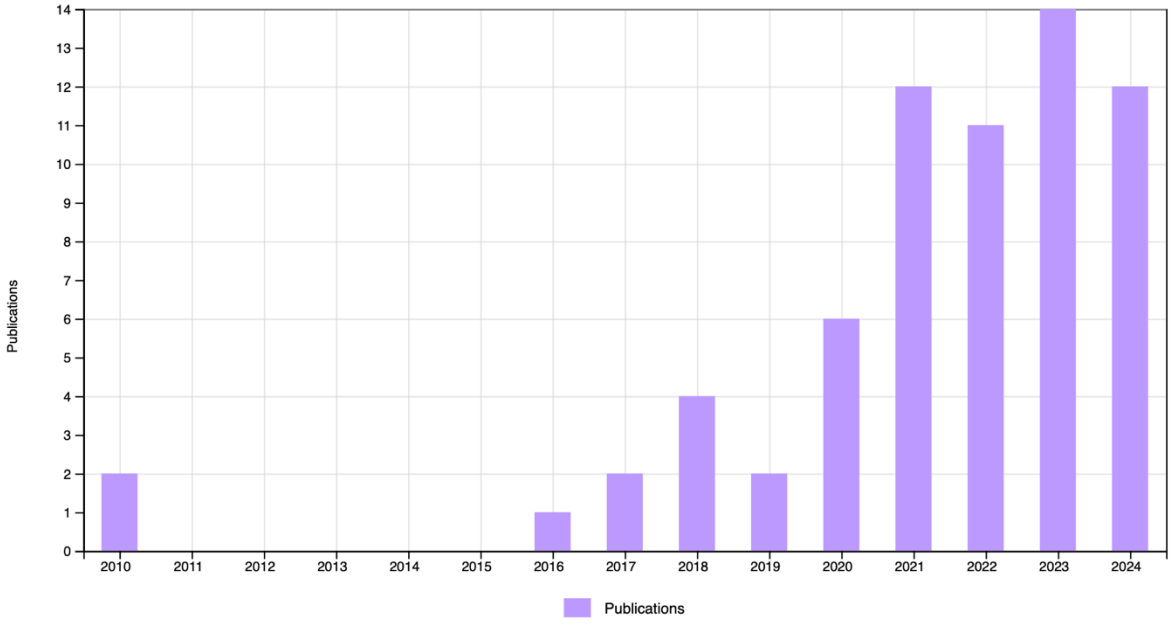
[5] Agreements such as the United Nations Agenda 2030, the Paris Agreement on climate and the European Green Deal have pushed institutions and businesses to adopt more sustainable behaviors from an environmental, social and governance perspective.

With reference to CPY, the most influential article is that of Lange et al. (2020) with a number of citations per year equal to 98.83; the article of Yip et al. (2018) is in second place with an average number of citations per year equal to 23.75; the article of Gregurec et al. (2021) is in third place with 21 citations.



From the analysis of the most influential articles by virtue of the number of citations per year, it emerges that the topic under analysis is investigated in relation to the impact on the sustainable development of service firms but in particular it is paid attention to in reference to the environmental impact deriving from the application of digital technologies to companies in the tertiary sector.

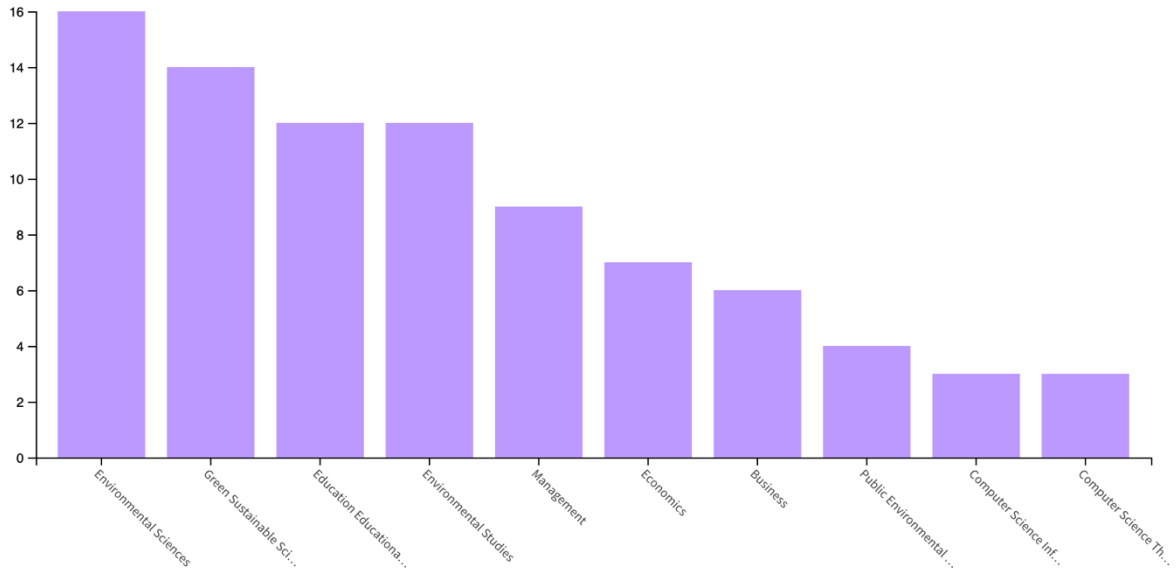
The topic under analysis is explored across different thematic areas. Figure 4 shows the ten most important thematic areas by virtue of the number of publications.

The topic of analysis has been explored mainly from the point of view of environmental sustainability. Several scholars have evaluated the environmental impact of the application of digital technologies to firms operating in the tertiary sector (Yao et al., 2023; Lange at al., 2020),

In the field of business, management and economics, several scholars have focused on the analysis of the managerial implications related to the adoption of digital technologies in tertiary sector firms by exploring the benefits for sustainable development by adopting perspectives that go beyond the environmental dimension alone (Lathan et al., 2024; De Caro-Barek et al., 2024; Masakova et al., 2023).



The high emphasis placed on the environmental sustainability of the application of digital technologies to tertiary sector firms is the consequence of the centrality of issues related to climate change and pollution, as well as the growing pressure placed on firms by international agreements and government policies aimed at incentivizing the sustainable transition.

After Covid-19, there has also been a growing awareness towards other dimensions of sustainable development. In particular, studies have focused on how digital technologies applied to tertiary sector firms can facilitate the achievement of the SDGs and enable the creation of sustainable tertiarization.

The articles included in the review, after the descriptive analysis, were explored through content analysis to extract information related to the role of digital technologies in the context of tertiarization.

One of the most discussed topics on the role of digital technologies as drivers of sustainable tertiarization is their connection with the reduction of CO2 emissions of firms operating in the service sector. Yao (2023), Algassim (2023), and Rosa (2023) highlight that the digital transformation of service firms, although not devoid of managerial challenges, is instrumental in reducing CO2 emissions and managing water resources more efficiently, which are fundamental traits for achieving SDG 6 of the United Nations 2030 Agenda. According to Hu (2023), Yip (2018), Oloruntobi (2023) the application of digital technologies to service firms supports business productivity, operational flexibility and energy efficiency, favoring the definition of sustainable business models and consequently the green energy transition, fundamental aspects for the achievement of the sustainable development goal SDG 7. According to Cortes-Murcia (2022) and Gregurec (2021) the application of digital technologies to tertiary sector firms not only makes them more competitive but also reduces the environmental impact of their activation allowing the actors of the system to cooperate more effectively. Gao (2023), Lange (2020), Ali (2024), Lee (2017) have shown that the use of digital technologies favors the environmental sustainability of service firms to the extent that the increase in energy consumption generated by the use of digital technologies is compensated by greater energy efficiency of digitalization. In this regard, it is worth highlighting that efforts towards a green energy transition require an improvement in eco-social literacy (Lázaro Torres et al., 2023).

Fig. 4: The main research areas in the sample

Source: Authors' elaboration

A second topic that emerged concerns the impact of the application of digital technologies to health services to achieve the SDGs. Digital technologies allow for an improvement in healthcare efficiency without compromising clinical outcomes, promote accessibility to care by promoting well-being for all at all ages in line with the provisions of SDG 3 (Lathan et al., 2024). Muhos (2019) and Park (2019) highlight that the application of digital technologies to the health services sector allows for easier and more timely access to the same services, allowing the overcoming of logistical and economic barriers that make access to traditional methods of healthcare delivery more difficult. Digital technologies

promote the transition towards more patient-centered hospital healthcare models, improve access to healthcare and contribute to the sustainability of healthcare systems. Ristow (2022) and Barnett (2022) highlighted the positive impact of the application of digital technologies on enhancing the delivery of health services and their accessibility. Alswailem (2021) highlighted the importance of digital technologies in ensuring that services remain high quality, accessible and sustainable even in contexts of extreme difficulty such as happened with Covid-19 which has put pressure on hospital systems.

A third topic that emerged from the analysis concerns the effects of the application of digital technologies to the educational sector. De Caro-Barek (2024) highlights that the widespread application of digital technologies to the education sector is revolutionizing the entire sector by improving its accessibility, efficiency and sustainability, fundamental pillars to ensure the achievement of SDG 4 of the United Nations 2030 Agenda. Urbanek (2023), Laciok (2021) and Ayman (2020) highlight that a widespread use of digital communication tools in higher education institutions promotes inclusiveness and reduces inequalities in tertiary education. In the post Covid-19 era, an improvement in digital communication skills and a definition of more flexible and dynamic learning paths have been observed. Studies by Maketo (2023), Chigunwe (2022), Lambert (2020) and Adam (2017) have shown that the application of digital technologies to the education sector promotes the diffusion of quality, inclusive and equitable education, stimulating the democratization of access to knowledge at a global level.

A fourth topic concerns the impact of digital technologies on gender equality in tertiary sector firms. Digital technologies play a fundamental role in promoting gender equality, facilitate women's entry into the world of work and improve their employment opportunities, which are key aspects for achieving SDG 5 of the United Nations 2030 Agenda (Masakova et al., 2023). Kashyap (2021) and Zurdo (2022) also recognized the instrumentality of digital technologies in reducing gender inequalities in work contexts, highlighting that the best results are achieved in countries with a developed tertiary sector. Palumbo (2022) highlighted that the application of digital technologies in work contexts is not without risks, these, if not correctly implemented, can generate psychosocial tensions that undermine the health and safety of employees and consequently organizational excellence, for this reason it is necessary to define organizational measures for the health and safety of employees and to curb the disadvantage of digitalization on psychosocial risks.

A final element that emerged from the analysis concerns the use of digital technologies in communication with stakeholders. According to Ayman (2020), digital technologies contribute to improving communication with stakeholders, promoting transparency and stakeholder involvement, which are fundamental aspects for achieving sustainable development. Farhangi (2021) highlighted the importance of digital communication, including through social media, as a tool for resilience towards negative contingencies. Suhanyi (2024) recognized the importance of e-government and of the application of digital technologies to public services as they improve their efficiency, accessibility and transparency.

The cross-sectional analysis of the five thematic strands - 1) the role of digital technologies as drivers of sustainable tertiarization and their connection with the reduction of Co2 emissions in service sector firms, 2) the impact of digital technologies in health servicies to achieve the SDGs, 3) the effects of applyng digital technologies in the educational sector, 4) the impact of digital technologies on gender equality in tertiary sector firms, 5) the use of digital technologies in communication whith stakeholders – confirms how digital technologies are a crucial enabler for the achievement of multiple SDGs. This evidence shows that the use of digital technologies can simultaneously generate environmental, social and economic benefits for companies in the tertiary sector. The positive impact that the use of digital technologies has on operational efficiency in terms of improved productivity, flexibility and speed of processes, as well as the role of enabler of sustainable business models, amply justifies the investment in green technologies.

Despite the clear advantages associated with the digitalization of companies in the tertiary sector, it is also appropriate to highlight the critical issues associated with it and which influence its systemic impact. The lack of widespread digital skills and resistance to organizational change hinder adoption, while the increase in energy consumption associated with data centers and infrastructures generates new environmental risks, if not accompanied by investments in renewable energy. At the same time, digital acceleration in the workplace can trigger psychosocial tensions, particularly in the most vulnerable groups, underlining the urgency of dedicated HR policies.

This study aims to systematize knowledge on the link between digital technologies and the achievement of the SDGs for tertiary sector firms. Given the importance placed by national and supranational bodies in the achievement of the SDGs, we argue that future studies that fall within this line of research should explicitly refer to the reference SDGs to facilitate knowledge sharing and support progress towards their achievement.
The systematization of knowledge on the subject of analysis has also highlighted elements of complexity related to the application of digital technologies to firms in the tertiary sector; with the aim of overcoming the elements that hinder the achievement of the SDGs, the need for further research efforts emerges aimed at investigating the operational elements capable of promoting the integration of digital technologies in the tertiary sector in line with the dictates of the objectives of the 2030 Agenda .

Research limitations. *Systematic literature reviews are designed to provide a fair, unbiased, and systematic solution to a research problem by synthesizing all primary sources relevant to the topic being analyzed. However, readers should be aware of limitations when analyzing the data provided in this article.*

This systematic literature review is based on the analysis of existing research studies and although a careful literature search was conducted to find strictly relevant articles, some relevant documents may not have been included, for example, because not addressing the issues related to SDGs, digital technologies and tertiarization in the title, abstract or keywords.

It should also be considered that the conceptualization of the evidence of the various documents included in the review was characterized by a certain level of interpretation given that there were only a few articles that explicitly addressed the instrumentality of digital technologies in achieving sustainable development for companies in the tertiary sector.

Managerial implications. *The analysis of the 66 studies included in the systematic literature review highlights important managerial and policy implications as a consequence of the central role of digital technologies in promoting the sustainable development of tertiary sector firms.*

In particular, the results suggest important technological, organizational and political challenges.

The high attention paid to the issues of environmental sustainability connected to the application of digital technologies to service firms shows the need to direct investments towards the search for greater energy efficiency of digital technologies in order to promote the reduction of CO2 emissions and accelerate the green transition of firms.

Secondly, the need to adopt adequate organizational policies to enhance the positive effects of digitalization in service companies and promote the establishment of a more inclusive, fair and sustainable development model was highlighted.

A final point that emerged from the analysis concerns the need to define policies aimed at promoting the global accessibility of digital technologies and thus promote the promotion of sustainable development for all.

Ultimately, the study shows that the application of digital technologies in an instrumental perspective to achieve the objectives of sustainable development is not free from elements of complexity, managers will have the task of developing adequate organizational measures to enhance the positive effects deriving from the application of digital technologies and consequently limit the negative effects.

Originality of the paper. *Previous studies have analyzed the link between tertiarization and sustainable transition, particularly the link between the structural change of the economy, the use of digital technologies and the level of energy consumption in companies has been investigated.*

To our knowledge, there are no systematic reviews that provide a theoretical systematization on the link between digital technologies, SDGs and tertiary sector firms.

Key words: *digital technology; tertiary sector; tertiarization; SDGs; sustainability; systematic literature review*

Governance and Digital Innovation: Redefining the Business Model Canvas

MAURO SCIARELLI[1] IRENE RICCIARDI[2] CRISTINA CERVINO[3] LORENZO TURRIZIANI[4]

Abstract

L'integrazione della sostenibilità nei modelli di business rappresenta una sfida cruciale per le imprese, in particolare nel settore bancario, dove la governance assume un ruolo determinante nel bilanciare obiettivi economici, sociali e ambientali. Questo studio propone un'estensione del Triple Layered Business Model Canvas (TLBMC) per includere la dimensione della governance, analizzando anche l'impatto della digitalizzazione. Attraverso un caso di studio, la ricerca sviluppa un framework teorico che collega i principi ESG alle capacità digitali. I risultati mostreranno che una governance solida e trasparente non solo migliora la performance ESG, ma favorisce anche l'innovazione del modello di business, aumentando la resilienza e la competitività dell'impresa. Questo contributo teorico e pratico offrirà nuove prospettive per manager e accademici, suggerendo strategie per una gestione più efficace e integrata della sostenibilità nel settore dei servizi finanziari.

Framing of the research. *La crescente attenzione alla sostenibilità sta esercitando un' elevata pressione sulle aziende, spingendole ad affrontare in modo più attivo le questioni legate a crisi finanziarie, disuguaglianze economiche e sociali, impatti ambientali, scarsità di risorse materiali, domanda energetica e sviluppo tecnologico (Rockström et al., 2009). Queste sfide rappresentano non solo un rischio per le organizzazioni (Tenberg, 1995; Paterson, 2001), ma anche un'opportunità per sviluppare innovazioni sostenibili (Hart, 2005; Adams et al., 2016). Per affrontare con successo queste criticità, le aziende devono integrare soluzioni innovative che siano eco-efficienti ed eco-efficaci, contribuendo così alla conservazione e al miglioramento delle risorse naturali, sociali e finanziarie nel loro core business (Castelló & Lozano, 2011; Rifkin, 2014). Tuttavia, affinché l'innovazione sostenibile abbia un impatto significativo, non è sufficiente introdurre cambiamenti incrementali o limitati a specifici ambiti aziendali ma è necessario un approccio più ampio che coinvolga l'intera organizzazione e i suoi stakeholder (Adams et al., 2016; Nidumolu et al., 2009).*

In questo contesto, la Corporate Social Responsibility (CSR) emerge come uno degli strumenti fondamentali per integrare la sostenibilità nei modelli di business. La CSR rappresenta l'impegno volontario delle aziende nel migliorare la governance aziendale e garantire operazioni trasparenti e responsabili (Cochran, 2007), includendo iniziative filantropiche e strategie che rispondono alle esigenze degli stakeholder, alle questioni ambientali e alle richieste sociali (Cai et al., 2012; Crowther e Aras, 2008). Con l'evoluzione delle sfide sociali e ambientali, la CSR si è progressivamente identificata con la sostenibilità tridimensionale d'impresa, diventando un tema centrale negli studi di management (Sciarelli & Sciarelli, 2018). Le aziende che hanno adottato strategie orientate alla CSR hanno visto un miglioramento nella propria reputazione, nel rafforzamento delle relazioni con clienti e stakeholder, e nella performance aziendale (Du, Bhattacharya e Sen, 2015).

La transizione verso modelli economici sostenibili è sempre più urgente, con le imprese che giocano un ruolo chiave grazie alle risorse e competenze di cui dispongono (Porter & Kramer, 2011). Tuttavia, molte aziende incontrano difficoltà nel raggiungere i propri obiettivi di sostenibilità, poiché i progressi tecnologici in questo ambito sono spesso incrementali. Per superare tali ostacoli, è fondamentale innovare i modelli di business, allineando incentivi e meccanismi di revenue a soluzioni sostenibili (Rashid et al., 2013). Le innovazioni nelle logiche di business sembrano generare rendimenti più elevati rispetto alle innovazioni di prodotto o di processo (Lindgardt et al., 2009). La letteratura evidenzia i numerosi vantaggi che i modelli di business sostenibili offrono alle organizzazioni (Nidumolu et al., 2009; Porter & Kramer, 2011), portando alcuni autori a ritenere che in futuro i modelli di business non sostenibili diventeranno obsoleti. Inoltre, i modelli di business sostenibili offrono vantaggi aggiuntivi come una maggiore resilienza e mitigazione del rischio (Choi & Wang, 2009), oltre a opportunità di diversificazione e co-creazione di valore (Nidumolu et al., 2009; Porter & Kramer, 2011; Tukker & Tischner, 2006). Per questo motivo, molte organizzazioni stanno investendo nell'implementazione di soluzioni sostenibili (Evans et al., 2017).

Esiste, dunque, un rapporto bidirezionale e interdipendente tra sostenibilità e innovazione: da un lato, la sostenibilità agisce come motore propulsore per lo sviluppo di innovazioni creative nelle organizzazioni; dall'altro, la stessa sostenibilità aziendale richiede una ridefinizione dei modelli di business attraverso approcci innovativi. Questo circolo virtuoso si manifesta nella capacità di generare nuove modalità di creazione, distribuzione e acquisizione di valore che ridefiniscono radicalmente i parametri competitivi (Evans et al., 2017). In questo contesto, l'innovazione diventa uno strumento abilitante per tradurre i principi sostenibili in vantaggio strategico, mentre la sostenibilità funge da catalizzatore per ripensare processi, prodotti e relazioni con gli stakeholder attraverso un approccio olistico.

Numerosi approcci teorici e pratici condividono l'idea che il miglioramento della sostenibilità implichi cambiamenti, innovazioni o adattamenti delle organizzazioni al contesto circostante (Faber et al., 2005). La capacità di innovare nel campo della sostenibilità è oggi una competenza essenziale per le imprese, che possono perseguire sia piccoli miglioramenti incrementali sia innovazioni radicali e dirompenti (Adams et al., 2012). In questo contesto, l'innovazione del modello di business emerge come un meccanismo chiave per integrare la sostenibilità all'interno del business (Jolink & Niesten, 2015).

Per le imprese che desiderano innovare in chiave sostenibile il proprio paradigma di business, il Triple Layer Business Model Canvas (TLBMC) si propone come un efficace strumento operativo. Derivato dal business model canvas di Osterwalder e Pigneur (2010), ampiamente utilizzato per l'innovazione dei modelli aziendali, il TLBMC integra esplicitamente gli impatti ambientali e sociali. Questo framework aggiunge livelli che si allineano con la struttura originale del canvas, permettendo di sviluppare, visualizzare e comunicare modelli di business sostenibili in modo più efficace (Stubbs & Cocklin, 2008). Seguendo il principio della triple-bottom line (Elkington, 1994), il TLBMC rende la creazione di valore economico, ambientale e sociale elementi centrali del modello di business. Questi strati consentono di rappresentare un livello ambientale basato sull'approccio del ciclo di vita e un livello sociale basato sulla teoria degli stakeholder (Abbasnia et al., 2023). Di conseguenza, i tre strati interconnessi, che lavorano sinergicamente (Midgley & Arya, 2022), mostrano visivamente come un'azienda contribuisce alla creazione di valore in tre dimensioni (Stubbs & Cocklin, 2008), in linea con la prospettiva del Triple Bottom Line (Elkington, 1998). Inoltre, sfrutta strumenti come l'analisi del ciclo di vita e la gestione degli stakeholder per connettere le diverse dimensioni della sostenibilità, offrendo una prospettiva strutturata per la creazione di valore che include anche le implicazioni ambientali e sociali (Joyce and Paquin, 2016).

Più specificamente, il Triple Layered Business Model Canvas (TLBMC) ha lo scopo di evidenziare le dinamiche spesso tacite e informali all'interno delle organizzazioni attraverso il concetto di coerenza duale. La coerenza orizzontale si riferisce all'allineamento dei nove blocchi in ciascun canvas, assicurando un allineamento sistemico, poiché ogni blocco contribuisce alla creazione di valore a profondità variabili. La coerenza verticale, invece, riguarda l'interconnessione di ciascun componente all'interno di uno strato con tutti gli altri componenti, consentendo una certa uniformità tra i diversi tipi di valore. Chiaramente, ogni blocco all'interno di ciascun canvas rappresenta una potenziale fonte di innovazione (Joyce & Paquin, 2016). Attraverso questa logica multi-strato, il framework contribuisce al dibattito in corso sul legame inestricabile di reciprocità tra sostenibilità e innovazione dei modelli di business esistenti (Medeiros, 2017).

Il livello economico del Business Model Canvas (BMC) originale descrive il modello di business di un'organizzazione tramite nove sezioni interconnesse, che includono la proposta di valore, le risorse chiave, le attività chiave, i partner, i segmenti di mercato, le relazioni con i clienti, i canali di distribuzione, la struttura dei costi e i flussi di ricavi (Osterwalder et al., 2005; Verrue, 2014). Questo livello è focalizzato principalmente su una logica tradizionale di profitto, mettendo in evidenza la dimensione economica nel contesto della sostenibilità (Budimanet al., 2023). Al contrario, il livello ambientale del Triple Layer Business Model Canvas (TLBMC) si fonda sull'approccio della Life Cycle Assessment (LCA), che analizza le implicazioni ambientali di un prodotto o servizio durante tutte le fasi del suo ciclo di vita (Finnveden et al., 2009). In questo contesto, il livello ambientale mira a dimostrare la capacità di un'organizzazione di generare benefici ecologici che bilanciano le esternalità negative create, fornendo agli stakeholder una comprensione più chiara degli impatti ambientali delle attività aziendali. Questo livello aiuta le aziende a indirizzare i propri sforzi per raggiungere una sostenibilità ambientale effettiva, integrando il ciclo di vita nel modello di business e permettendo una misurazione più solida e quantitativa degli impatti (Joyce & Paquin, 2016). Al centro di questo canvas si trova il valore funzionale, che si interconnette con altri elementi, tra cui forniture, outsourcing, materiali, produzione, fine vita, distribuzione e uso del prodotto (Putra, 2020).

Il livello sociale, infine, si ispira alla teoria degli stakeholder, che sostiene che le decisioni aziendali dovrebbero mirare a creare valore per tutti i gruppi o individui che possono influire o essere influenzati dal raggiungimento degli obiettivi organizzativi (Freeman, 1984). Questo livello, che rappresenta la "S" del paradigma ESG, include vari attori, tra cui le comunità locali, la governance, i dipendenti, la cultura sociale, gli utenti finali e, in generale, il valore sociale generato dall'organizzazione (Sciarelli & Sciarelli, 2018). La capacità di un'impresa di generare benessere per gli stakeholder e per la società in generale è espressa attraverso gli impatti sociali, che considerano non solo i costi economici ma anche i sacrifici sociali legati alle attività aziendali, mentre i benefici sociali derivano dai risultati positivi generati dalle operazioni aziendali. La misurazione degli impatti sociali si effettua tramite indicatori legati alle ore lavorative, salute, sicurezza, coinvolgimento comunitario e altri aspetti rilevanti.

Nell'era dell'industria 4.0, anche il processo di digitalizzazione impatta sul processo di creazione del valore poichè favorisce l'accessibilità e la disponibilità dei dati, informazioni e conoscenze (Zimmermann, 2000). Più precisamente, la DT stimola le aziende alla riprogettazione dinamica delle attività del business model canvas mediante tecnologie digitali

per soluzioni digitalizzate e per il coinvolgimento del cliente. Nel primo caso, le aziende mirano ad adottare soluzioni digitali che rendono più efficaci ed efficienti lo svolgimento dei processi. Nel secondo caso, le aziende adottano strumenti digitali per incrementare le modalità di comunicazione, anche omnicanale (Matricano & Liguori, 2024)

Pertanto, il TLBMC non solo visualizza tutte le potenziali fonti di innovazione, ma collega componenti esplicite e implicite, fungendo anche da strumento di creazione. Un modello rappresentato in modo visuale, con vari strati, facilita lo sviluppo creativo di nuovi modelli di business. Infine, il TLBMC agisce come uno strumento di validazione, cercando di bilanciare i sacrifici e i benefici derivanti dal modello aziendale, offrendo una visione integrata delle dinamiche economiche, ambientali e sociali (Joyce & Paquin, 2016).

Purpose of the paper. *Il presente contributo intende proporre una ridefinizione olistica del Business Model Canvas che integri le dimensioni economiche, sociali, ambientali e di governance della sostenibilità, enfatizzando anche il ruolo rilevante, e spesso complicato, delle tecnologie digitali. Più precisamente, l'obiettivo principale è fornire un framework teorico unificato per esplorare come le innovazioni nei modelli di business possano migliorare le prestazioni ESG d'impresa.*

Come ampiamente mostrato nella sezione precedente, l'innovazione sostenibile dei modelli di business, infatti, rappresenta un campo di riflessione accademica crescente (Evans et al., 2017). La letteratura precedente ha focalizzato l'attenzione solo sulla creazione di valore economico, definendo la tela originale del Business Model Canvas (Ostelwalder e Pigneur, 2010). Successivamente, alcuni studi hanno riprogettato il modello tradizionale, inserendo il livello sociale e ambientale per giungere al TLBMC (Joyce et al., 2016). Altri studi adottano invece un approccio più settoriale, sviluppando un modello basato sul canvas originale di Ostelwalder e Pigneur (2010), orientato all'esplorazione della bioeconomia circolare nel settore della moda (Basile et al., 2025). Nel flusso di ricerca identificato, Marnoto et al. (2024) indagano la relazione tra il paradigma ESG e le capacità digitali, analizzando come queste possano favorire l'innovazione del modello di business, con un focus specifico sulle aziende familiari. Tuttavia, nonostante la crescente attenzione alla sostenibilità ESG, esistono ancora pochi studi che indagano la dimensione di governance soprattutto nel settore bancario (Hope e Thomas, 2008; Hristov & Searcy,2024). Come evidenziato da Dicuonzo et al. (2022), l'integrazione della sostenibilità nei sistemi di governance delle banche è fondamentale per rispondere alla crescente domanda di trasparenza e responsabilità da parte degli stakeholder. In questo contesto, la governance gioca un ruolo cruciale nelle istituzioni finanziarie sulla dimensione sociale e ambientale. Tale approccio non solo rafforza la reputazione delle banche (Houston e Shan, 2019), ma contribuisce anche alla stabilità finanziaria (Chiaramonte et al., 2021).

Anche se una parte di studiosi (Evans et al., 2017) sta iniziando a costruire una prospettiva integrata per comprendere come le innovazioni nei modelli di business possano contribuire alla creazione del valore ESG aziendale, nessun contributo ha esteso la coerenza orizzontale (la profondità di ciascuno strato) e verticale (la sinergia tra i diversi livelli) del TPLBC, aggiungendo la tela della governance di sostenibilità ESG.

Inoltre, sebbene Matriciano e Liguori (2024) abbiano proposto un modello digitale basato sulla versione economica del BMC di Osterwalder e Pigneur (2010), non esistono studi che esplorano in modo approfondito il ruolo delle tecnologie digitali nell'ambito di un Business Model Canvas esteso alla sostenibilità olistica ESG. Con l'obiettivo di colmare questi gap, il presente contributo intende rispondere alle seguenti domande di ricerca:

RQ1: Come il fattore di governance (G) può essere integrato nel Triple Layered Business Model Canvas ?

RQ2: Come l'approccio digitale può essere incluso nel business model canvas allargato al paradigma ESG?

Methodology. *Per testare la componente Governance (G) e il BMC digitale all'interno del nuovo framework sviluppato, i dati saranno raccolti seguendo la metodologia di Yin (2003), che prevede diversi passaggi: 1) definire le domande di ricerca e gli obiettivi, 2) sviluppare un protocollo di studio di caso che dettagli il suo scopo, le procedure di raccolta dati, la struttura del report dello studio di caso e le domande del protocollo (incluso il modo in cui operazionalizzare il fenomeno e formulare le domande dell'intervista).*

Il nostro studio si focalizzerà sul settore bancario, in cui la dimensione della Governance (G) riveste un ruolo di primaria importanza. Verrà adottato un approccio di studio di caso singolo, in quanto particolarmente adatto a descrivere fenomeni complessi in modo dettagliato e approfondito, come evidenziato da Siggelkow (2007). Se applicato correttamente, questo metodo si rivelerà particolarmente utile per la ricerca scientifica, la valutazione di programmi e lo sviluppo di teorie e interventi (Baxter & Jack, 2008). Questo approccio consentirà un'analisi olistica e approfondita dei fenomeni studiati (Patton, 1980; Mackey & Gass, 2015) e permetterà di esaminare le diverse sfaccettature di un fenomeno complesso (George et al., 2005). Inoltre, risulterà efficace per rispondere a domande di tipo "come" e "perché" (Gerring, 2006). Come sottolineato da George (2005), questa metodologia si dimostrerà particolarmente efficace per l'analisi di fenomeni rilevanti in contesti rari o unici.

Sebbene i risultati di uno studio di caso singolo non siano statisticamente generalizzabili, essi offriranno una comprensione ricca e contestualizzata di situazioni specifiche, contribuendo all'approfondimento teorico e pratico (Corden & Sainsbury, 2006). Seguendo studi precedenti (Yin, 2003; Gnyawali & Park, 2011), la raccolta dati si svolgerà in due fasi, coerentemente con tale approccio.I dati secondari verranno raccolti tramite siti web, bilanci di sostenibilità e documenti ufficiali dell'ente bancario. Successivamente, i dati saranno acquisiti attraverso interviste semi-strutturate condotte da un team di ricerca. La collaborazione tra più ricercatori arricchirà l'analisi, migliorando la qualità dei dati grazie alla diversità di prospettive e rafforzando la credibilità dei risultati attraverso osservazioni convergenti (Eisenhardt, 1989).

Expected Results. *Attraverso l'analisi di un caso di studio singolo nel settore bancario, condotta mediante interviste e un'approfondita revisione documentale, verranno sviluppate due matrici che non solo integreranno la dimensione della governance, ma includeranno progressivamente anche le tre dimensioni della sostenibilità (ESG) e la dimensione digitale.*

La prima matrice verrà elaborata per mappare e strutturare le interconnessioni tra diversi aspetti della governance aziendale, identificando aree chiave come Inclusione e Diversità, Pianificazione Strategica, Etica e Responsabilità Sociale, Creazione di Valore nella Governance, Cultura Aziendale, Coinvolgimento degli Stakeholder, Trasparenza, Impatto della Governance e Benefici della Governance.

Successivamente, la seconda matrice sarà sviluppata con un approccio più ampio e integrato, incorporando le dimensioni ambientale, sociale e di governance (ESG) insieme alla dimensione digitale. In questo modello ampliato, alle sezioni precedenti si aggiungeranno: ESG Value, ESG Impacts e ESG Benefits.

Questo approccio permetterà di potenziare la coerenza strategica su due livelli: orizzontale, garantendo un allineamento sinergico tra le diverse funzioni aziendali, e verticale, assicurando l'integrazione delle strategie di sostenibilità in tutti i livelli organizzativi. Il modello proposto non solo contribuirà a una visione più sistemica e integrata della sostenibilità aziendale, ma offrirà anche un supporto concreto per la definizione di pratiche manageriali più efficaci e responsabili.

Research limitations. *Questa ricerca presenta alcune limitazioni, principalmente riconducibili alla scelta metodologica adottata. Sebbene l'analisi di caso permetta un'esplorazione approfondita e dettagliata del fenomeno studiato, i risultati ottenuti non sono automaticamente generalizzabili ad altri contesti. Tale limite è ulteriormente accentuato dal focus esclusivo sul settore bancario, che potrebbe non riflettere le dinamiche presenti in altri ambiti.*

Per rafforzare la validità esterna e la trasferibilità delle evidenze emerse, sarebbe opportuno estendere l'indagine a una più ampia gamma di settori, adottando un approccio comparativo che consenta di individuare sia caratteristiche comuni sia specificità settoriali. A tal fine, le ricerche future dovrebbero esplorare contesti differenti, validando, affinando e adattando i risultati osservati nel settore bancario. Inoltre, l'integrazione di metodi quantitativi potrebbe supportare la verifica empirica delle intuizioni emerse, ampliando così le prospettive di indagine e fornendo una base più solida per le implicazioni teoriche e pratiche dello studio.

Un'ulteriore limitazione riguarda la dimensione digitale analizzata nel modello proposto. Sebbene il nostro studio consideri il processo di digitalizzazione, non viene esaminato in modo specifico il ruolo degli strumenti di intelligenza artificiale. Poiché l'adozione di tecnologie avanzate, come il machine learning e l'automazione basata sull'intelligenza artificiale, sta trasformando significativamente le strategie e le operazioni nel settore bancario e oltre, futuri studi potrebbero approfondire questa prospettiva, valutandone l'impatto sulle dinamiche organizzative e sulle capacità gestionali.

Managerial implications. *Da una prospettiva manageriale, questa ricerca contribuisce a una comprensione più approfondita di come imprenditori, manager, professionisti, esperti e accademici possano utilizzare il modello concettuale proposto per fornire una visione olistica della creazione di valore ESG (Marnoto et al., 2024) nel settore bancario. In particolare, i manager possono orientare le proprie strategie di innovazione integrando il paradigma ESG nel processo di digitalizzazione. Lo studio suggerisce, infatti, uno strumento che supporti l'inserimento della sostenibilità nell'innovazione dei modelli di business.*

Originality of the paper. *Questo studio contribuisce all'ampliamento della comprensione teorica sulle dinamiche di interazione tra le pratiche ESG e le capacità digitali nel promuovere l'IMC, con un focus specifico nel settore bancario. Attraverso una scomposizione analitica delle pratiche ESG nelle dimensioni ambientale, sociale e di governance, la ricerca fornisce un quadro dettagliato delle sinergie e delle potenziali tensioni che emergono nell'integrazione con le capacità digitali.*

Key words*: business model, sustainable innovation, digital canvas, ESG performance; sustainability, tertiarization*

From farmers to the service marketplace: a choice experiment[1]

CLEMENTINA BRUNO[2] ANTONELLA CAPRIELLO[3]

Abstract

This research contribution explores the results of a choice experiment developed within the market analysis activity contextualized in the project Pa.N.E. - Panem Nostrum Everyday - Nutrire Terdona, funded by the European Union and the Piedmont Region, and focused on the development and the promotion of an ancient wheat variety, Wheat San Pastore, by relying on a relatively new bread, Pane Grosso di Tortona, and related bakery products. The choice experiment, proposed with a paper-based questionnaire and after tasting the product, is aimed at evaluating the potential consumers' willingness to purchase Pane Grosso, depending on the price level, the bread format and the distribution channel. In addition, socio-demographic and lifestyle variables are considered, as well as the characteristics consumers evaluate in making their bread purchase. The data collected through the questionnaire have been analyzed with a logit model. The results provide relevant insights related to the most promising distribution channels, the role of price, the preferred bread format, and suggest some interesting consumers segments to be targeted.

Framing of the research. *This research contribution has been developed in the framework of a multi-disciplinary project, project Pa.N.E. - Panem Nostrum Everyday - Nutrire Terdona, funded by the European Union and the Piedmont Region, aimed at recovering and relaunching an ancient wheat variety, Wheat San Pastore, whose production was designed to be used for bread, resulting in the ad-hoc creation of bread (Pane Grosso di Tortona), and for related bakery creations, with sweet and savory products.*

The physical chemical, analytical chemical and biomedical analysis conducted by our project partners showed that Pane Grosso, obtained by Wheat San Pastore, presents particular nutritional characteristics that could allow to classify it within the category of functional foods in accordance with the dominant literature. In addition, the cereal is cultivated using environmentally friendly techniques and the approach is consistent with sustainable principles.

According to the literature bread, indeed, is recognized by consumers as a good base product for carrying functional properties (Kraus, 2015). The same author also highlights that good taste, as well as being a safe, natural and healthy products, are among the most important attributes of functional foods. Sgroi et al. (2024) highlight the role of frequency of consumption and of product knowledge in determining functional food demand; in addition, the authors highlight the relevance of socio-demographic factors, such as age, income, gender and urban population density (their study is focused on the Sicily region). Indeed, in functional foods, market segmentation appears as particularly relevant, since the different segments show different motivations and different purchasing behaviors (Horská et al., 2023; Kapoor and Munjal, 2017; Annunziata and Vecchio, 2010).

Tikkanen e Vääriskoski (2010) showed that consumers perceive, among the others, the functional benefits of branded bread. With respect to the "naturality" attributes, Edenbrant et al. (2018), focusing on rye bread, demonstrated that consumers prefer pesticides-free products and methods and organic bread. De Boni et al. (2019), in their experiment comparing three different high-quality Italian breads with special focus on sustainability issues, underline that the main factor explaining consumers' choices are price sensitivity, food waste management sensitivity, nutritional characteristics, attitude towards consuming special breads, consumers' knowledge of sustainability. Among these factors, the healthy characteristics of the product represent information difficult to achieve, suggesting the relevance of communication activities.

Therefore, in a national market where bread consumption is particularly low with respect to the European level (41 kg per capita per year in Italy; the corresponding value for Romania is 74 kg; Italmopa, 2024), the Wheat San Pastore bread shows feature that can result as appealing for modern consumers. In addition, Italian consumers preferences remain firmly tied to bakery purchases, with 20 thousand artisanal bakeries active all over the Country, producing 1,5 million tons of bread (Il Sole 24 Ore, 19th January 2024). It appears worthwhile, however, to explore the opportunities for other distribution channels: especially after the pandemics, grocery purchases have demonstrated a tendency towards

---

DOI 10.7433/SRECP.SP.2025.01

multichannel shopping, both for young and adult consumers, and the need to meet timesaving and convenience requirements, but also the rediscovery of human relationship (Bellini et al., 2023).

Purpose of the paper. *This paper presents the results of a quantitative study aimed at verifying the market opportunities for Wheat San Pastore products, with a special focus on Pane Grosso. The study, carried out from a B2C perspective, complements a B2B qualitative analysis focused on bakeries, restaurants and pastry shops and an analysis based on expert opinions. Moreover, the findings appear relatively robust with a parallel B2C analysis based on qualitative methods (focus group), not reported in this paper, reveling the consistency of our findings.*

The aim of the quantitative study is to verify the (potential) consumers' attitude towards Pane Grosso after tasting the product. In particular, we tested the stated consumers' propensity to buy Pane Grosso in different scenarios, accounting for the role of price, of the bread format and of the distribution channel, potentially relevant variables in determining consumers' choice, following the elements emerging from the literature discussed above. The analysis also considers socio-demographic characteristics of respondents, as well as their consumption habits and their lifestyle, with the purpose of identifying the most promising target segments for Wheat San Pastore products.

Methodology. *For the primary data collection, we relied on a paper-based questionnaire, containing a choice experiment, administered at the same time as Pane Grosso tasting.*

In the questionnaire, respondents were asked to answer questions related to the following themes:

- *Demographic variables: gender, age, place of residence, interest in sport activities, household composition, education.*
- *Bread consumption habits: bread consumption and quantity, usual point of sale, usual type of bread purchased, most relevant attributes driving the bread choice, willingness to pay for ancient wheat bread, consumption of other bakery products.*
- *Knowledge of Pane Grosso and tasting, evaluation of the tasting experience and availability to recommend the product.*
- *Choice experiment: to each respondent, we presented 4 choice scenarios, in which he was required to state whether he would have been willing to purchase Pane Grosso with the proposed characteristics (related to the product and the distribution channel), or if he would have preferred his usual bread type, purchased at his customary point of sale. The 4 scenarios referred to 4 different distribution channels (artisanal bakery, supermarket, Coldiretti local market, online purchase with home delivery); The scenario also presented varying price levels (consistent with the proposed distribution channel) and two different bread format (0.5 kg and 1 kg).*

We run a descriptive statistical analysis of the collected data, which has provided interesting information related to the consumers consumption habits, the knowledge of the product, and the level of satisfaction with the product after tasting. In addition, the choice experiment allowed the application of an econometric analysis oriented towards the identification of the variables relevant for explaining the preference for Pane Grosso, in terms of product attributes and consumer characteristics. This information is relevant both in terms of market strategy and to formulate service marketing policies.

The choice experiment generated, in each scenario, a binary response variable (stated willingness or non-willingness to purchase Pane Grosso with the described attributes). We analyzed this data by applying a model able to deal with binary discrete response variables, namely the logit model. If we define as Y=1 the willingness to buy Pane Grosso and Y=0 the alternative (preference for the usual bread type at the customary sale point), the logistic regression modelling the probability of preferring Pane Grosso can be defined as (see Franses and Paap, 2001, whose notation is maintaned):

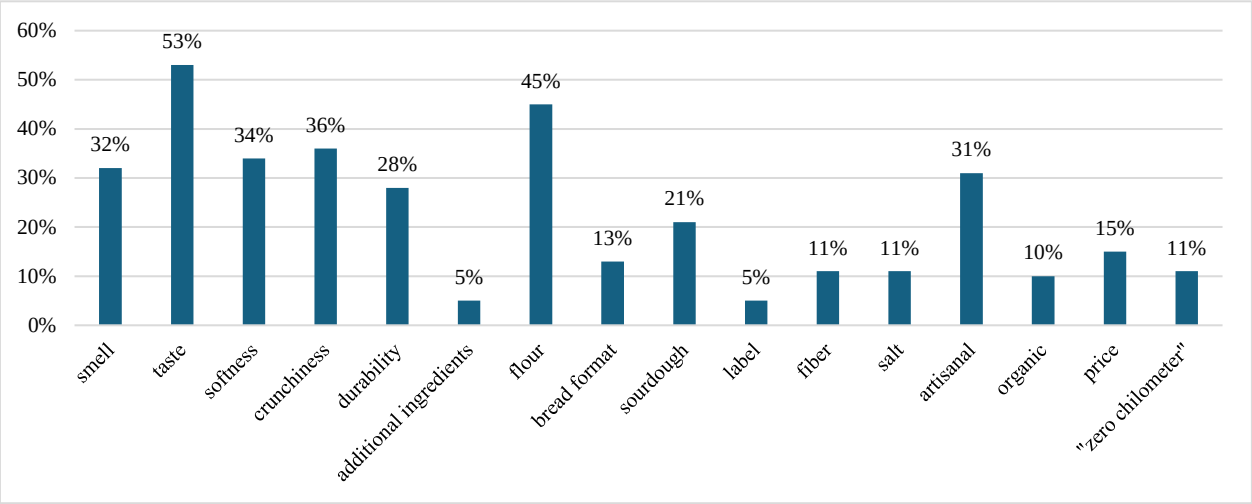
$$\Pr[Y_i = 1|X_i] = F(X_i\beta) = \frac{exp(X_i\beta)}{1 + exp(X_i\beta)}$$

For all the i observations in the sample, Y_i represent the response variable, assuming value 1 or 0; X_i represent the explanatory variables (product or respondent characteristics), and β are the variable coefficients. Notice that, since each respondent has been asked to evaluate four purchase scenarios, we have four observations for each respondent, which cannot be considered as independent. Therefore, we run the estimates using cluster robust standard errors.

Results. *The questionnaire has been distributed during several local events taking place from spring to autumn 2023. In addition, a limited number of questionnaires have been administered to subjects interested in tasting the product and participating to the survey. The total number of questionnaires collected is 258. Not all the questionnaires resulted to be filled in all their parts. Therefore, for each point analyzed below, we will indicate the related number of observations.*

Among the respondent, women prevailed (146 women vs 111 men; one missing data). 21% of respondents are in the age range 18-30 years old. A similar percentage refers to the range 31-45, while about 32% is in the class 46-60 and 19% in the class 61-75. The over-75s are relatively underrepresented, with less than 7% of the questionnaires.

The majority of respondents (57% of 257 respondents) practices sport at an amateur level. In addition, most respondents (59% of 258) live in the province where the production of Pane Grosso is mainly concentrated, which is not surprising given the local nature of the events during which the questionnaires where collected.



With respect to the education level, we found that the majority of interviewees own a high school (46%) or a university (31%) degree; the basis is 257 observations. Finally, the average dimension of the household is about 2.5 components,

with a certain variability (from a minimum of one to a maximum of seven components, the statistics are based on 251 observations).

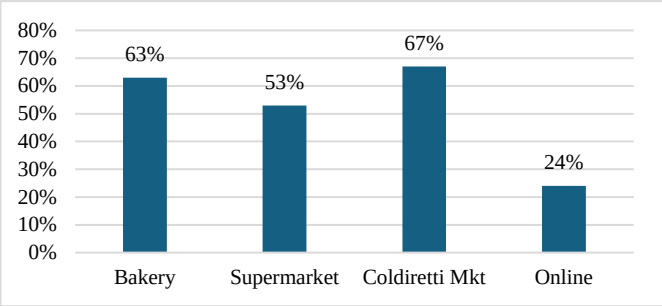
Considering bread consumption habits, we found that more than 12% of the sample (257 interviewees) does not habitually consume bread. With respect to the quantity consumed in the household, 37% of the respondents consume less than 500 gr. per week, 38% between 500 gr. and one kg. 20% between 1 and 2 kg. and less than 5% more than 2 kg. (basis: 237 answers). As expected, the weekly consumption tends to increase with the dimension of the households, although the trend is not strictly increasing. The preferred point of sale is the bakery (69%), followed by the supermarket (37%). Only a minority of respondents commonly purchase bread at the Coldiretti farm market (3%) or relies on different channels (7%). Notice that the percentages do not sum up to 100% since several respondents indicate more than one option; a total of 230 respondents provided this information. About the preferred type of bread, we found an impressing variety of responses. Interestingly, some respondents mentioned Pane Grosso.

An interesting question concerned the most relevant characteristics the respondents considered in purchasing bread. Notice that we required to indicate a maximum of three options within the options set we provided, but several respondents have chosen more than three options, and we decided to keep all the answers. Figure 1 represents the frequency of choice of each characteristic (basis 255 answers).

Figure 1. Relevant characteristics in bread purchase

Source: our elaboration

The most relevant characteristic, as expected, is bread taste (53%), although the texture would prevail if we considered softness and crunchiness together (34% and 36% respectively). Attention is payed also to the type of flour, the smell and the artisanal nature of the product. Notice that price is considered as relevant by only 15% of the respondents. However, in the following question, related to their willingness to pay for an ancient wheat bread, the most frequently chosen range is between 3 and 4 euros per kg (238 respondents), which is a relatively low price. Therefore, the role of the price variable needs to be explored more deeply.



The majority of interviewees (85%) state that they use other bakery products (basis: 254 respondents) and the most mentioned are "grissini" (52%), "focaccia" (59%) and pizza (54%) (basis 223 respondents).

With specific regard to Pane Grosso, we found that only 39% of respondents (basis: 257) stated that they already knew it. Considering that most of them live relatively close to the production area, this indicates that Pane Grosso can be still considered as a relatively "new" product, for which marketing and communication actions are recommended. 254 respondents accepted to taste Pane Grosso. The appreciation for the product has been high, with an average score of 8.3 on a scale ranging from 1 to 10. Notice that we remark some case of non-appreciation, as well as of extremely high appreciation, with the score ranging from a minimum value of 4 to a maximum value of 10 (basis: 248 respondents). In addition, 98% of respondents (basis: 256 respondents) would recommend the product.

With respect to the choice experiment, we found an acceptance rate of Pane Grosso equal to about 52%, meaning that slightly more than one half of the proposed scenarios have been accepted by the respondents.

Figure 2 represents the acceptance rate per distribution channel, showing that scenarios with highest acceptance are those considering Coldiretti farm market and artisanal bakeries.

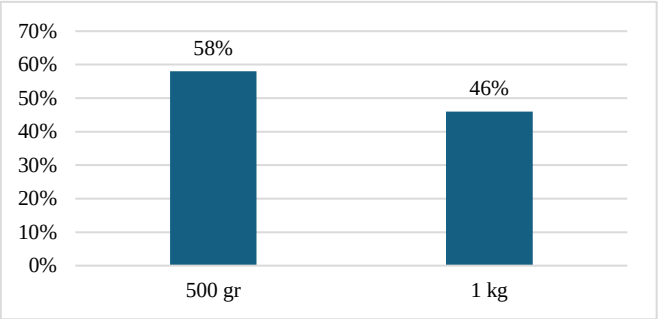


Figure 2. Pane Grosso acceptance rate in the choice experiment by distribution channel

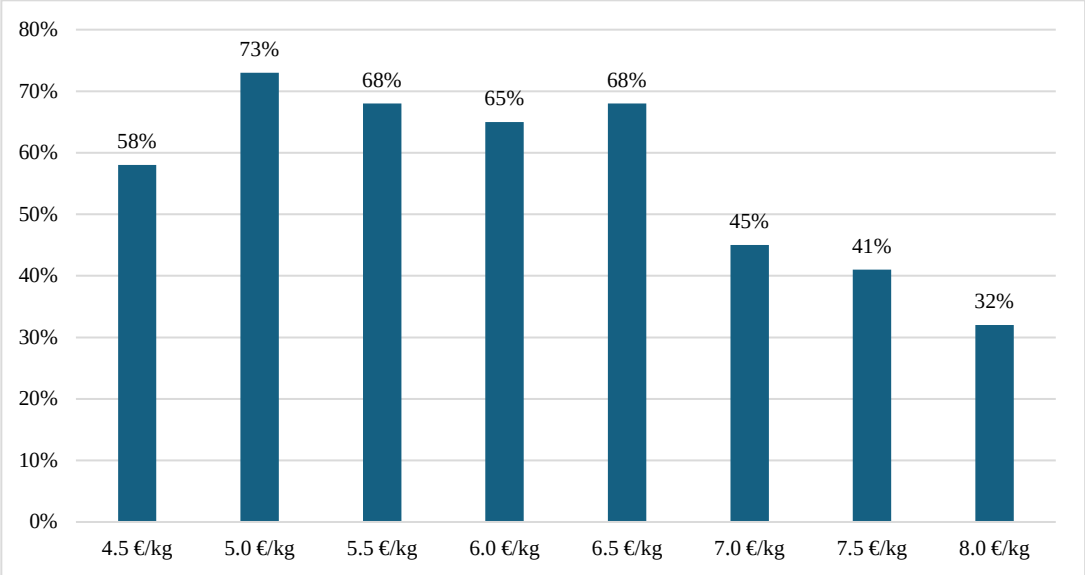
Source: our elaboration



Figures 3 and 4 represent the acceptance rate by bread format and by price level. With respect to the former attribute, we found an average acceptance rate higher for the smaller format, which is consistent with the current tendency of low bread consumption that characterize Italian households. With respect to the price attribute, we find, as expected, a negative relationship with the acceptance rate. However, this trend is not completely evident, especially regarding the lower price range. In particular, the acceptance rate appears relatively low for the lower price level, thus suggesting that higher demand could not strictly correspond to lower prices, in the case of bread type with special characteristics. This evidence supports the need to deepen the analysis of the role of price (notice that not all the price levels have been proposed for each distribution channel, since we have decided to exclude prices implausibly low or high for specific channels).

Figure 3. Pane Grosso acceptance rate in the choice experiment by bread format

Source: our elaboration

Figure 4. Pane Grosso acceptance rate in the choice experiment by price level

Source: our elaboration

We have analyzed the preferences stated by potential consumers in the proposed choice experiment with a logistic regression, aimed at explaining the stated choice of purchasing or not Pane Grosso with the attributes described in each scenario. In addition, we have considered additional explanatory variables, related to demographic characteristics of the respondents and their consumption habits and lifestyle. Table 1 reports descriptive statistics for the independent variables considered. Notice that, in principle, for each respondent we should have 4 observations, since the choice experiment presented 4 scenarios per questionnaire. However, not all the interviewees have provided an answer for all the proposed scenarios, therefore Table 1 reports the summary statistics for the completed scenarios only, corresponding to 939 observations. For the other explanatory variables, additional missing values emerge.

The first five variables reported are attributes characterizing the scenarios considered. In particular:

- *half_kg is a dummy variable equal to one if Pane Grosso is proposed, in the scenario, in the 500-gr. format, and zero in the alternative case (1 kg format);*
- *Coldiretti_mkt, online and bakery are binary variables that assume a value equal to one if that distribution channel has been proposed in the scenario, and zero otherwise. The supermarket channel has, as well, been proposed to respondents and it is considered the base case, with the related dummy variable omitted to avoid multicollinearity:*
- *p is the variable that captures the price at which Pane Grosso has been proposed in each scenario. The proposed values range from 4.5 to 8 €/kg.*

Subsequently we consider some socio-demographic or lifestyle variables characterizing the respondents:

- *sport is a dummy variable equal to one if the respondent states that she/he practices sport (at an amateur or at a competitive level);*
- *graduate or more is a dummy variable equal to one for people owning a university degree or a higher title;*
- *high_cons is a dummy variable equal to one for respondents stating that, in their household, the weekly bread consumption is more than one kg;*
- *age_18_30, age_31_45, age_46_60 are dummy variables assuming value of one when the respondent belongs to the related age class, and zero otherwise. The last two age categories (including people from 60 to 75 years old and people over 75) have been aggregated, due to the low numerosity of the latter class, and serve as base case, with the related variable omitted in order to avoid multicollinearity;*

Finally, the variables identified by the prefix "c_" are dummies assuming value equal to one when the respondent has identified the related characteristic as relevant for bread purchase and correspond to the characteristics described in Figure 1.

Source: our elaboration

Table 2 presents the results of the estimates related to three logistic regression models. In order to obtain estimates as parsimonious as possible, we implemented a (forward) stepwise procedure, in order to preserve only the significant coefficients. The significance threshold has been fixed at a p-value of 0.1. In Table 2, the column referred to Model (1)

shows the coefficients of the explanatory variables that remained after applying the stepwise procedure (from the full set of variables presented in Table 1).

With respect to the distribution channel considered, we find that that the online channel significantly reduces the probability of accepting (stating that one would have purchased) Pane Grosso, with respect to the base case represented by the supermarket channel, as shown by negative and significant coefficient of the variable "online". On the other hand, the availability of the product at an artisanal bakery would significantly increase the acceptance probability. The "Coldiretti_mkt" variable disappears after the application of the stepwise procedure, meaning that the preference towards this channel does not significantly differs from the preference given to the supermarket. Therefore, we can conclude that, among the distribution channels considered, the preferred one is the bakery, while the least valued one is the internet. Coldiretti market and supermarket lie at intermediate levels.

The "small" format for bread (500 gr. rather than 1 kg) increases the probability of acceptance, and this is relatively consistent with the tendency shown by the Italian household to consume limited quantities of bread. Although Pane Grosso tends to show high durability, probably the respondents prefer to consume more fresh bread in a smaller format.

The price variable, although not considered as relevant by many respondents in making their bread purchase (Figure 1), appears to be significant in explaining the preferences stated in the choice experiment. Indeed, the price coefficient is negative (as expected) and highly significant, meaning that price has a role in making an evaluation of a potential purchase.

With respect to the respondent characteristics, we find that the dummy "high_cons" present a negative and significant coefficient. This means that Pane Grosso is less appealing for consumers living in households with relevant bread consumption. This result could be related to budget constraints, or lower willingness to pay for niche or "premium" products (such as Pane Grosso), in families characterized by high consumption.

The three age dummies present positive and significant coefficients, meaning that the respondents belonging to the three considered age classes are more willing to buy Pane Grosso, all things equal, than respondent aged more than 60. This is particularly evident for the youngest consumers class, which shows a coefficient larger in magnitude and with higher significance level, suggesting that this could represent a particularly interesting segment.

With respect to characteristics considered by respondents in their actual bread purchases, the preference for local products ("c_zero_km"), for the use of sourdough and for organic foods increase the acceptance probability, meaning that Pane Grosso meets the tastes of consumers that evaluate these characteristics. The attention paid to price, instead, reduces the probability of choosing Pane Grosso in the choice experiment, as expected, since high price sensitivity is likely to reduce the willingness to purchase niche products.

Subsequently, we decided to deepen the analysis of the price attribute. Indeed, on one hand, we found that the price characteristic is considered as relevant for bread purchases by a relatively small share of respondents. In addition, the relationship between proposed price and acceptance rate in the choice experiment is not completely clear (Figure 4). On the other hand, however, the estimates of Model (1) show a negative and significant effect of price on the acceptance probability (when all the other variables are held constant). Therefore, we have tested the estimates of Model (2) and Model (3). In Model (2), we apply the mentioned stepwise procedure to a set of explanatory variables including, in addition to the variables tested in Model (1), also the squared price (p2), in order to allow a potential non-monotonic price effect. Moreover, in Model (3) we add also the interactions between the price variable and the socio-demographic and lifestyle variables resulted as significant in Model (1), namely the age dummies and "high_cons" variable, in order to verify if the price effect is different for several consumers segments.

In both the Models (2) and (3), the stepwise procedure preserves the variable "p2" but eliminates the variable "p". Therefore, from Model (2) we conclude that the inclusion of the square price term is useful, since it allows a curvilinear price effect, which remains, however, strictly decreasing for all positive price levels. Slightly different are the results of Model (3), where the application of the stepwise procedure preserves two interaction terms (in both the cases, the variable not interacted with price disappears). One term is the interaction between "p" and "high_cons", which shows a negative and significant coefficient, suggesting that respondents living in households characterized by high bread consumption levels tend to be more sensitive to price, which seems a reasonable conclusion. The other term involves the interaction between price and the most represented age class (namely people between 46 and 60 years old). In this case, the positive and significant coefficient indicates that, for this age class, the sensitivity to price is lower than for the other categories. In addition, for this age class only, the effect of price is non-monotonic in the range of positive price level, although we verified that it is strictly decreasing for the price levels proposed in the choice experiment. For all the other significant variables considered, Model (2) and (3) do not present relevant differences with respect to Model (1).

Source: our elaboration.

Research limitations. *A limitation of the study is represented by the sample composition. In fact, although the data have been mainly collected in the area corresponding to the reference market of Pane Grosso, the respondents' participation was completely on voluntary basis, and we have accepted all the voluntary respondents. Therefore, the sample may not completely represent the characteristics of the population of the area and this point limits the possibility of generalizing the results. Nevertheless, we believe that the study provides relevant insights regarding the potential market for Pane Grosso and reveals the key distribution channels.*

Managerial implications. *Notwithstanding the caution imposed by the limitations of the research discussed above, this study provides important insights for the development of proper market strategies for Pane Grosso. First, the high appreciation of Pane Grosso demonstrated by the respondents after tasting, and the large use of other bakery product different from bread, suggest a good market potential for Pane Grosso and the related bakery products. With special focus on Pane Grosso, we found indications about the most promising distribution channel (bakeries), and the least promising one (online sales), as well as about the bread format, with a smaller one preferred over the "standard" one-kg format. In addition, although most respondents do not indicate price as a relevant variable in making bread purchases (which is also a reasonable statement given the little relevance of bread expenditure with respect to the household budget), in the proposed choice experiment we found that price does matter in explaining respondent stated preferences. Therefore, the price variable cannot be neglected in Pane Grosso marketing mix definition. Finally, the most appealing target segments seem to be younger consumers, but also middle-aged consumers which resulted as less price sensitive, and consumers that value local and natural products. Price-sensitive consumers, instead, are not likely to appreciate this niche product.*

Originality of the paper. *The paper adopts a stated-preference approach for supporting the development of a marketing strategy for a relatively new product, Pane Grosso, characterized by a strong local connotation. The choice experiment on which the study is based has been conducted with reference to the local market (involving residents and potential visitors) and implied tasting the product. Therefore, the process simulated very closely the actual choices of potential consumers in the market.*

Key words: *bread; choice experiment, logistic regression, stated preferences.*

Aknowledgments:
We thank the Piedmont Region and the European Union for supporting the research project "Panem Nostrum Everyday. Nutrire Terdona" CUP: J66B20006320002.
We are grateful to Weam El Mostachrik for the excellent assistance on the data.

Twin transition and spatial embeddedness: an empirical analysis on the Italian provinces

LORENA MARIA D'AGOSTINO[1] CAMILLA CIVARDI[2] CLAUDIA GHISETTI[3]
ERICA SANTINI[4] JACOPO STAIANO[5]

Abstract

This paper investigates the factors influencing the adoption of digital, green, and twin transition (TT) practices across Italian provinces, considering the impact of public funding dispersion. Using the novel PLOTTI dataset, which integrates province level data from the ISTAT business census, the national database of state aids (RNA), and Moody's AIDA, we capture the diffusion of digital, green, and twin innovations at the local level. Our empirical analysis relies on a cross-sectional econometric framework that incorporates spatial dependencies to identify provincial spillovers. Preliminary results reveal that a more evenly distributed allocation of public funds, in other words, lower concentration, facilitates broader engagement with both digital and green innovations, suggesting that inclusive policy approaches accelerate TT adoption in local production systems (LPSs). We discuss implications for policymakers and business leaders, emphasizing the need for inclusive public interventions, collaborative networks, and place leadership arrangements that can help overcome the barriers to twin transition. While the paper highlights the importance of local production structures in Italy, we also outline that the lessons learned extend to any region seeking to reconcile sustainability goals with digital transformation.

Framing of the research. *The growing imperative of environmental sustainability and the rapid expansion of digital technologies have led scholars, policymakers, and businesses to explore new integrative frameworks, bringing together both green and digital innovations (Lichtenthaler, 2021; Lenz, 2021). Over the past decade, concerns regarding climate change, carbon emissions, and resource depletion have intensified (Markard et al., 2012). In response, governments worldwide have supported policies aimed at promoting a more sustainable economic system, from stricter environmental regulations to subsidies for renewable energy (Blüm, 2022).*

At the same time, recent technological breakthroughs, particularly in data analytics, artificial intelligence (AI), the Internet of Things (IoT), and robotics, have fundamentally reshaped the way businesses operate, communicate, and manage resources (Dwivedi et al., 2022). These digital transformations hold significant potential to reduce environmental footprints; for instance, advanced analytics can minimize waste by forecasting demand more accurately, while IoT solutions can enhance energy efficiency by monitoring machine performance in real time (Del Río Castro et al., 2021). Nonetheless, the environmental benefits of such digital tools are not automatic and can be offset by increased energy consumption, rebound effects, or the environmental costs of building digital infrastructure (Ahmadova et al., 2022).

Bringing these two imperatives together, the concept of the "Twin Transition" (TT) recognizes that combining sustainability with digitalization can yield synergies that accelerate innovation at multiple levels, ranging from individual firms to entire regional ecosystems (Bianchini et al., 2023). Twin Transition projects have the dual objective of greening the economy while leveraging digital solutions to address social and environmental issues in a cost-effective and innovative manner (Loorbach et al., 2017). This orientation strongly aligns with the European Union's strategic agenda, where the European Green Deal (2019) and NextGenerationEU (2021-2027) highlight the synergy between green and digital transitions (European Commission, 2023b).

Italy, known for its strong tradition of manufacturing and artisanal craftsmanship, provides an intriguing environment to study TT, particularly because of the country's distinctive economic structure. Various sized enterprises are often clustered in specialized local production systems (LPSs) and constitute a major share of the Italian industrial fabric

(Bellandi et al., 2021). These LPSs can be found in well-known industrial districts, such as those focusing on textiles, furniture, or mechanical engineering, that have historically leveraged local social capital, cultural traditions, and specialized networks to sustain competitiveness (Becattini, 1987).

Despite their strengths in collaboration and product specialization, Italian companies also confront challenges: limited financial resources, relatively small scales of operation, and occasional reliance on path-dependent practices that may slow adoption of radical changes (Montresor & Vezzani, 2023). Consequently, the move to combine sustainability and digital solutions becomes a demanding task, given that these companies must simultaneously overcome the inertia of existing systems, adapt to new market pressures, and invest in skill development or infrastructure (Raven, 2007; Elzen et al., 2011).

Nonetheless, local production systems are often embedded in "place leadership" dynamics, wherein local institutions, trade associations, and regional agencies play a pivotal role in fostering innovation (Bellandi et al., 2021). Through coordinating funding, policy incentives, and training, these place leadership actors can accelerate the uptake of digital and green practices that might otherwise be too risky or resource-intensive for single companies to pursue alone (Macdonald & Williams, 1994).

Within the European Union, a combination of legislation (e.g., the Fit for 55 package) and recovery funds (e.g., the Recovery and Resilience Facility) aim to propel member states toward reduced emissions, energy efficiency, and widespread adoption of advanced technologies (European Commission, 2023a, 2023c, 2023d). Italy's National Recovery and Resilience Plan (PNRR) is similarly aligned, earmarking substantial investment to promote digital upgrades, reduce carbon emissions, and stimulate eco-friendly projects among both public and private sectors (Italian Ministry of Economy and Finance, 2021). Additional national programs, including Transition 4.0 tax credits and direct measures by agencies such as Invitalia or Banca del Mezzogiorno MedioCredito Centrale, contribute to a multi-pronged policy environment.

Despite these efforts, gaps remain in understanding precisely how these funds are distributed, whether they are concentrated among a few large beneficiaries or spread across multiple smaller businesses, and how this distribution shapes local economies' capacity to adapt and thrive within the TT paradigm. This phenomenon is of particular interest when examining spatial disparities in a country as regionally diverse as Italy, where industrial ecosystems, infrastructure, and public administration capabilities vary widely between the north, center, and south (Bianchini et al., 2023).

Purpose of the paper. *This paper seeks to explore the determinants of digital, green, and twin transition adoption at the provincial level in Italy, devoting special attention to the role of public funding dispersion. Our key research question is: What are the factors underlying the adoption of digital, green, and twin practices in Italian provinces?*

Understanding these dynamics has substantial policy relevance. While research on sustainability and digital innovation often targets individual firm outcomes, local production systems and provinces provide a broader lens to examine systemic changes, knowledge spillovers, and collective learning (Montresor & Vezzani, 2023). If TT is to become deeply rooted in local industrial fabrics, it is crucial to consider how funds, infrastructure, institutions, and place-based leadership interact in different regions.

Recent literature suggests that both environmental and digital innovations are shaped by local context, including institutional arrangements, the degree of networking among firms, and regional capacity for R&D (Lichtenthaler, 2021; Sareen & Haarstad, 2021). At the firm level, digital readiness and green orientation may be highly correlated, such that early adopters of advanced digital tools often find it easier to incorporate sustainability practices over time (Montresor & Vezzani, 2023). Nevertheless, smaller enterprises may lag behind if financial barriers, policy misalignments, or knowledge deficits prevent them from investing in both digital upgrades and sustainability transitions simultaneously.

A key contribution of this paper is examining how public funds, particularly state aids, are distributed within a province. Rather than look solely at the total volume of funds, we measure the degree to which that support is concentrated or dispersed using the Herfindahl-Hirschman Index (HHI). Previous research indicates that, while "big push" investments in a handful of champion firms may accelerate short-term outcomes, it often fails to generate more widespread local spillovers (Pfeffer, 1972). Conversely, distributing funding among a broader base of businesses can encourage more inclusive adoption processes, stimulate knowledge exchanges, and enhance overall resilience in local systems (Dearing & Cox, 2018). The strong industrial traditions in many Italian provinces set the stage for testing whether widespread access to financial support prompts more collaborative and systemic transitions toward both digital and green practices.

Methodology. *To investigate the adoption of TT practices at the local level, we exploit a novel dataset, the "Place Leaders of Twin Transition in the Italian local manufacturing systems" (PLOTTI) and focus on Italian provinces. Considering the lack of available micro-level data and specific information at the local labour market level, we chose to focus our analysis on Italian provinces. This broader geographic scope allows us to effectively control for local specializations and diverse economic structures, providing a practical and meaningful approach to address the data constraints. By analysing provincial-level data, we can still capture important variations in economic activities and specializations, enabling a comprehensive understanding of regional labour market dynamics despite the absence of more granular data. PLOTTI database draws information from three different main sources: ISTAT business census data, the national database of state aids (Registro nazionale degli aiuti di Stato, RNA), and Moody's AIDA business database. Additional information on provinces is sourced from ISTAT and EUROSTAT.*

From the most recent ISTAT business census, covering approximately 280,000 companies, we use three questions relevant to our conceptualization of TT: one on innovation activities (digital transition), one on environmental sustainability measures (green transition), and one on technologies supporting eco-friendly initiatives (TT).

From the national database of state aids (RNA), PLOTTI contains information on aids to Italian companies in the period 2014-2024 that have a match to AIDA business database. From the initial 63,302 aids, PLOTTI contains 45,976 aids to 34,917 companies. Each of these aids has been classified in digital (i.e. 81.9%), green (10.4%) or twin 2.7% domains.

Our empirical approach is summarized by the following model:

*Y_pk = f(HHI_p; X_p; Z_p; W_pm*Y_m),*

where Y_pk represents the percentage of firms in province p that have implemented initiative k (i.e., digital, green, or twin). Regressors are 1-year lagged. Our main variable of interest is HHI_p, which is a Herfindahl-Hirschman index capturing the dispersion of public funds in province p among firms, based on total amount (i.e. HHI_amount) and number (HHI_number) of financings received. X_p includes provincial-level variables to control for the number of industrial districts embedded in the province p, economic size, agglomeration economies, specialization, and innovation propensity. Z_p comprises variables built on firm data that received the aids and aggregated at the level of the province: average firm size (using total assets), share of firms in knowledge-intensive manufacturing sectors, and the Shannon Entropy Index for sectoral specialization. Finally, W_pm is a distance matrix measuring the spillover effects from neighbouring province m's adoption rate Y_m. The econometric strategy employs a cross-section baseline model where Y_pk is estimated through OLS; in addition, spatial spillovers in either dependent variable or residuals (or both) are accounted for by means of Spatial Lag Model, Spatial Error Model or Spatial Durbin model.

Results. *We present some exploratory and preliminary results. Tab. 1 shows the distribution across provinces of the three outcome variables and other important independent variables.*

As expected, a larger share of firms is engaged in initiatives to reduce the environmental impact of their economic activities, about 1 out of 5 (i.e. 21.94%). By contrast, the adoption of advance digital technologies is less pervasive, with only 4.73% of firms using it. Accordingly, TT firms account for only 1.85% on average. Tab. 1 also shows the top five provinces with the highest scores in each category: Digital, Green and TT. It is interesting to observe that the provinces vary across categories, and there is no clear divide between North, Centre and South of Italy. In terms of regions, Calabria, Lombardy, and Veneto consistently appear in the top five, though with different corresponding provinces.

The variables "HHI_funds" and "HHI_number" measure the Herfindahl-Hirschman Index (dispersion of public funds) based on the amount and the number of financings received by the provinces between 2019 and 2021, respectively. The difference between the average values of the two is mainly due to the fact that some provinces never received any financing (i.e., HHI_number equals zero), which affects the calculation results. Nevertheless, the dispersion of financing amounts across provinces is notably larger than the dispersion in the number of financings to firms, which in many cases received just one aid. The higher standard deviation (SD = 0.1679) for HHI_amount also indicates greater variability in the concentration of funding amounts. In contrast, HHI_number has a smaller SD (0.0507), reflecting that, in most provinces, financing is either absent or more evenly distributed. The median values further reinforce this pattern, with HHI_number being close to zero in many cases. Moreover, the HHI_amount is highest in provinces such as Lucca, Firenze, and Pisa (all in Tuscany), suggesting that financing amounts in these areas are more concentrated among fewer recipients, while the HHI_number is led by Caltanissetta and Messina (Sicilia), as well as Brindisi (Puglia), indicating that in the South of Italy, the number of financings is more unevenly distributed across firms, with some receiving significantly more support than others.

Finally, we consider the number and the total amount of financings received by each province between 2019 and 2021 (variable "NFin19_21" and "TotFin19_21"), as well as the number of industrial districts in each province (variable "Industrial district"). As we can observe, the mean number of financings per province (148.90) is notably higher than the median (83), indicating a right-skewed distribution, where a few provinces receive significantly more financings than others. This is further reflected in the high standard deviation (SD = 273.98), showing considerable variability across provinces. The total financing amounts exhibit even greater disparity, with an average of approximately €5.58 million, but a median of only €1.37 million. The high standard deviation (€11.28 million) suggests that some provinces received disproportionately large amounts, while many others received much less. The provinces with the highest numbers of financings are mostly large economic hubs like Rome, Milan, and Brescia, along with Bolzano and Genoa, which may reflect strong economic activity and government funding availability. Additionally, the top recipients of total financing include Rome, Milan, and Turin, which are among Italy's major economic and financial centers, along with Naples and Brescia, likely due to the presence of large-scale industries and infrastructure projects.

To conclude, the number of industrial districts per province is quite low on average (1.33) and has a median of 1, meaning that many provinces have either one or no industrial districts. The high standard deviation (1.83) suggests that some provinces have significantly more industrial districts than others, creating a highly uneven distribution. The provinces with the highest number of industrial districts are Ravenna (Emilia-Romagna), Sondrio (Lombardy), and Bergamo (Lombardy), reflecting the strong manufacturing and industrial tradition in these regions. Interestingly, Isernia (Molise) and Reggio di Calabria (Calabria) appear in the top five, which indicate the relevance of specialized industrial clusters even in these peripherical areas.

Tab. 1 - Summary statistics of main variables

Variable	Obs.	Mean	Median	SD	Top 5 Provinces (with Region)
Digital	107	4.73	4.44	1.63	Bergamo (Lombardia) Sassari (Sardegna) Treviso (Veneto) Cosenza (Calabria) Isernia (Molise)

TotFin19_21	107	5582047.82	1365739.21	11276256.98	Roma (Lazio) Torino (Piemonte) Milano (Lombardia) Napoli (Campania) Brescia (Lombardia)
Industrial district	106	1.33	1	1.83	Ravenna (Emilia-Romagna) Sondrio (Lombardia) Isernia (Molise) Bergamo (Lombardia) Reggio di Calabria (Calabria)

Tab. 2 shows the correlation between the key variables discussed above, providing valuable insights into the relationships among digital adoption, green practices, funding dispersion, and industrial structure. First, we observe that, although positive and statistically significant, the correlation between provinces with higher shares in both Digital and Green are relatively low (0.34). This suggests that while firms investing in digital technologies are somewhat more likely to engage in green initiatives, the two trends do not always move together. Structural or sectoral differences across provinces may explain why some regions focus more on one aspect than the other. Secondly, funding dispersion seems to matter: provinces with a more dispersed distribution of public funds (a lower HHI_Num) show higher adoption rates for digital technologies. This outcome is consistent with the idea that inclusivity in funding fosters broader learning effects and encourages multiple actors to experiment with digital solutions. TT Adoption is more strongly linked to Digital than Green practices: the correlation between TT and Digital (0.60, p = 0.0000) is notably stronger than that between TT and Green (0.25, p = 0.0089).

Amount and number of financings play a role, but are not the only determinants of technological adoption: total financing amount (TotFin19_21) show weak to moderate positive correlations with Digital (0.22), but the strongest correlation in this category is between NFin19_21 and TotFin19_21 (0.79, p = 0.0000), which may indicate that provinces receiving more financings tend to also receive larger total amounts. However, these financings do not necessarily translate into a proportionate increase in digital or green technology adoption.

Finally, the number of industrial districts per province correlates positively with Digital (0.27, p = 0.0052) and Green (0.33, p = 0.0006), both statistically significant relationships. This suggests that provinces with a stronger industrial base tend to have higher adoption of both digital and green technologies, likely due to better infrastructure, knowledge-sharing networks, and a culture of innovation. The positive, though weaker, correlation between industrial districts and TT (0.23, p = 0.0164) indicates that technology -driven sustainability solutions are also somewhat more prevalent in industrial regions, although this relationship is not as pronounced as for general digital technologies.

Tab. 2 - Correlation table

	Digital	*Green*	*TT*	*HHI_amount*	*HHI_number*	*NFin19_21*	*TotFin19_21*	*Industrial district*
Digital	1.0000							
Green	0.3477 0.0002	1.0000						
TT	0.5967 0.0000	0.2516 0.0089	1.0000					
HHI_amount	-0.1261 0.1957	0.0075 0.9389	-0.0502 0.6076	1.0000				
HHI_number	-0.2968 0.0019	-0.1009 0.3011	-0.0713 0.4654	0.4035 0.0000	1.0000			
NFin19_21	0.1794 0.0645	0.0706 0.4697	0.0777 0.4262	-0.2415 0.0122	-0.2964 0.0019	1.0000		
TotFin19_21	0.2201 0.0227	0.1477 0.1290	0.0988 0.3115	-0.0850 0.3839	-0.2588 0.0071	0.7903 0.0000	1.0000	
Industrial district	0.2693 0.0052	0.3280 0.0006	0.2326 0.0164	-0.2085 0.0319	-0.2670 0.0057	0.2047 0.0353	0.1559 0.1104	1.0000

While the analysis is still ongoing, we can present some preliminary results.

As for the role of industrial districts, we observe that while industrial districts have historically spurred innovation, our preliminary evidence does not uniformly show that simply having a district is enough to drive TT adoption. Contextual factors such as type of specialization, local leadership, and synergy among district firms seem to be critical. Some industrial districts appear dynamic and receptive to TT, while others may be locked into established routines.

We also observe variation in Twin Adoption. The twin dimension, where digital innovation explicitly supports sustainability objectives, remains the smallest share among the three categories (digital, green, twin). Even among provinces with vigorous digital ecosystems, the percentage of firms that apply those digital tools specifically to reduce environmental impacts tends to be relatively limited (often below 2-3% at the provincial level, as shown in ISTAT'). This gap highlights the potential for more explicit policy measures that tie digital strategies to green outcomes.

These insights resonate with existing literature stressing that the success of TT depends on the ability of local systems to harness knowledge spillovers and coordinate across multiple stakeholders (Sareen & Haarstad, 2021; Montresor & Vezzani, 2023). Moreover, they reinforce the idea that the local design and delivery of public funds, beyond mere volume, can shape the scale and speed of TT adoption.

Research limitations. *While PLOTTI offers extensive multilevel- data, it does not account for qualitative factors such as managerial perceptions or organizational culture that encourage or discourage radical innovation. Such qualitative dimensions are critical in understanding the full complexity of TT adoption, particularly in industrial districts (Bellandi et al., 2019). Future studies may want to adopt a mixed methods approach to fully capture alternative qualitative dimensions.*

Additionally, while the combination of ISTAT's business census questions and the RNA classification (digital, green, twin) provides a helpful framework, these categorizations may not fully reflect the complexity of integrated solutions. Some firms may practice partial digitalization or modest environmental improvements that do not neatly fall into the twin category.

Finally, there are potential endogeneity concerns. The degree of funding dispersion itself might be influenced by local institutional strength or pre-existing relationships between firms and public agencies (Pfeffer, 1972). Although we partially address this issue with robust controls, the results may still reflect underlying selection biases. Future research might leverage instrumental variables or differences in regional policy rules to isolate more precise estimates.

Managerial implications. *The findings of this study carry significant relevance for policy and managerial practice in local manufacturing contexts. In particular, the evidence highlights the value of inclusive funding strategies: distributing resources across a broader range of firms fosters widespread innovation uptake, rather than concentrating opportunities among a few dominant players. Such an approach may prove especially beneficial in manufacturing-based local production systems, where multiple specialized firms operate in interconnected value chains.*

Further, place-based leadership emerges as critical. Local governments, trade associations, and development agencies can play a key role by organizing collective training on digital platforms specifically linked to sustainability

objectives. By lowering the perceived risks of innovation and fostering knowledge exchange, such initiatives can accelerate TT adoption, particularly in manufacturing clusters where firms may otherwise hesitate to integrate digital tools for green purposes.

Beyond individual provinces, stronger regional coordination can enhance knowledge spillovers and accelerate TT adoption. Initiatives such as shared pilot programs and cross-province consortia can drive innovation, particularly in regions where supply chains and industrial networks span multiple administrative areas.

A key priority is bridging the gap between digital and environmental goals by crafting policies that explicitly tie digital investments to sustainability outcomes. Ensuring that technological adoption supports both competitiveness and ecological benefits can strengthen the case for TT adoption across diverse sectors.

Finally, for manufacturing systems with deep-rooted traditional methods, a stepwise approach can facilitate transition: starting with simpler digital solutions enables firms to build confidence and technical capacity, creating a foundation for progressively integrating advanced green practices. This gradual pathway can help mitigate resistance and ensure long-term TT adoption.

Originality of the paper. *This research advances the existing literature by examining TT through a provincial lens in Italy, where manufacturing-based local production systems offer a distinctive environment for innovation and sustainability (Bianchini et al., 2023; Montresor & Vezzani, 2023). Rather than zeroing in on single-firm analyses, we bring to light how place-based factors, such as funding policies, and industrial district organization, shape the collective capacity to integrate digital and ecological goals.*

Moreover, our emphasis on public funding dispersion adds a novel dimension to debates about effective policy design for fostering inclusive innovation. By systematically investigating whether dispersed funding correlates with broader TT adoption, we provide evidence that goes beyond the total funding volume to illustrate how resource allocation patterns matter for local production systems. Coupled with spatial econometric approaches, this analysis underscores the importance of knowledge diffusion and cross-province interactions, potentially informing decision-makers who seek to structure policies that spur regionally cohesive, green-digital transformations.

While focused on Italy, the methodological insights and policy lessons extend to other contexts that feature strong industrial clusters or local manufacturing ecosystems, highlighting the role of territorial conditions in orchestrating large-scale technological and environmental transitions (Rogers, 1962; Geels, 2011).

Key words: *Twin Transition; Digitalization; Sustainability; Local Production Systems; Public Funding; Spatial Econometrics*
