Exploring the Role of Cultural Intelligence in Career Sustainability: A Multi-Industry Comparative Study

BICE DELLA PIANA[1] MAY OWEN[2]

Abstract

The concept of sustainable careers has gained increasing attention. Some recent studies proposed a framework which identifies happiness, health, and productivity as core dimensions of career sustainability and spirituality. While previous research has examined Cultural Intelligence in the context of the airline industry, particularly in Intercultural Service Encounters, little is known about how Cultural Intelligence contributes to career sustainability across various industries. This study seeks to extend the existing research by conducting a multi-industry comparative study, investigating the role of Cultural Intelligence in fostering career sustainability across service-oriented industries. It provides preliminary insights into how individuals, organisations, and national culture interact to shape sustainable careers in Intercultural Service Encounters settings.

Key words: *Sustainable careers, Cultural Intelligence, Intercultural Service Encounters, Career Ecosystem, Cross-Industry Comparison.*

Framing of the research

Sustainable Careers

Sustainable careers represent sequences of career experiences that ensure ongoing employment and facilitate personal development, adaptation to change, and individual and organizational resilience over time (Van der Heijden et al., 2020; De Vos et al., 2020). Initially introduced by Van der Heijden and De Vos (2015), the concept underscores dynamic alignment between individual capabilities, organisational roles, and contextual factors, emphasizing mutual benefits and adaptability. The sustainable career model delineates three primary dimensions: health, happiness, and productivity (De Vos et al., 2020).

Health encompasses the alignment of careers with physical and psychological wellbeing, emphasizing that career decisions must account for physical demands such as those experienced by healthcare workers, and psychological stressors prevalent in high-demand roles, potentially leading to burnout (Khamisa et al., 2016; Bernal et al., 2015).

Happiness refers to subjective assessments of career success, rooted in how careers align with personal values and broader life satisfaction (Sheldon et al., 2002). Happiness in careers is dynamic and must continually realign with evolving life circumstances, indicating the importance of ongoing career reassessment.

Productivity covers current job performance and future employability, crucial for career longevity. Adaptation to changing organisational needs and job demands is essential, reflecting career adaptability and resilience to external disruptions like technological changes or economic downturns (De Vos et al., 2020).

Recent studies have explored sustainable careers from diverse angles, such as the role of reduced-load work arrangements in maintaining career sustainability through balanced workload management (Kossek & Ollier-Malaterre, 2024). Research by Straub, Vinkenburg, and Van Kleef (2020) examines career customization, noting that flexibility in workload and job responsibilities can enhance career sustainability if aligned with individual and organisational needs. Conversely, Richardson and Mckenna (2020) explore the unsustainable aspects of careers in professional sports, highlighting unique social demands and resources that require strategic management for career transitions.

Cultural Intelligence (CQ)

Cultural intelligence, crucial in global workplaces, facilitates effective performance in intercultural interactions by enhancing intercultural understanding and adaptability (Ang et al., 2007; Van Dyne et al., 2008). CQ comprises four core dimensions: metacognitive, cognitive, motivational, and behavioural (Ang et al., 2007).

Metacognitive CQ involves high-level strategies enabling continuous revision of assumptions about cultural interactions, essential for adjusting behaviours in culturally diverse situations (Ang et al., 2007; Triandis, 2006). Cognitive CQ covers explicit knowledge about cultural practices, facilitating informed intercultural communication and interaction (Van Dyne et al., 2008). Motivational CQ reflects an individual's willingness to engage with cultural diversity,

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

crucial for sustained career engagement and adaptability. Behavioural CQ involves demonstrating culturally appropriate behaviours, facilitating effective intercultural communication and performance (Van Dyne et al., 2008).

Tungtakanpoung and Prouska (2024) underscore the strategic role of CQ within ICSEs-intensive industries, linking enhanced CQ competencies with increased career sustainability through superior customer satisfaction and employee adaptability. Similarly, Lin, Zhang, and Gursoy (2021) validate CQ as directly contributing to improved performance and customer satisfaction, further supporting the importance of embedding CQ training within organisational practices to foster career longevity.

Cultural Intelligence and Career Sustainability

Research increasingly emphasizes CQ's integral role in career sustainability, especially within industries characterized by significant intercultural interaction. Studies suggest high CQ facilitates overcoming intercultural barriers, thus directly impacting job performance, employability, and career satisfaction. Additionally, cross-cultural competency training, when aligned with organisational practices, significantly enhances career sustainability by preparing employees for dynamic intercultural demands (Lin, Zhang, & Gursoy, 2021).

Further, Tungtakanpoung & Prouska (2024) integrate CQ into career sustainability frameworks, demonstrating that cultural adaptability can lead to enhanced career success by supporting sustained employability and resilience in diverse cultural contexts. They advocate a holistic approach, embedding CQ within broader HR strategies aimed at long-term career development.

This comprehensive review of sustainable career and cultural intelligence literature illustrates the critical interplay between individual competencies, organisational policies, and broader societal influences in facilitating career sustainability across diverse industries. Based on previous research, the findings suggest that CQ significantly influences career sustainability across different service-oriented industries by enhancing individual performance and adaptability in intercultural contexts. Service employees with high CQ competencies demonstrated greater effectiveness in managing intercultural interactions, leading to increased customer satisfaction, improved personal job satisfaction, and sustained employability. Industry-specific variations revealed nuanced differences in how CQ competencies are valued and developed within organisational cultures and across different national contexts. These findings expand upon existing models by highlighting the specific ways CQ facilitates sustainable careers in diverse industries, reinforcing the critical role of cultural adaptability.

Industry-Specific Insights

Intercultural Service Encounters (ICSE) is a specific form of service encounter where providers have a different cultural background to receivers (Gutek, 1999; Gutek et al., 2002; Delcourt et al., 2013; Gaur et al., 2017; Lorenz et al., 2017; Vrontis et al., 2021). ICSEs have increased greatly due to globalization which accelerated goods and services customer interactions (Sharma et al., 2009; Tam et al., 2014, 2016).

These encounters are prevalent in various industries where cross-cultural communication and understanding are essential for delivering effective and satisfactory service. Below are the key industries related to ICSEs:

Industry	**Examples of Intercultural Service Encounters (ICSEs)**
Hospitality and Tourism	Hotels, restaurants, travel agencies, airlines
Retail and E-Commerce	International retail chains, luxury goods, e-commerce platforms
Healthcare	Hospitals, telemedicine, pharmaceuticals
Education	International schools, language schools, study abroad programs
Financial Services	Banks, insurance companies, fintech
Technology and IT Services	Customer support, software development, tech retail
Transportation and Logistics	Ride-sharing services, shipping/delivery services, public transportation
Entertainment and Media	Film and television production, live events, streaming platforms
Real Estate	International property sales, hospitality real estate, relocation services
Non-Profit and Social Services	International NGOs, community services, cultural exchange programs
Legal and Consulting Services	International law firms, management consulting, immigration services
Automotive	Car dealerships, ride-hailing services, automotive manufacturing
Fashion and Beauty	International fashion brands, cosmetics, fashion events
Sports and Recreation	International sports events, fitness centers, adventure tourism
Telecommunications	Customer support, mobile services, internet service providers

Even though definitions on ICSE abound, a consensual definition of ICSE by Stauss and Mang (1999, p. 331), states: "service encounters are inter-cultural if the service provider and customer belong to different cultures".

Several scholars emphasize that ICSEs are complex ibecause they involve intergroup and interpersonal facets (Wang and Mattila, 2010). This complexity may cause misunderstanding, resulting in frustrated service providers, dissatisfied customers, and, ultimately, loss of business (Wang and Mattila, 2010).

A comprensive review on ICSE by Vrontis et al. (2021), highlight many studies state that, even if there are different definitions adopeted with regard to culutral competence and intercultural competence, such as intercultural sensitivity, intercultural effectiveness, and cultural intelligence, all suggest that this kind of competence influences intercultural interactions Sharma et al. (2009). Even though it is a theory that connect directly with ICSEs, only a small number of the studies mention it (i.e. Sharma et al., 2009, 2012, 2016).

Purpose of the paper. *The sustainability of careers has emerged as a significant area of scholarly interest due to rapidly evolving global economic environments and increasing intercultural workplace interactions. The concept of sustainable careers emphasises continuous employment in roles that facilitate personal development and adaptivity to external changes, thereby securing longevity and satisfaction for individuals and productivity for organisations (Van der Heijden et al., 2020). Cultural Intelligence (CQ), specifically, has been highlighted as pivotal in enhancing career sustainability, especially within occupations characterised by intercultural service encounters (ICSEs) (Tungtakanpoung & Prouska, 2024). However, existing research largely focuses on singular industries, notably airlines, leaving gaps concerning other service-oriented sectors. This study aims to bridge this gap by exploring the impact of CQ on sustainable careers across multiple industries, incorporating various national cultural contexts.*

This research integrates the Career Ecosystem theory (Baruch & Rousseau, 2019), the sustainable careers framework (De Vos et al., 2020, Tungtakanpoung & Prouska., 2024). Career Ecosystem theory posits that career sustainability is shaped through interactions between individuals, organisations, and broader national cultural contexts. Thus, sustainable career practices require alignment across these multiple dimensions, highlighting shared responsibility between employers and employees (Donald et al., 2024). Cultural Intelligence significantly impacts career sustainability through productivity, particularly in ICSEs-intensive occupations. Employees with high CQ demonstrate an enhanced ability to overcome cultural barriers such as language or behavioural misunderstandings, thereby offering superior service experiences (Lin, Zhang & Gursoy, 2022). Such competence directly impacts their performance and productivity, pivotal for sustaining long-term careers in ICSE contexts.

The present study adopts a multi-industry approach, examining sectors beyond airlines, to understand variations in CQ's influence across different industries. Preliminary ethnographic research conducted in Thai Airways underscores the significance of CQ in performance and customer service interactions (Tungtakanpoung & Prouska, 2024). Expanding upon this, the study aims to uncover variations in the impact of CQ on career sustainability across broader service industries, emphasizing intercultural interactions as common denominators.

Methodology. *This study employs ethnographic qualitative methodologies, encompassing in-depth semi-structured interviews and critical incident techniques across multiple national contexts. This approach ensures a comprehensive understanding of the practical implications of CQ on sustainable career practices in intercultural settings.*

This study employs an ethnographic qualitative methodology, combining in-depth semi-structured interviews, critical incident techniques (CIT), and participant observations across multiple cultural contexts. The ethnographic component involved immersive engagement within selected organizational settings to observe ICSEs and understand the lived experiences of service employees.

A total of 30 interviews were conducted, with 10 participants from each of the hospitality, healthcare, and education sectors. Data collection occurred over a six-month period from March to July 2025, across two countries: the UK and Italy. Critical incidents were classified using Flanagan's (1954) method and further analyzed based on their frequency, perceived impact on career sustainability, and relevance to the four CQ dimensions. Incidents were weighted according to their reported influence on the participant's health, happiness, or productivity—aligning with De Vos et al.'s (2020) sustainable career dimensions.

Thematic analysis followed Braun & Clarke's (2013) guidelines. Transcripts will be coded for reliability. Each critical incident was mapped to the corresponding CQ competencies (metacognitive, cognitive, motivational, behavioural) and cross-verified against industry-specific factors and cultural context.

Data collection involves semi-structured interviews and critical incident in service industries across multiple national contexts. The ethnographic approach enables researchers to observe and document intercultural interactions and the application of CQ competencies, facilitating a deep understanding of how these competencies impact career sustainability.

Semi-structured interviews: Conducted with service employees across different sectors to explore their experiences and perceptions related to CQ competencies and career sustainability.

Critical Incident Technique: Researchers immerse themselves within the environments, noting interpersonal interactions, behaviors, and practices related to CQ through integrated CIT to the interview.

The collected qualitative data is analysed using thematic analysis to identify recurring patterns and themes related to CQ and career sustainability. Transcripts and observational notes are coded and categorised to facilitate thematic analysis (Braun & Clarke, 2013).

Semi-structured interviews incorporating the CIT were conducted to elicit critical incidents from participants. Participants were prompted to recall specific intercultural encounters that substantially impacted their career sustainability, either positively or negatively. Example interview questions included: "Can you share a specific incident

where your cultural intelligence significantly influenced your career sustainability or intercultural effectiveness?" (Viergever, 2019).

Additionally, critical incident techniques within the workplace environments provided contextual richness, capturing naturally occurring behaviours, interactions, and emotions during intercultural encounters (Robson, 2011). This will provide deeper insights into organisational culture and practices.

The collected qualitative data is analysed using thematic analysis to identify recurring patterns and themes related to CQ and career sustainability. Transcripts and observational notes are coded and categorised to facilitate thematic analysis (Braun & Clarke, 2013).

Research Questions

1. *How does cultural intelligence influence performance and career sustainability in industries characterized by high levels of intercultural service encounters (ICSEs)?*
2. *How does the impact of cultural intelligence on career sustainability vary across different industries and national cultural contexts?*
3. *How do individuals, organizations, and national culture interact to shape sustainable careers within ICSE settings?*

These two methods involve combining multiple methods or data sources to enhance the validity and richness of research findings (Robson, 2011). In this study, semi-structured interviews and critical incident techniques provided insights into individual perceptions, emotional manifestations, and organizational behaviour across different cultural contexts. Interviews illuminated employee perspectives on organizational policies and career experiences, while CIT facilitated an understanding of employees' emotional and behavioural expressions during intercultural interactions.

Ethnography provides a deep understanding of social behaviours and the significance individuals ascribe to them through immersive engagement and detailed CIT (Hammersley & Atkinson, 2019). This method is particularly suited to studying ICSEs, offering insights into real-life contexts, interactions, and the complex dynamics of cultural intelligence within organisational settings.

Semi-Structured Interviews

Semi-structured interviews allowed the exploration of in-depth individual experiences, attitudes, and perceptions about CQ competencies and sustainable career practices (Robson & McCartan, 2016). Interviews were designed to enable flexibility, permitting respondents to elaborate on issues important to their intercultural work experiences. The sessions were recorded and transcribed, providing accurate documentation of responses and facilitating detailed thematic analysis.

Samples-Semi-structured Interview

This research employs a qualitative, ethnographic approach to explore how cultural intelligence (CQ) influences career sustainability within Intercultural Service Encounters (ICSEs) across the hospitality, healthcare, and education industries. A triangulated methodological framework was adopted, integrating semi-structured interviews, participant observations, and secondary data analysis, to obtain a comprehensive understanding of intercultural interactions and their implications for sustainable careers (Robson, 2011).

Semi-Structured Interview Questions Linked with Research Questions and Literature

INTERVIEW QUESTIONS	**LINKED RESEARCH QUESTION(S)**	**LINKED LITERATURE**
DEMOGRAPHIC AND BACKGROUND INFORMATION:		
1. Could you briefly describe your current role and your industry (hospitality, healthcare, or education)?	Contextual understanding	Contextual information
2. How long have you worked in intercultural service encounters (ICSEs)?	Contextual understanding	Contextual understanding
CULTURAL INTELLIGENCE (CQ):		
3. Can you share an experience when cultural intelligence significantly impacted your performance in intercultural interactions?	RQ1, RQ2	Lin, Zhang & Gursoy (2021); Tungtakanpoung & Prouska (2024)
4. How do you prepare yourself to interact effectively in culturally diverse environments?	RQ1	Ang et al. (2007); Van Dyne et al. (2008)
5. Which CQ competency (metacognitive, cognitive, motivational, behavioral) do you feel most influences your intercultural effectiveness?	RQ1, RQ2	Ang et al. (2007); Van Dyne et al. (2008)
6. How does your organization support the development of your cultural intelligence competencies?	RQ3	Donald et al. (2024); Lin, Zhang & Gursoy (2021)
CAREER SUSTAINABILITY:		
7. How does cultural intelligence contribute to your overall job satisfaction and career sustainability?	RQ1, RQ3	De Vos et al. (2020); Van der Heijden et al. (2020)
8. What challenges do you face in maintaining career sustainability in your role, particularly related to ICSEs?	RQ2, RQ3	Van der Heijden et al. (2020); De Vos et al. (2020)

INTERVIEW QUESTIONS	LINKED RESEARCH QUESTION(S)	LINKED LITERATURE
9. How critical is cultural adaptability to your long-term career success?	RQ1	Lin, Zhang & Gursoy (2021); Tungtakanpoung & Prouska (2024)
INTERACTIONS BETWEEN INDIVIDUALS, ORGANIZATIONS, AND CULTURE:		
9. Could you provide examples of how national culture influences employee interactions and organizational practices in your workplace?	RQ3	Baruch & Rousseau (2019); Donald et al. (2024)
10. In what ways do organizational policies help or hinder the development of intercultural competence and sustainable careers?	RQ3	Donald et al. (2024); Van der Heijden et al. (2020)
RECOMMENDATIONS AND INSIGHTS:		
10. What recommendations do you have for enhancing intercultural competence training and career sustainability within your organization?	RQ3	Lin, Zhang & Gursoy (2021); Tungtakanpoung & Prouska (2024)
11. Do you have additional insights or recommendations regarding intercultural competence and career sustainability within your organization?	RQ1, RQ3	Tungtakanpoung & Prouska (2024); Lin, Zhang & Gursoy (2021)

Critical Incident Technique (CIT)

The Critical Incident Technique, originally described by Flanagan (1954), is employed to specifically identify factors, events, behaviors, or experiences that significantly help or hinder effective intercultural performance and career sustainability. CIT's methodological framework aligns closely with the study's aim, focusing explicitly on critical incidents in intercultural contexts that influence career productivity, satisfaction, and overall sustainability (Viergever, 2019). The CIT provides structured steps for data collection, analysis, and interpretation, ensuring consistency and depth of qualitative inquiry.

Data Analysis

The collected qualitative data underwent thematic analysis, following CIT's structured analytical process, which involved identifying and categorizing critical incidents into meaningful clusters or themes (Viergever, 2019).

This process entailed:

1. *Detailed review and coding of transcribed interviews and CIT from the interview notes to identify critical incidents.*
2. *Grouping similar incidents to form categories reflecting specific CQ competencies and their impacts on career sustainability.*
3. *Evaluating and interpreting categories to understand their implications within the broader context of ICSE and career sustainability.*

Thematic analysis highlighted recurring patterns and relationships among CQ competencies (metacognitive, cognitive, motivational, behavioral) and their role in enhancing productivity, adaptability, and satisfaction within intercultural environments.

Data collected through interviews, CIT analysis underwent thematic analysis using open coding methods (Strauss & Corbin, 1998). Open coding facilitated identification and categorization of recurring themes and patterns regarding the role of CQ in shaping sustainable career outcomes. The analysis process focused on discovering connections between individual behaviors, organizational support systems, and national cultural influences.

Validity and Reliability

To ensure methodological rigor, the methodology approach was employed across the semi-structured interviews, and CIT enhancing the validity and reliability of the findings (Robson, 2011). This approach ensured comprehensive cross-verification of critical incidents and minimized potential researcher bias. The qualitative methods significantly enhanced the study's validity by enabling cross-verification of findings (Robson, 2011). The consistent alignment across different data sources provided robust confirmation of the emerging themes and reinforced the reliability of the conclusions drawn.

Ethical Considerations

Participants' informed consent was secured prior to data collection, ensuring confidentiality and anonymity in the reporting of critical incidents. Ethical approval was obtained in line with institutional guidelines to safeguard participant welfare.

Results. *Initial insights will highlight that CQ competencies significantly enhance employee adaptability and resilience in intercultural contexts, directly influencing productivity. Employees proficient in CQ competencies demonstrate increased adaptability to cultural variability, resulting in heightened service quality and customer satisfaction. This enhances career sustainability through improved health, happiness, and productivity dimensions, underscoring the strategic value of developing CQ competencies within employee training and development frameworks across diverse service-oriented industries.*

Theoretical Implications. *This study contributes theoretically by extending the sustainable career and Career Ecosystem frameworks into underexplored sectors, specifically healthcare, hospitality and education, in contrast to previous airline-focused research (e.g., Tungtakanpoung & Prouska, 2024). It highlights that CQ's influence on career*

sustainability varies by sector: for example, motivational CQ played a stronger role in healthcare settings due to emotional labour demands, while behavioural CQ was more salient in education due to classroom adaptability needs.

Furthermore, this research introduces a comparative cross-industry and cross-national perspective rarely addressed in the ICSE literature, revealing how national cultural norms (e.g., hierarchical vs egalitarian organisational structures) modulate the effect of CQ on career outcomes.

Managerial implications. *Practically, findings advocate for organisational investment in CQ training as an integral component of career development programs. Such initiatives could enhance employees' career longevity and satisfaction, aligning organisational sustainability objectives with employee career aspirations. HR policies should prioritize developing CQ competencies, particularly in service-intensive industries involving frequent intercultural interactions.*

Specifically, the findings offer sector-specific recommendations. In healthcare, training should focus on developing motivational CQ to enhance resilience and retention in emotionally intensive roles. In hospitality, behavioural CQ development can improve service consistency in diverse guest interactions. Educational institutions may benefit from cognitive CQ training to help educators adapt pedagogical strategies to multicultural classrooms. For multinational organisations, aligning HR development strategies with national cultural contexts is essential. For instance, Thai employees valued CQ training integrated into team-based learning, while UK-based participants preferred self-directed development modules. This suggests that one-size-fits-all CQ programs may be ineffective across borders.

Research limitations. *The study extends sustainable career frameworks by explicitly integrating CQ competencies within the Career Ecosystem theory. It underscores the need for systemic integration of individual capabilities, organisational support, and national cultural influences in career management practices, thus enriching the theoretical understanding of career sustainability.*

Originality of the paper. *This study offers significant theoretical advancements and actionable insights by clarifying the role of Cultural Intelligence in sustainable career ecosystems. It bridges a critical gap by examining multiple service industries and highlights CQ's essential role in facilitating productive intercultural interactions, thus promoting career longevity. The multi-industry and cross-cultural comparative lens adopted here provides both theoretical clarity and practical guidance, essential for stakeholders in today's globalised employment landscape. By exploring CQ's impact on performance and career sustainability across different service industries, this research will offer both theoretical advancements and actionable insights for individuals and organisations seeking to foster long-term career success in intercultural work environments.*

The impact of country image evaluations on consumer perceptions of brand sustainability and willingness-to-pay: Empirical evidence

CHIARA SCRIMIERI[1] ADAMANTIOS DIAMANTOPOULOS[2] MICHELA MATARAZZO[3]
ALBERTO PASTORE[4]

Abstract

Drawing on cue utilization theory, signaling theory, and attribution theory, we develop and test a model of the influence of country image evaluations on consumers' perceptions of brand sustainability and their willingness-to-pay (WTP) for a brand, both under the presence and the absence of a sustainability label. We find that both country image and the presence of a label (1) have independent effects on perceptions of brand sustainability, (2) positively impact WTP, and (3) consumer skepticism about sustainability claims also influences perceptions of brand sustainability and - through it - WTP.

Framing of the research. *There is little doubt that the importance of sustainability - in terms of economic, social, and environmental aspects (Elkington, 1984) - is increasing: consumers are seeking sustainable products (e.g., Whelan and Kronthal-Sacco, 2019), companies are implementing various sustainability initiatives (e.g., Chernev and Blair, 2021), and countries are actively promoting sustainable development (e.g., Dekhili et al., 2021). In this context, country-of-origin (COO), namely "the country which a consumer associates with a product or brand as being its source, regardless of where the product is actually produced" (Jaffe and Nebenzahl, 2006, p.29) has been shown to influence consumers' evaluations of sustainable products (Cowan and Guzman, 2020). However, literature on the interplay between COO and sustainability with a specific focus on consumers' WTP as an outcome variable is both sparse and (highly) contradictory (Scrimieri et al., 2024). For example, Magnusson et al. (2015) found that consumers perceive corporate social responsibility (CSR) initiatives more positively when they are associated with COOs with a strong environmental reputation; this positive perception leads to a higher WTP for the products offered by these firms. However, according to Dekhili and Achabou (2015), while a favorable COO image has no impact on the WTP for an eco-labeled product, an unfavorable COO image has a negative impact on the WTP for the product. Montanari et al. (2023) supported Dekhili and Achabou's (2015) findings in the case of a favorable COO image (i.e., no effect on WTP) but found completely the opposite in the case of a less favorable COO image: WTP increased for the sustainable product when associated with the weaker COO.*

Focusing on WTP is important since it denotes the maximum price a consumer is willing to spend on a product or service, through a trade-off between perceived benefits and costs (Koschate- Fischer et al., 2012). WTP is, therefore, of substantial managerial relevance for the development of pricing strategies. While an increasing consumer inclination towards sustainable products and services has been noted (Elhoushy and Lanzini, 2021; Paul et al., 2016; Rosenbaum et al., 2022), there is also a documented discrepancy between the importance consumers claim to assign to sustainability and their actual buying decisions (Narayanan and Singh, 2023; Barbarossa and Pastore, 2015; Bangsa and Schlegelmilch, 2019). Consumers may indeed display positive attitudes towards sustainable products but whether they are also willing to pay higher prices to obtain them is a question yet to be (unambiguously) answered.

Purpose of the paper. *In this study, we investigate how the image of the brand's COO (Roth and Romeo, 1992) and the presence/absence of information about the latter's sustainability (e.g., an eco-label on the product package) impact (a) consumer perceptions of brand sustainability, and (b) consumers' willingness-to-pay (WTP) for the focal brand. We do this by means of the model in Figure 1 which is general enough to apply to any COO and any aspect of sustainability (i.e., economic, social, or environmental). The conceptual underpinnings of our model are signaling theory (Erdem and Swait, 1998; Erdem et al., 2006; Erdem and Swait, 2016), cue utilization theory (Jacoby and Haddock, 1971; Olson, 1972; Olson and Jacoby, 1972), and attribution theory (Heider, 1958; Kelley and Michela, 1980; Folkes, 1988).*

Signaling theory (Erdem and Swait, 1998) states that firms convey information about their specific attributes, such as their reputation and product features, to gain a competitive advantage; in turn, consumers examine these signals when

making purchasing decisions (Erdem et al., 2006). According to cue utilization theory (Richardson et al., 1994), COO and sustainability labels are extrinsic cues that act as signals and influence consumer responses (e.g., Lu at al., 2016; Lee et al., 2020).

When a brand carries a sustainability label and originates in a country with a strong image, it is more likely that the brand will be perceived as being sustainable (since the sustainability cue is more credible). However, absence of a sustainability label does not necessarily mean that the consumer will conclude that the brand is not sustainable. This is because consumers may assume that the brand is sustainable because it originates in a country with a strong image. Conversely, when the image of the brand's COO is not evaluated favorably, the presence of a sustainability label does not guarantee that the brand will be perceived as being sustainable. This is because, according to signaling theory, the sustainability information conveyed to consumers may not be seen as being a credible signal, if the COO image is unfavorable.

Fig. 1: Conceptual framework

Source: own elaboration

From the above discussion, two important points become evident. First, consumer perceptions about a brand's sustainability are not solely formulated based on the presence of an explicit sustainability cue (e.g., an eco-label) but also implicitly influenced by the image of the brand's COO. Second, consumer skepticism towards sustainability claims also needs to be accounted for as a potential influence on brand sustainability perceptions. These issues are addressed by the model structure in Figure 1 by specifying country image evaluations as a predictor of brand sustainability perceptions and the presence (vs. absence) of a sustainability label as a moderator on this relationship. Consumer skepticism and product involvement are also as included further predictors of sustainability perceptions. The latter are likely to be negatively affected by skepticism and positively by product involvement (greater involvement is expected to lead to a more accurate product evaluation - including sustainability aspects).

Once consumers have processed the COO and sustainability signals and reached a conclusion about the brand's sustainability (or lack of), the question arises how they will react in terms of their WTP. Drawing on signaling theory and cue utilization theory, the (ceteris paribus) expectation would be that a brand perceived to be sustainable and originating in a COO the image of which is favorably evaluated by consumers (two positive signals), would result in the highest WTP. Thus, as shown in Figure 1, the main effects from country image evaluations and brand sustainability perceptions on WTP are both expected to be positive. However, these effects are not expected to be invariant but conditioned by several factors as discussed below.

First, the effect from country image on WTP is expected to be positively moderated by product-country typicality (Tseng and Balabanis, 2011; Usunier and Cestre, 2007). When consumers consider the product to be highly typical of its COO, then a stronger impact of country image on WTP would be expected than when typicality is low.

Second, we expect the link between perceived brand sustainability and WTP to be conditioned by the attribution of responsibility (Folkes, 1984, 1988) and cause involvement (Hill and lee, 2015). Regarding the former construct, the relationship between perceived brand sustainability and WTP is likely to be stronger for those consumers who feel

personally responsible for (at least partly) covering the costs of sustainability and weaker for those that attribute the costs of sustainability to others (such as governments, institutions, or companies). Regarding cause involvement, this refers to the extent to which consumers perceive a cause as personally relevant to them (Grau and Folse, 2007). When consumers perceive a brand as highly sustainable and feel personally involved in environmental or social causes, they are more likely to reveal a higher WTP for the brand.

Note that to avoid overestimation of the effects of country image and brand sustainability on WTP, we include price sensitivity (Wakefield and Inman, 2003) and the consumer's (net) monthly income as control variables in our model.

Methodology. *To test our model, an experimental study was conducted in Italy using a between-groups design, whereby each participant was randomly exposed to a (fictitious) chocolate brand originating in Denmark, either with or without a sustainability (Fairtrade) label; the latter is widely used in this product category. The experiment was run with the fictitious brand L3B as product stimulus to minimize the potentially confounding effect of brand equity of already established brands (Dimofte et al., 2008) and have as few spontaneous COO associations as possible (Diamantopoulos et al., 2021). We opted for Denmark as the focal COO as it ranks 3rd in in the Sustainable Development Report (SDR, 2024) and thus its country image could be expected to influence consumer perceptions of sustainability of its products/brands.*

A total of 298 ordinary consumers (MAge =33.72, SDAge =11.01; 49.7 % male) participated in an online survey via the crowdsourcing platform Prolific (www.prolific.com[5]). Following exposure to the experimental stimuli, respondents evaluated four price points in Euros ('too cheap,' 'cheap,' 'expensive,' and 'too expensive') using Van Westendorp's (1976) Price Sensitivity Meter (PSM). To calculate WTP, the average of the "expensive" and "too expensive" price points was first computed (see Ceylana et al., 2014; Diamantopoulos et al., 2021). The resulting value was then weighted by the participants' likelihood of purchase; the latter was measured on a scale ranging from "0% = I would definitely not buy" to "100% = I would definitely buy" based on Juster (1966) and subsequently re-calibrated into probabilities. This adjustment produces a more realistic estimate of WTP since it explicitly takes the intention to buy the product into account (He et al., 2024).

Participants also completed multi-item scales measuring country image (Roth and Romeo, 1992), perceived brand sustainability (adapted from Gershoff and Frels, 2015), consumer skepticism (adapted from Obermiller & Spangenberg, 1998), product category involvement (Mittal and Lee, 1988), attribution of responsibility (Montanari et al., 2023), cause involvement (Hill and Lee, 2015), product-origin typicality (Halkias and Diamantopoulos, 2020) and price sensitivity (Wakefield and Inman, 2003)[6]. Finally, respondents provided standard demographic information.

Results. *We employed SmartPLS4 (Ringle et al, 2024) with 10,000 bootstrap resamples to estimate the model in Figure 1 and test the various relationships of interest. Tables 1 and 2 summarize the results.*

Tab. 1: Measurement Properties (Multi-item Scales)

	Loadings	***Cronbach's Alpha***	***Composite Reliability***	***AVE***
Country Image (COI)	*0.789-0.880*	*0.849*	*0.899*	*0.689*
Consumer Skepticism (SKEPT)	*0.821-0.904*	*0.915*	*0.936*	*0.747*
Product Involvement (INVOLVE)	*0.881-0.946*	*0.905*	*0.937*	*0.832*
Perceived Brand Sustainability (SUSTAIN)	*0.919-0.966*	*0.958*	*0.969*	*0.888*
Product-Country Typicality (TYPICAL)	*0.912-0.939*	*0.949*	*0.963*	*0.867*
Cause Involvement (CAUSE)	*0.567-0.907*	*0.903*	*0.911*	*0.676*
Price Sensitivity (PRICE)	*0.921-0.923*	*0.823*	*0.919*	*0.850*

As Table 1 shows, our construct measures display highly satisfactory psychometric properties. Cronbach's alpha and composite reliability (CR) well exceed the common 0.70 threshold; average variance extracted (AVE) for all constructs is above 0.50 (Hair et al., 2020); and all heterotrait-monotrait (HTMT) ratios are much lower than the 0.85 critical threshold (the highest comes to 0.596) offering strong evidence of discriminant validity (Henseler et al., 2015).

[5] A total of 306 individuals responded to the survey but 8 were subsequently excluded due to failing attentions check, non-transitive PSM responses, or extreme WTP values.

[6] In addition, participants in the experimental condition featuring a sustainability label, were asked to indicate their familiarity with the Fairtrade label; the majority (65.10%) accurately associated this label with social and environmental concerns.

Tab. 2: Parameter Estimates and Indirect Effects

Abbreviations: COI=Country Image, LABEL=Sustainability Label, SKEPT=Consumer Skepticism, INVOLVE=Product Involvement, SUSTAIN=Perceived Brand Sustainability, RESP=Attribution of Responsibility, CAUSE=Cause Involvement, TYPICAL=Product-Country Typicality, PRICE=Price Sensitivity, INCOME=Net Monthly Income

Country image, the presence of a sustainability label, and (a lack of) consumer skepticism,[7] all positively influence consumer perceptions of brand sustainability (Table 2). Product category involvement has no significant effect while the presence of the label does not moderate the relationship between country image and sustainability perceptions. The model explains 48.2 % of the variance in perceived brand sustainability.

Perceived brand sustainability, in turn, has a positive influence on WTP thus resulting in positive indirect effects from country image and lack of skepticism. Since the direct effect from country image on WTP is also positive, this is a case of complementary mediation (Zhao, Lynch, and Chen 2010). The presence of a sustainability label also has a positive indirect effect on WTP as does lack of consumer skepticism. None of the expected moderating effects of product ethnicity, attribution of responsibility, or cause involvement turned out to be significant; nor did these variables have a direct influence on WTP. Regarding the control variables, neither income nor price sensitivity significantly influences WTP; 19.3 % of the variance in WTP is explained by the model.

A comparison of total effects on WTP reveals that country image (95% BCI: 0.133, 0.396) and the presence of a label (95% BCI: 0.165, 0.374) have similar impacts, while the influence of consumer skepticism is considerably less strong (95% BCI: 0.038, 0.115). Finally, the model has good (out-of-sample) predictive as indicated by a positive $Q^2_{predict}$ value (= 0.067); RMSE (= 1.822) and MAE (= 1.169) values lower than those of the corresponding LM benchmarks (1.827 and 1.179 respectively); and a model average loss value (= 2.088) significantly lower than the relevant IA loss value (=2.557).[8]

Research limitations. *Obvious limitations of the current study are the consideration of a particular product category, a single COO and a certain type of sustainability label. A further limitation is the focus on a particular COO notion, namely the brand origin, which also coincides with the country of manufacture in the current study. However, in many instances, the brand origin and the country of production are distinct, and this inevitably complicates the interrelationship between COO and sustainability cues, particularly if there is incongruence in the origins concerned.*

Managerial implications. *Our findings demonstrate the important role of country image evaluations in influencing consumer perceptions of sustainability as well as WTP. Thus, to capitalize on sustainability claims when developing price positioning strategies, marketing decision makers should consider consumer evaluations of the image associated with the brand's COO. They should further bear in mind that consumer skepticism will also influence brand sustainability perceptions and, through them, WTP. Whether the extra costs of sustainability are likely to be covered by consumers' higher WTP is, of course, another important issue that managers need to consider (but beyond the scope of the present study).*

Originality of the paper. *Our model provides a new theoretical lens on the impact of sustainability and COO cues on consumers' WTP and highlights the close interdependence of these cues. Prior sustainability research implicitly assumes that consumers who receive information about sustainability will automatically declare the brand as being*

[7] The scale consumer skepticism was adapted from Obermiller and Spangenberg (1998) and its items capture lack of skepticism; hence the positive sign of the relevant parameter.

[8] RMSE = Root Mean Square Error; MAE = Mean Absolute Error; LM = Linear Regression Model; IA = Indicator Average (naive benchmark). For details, see Shmueli et al. (2016, 2019) and Sharma et al. (2023).

sustainable, as result of which they would be willing to pay a higher price for it (e.g., Reimers and Hoffmann, 2019). Our model questions this "linear" process, as it does not (a) involve explicit measurement of consumers perceptions of brand sustainability, and (b) account for the perceived credibility of sustainability signals (as reflected in consumer skepticism). Indeed, the conflicting findings of prior empirical research on the simultaneous impact of COO and sustainability cues on WTP may well be (at least partly) due to the neglect of these factors in the relevant research designs.

Key words: *country-of-origin; sustainability; willingness-to-pay; empirical study.*

Made in Italy effect: Exploring the relationship between Reshoring and Country of origin

KANWAL GUL[1] VALENTINA DELLA CORTE[2] SIMONE LUONGO[3] ENRICO DI TARANTO[4]

Abstract

The Italian fashion industry is experiencing a significant reshoring movement, driven by consumer demand for sustainability, regulatory pressures and the need to preserve the prestige of the "Made in Italy" label. This study explores the relationship between country of origin (COO) and reshoring decisions in luxury fashion, analyzing literature from 2020-2025. Findings indicate that reshoring strengthens brand heritage, enhances sustainability efforts, and improves consumer trust through digital transparency. The shift from offshoring to reshoring is fueled by changing consumer preferences, with Gen Z and eco-conscious buyers willing to pay premiums for ethical and sustainable products. Regulatory policies such as the EU Circular Economy Action Plan and the Decreto Internazionalizzazione further incentivize brands to relocate production. Additionally, luxury brands leverage reshoring to reinforce authenticity and mitigate supply chain risks. However, challenges such as labor shortages and limited digital adoption among SMEs persist. In particular, this research identifies three key themes: reshoring as a strategy to maintain brand authenticity, its role in sustainable production and the growing importance of digital transparency via blockchain. The study underscores reshoring's impact on consumer perception and luxury brand positioning, providing valuable insights for managers navigating the evolving landscape. This research contributes to the ongoing discourse on reshoring by examining its economic, environmental, and cultural implications. It highlights the necessity for continued investments in workforce training and digital innovation to ensure long-term success in the Italian fashion industry.

Framing of the research. *Italy and its foremost fashion centers are globally recognised for their exceptional craftsmanship, high-quality goods, luxurious brands and deep-seated cultural heritage. The "Made in Italy" label signifies superior craftsmanship, thus warranting elevated pricing and exclusivity. Because of globalisation, higher demand and the offshoring trend in the late 2000s, Italian brands shifted their manufacturing operations abroad to reduce costs and meet higher demand (Rune & Gummesson, 2023). The offshoring trend was followed by almost every Western country, but now the West is reconsidering its love affair with offshoring. In recent years, firms have been relocating value chains, especially the production of goods, back to their home countries or regions, which is called reshoring (Pedroletti & Ciabuschi, 2023; Robinson & Hsieh, 2016). The offshoring promise of low cost, efficiency and higher profits had reneged. Natural calamities, the COVID-19 pandemic, the Russia- Ukraine war, disruption of the global supply chain, and Trump's new tariff policies for the globe are pushing the world to rethink their offshore businesses (Antoinette Radford, 2025; The White House, 2025). The world is observing sustainability and ethicality in consumption patterns; hence, reshoring is not limited to profit and loss but includes resilience, transparency, craftmanship and affiliation for the country of origin (COO) (Gillani et al., 2023). In fashion, COO remains a potent driver to influence consumption (Diamantopoulos et al., 2011). Hence, consumer demand for ethicality, transparency and sustainability is influencing the reshoring decisions of the fashion industry (Dong et al., 2020). According to a US consumer sentiment survey (2020), 60% of consumers agreed to pay extra for sustainable packaging, and 78% chose a sustainable lifestyle over unconscious consumption. The usage of eco-friendly materials and ethical labor (recyclable polyester and organic cotton) is being prioritised by consumers. Which compels brands to reshore their business to align with consumer demand. Regulatory policies, i.e., the EU Circular Economy Action Plan, force fashion brands to reshore manufacturing facilities to comply with sustainability policies and avoid penalties (European Commission, 2022). Also, from a marketing perspective, the "Made in Italy" label creates a sense of luxury, quality and sustainability; hence, manufacturing in the home country would reinforce the "Made in" effect (Kaylyn Wenzel, 2022). Demographically speaking, Gen Z is seeking eco-friendly brand options and is willing to pay premium prices (Imran Amed, 2025). Also they are equipped with smartphones and are being bombarded with hashtags like ethicality, sustainability and eco-friendly fashion (Sustainable*

DOI 10.7433/SRECP.SP.2025.01

Closet, 2022). According to PwC, consumers are willing to pay 9.7% more on average for sustainably produced goods because they have directly observed climate change in their lives (PwC, 2024). Consequently, businesses are thinking of reshoring to meet consumer demands.

Purpose of the paper. *Italy's fashion industry is experiencing a profound reshoring movement strategically designed to strengthen the prestige of the "Made in Italy" label while addressing long-standing vulnerabilities within the supply chain (Merlo & Pinchera, 2023). In the post-pandemic landscape, leading fashion brands are increasingly acquiring specialized subcontractors, such as tanneries and knitwear manufacturers, to reintegrate previously outsourced production stages. This shift not only ensures stricter quality control but also protects Italy's rich artisanal heritage amid an ongoing shortage of skilled labor.*

A crucial driver of this trend is the Decreto Internazionalizzazione (D.lgs. 209/2023), which offers substantial fiscal incentives to companies reshoring production from non-EU countries. Firms that relocate operations back to Italy benefit from a 50% tax reduction and a decade-long exemption on certain income taxes, making reshoring an economically compelling option (Decreto Internazionalizzazione", 2023).

However, economic factors alone do not fully explain this transition. Empirical studies indicate that 78% of Italian fashion firms prioritize the authenticity and craftsmanship of "Made in Italy" over cost efficiency, suggesting that reshoring is primarily viewed as a means to enhance brand value and consumer perception rather than merely a response to logistical challenges (De Giovanni Stefano Franco & Chitarrini Matr, 2023). Despite these advantages, challenges persist.

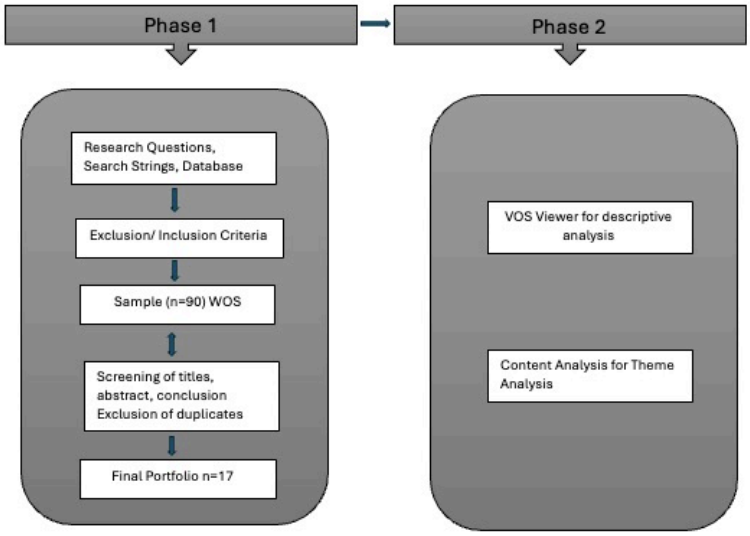
The adoption of blockchain technology, a critical tool for transparency and traceability, remains limited, particularly among small and medium-sized enterprises (SMEs) (Pedroletti & Ciabuschi, 2023). Additionally, certain regions such as Tuscany, face a shortage of highly skilled artisans, with luxury houses like Gucci and Prada competing intensely to secure talent (Pinchera & Rinallo, 2020). This labor deficit raises concerns about the long-term sustainability of Italy's reshoring efforts, especially given the aging workforce in the artisanal sector.

Luxury conglomerates are leading the reshoring charge, not only to enhance supply chain resilience but also to reinforce brand storytelling. LVMH's investments in Tuscan tanneries exemplify how major players are doubling down on provenance, using local production as a marketing differentiator (Donzé & Wubs, 2020). Furthermore, reshoring aligns with Europe's tightening sustainability regulations, compelling fashion brands to adopt more environmentally responsible production methods while preserving their unique heritage. Ultimately, Italy's fashion industry is redefining reshoring as a dual strategy: it serves both as a tool for brand differentiation, elevating the value of Italian craftsmanship, and as a means to comply with regulatory pressures on sustainability and ethical sourcing. As the industry evolves, the long-term success of this transition will hinge on continued investments in workforce training, digital innovation and sustainable practices to secure Italy's status as a global leader in luxury fashion.

Reshoring has been observed mainly in European countries due to strategic reasons, efficiency, a rapidly changing external environment and global politics. In the past, the reasons for offshoring business were almost the same as for reshoring of the same business today. Nonetheless, new variables have also been observed influencing reshoring decisions, i.e, sustainability, ethicality, governance and COO, but their impact/relationship is under-researched. Multiple studies are being conducted to understand drivers and barriers of reshoring decisions, but the outcome of reshoring compared to offshoring is a gap in the current research (Wiesmann et al., 2017). Also, Industry-wise (fashion, leather or furniture) reshoring motivators are under-researched. This paper is focused on reshoring drivers of the luxury fashion industry in particular. "Made in Italy" is a luxury label that denotes craftsmanship, culture and quality. A meta-analysis explored that COO positively influence perceptions of luxury brand evaluations as the image of the product country creates an impact on consumer decision making (Oduro et al., 2024). According to research, consumers associate Chinese products with low cost and low reliability, German Products with reliability, Japanese products with quality and French and Italian products with luxury and craftsmanship. Consequently, these associations influence purchase decisions of consumers when they spend money on luxury items, e.g. Luxury bags and Clothes. Hence, we are conducting this bibliometric analysis to find the relationship between "Made in Italy" and COO to suggest policies and explore its importance in terms of fashion reshoring. This work in progress analyzes current literature based on the relationship between Made in Italy and COO and how much it affects and influences consumer perceptions and behaviors. Accordingly, this study highlights the pros and cons of fashion reshoring and will benefit managers in taking calculative risks in terms of relocating their production (Pasquinelli, 2023).

Methodology. *The phrase "Made in Italy" in the fashion sector has undergone a significant transformation since 2020. It has shifted from simply indicating the origin of manufacturing to representing a dynamic cultural identity that highlights tradition, innovation and regional uniqueness. This study combines studies, market analyses and institutional research to illustrate this change in perception. It shows how global consumers currently view Italian fashion through three interconnected lenses: artisanal authenticity, storytelling in the digital age and sustainable value propositions.*

We have analyzed 90 papers published from 2020 to date. This study was conducted in two phases. During phase 1, we developed the research questions (RQ1 and RQ2), keywords, database and exclusion inclusion criteria. We propose the following research questions:



RQ1: Do Made in Italy and COO have a positive and strong relationship?

RQ2: Made in Italy and COO relationship can be a strong driver for reshoring decisions, why or why not?

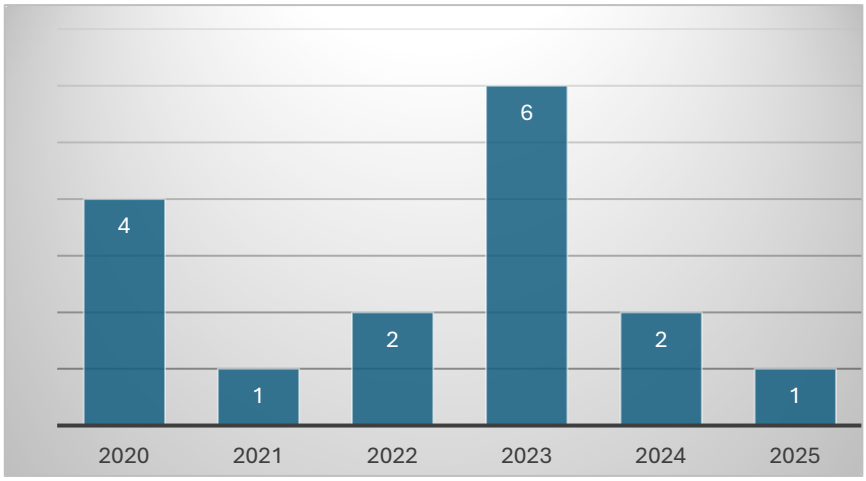
Phase 2 referred to the content analysis of the articles retrieved.

The workflow is reported in Figure 1.

Fig. 1: Methodological workflow

Source: authors' elaboration

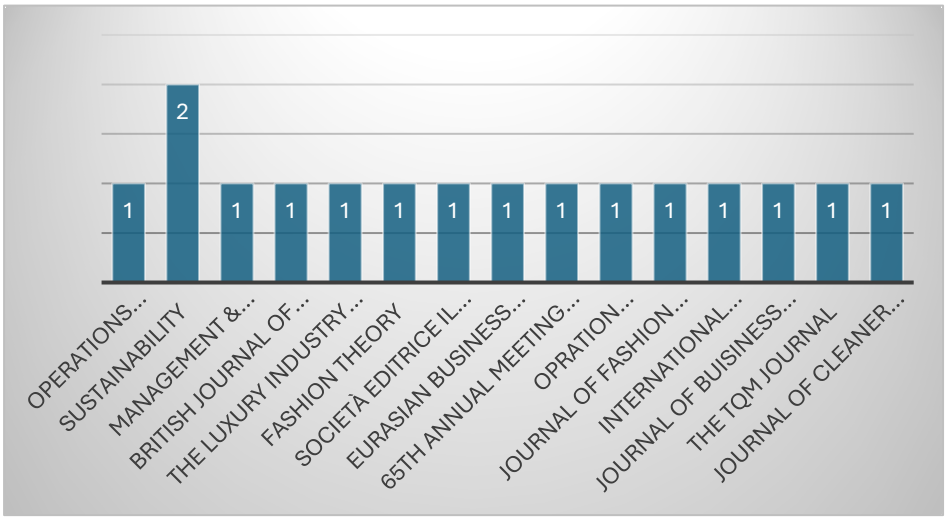
Phase 1 involved the definition of objectives for the literature review, the search string parameters, the database (Web of Science, Google Scholar and University theses database) and the exclusion criteria. The analysis of the publication in the encompassing years 2020 - present considered certain initial parameters like COVID-19 (2020), the Russia- Ukraine War (2021- present) and Made in Italy (MICS initiative 2023- present). The research was conducted solely in English, given its widespread global use and influence and the language of the published research under investigation. Consequently, the initial screening of studies employed the keywords "Sustainability" AND "Luxury Fashion," or "Sustainability" AND "Made in Italy" or "Made in Italy AND "Country of Origin" The searches were finished in Jan 2025. A total of 90 articles were retrieved from the database search. After screening out of irrelevant articles on the basis of abstract, study theme, relevance with Italian identity, we are left with 17 articles (this study is a work in progress). These articles include Master's Theses, Book chapters and Scientific articles.



The study involved a content analysis of 17 selected articles in Stage 1, utilizing the bibliometric software VOSviewer to examine authors, keywords (with at least five occurrences), and countries.

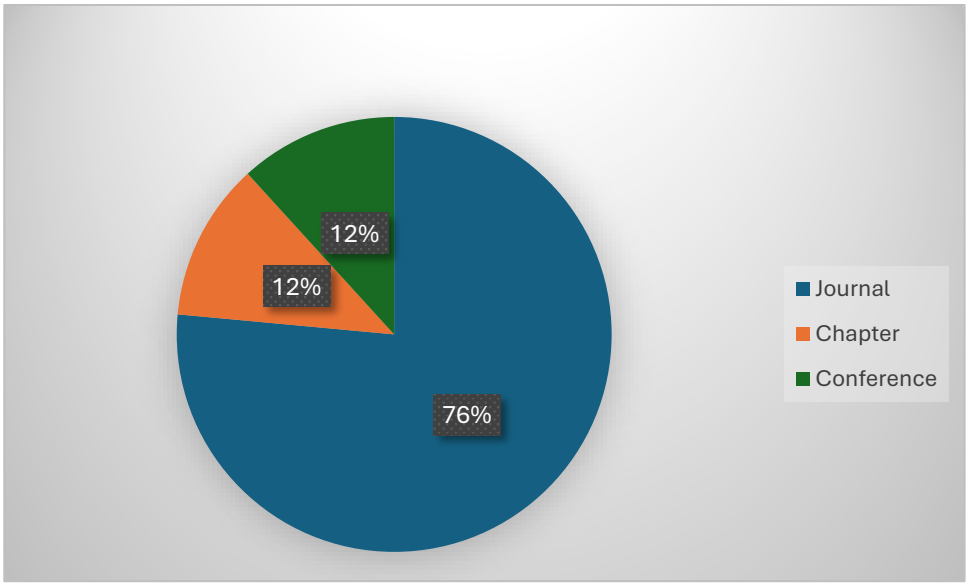
Results. *The "Made In" label serves as a critical heuristic for consumers to assess product quality, ethical practices, and cultural authenticity, particularly in the fashion industry. This review synthesizes 17 studies (2020-2024) to analyze how country-of-origin (COO) cues intersect with sustainability, reshoring and brand loyalty. Specifically, The trend of publications is reported in Figure 2, the main relevant sources in Figure 3, and the types of publications are reported in Figure 3. Key themes include regional disparities in COO perceptions, the luxury-fast fashion dichotomy and the moderating role of digital transparency.*

As for the thematic analysis, this study follows Braun & Clarke's six-step thematic analysis framework (Byrne, 2022): First, the selected studies were thoroughly reviewed multiple times to identify recurring patterns and key ideas. Second, an initial coding phase was conducted, categorising essential concepts such as "craftsmanship," "sustainability," "consumer trust" and "digital transparency" across the dataset. Third, these codes were grouped into broader themes that captured the relationship between reshoring and the country of origin (COO). Fourth, the identified themes were carefully reviewed and refined to ensure their relevance to the research question. Fifth, each theme was clearly defined and linked to specific insights drawn from the literature. Finally, the findings were synthesized into a coherent narrative, highlighting key trends and identifying gaps in the existing research.



The preliminary findings highlight three major themes:

Fig. 2: Publications per year (2020-2025)



Source: authors' elaboration

Fig. 3: Most relevant sources

Source: authors' elaboration

Fig. 4: Types of publications

Source: authors' elaboration

The preliminary findings highlight three major themes:

- ***Theme 1** - reshoring as a means to strengthen brand heritage: reshoring is increasingly recognized as a strategy to protect and enhance COO narratives. For instance, Italian luxury brands have brought production back to Italy to preserve their "Made in Italy" heritage. Research suggests that consumers perceive domestic manufacturing as synonymous with high-quality craftsmanship, ethical labor standards and sustainability, all of which play a crucial role in influencing purchasing decisions. Additionally, reshoring helps mitigate risks associated with global supply chains, such as delays and geopolitical tensions, ensuring greater operational efficiency while reinforcing brand authenticity (Piancazzo et al., 2024).*
- ***Theme 2** - reshoring as a driver of sustainability: Consumer demand for sustainable practices is pushing brands to localize production. By shortening supply chains, reshoring helps reduce carbon footprints while allowing for greater oversight of ethical labor conditions. Many brands have integrated sustainability narratives into their COO labels, highlighting how localized production can significantly lower emissions compared to offshore manufacturing. Additionally, national, EU and international regulatory frameworks are increasingly promoting reshoring by enforcing stricter transparency requirements in supply chains and encouraging more sustainable production practices.*
- ***Theme 3** - digital transparency to improve COO trust: digital tools, such as blockchain-enabled digital product passports, are revolutionizing how brands authenticate COO claims. By providing verifiable tracking of materials and production processes, these technologies enhance consumer trust and reinforce brand authenticity. Studies have shown that implementing blockchain-based tracing systems can significantly improve consumer confidence in product origins. However, adoption remains uneven, with small-to-medium enterprises (SMEs) facing greater challenges in integrating these digital solutions due to resource constraints and technological barriers (Torregrosa et al., 2023).*

Research limitations. *Despite offering valuable insights into the relationship between reshoring, COO perceptions, and sustainability in the luxury fashion industry, this study has several limitations.*

First, while bibliometric analysis provides a structured understanding of key themes, it does not capture real-time industry shifts or the latest corporate strategies that may not yet be documented in academic literature. Therefore, a more comprehensive approach, incorporating primary data collection through interviews or surveys with industry experts and consumers, could offer a deeper, more nuanced perspective on reshoring decisions.

Second, the study focuses predominantly on Italy's luxury fashion sector, which limits its generalizability to other countries or segments within the fashion industry. While "Made in Italy" is a powerful branding tool, COO effects vary across different national contexts, making it challenging to extrapolate findings to markets such as France, the U.S., or emerging economies. Additionally, reshoring motivations in fast fashion or mid-market brands may differ significantly from those in luxury, where craftsmanship and exclusivity are more prominent drivers.

Third, the study emphasizes reshoring as a response to sustainability concerns, consumer demand and regulatory pressures. However, economic factors such as production costs, labor shortages and geopolitical risks also play a crucial role in reshoring decisions. The paper does not comprehensively quantify the financial trade-offs between reshoring and offshoring, which could provide further insights into the feasibility of long-term reshoring strategies.

Managerial implications. *This study highlights key strategies for luxury fashion brands considering reshoring their production. First, managers should recognize that reshoring offers an opportunity to strengthen brand heritage and improve the perception of craftsmanship, quality and sustainability. By returning production to Italy, brands can reinforce the "Made in Italy" label, which is synonymous with luxury, high-quality craftsmanship and ethical standards. This can enhance consumer loyalty and appeal to environmentally conscious Gen Z consumers who are willing to pay a premium for sustainably produced goods.*

Furthermore, managers should invest in technologies like blockchain to improve transparency and traceability in their supply chains. Digital tools are increasingly important for gaining consumer trust and enhancing brand authenticity, particularly in the face of growing demand for ethical and transparent business practices.

Additionally, reshoring allows for greater control over supply chain disruptions, which have been exacerbated by global events like the COVID-19 pandemic and geopolitical tensions. Managers should leverage reshoring to improve operational efficiency and mitigate risks associated with international sourcing.

However, challenges such as labor shortages and the high cost of specialized artisans in Italy should be carefully managed. Brands must invest in workforce development and offer competitive wages to attract and retain skilled labor.

Originality of the paper. *The originality of this study lies in its integrated and multidimensional approach to exploring the reshoring phenomenon in Italy's luxury fashion sector, with a specific focus on the concept of "Made in Italy" and the impact of COO on consumer decision-making. While numerous studies have addressed reshoring in a general context, few have specifically examined its role in the luxury fashion industry and the influence of the "Made in Italy" label in reshoring decisions.*

Accordingly, it provides a unique perspective by linking reshoring with sustainability, ethical consumption and digital transparency, key drivers in today's global business environment. It moves beyond traditional economic motivations such as cost reduction or supply chain efficiency, incorporating consumer behavior trends, especially the rising demand for eco-friendly products and responsible manufacturing practices. By examining the relationship between COO perceptions and reshoring in the context of luxury fashion, the work introduces new insights into how "Made in Italy" acts not only

as a symbol of craftsmanship and quality but also as a significant driver for reshoring strategies, aligning with consumer preferences for sustainability and transparency.

Furthermore, the study highlights the role of digital tools like blockchain in reshoring decisions, providing transparency and traceability in supply chains. This technological component adds a contemporary dimension to the study, reflecting the industry's move towards greater accountability and consumer trust. The research also considers the broader implications of reshoring beyond economic factors, such as the preservation of artisanal skills, the protection of brand heritage, and the impact of regulatory frameworks like the EU Circular Economy Action Plan.

By focusing on a timely topic, the paper contributes to the existing literature by offering a deeper understanding of the reshoring process within the luxury fashion sector, specifically in Italy. It offers valuable insights for managers looking to strategically align their operations with consumer demands for ethical, transparent and sustainable production practices, while preserving the prestigious "Made in Italy" identity. This paper thus adds significant originality by combining industry trends, consumer insights and technological advancements in reshoring decision-making.

Institutional perspectives on internationalization choices of state-owned enterprises

GABRIELE GALLI[1] ROBERTO URBANI[2] ANTONIO MAJOCCHI[3]

Abstract

State-owned enterprises (SOEs) play a key role in global economics, navigating challenging ground between governmental directives and market forces. In contrast to privately-owned enterprises focused more on profit maximization, SOEs often balance broader socio-economic objectives, positioning them uniquely in international business strategy discussions. The internationalization strategies of SOEs are particularly influenced by their home countries' political and economic frameworks, which shape their choices between greenfield investments and mergers and acquisitions (M&As). This decision-making process is crucial as it reflects both the strategic priorities and the operational constraints imposed by state ownership. The general problem addressed in this study is the unclear influence of state ownership and home country institutional frameworks on SOEs' choices of establishment mode in foreign markets. Here, we show, using a dataset from 2000 to 2023 and various global markets, that state ownership biases SOEs towards selecting greenfield investments over M&As when expanding internationally. This result challenges the prevailing assumption that SOEs primarily prefer M&As to quickly establish a presence in new markets and leverage existing structures. Our findings indicate that the institutional context of the home country, specifically whether it aligns with Liberal Market Economies or Coordinated Market Economies, plays an important role in shaping these preferences. This insight modifies our understanding of how different governance structures impact SOE behavior. The results of this study show the importance of considering institutional and political contexts when analyzing the strategic decisions of SOEs, which not only pursue economic returns but also fulfill governmental mandates. These results aid policymakers and corporate strategists in designing frameworks that accommodate both economic and socio-political objectives, ensuring that SOEs' international ventures support broader national interests. In a general context, this research enriches the discourse on global economic strategies by illustrating how state-driven entities adapt to and shape international market dynamics, reflecting broader geopolitical and economic trends. These findings contribute to a global economic narrative, highlighting the strategic dimensions of state ownership in international business.

Framing of the research. *In the last decades, the global scenario has become increasingly complicated, especially for firms that are facing multiple interests and objectives. While private-owned enterprises (POEs) usually try to reach the so-called "profit-maximization" goal, other companies must combine it with different objectives, such as security, long-term survival, or supply of resources. Crucial actors following these concepts are SOEs. These corporate entities are particular companies in which the state exerts some kind of ownership. Due to this ownership (and control), SOEs are able to combine different views, needs and interests. This reflects the vast political and institutional actors that can influence SOEs' activities (Tihanyi et al., 2019). SOEs started their internationalization process worldwide to pursue strategic objectives and business opportunities. From the 2000s, the number of SOEs that became multinational has dramatically increased, showing a vast number of foreign direct investments (FDIs) in both developed and emerging economies (OECD, 2023). Due to their crucial role in the home country's economic development, several SOEs started to be recognized as "national champions" (Hennart, 2017).*

SOEs have long operated at the intersection of politics and economics, adapting to evolving institutional landscapes across different regions. Their role and influence have shifted over time, shaped by historical events, market liberalization, and government policies. In the decades following World War II, SOEs proliferated in developed economies, expanding their international reach and contributing to national economic strategies (Bruton et al., 2015). In contrast, emerging markets only began to assert their presence in the global economy over the past two decades as governments increasingly leveraged SOEs to drive international expansion and enhance their competitiveness on the world stage (Cuervo-Cazurra et al., 2023). This transformation has positioned SOEs as key players in global markets, often acting as extensions of state interests beyond their domestic borders.

DOI 10.7433/SRECP.SP.2025.01

Unlike private firms, SOEs operate with a dual mandate: they are expected to generate economic value while simultaneously serving broader national objectives. Governments often rely on them to ensure energy security, control strategic industries, and foster technological innovation (Bass & Chakrabarty, 2014). In times of geopolitical uncertainty, SOEs become even more critical as instruments of state policy. The study of SOEs within international business (IB) research has traced their evolution across diverse political and economic systems, examining the institutional, regulatory, and governance factors that shape their behavior (Cuervo-Cazurra, 2018). While some scholars emphasize the advantages SOEs gain from state backing - such as preferential financing and policy support - others highlight the constraints they face, including regulatory scrutiny and political interference. As globalization intensifies and geopolitical tensions reshape trade relationships, SOEs remain at the center of debates on economic sovereignty, market efficiency, and state intervention (Mariotti & Marzano, 2019). Their role is relevant to policymakers and institutions, private firms, and investors seeking to understand the broader forces shaping global business dynamics.

Previous literature posed attention to different types and dynamics of SOEs' internationalization, focusing on different theories such as agency theory, resource-based view, resource dependence theory, and institutional theory (Benito et al., 2016). The latter, especially, was extensively used to incorporate a wide range of perspectives stemming from different institutions. Every kind of institutional actor influences SOEs' choices and, especially, all the decisions concerning activities outside the border of the country. Indeed, home country characteristics play a crucial role in shaping SOEs' behavior (Cuervo-Cazurra & Li, 2021). The quality of home institutions, political factors, and laws contribute to the internationalization efforts of SOEs, facilitating FDIs and cross-border deals (Chen et al., 2019).

One of the core concepts in the literature of international relations and IB is the "Varieties of Capitalism" (VoC) framework (Hall & Soskice, 2001). VoC provides a comparative institutional perspective on national economies, distinguishing between Liberal Market Economies (LMEs) and Coordinated Market Economies (CMEs). This approach emphasizes the institutional complementarities that shape firm behavior, economic performance, and competitive advantage across different capitalist systems. Within this framework, LMEs - such as the United States and the United Kingdom - rely on market-based coordination, competitive labor markets, and financial systems prioritizing short-term shareholder value. In contrast, CMEs - such as Germany and Sweden - depend on non-market coordination, long-term relationships with stakeholders, and bank-based financial systems that support strategic investments (Jackson & Deeg, 2008).

The VoC perspective has significant implications for international business research, particularly in explaining the internationalization strategies of firms. The institutional arrangements in LMEs and CMEs influence corporate governance structures, labor relations, and innovation patterns, which in turn shape firms' approaches to foreign market entry and global expansion. For instance, firms from LMEs often pursue internationalization strategies characterized by cross-border mergers and acquisitions (M&As) and market-driven expansion, as these align with their emphasis on flexibility and shareholder value maximization. Conversely, firms from CMEs tend to favor international joint ventures and strategic alliances, leveraging their coordinated networks and long-term relational commitments to mitigate risks and ensure sustainable growth (Mariotti & Marzano, 2019).

Moreover, the VoC framework sheds light on how multinational enterprises adapt their strategies to host-country institutional environments. When expanding into markets with institutional configurations different from their home country, firms may encounter institutional voids, regulatory constraints, or differing labor market dynamics that require strategic adaptation (Inoue et al., 2013). For example, an LME-based firm entering a CME-based market may need to adjust its managerial practices to accommodate collective bargaining agreements and long-term employment relationships, while a CME-based firm expanding into an LME-based environment might face pressures to prioritize short-term financial performance over stakeholder-oriented strategies. Overall, the VoC framework offers a robust analytical lens for understanding the diversity of capitalist systems and their impact on international business strategies. By integrating institutional diversity into IB research, previous literature partially explained variations in firm behavior, level of internationalization and global competitiveness (Mariotti & Marzano, 2020).

Although previous research has incorporated the concept of VoC in IB research, one of the key topics was neglected: the entry and establishment mode choice. Entry modes refer to firms' strategic choices when expanding into foreign markets, determining the structure and degree of control they maintain over international operations (Hennart, 2009). The selection of an appropriate entry mode is influenced by factors such as firm-specific advantages, industry conditions, institutional environments, and risk considerations. Establishment modes refer to how firms set up their operations in a foreign market, typically focusing on investment-based entry strategies. They are a subset of entry modes that emphasize the degree of ownership and control a firm maintains over its foreign subsidiary. The two primary establishment modes are greenfield investments and M&As. The establishment mode choice is a crucial topic in IB research and can be influenced by multiple factors. The influence of different types of capitalism and institutional factors, such as democracy and inter-country relations, was neglected, remaining unclear in current literature.

Purpose of the paper. *This paper aims to investigate the impact of state ownership on firms' establishment mode choices in foreign markets, specifically examining the choice between greenfield investments and M&As. SOEs operate under distinct strategic and institutional constraints compared to POEs, influencing their risk preferences, resource allocations, and long-term objectives in international expansion (Estrin et al., 2016). While prior research has explored the role of ownership structure in IB decisions, limited attention has been given to how state ownership shapes entry and establishment mode selection in cross-border investments (Grøgaard et al., 2019). This study seeks to bridge this gap by quantitatively analyzing the relationship between state ownership and establishment mode choice.*

Beyond the direct effects of state ownership, this paper further examines how institutional contexts moderate this relationship. Specifically, we draw on the VoC framework to explore how home-country institutional environments influence the strategic behavior of state-owned firms (Grosman et al., 2016). Firms originating from CMEs and LMEs operate under different governance structures, financial systems, and labor relations, which may shape their internationalization strategies differently. By integrating the VoC perspective, we aim to provide a nuanced understanding of how national economic systems condition the effects of state ownership on establishment mode decisions (Liang et al., 2015).

Additionally, this study investigates the moderating role of democracy and inter-country relations in shaping SOEs' internationalization strategies. The level of democracy in a firm's home country can influence the extent to which political actors interfere in corporate decision-making, affecting risk tolerance, investment preferences, and strategic autonomy. In more democratic environments, SOEs may experience greater transparency and regulatory oversight, potentially altering their approach to foreign expansion. Conversely, in less democratic settings, state influence may be more pronounced, leading to different investment behaviors abroad. By examining the interplay between state ownership, VoC, democracy and inter-country relations, this paper contributes to a more comprehensive understanding of how institutional factors shape establishment mode choices in IB research. Therefore, we theorized a preliminary set of hypotheses:

H1: Ceteris paribus, SOEs are more likely to choose greenfield investments over M&As compared to POEs
H2: In CMEs SOEs show a higher propensity to greenfield investments over M&As compared to POEs
H3: In LMEs SOEs show a lower propensity to greenfield investments over M&As compared to POEs
H4: As the level of democracy in the home country increases, SOEs demonstrate a greater tendency to choose greenfield investments over M&As compared to POEs
H5: Stronger inter-country relations between the home and host country increase the likelihood that SOEs will prefer greenfield investments over M&As compared to POEs

Methodology. *We use a dataset containing information on state-owned enterprises (SOEs) and privately-owned enterprises (POEs) that have engaged in foreign market entries from 2000 to 2023. The data is sourced from reputable international databases[4] such as the Bureau Van Dijk, OECD and World Bank, capturing details on entry modes (greenfield investments versus mergers and acquisitions), degrees of state ownership, and other firm-specific attributes like industry classification, size, and age. Additionally, we integrate economic and political indicators from both home and host countries to enrich our analysis.*

To ensure a balanced and comparable dataset, we adopt a refined three-step process for sample construction. Initially, we create a control group of POEs that did not undertake international expansions during the same period, ensuring comparability in terms of size, industry, and economic conditions of the home country. Next, we exclude any firms that received similar state interventions or engaged in comparable entry modes in different markets to eliminate potential confounding effects. To this end as third step of data sampling, in line with (Guerzoni & Raiteri, 2015; Guo et al., 2016; Shipman et al., 2017; Caragliu & Del Bo, 2019) to ensure that the control sample and the treated sample are as consistent as possible, we consider a Propensity Score Matching (PSM) using a 1:n ratio, matching each SOE with multiple POEs based on a broad set of characteristics, including industry, size, and economic health, to have robust comparability.

After matching, we use logistic regression to assess the impact of state ownership on the choice of entry mode. The logistic regression model is specified as follows.

$$\text{Logit}\big(P(Y_i = 1)\big) = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \ldots + \beta_n X_{ni} + \epsilon_i$$

Where Y_i is the choice of entry mode (1 for greenfield investments, 0 for mergers and acquisitions), X_{1i} X_{2i} X_{ni} represent the independent variables including state ownership, industry characteristics, and institutional factors, and ϵ_i is the error term. This model allows us to control for various influences on the decision-making process regarding entry modes.

Moreover, we explore the moderating effects of home-country institutions using the Varieties of Capitalism framework, as well as other political factors such as democracy levels and international relations, to understand how they influence the relationship between state ownership and entry mode choice.

To validate the quality of our matching and the effectiveness of our sample, we first perform a series of tests to evaluate the balance of characteristics between matched groups. We calculate the Standardized Mean Differences (SMD) for all variables pre and post-matching and conduct t-tests to compare the means of these groups to verify there are no significant differences prior to treatment. Using a caliper width, we limit the maximum allowable distance between the

propensity scores of matched firms, employing nearest-neighbor matching without replacement. This process ensures that the sample mirrors the distribution of characteristics within the treatment group, enhancing the credibility of our causal inferences.

Results. *The expected results of this study would aim to better understand how state ownership influences decisions on how firms enter the international business, focusing on the choice between greenfield investment and mergers and acquisitions. Based on the theoretical framework and empirical strategy outlined, state-owned enterprises (SOEs) are expected to demonstrate a greater propensity for greenfield investment than private enterprises (POEs). This trend can be attributed to the strategic and institutional imperatives that drive SOEs, including the pursuit of long-term national goals and the influence of home country governance structures. In addition, the research expects that the impact of state ownership on entry decisions is moderated by the type of capitalism practiced in the home country. Specifically, SOEs from coordinated market economies (CMEs) are expected to show a greater preference for greenfield investment because of their institutional environment that favors strategic, long-term investment over short-term gains. In contrast, SOEs in liberal market economies (LMEs) may show a lower propensity for greenfield investment, potentially favoring mergers and acquisitions that align with flexible, market-oriented business strategies.*

In addition to the baseline model, this study could reveal how levels of democracy and international relations between home and host countries influence SOEs' strategic choices. It is likely that higher levels of democracy in the home country correlate with greater transparency and accountability of SOEs, which could lead to a preference for greenfield investments that require substantial long-term commitments and are less susceptible to political fluctuations. Similarly, strong country relationships are expected to facilitate greenfield investment by reducing the political and economic risks associated with foreign direct investment.

Research limitations. *Although this study attempts to provide an analysis of the choices of how SOEs are established, several limitations must be acknowledged. First, the use of data from secondary sources may introduce biases related to the accuracy of data reported by different countries and firms. Despite efforts to ensure data quality through reliable sources, some level of inconsistency and error is inevitable.*

Another limitation concerns the generalizability of the results. The fact that the study focuses on state-owned versus privately owned enterprises, primarily in specific types of market economies (LMEs and CMEs), may limit the applicability of the results to other contexts, such as transition or developing economies, where state ownership and institutional frameworks differ significantly. In addition, the propensity score matching method, while effective in controlling for observable confounding variables, cannot account for unobserved heterogeneity that might influence establishment mode choices.

In addition, the study's methodology, which focuses on quantitative analysis, may overlook qualitative factors such as cultural influences, managerial decision-making processes, and informal institutional pressures that could have a significant impact on SOE strategic choices. These elements often require more granular, case-by-case investigation beyond the scope of the current study.

Despite these limitations, the research provides valuable insights into the strategic behaviors of SOEs in the international landscape, contributing to theoretical and empirical discussions in the field of international business.

Managerial implications. *The findings of this study have potential implications for both managers and policymakers involved in international investments regulation. For managers, understanding the influence of state ownership on establishment mode choices can help in making strategic decisions that align with both firm objectives and institutional constraints. SOEs should consider the institutional environment of both home and host countries when selecting between greenfield investments and M&As, ensuring that their strategies align with long-term goals and risk management considerations. In particular, SOEs from CMEs may benefit from leveraging existing networks and long-term investment strategies when entering foreign markets. At the same time, those from LMEs may need to adopt more flexible approaches to account for different market dynamics.*

From a policy perspective, governments and international regulatory bodies should recognize the unique challenges and advantages of state ownership in cross-border investments. Policymakers in home countries should establish frameworks that provide SOEs with strategic autonomy while ensuring transparency and accountability in their international activities. Similarly, host-country regulators need to consider the institutional origins of SOEs when formulating policies on FDIs, balancing economic benefits with potential concerns about state influence. Furthermore, policies promoting strong inter-country relations can facilitate more predictable and mutually beneficial investment decisions by SOEs, fostering stable international environments.

By addressing these managerial and policy considerations, this study contributes to a better understanding of how institutional contexts shape the internationalization strategies of SOEs, offering actionable insights for practitioners and regulators alike. Future research can further explore how evolving institutional configurations, such as hybrid market economies or changes in global governance, affect firm internationalization and cross-border collaboration. Moreover, different types of VoC and democracies can be used to understand if specific institutional environments facilitate or constrain global investments, particularly regarding entry and establishment mode choice.

Originality of the paper. *This paper contributes significantly to the IB literature by offering a novel perspective on the establishment mode choices of SOEs. While prior studies have examined entry modes under multiple conditions, limited research has explicitly investigated the role of state ownership in shaping firms' preferences for greenfield investments versus M&A. By focusing on SOEs, this study extends the traditional understanding of entry mode strategies, incorporating the unique constraints and opportunities that state ownership brings to international expansion decisions.*

One key originality of this study lies in its conceptual approach, which integrates the VoC framework and political institutional factors (democracy) into the analysis of SOEs' internationalization. Existing research on establishment mode choices has predominantly focused on firm-level characteristics or industry conditions. However, this study emphasizes the role of home country institutional structures in shaping SOE behavior, providing a more comprehensive view of how institutional environments influence foreign investment decisions. By distinguishing CMEs and LMEs, this paper highlights how different economic systems impact SOEs' risk preferences and strategic choices.

Furthermore, by incorporating democracy and inter-country relations as moderating factors, this paper sheds light on the political dimensions of SOEs' decision-making, recognizing that governance structures can significantly influence firms' internationalization behavior.

Methodologically, this study also contributes by employing a robust empirical strategy that integrates multiple institutional and political indicators. By analyzing a cross-national dataset of SOEs and POEs, this research provides empirical insights that enhance the generalizability of its findings. Moreover, including inter-country relations as a moderating factor expands the scope of international business research by addressing the geopolitical considerations that may shape SOEs' investment decisions.

Overall, this paper contributes original insights by bridging gaps in the literature on state ownership, institutional theory, and establishment mode choices. By integrating economic systems, political governance, and international relations into the analysis, this study advances theoretical and empirical understandings of how SOEs create foreign investment decisions, with implications for both managers and policy-makers.

Key words: *Entry modes; Establishment modes; State ownership; International Business; Institutions; Varieties of Capitalism.*

“Made in Japan” vs “Made in Germany”: An Application of the Implicit Association Test to the Study of the Country-of-Origin Effect

DANIELE PORCHEDDU[1] RAFFAELE CAMPO[2] ANTONIO USAI[3]
MICHELA IESU[4] GAVINO VACCA[5]

Abstract

Research on the Country-of-OriginEffect (COO-effect) reveals that the place of origin of a given product can affect consumers’ purchase choices positively or negatively, depending on the positive or negative beliefs consumers associate with that place. Certain products are perceived as better than others because they enjoy the positive association with a particular country, and marketers can benefit from emphasizing and promoting information about the country of origin when it enjoys positive stereotypes by extolling the geographical origin of the product, for example, through packaging and communication tools. A positive country-of-origin reputation amplifies the product’s perceived value, favoring its purchase by consumers. To the best of our knowledge, studies regarding this psychological effect have always been conducted on an explicit level through traditional research tools, such as questionnaires, which measure cognitive and affective constructs consciously held and stated by respondents. The problem for marketers is that people do not always want (or are able) to say what they think; even if they do, their behaviors are not always consistent with what they say. As a result, the results of market surveys conducted with traditional tools such as questionnaires may not always be reliable and may be characterized by reduced predictive ability. To better predict purchasing behavior, it is also necessary to analyze implicit constructs of which people are unaware, which, together with explicit cognitions (consciously accessed), guide their purchasing behavior. In our research, we apply to the study of COO-effect a test for measuring implicit constructs within a lab experiment involving 50 participants. Specifically, we investigated the degree of innovativeness perceived by Italian consumers concerning “Made in Germany” products, on the one hand, and “Made in Japan” products, on the other, both at the explicit level (through a questionnaire) and at the implicit level (through participation in a Implicit Association Test). This dual approach makes our research original; to the best of our knowledge, this is the first time that the COO-effect has also been analyzed on the implicit level, and our lab experiment was designed and implemented precisely to provide an initial answer to this methodological gap. The research confirms our initial working hypothesis that Italian consumers are inclined to relate the dimension of innovativeness more strongly to the COO label “Made in Japan” (vs the label “Made in Germany”). From comparing the results that emerged via Questionnaire and IAT, we found that on the implicit level there was not as marked a difference in perceived innovativeness as that which emerged on the explicit level, and that 52% of the participants manifested inconsistency between what they stated explicitly in the Questionnaire and what emerged on the implicit level via the IAT. Some managerial implications and limitations of our study are finally discussed.

Framing of the research. *Many studies have shown that the place of origin of a given product can affect consumers’ purchase choices positively (or negatively), depending on the positive (or negative) beliefs consumers associate with that place. Schooler’s (1965) pioneering study showed that the country of origin of products produced effects on consumer behavior: the sample of participants, consisting of Guatemalan students, all other things being equal, rated products whose labels referred to Guatemala and Mexico as being of higher quality while providing a negative rating for products from Costa Rica and El Salvador. Reierson (1966) also conducted research on COO-effect, involving a sample consisting of U.S. students whom he asked to express an opinion about certain goods from not only the U.S. but also from other countries such as Japan, Germany, Italy, France, UK, Sweden, Denmark, Belgium and Canada. That study showed a clear preference toward domestic products; however, research conducted by the same author the following year (Reierson, 1967) pointed out that such stereotypes could be changed with an appropriate*

marketing campaign. Gaedeke (1973) highlighted the fact that products made in USA were often preferred to goods manufactured in countries with less advanced economies; similarly, Schott et al. (2022) studied a sample of U.S. consumers with respect to the origin of chocolate bars (U.S. and Europe on one side, South America and Africa on the other), perceiving greater quality and taste in the case of bars produced in more developed countries. It would seem, then, that a country's level of development can have an important impact on consumer perceptions. Also of interest is the study by De Nisco & Oduro (2022), who, in a literature review, confirmed how COO influences consumer behavior: in particular, the Country of the Brand is the component of COO that seems to have the most significant impact on purchase intentions. Some studies have recently focused on the influence of COO on food consumption (Wang & Park, 2025; Flores Kuff et al., 2023; Dobrenova et al., 2015). Specifically, Wang and Park (2025) tested the impact of the origin of insects for food use (Japan vs China) by observing that Japanese people tend to prefer local insects; similarly, Flores Kuff et al. (2023) showed that cricket meal is perceived to be higher in quality when sourced from countries with positive reputations.

However, according to Nagashima (1970), people's attitudes toward products from a specific nation are not static over time. In this sense, "Made in" can be understood as the vehicle of cognitions and attitudes that consumers associate with a specific country at a particular historical moment. As pointed out by Vianelli & Marzano (2012), the limitations of the first strand of COO-effect studies were mainly due to the fact that they were research based on a single-cue methodology, that is, they investigated the effects of the country of origin of the product on consumers' choices without, however, considering the presence of other variables that could influence their behavior. This approach led to an overestimation of the phenomenon, "nation of origin" being the only variable on which respondents based their evaluations.

The second strand of studies, since the early 1980s, highlighted that the more variables considered, the smaller the effect exerted by the product's country of origin. The first significant survey in this direction was conducted by Johansson et al. (1985), who, through a multi-cue approach, investigated consumer perceptions of cars produced in Japan, Germany and the USA. As many as 13 attributes were associated with the automobile product that the respondents evaluated. The study's results were significant because they highlighted that country-of-origin effects on consumer attitudes were less significant than had been found in research to that point. Peterson & Jolibert (1995), through a meta-analysis concerning 52 COO-effect studies, quantified the differences between the single-cue and multi-cue approaches. In single-cue studies, the average COO-effect affects 30 percent, while in multi-cue surveys this effect drops to 16 percent. With reference to "purchase intentions", the effect of country of origin even decreases from 19% to 3%. Usunier (2002) highlighted the causes why COO has a less significant impact on the consumer buying process than what had emerged from early studies conducted on the phenomenon since the 1960s. Three main causes emerged from that study:

1) *For consumers to be influenced in their purchasing process, it is necessary for them to consider information about the product's origin relevant to their choice. This varies according to the product category considered;*
2) *The consumer must attach such importance to the product's origin that he/she invests time and energy in researching and comparing alternative origins;*
3) *For certain types of goods, the purchase of which does not involve high psychological involvement, information about the country of origin assumes less importance than other attributes such as price, brand, and warranty.*

Vianelli & Marzano (2012) point out that this strand of research makes an important contribution to the study of the COO-effect, since, on the one hand, it scales down its magnitude and, on the other hand, it offers a systemic analysis of the phenomenon, which is broken down into its various components and related to the multiple variables related to the product, the consumer and the economic environment of reference.

More recently, some reviews have shed light on the development of the topic in terms of research (Yadav et al., 2024; Samiee et al., 2024). Specifically, Yadav et al. (2024) systematically reviewed 590 papers published during the last 30 years, highlighting that the COO-effect may be relevant also with regard to international segmentation and positioning strategies. By the way, Cristea et al. (2015) studied the way it affects brand positioning, revealing that it can act on reduction of perceived risks and trigger positive attitudes towards the buying decision process. Pagan et al. (2025), in addition, focused on the role of ethnocentrism and animosity in the case of wine consumers in Brazil. By involving 154 young consumers, they found that COO influences the intention to buy wine and ethnocentrism; while it affects perceived quality, it seems does not impact purchase decisions, which is also negatively associated with animosity. As for these components, De Nisco et al. (2016) analyzed consumer ethnocentrism and economic animosity regarding the image of Germany by a sample of Italian and Spanish graduated students. Their findings indicate that economic animosity towards a country does not affect the perceived image of that country or the expected quality of products made there. At the same time, it influences receptivity, so there is an inclination to be hostile towards products imported from that country.

In addition, the impact of COO can be extended to B2B markets too. As a matter of fact, Crespo et al. (2025) studied the impact of supplier-country image on customers, observing that country image influences relationship quality dimensions and perceived product quality. Country Image is another relevant component of COO (Leonidou et al., 2022), and Charinsarn & Speece (2025) affirm that it is increasingly connected to environmental issues. By the way, stereotypes can contribute to developing the image of a country (Bertoli & Valdani, 2023), as also shown by Feng et al. (2022), whose study highlights how they impact tourists' intention to visit a country.

In its initial connotation, the expression "country of origin" implicitly assumed that design and production took place in a single nation. In today's environment, permeated by globalization, many companies operating on an international scale tend to relocate several activities that make up the value chain in order to gain reputational advantages and/or lower production costs, depending on where these activities are located. As a result, consumers come into contact with "hybrid" products for which the country in which the product is designed, assembled, manufactured and from which raw materials are sourced may not coincide. Vianelli & Marzano (2012) point out that there is no agreement among researchers as to which of the aforementioned components has the greatest impact on consumers' perceptions of product quality. Today, it is not only the country where the good is actually produced that matters. For some scholars, consumers place more importance on the country of design where R&D is carried out (Li et al., 2000). In contrast, research conducted by Quester et al. (2000) points out that the most relevant component of COO in terms of perceived quality is the country from which a product's raw materials originate (Country of Parts). According to a study conducted by Hamzaoui (2010), the country of origin of production (Country of Manufacture) is more important to consumers, regardless of whether the products are simple or technologically complex. Earlier research carried out by Insch & McBride (1998) showed that for companies from countries with a low reputation, it might be useful to move assembly activities (Country of Assembly) to another country with a "superior" image, overshadowing information about the actual place of production. Vianelli & Marzano (2012) point out that the latest studies on the subject identify the brand's country of origin (Country of Brand) as the component that most impact consumer perceptions. In essence, the place where the product was designed, manufactured or assembled turns out to be less important than the place where the brand was born. Thus, mental associations between the product's brand and the country in which it is historically rooted would matter most in the purchasing process.

Purpose of the paper. *This research investigates the relationship between COO and the perceived degree of innovativeness among a sample of young Italians. Our study compared the labels "Made in Germany" and "Made in Japan". The choice of these COOs was not random. Japan and Germany occupy the top two places in the Nation Brand Index ranking (Anholt-Ipsos, 2023) and they enjoy the best overall reputation globally. Japan is currently perceived as the most innovative country globally, but the difference with Germany is not stark; in fact, the German country is perceived to be among the top 5 most innovative countries worldwide. In addition, the European Patent Office highlights that Germany is the European country where the most patent applications are filed (European Patent Office, 2023). Specifically, we investigated the degree of innovativeness that such COO labels evoke, both on an explicit level through the administration of a Questionnaire and on an implicit level through participation in an Implicit Association Test (IAT) (defined by Gregg & Klymowsky, 2013, as a valuable tool for market research). This dual measurement stems from the need to obtain information that is generally not accessible through traditional research tools such as questionnaires. Indeed, people are not always able (or willing) to say what they think; even if they do, their behaviors are not always consistent with what they say. The phenomena just mentioned may reflect difficulties of introspection on the part of those involved and/or biases potentially resulting from respondents' desire to provide a certain (socially desirable) self-image (Zogmaister & Castelli, 2006; Greenwald & Banaji, 1995). For these reasons, survey results may be unreliable, characterized by incompleteness and reduced predictive ability of potential customers' responses. To better predict buying behavior it is also necessary to analyze the beliefs and stereotypes of which people are, at times, unconscious bearers. The instrument we used to conduct the measurement on the implicit plane is the Implicit Association Test (IAT; Greenwald et al., 1998). The choice is related to the high internal consistency values and other relevant psychometric features of this test relative to other implicit measures (Lane et al., 2007; Teige-Mocigemba et al., 2010). The IAT differs from "traditional" survey instruments such as interviews, questionnaires, and focus groups in that it does not require people to state their opinions explicitly but by measuring the response times associated with stimulus-item classification tasks into special pre-assigned categories and the accuracy of the answers given by participants, it is possible to trace the cognitive and affective constructs they unconsciously hold. Indeed, people carry "(...) implicit cognitions, which do not replace, but rather complement the opinions and ideas that [they] hold explicitly and consciously. In many cases, implicit and explicit cognitions concur in influencing behavior, yet frequently they affect different aspects of conduct: therefore, it is particularly interesting to study both of these levels" (Zogmaister & Castelli, 2006, p. 66).*

Methodology. *Our approach involved a comparison between a plane of constructs implicitly settled in participants' minds and a plane explicitly held and communicated by the subjects. To the best of our knowledge, while many contributions on COO-effect are available in the literature, none of them has been concerned with flanking analyses conducted on the explicit plane (typically through surveys) with investigations aimed at illuminating the plane of constructs implicitly held by individuals regarding product source claims. Our lab experiment, designed and implemented precisely to provide an initial response to the mentioned methodological gap, was structured in two phases. The first phase involved a questionnaire measurement of the explicit association between two different countries of origin of products ("Made in Japan" and "Made in Germany") and the degree of innovativeness perceived by the participants. In the second phase of our study, however, we administered an IAT to measure the implicit association between COO and the degree of innovativeness perceived by the subjects.*

The measurement of the explicit association between the two COOs being compared and the categories "Innovation", on the one hand, and "Tradition", on the other, was done by asking the participants to express their ratings on a bipolar adjective Osgood rating scale with reference to two explicit questions. Specifically, participants

were asked to express numerical ratings on a seven-grade scale: in which 7 indicates the pole expressed by the adjective "innovative", while 1 indicates the pole expressed by the adjective "traditional". Participants were asked to express themselves generically concerning "Made in Germany" and "Made in Japan" products without thinking of specific product categories or individual brands. The responses provided by all participants in the "explicit measurement" phase of the experiment populated a database and were subsequently subjected to the calculation of descriptive statistics. Finally, with reference to these data, a dependent-samples t-test was conducted to assess whether the differences in the mean values of the ratings between the two "innovation-tradition" poles recorded with reference to the two COOs were statistically significant. Regarding the explicit-type analysis plan, consistent also with the findings of the latest Anholt-Ipsos Report (Anholt-Ipsos, 2023), we expect to detect a higher degree of perceived innovativeness in the COO label "Made in Japan" than in the "Made in Germany" label.

The second part of our experiment involved a further measurement, this time on the implicit level, of the strength of the associative links between COO and innovativeness in the minds of participants. For this purpose, we resorted to an IAT, which we programmed and administered using the software "Inquisit 3.0.2.0" (Millisecond Software LLC, Seattle, WA). The IAT is a test designed to surface automatic, spontaneous (and often unconscious) cognitions among concepts that interest a researcher (Zogmaister & Castelli, 2006). The IAT, in effect, is able to capture the intensity of the association between two target categories (in our case "Made in Japan" vs "Made in Germany") and two attribute categories (in our experiment represented by "Innovation" vs "Tradition"). This Test is developed in a series of steps (five or seven, as in our case), some of which are merely preparatory in nature. The IAT involves a succession of tasks of classifying items (words, pictures or sounds) into their respective categories. Two categories, so-called "target," are taken into account (e.g., "Made in Germany" and "Made in Japan") and typically exemplified by words or images that can be attributed to them (see Figure 1). Two additional categories, called "attribute," arranged along a bipolar dimension (in our case "Innovation" vs "Tradition"), are introduced into the analysis and equally exemplified through words or images (see Table 1).

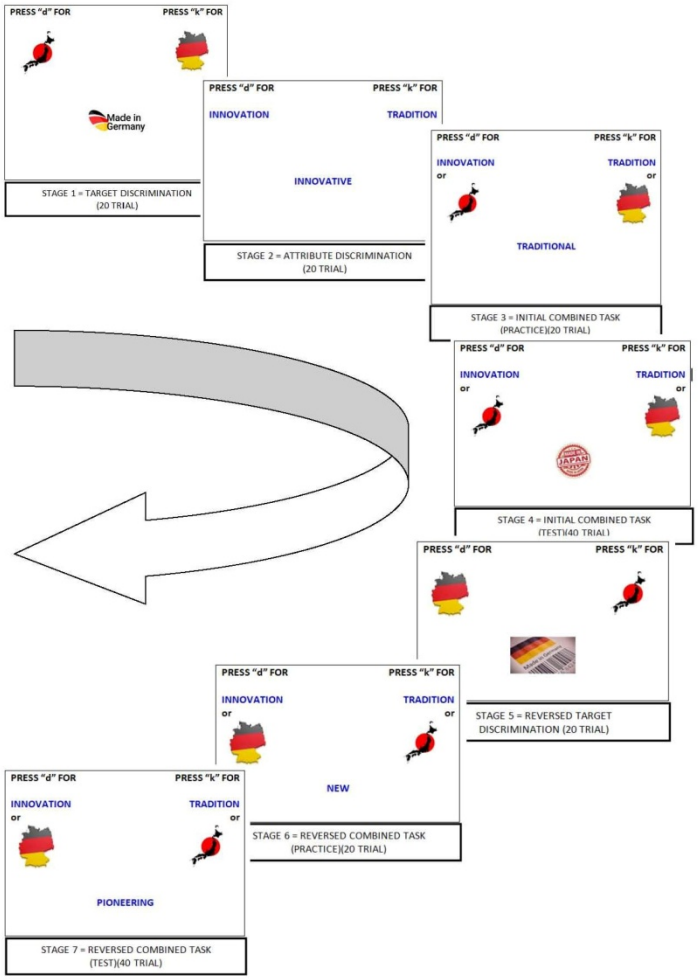
Fig. 1: Items representative of the target categories "Made in Germany" and "Made in Japan"

Source(s): All pictures are sourced from publicly available sources.

Tab. 1: Adjective-items representative of the two attribute categories

Attribute categories	*Adjective-items*
Innovation	*(a) innovative; (b) new; (c) pioneering; (d) innovator; (e) cutting edge*
Tradition	*a) traditional; (b) historical; (c) conservative; (d) backward; (e) customary.*

Source: Authors' own work.



Each time a stimulus appeared on the monitor of a computer station, the participant was asked, in order to proceed further, to categorize it (as quickly and accurately as possible) using the "d" and "k" keys on the keyboard. The strength of the associative links between targets and attributes is assessed by comparing the response times recorded by the participant, particularly within the context of two combined categorization sessions between pairs of compared categories (see steps 4 and 7 in Table 2 and in the graphic exemplification of Figure 2).

Tab. 2: Sequence of phases of the IAT conducted in our study

			Assigned answer key	
Step	***Number of stimuli administered***	***Nature Task***	***Button "d"***	***Button "k"***
1	*20*	*target categorization*	*Made in Japan*	*Made in Germany*
2	*20*	*attribute categorization*	*Innovation*	*Tradition*
3	*20*	*combined categorization (practice)*	*Made in Japan/Innovation*	*Made in Germany/Tradition*
4	*40*	*combined categorization (test)*	*Made in Japan/Innovation*	*Made in Germany/Tradition*
5	*40*	*reverse target categorization*	*Made in Germany*	*Made in Japan*
6	*20*	*inverted combined categorization (practice)*	*Made in Germany/Innovation*	*Made in Japan/Tradition*
7	*40*	*inverted combined categorization (test)*	*Made in Germany/Innovation*	*Made in Japan/Tradition*

Fig. 2: Synoptic overview of the phases of the IAT we conducted.

Source: Authors' own work.

The basic idea behind the IAT is that if two categories (one target and one attribute) are strongly associated in people's perceptions, then the response times recorded during the combined categorization steps are relatively faster (and the responses more accurate) when the two said categories share the same response key, compared to the case when two different keys are attached to them. The researcher's task is to measure and compare the response times and the percentage of correct responses recorded under the two combined categorization tasks to measure the so-called IAT-effect. However, the researcher, before performing the IAT, will have to hypothesize the existence of specific links between target categories and attributes. As a mere working hypothesis, by analogy to what was hypothesized with reference to the explicit analysis plan, we expect to record a strong association between "Made in Japan"/"Innovation", on the one hand, and "Made in Germany"/"Tradition", on the other hand (such a combination, in the scientific terminology of the IAT, is called a "compatible block."; the adjective "compatible" actually refers back

to "compatibility" concerning what the researcher hypothesized); while we expect the strength of the link to be weaker in the case of the "Made in Japan"/"Tradition" and "Made in Germany"/"Innovation" combination (so-called "incompatible block"; in this case the adjective "incompatible" refers back to inconsistency with respect to the hypothesis formulated by the researcher). If the researcher's hypothesis is true, the speed and accuracy of responses given about the "compatible block" will tend to be higher than what is recorded under the "incompatible block". Precisely by starting from the difference between the response times recorded in the "incompatible block" (step 7 of Table 2) and those recorded during the "compatible block" (step 4), it is possible to measure the IAT-effect, intended as a proxy for the intensity of the implicit association between the concepts examined. Positive values of the IAT-effect tend to support the associative robustness of the "compatible block" hypothesized by the researcher. At the sample level, then, it should be assessed, through appropriate statistical tests, whether the mean value of the IAT-effect (positive if the researcher's conjecture is valid) deviates significantly from a comparison value of zero (signalling value of total absence of performance differences within the two combined categorization tasks). Appropriate steps were taken during the administration of the stimulus-items to prevent any order-effects on the responses given.

Results. *Fifty adult subjects, including 25 women and 25 men, were admitted to our experiment. The sample size exceeds that necessary to ensure the statistical tests conducted (which are essentially based on t-student statistics), with $\alpha=0.05$, a test power of at least 80%, and to detect even a small effect size (d=0.2) (Clark-Carter, 2004). The participants, who reported to be in good health and to have normal (or corrected-to-normal) vision, collaborated in our research completely free of charge and voluntarily. All participants read and signed an informed consent form. The age of the participants was between 19 and 38 years (total mean age=27.5 years; SD=5.6).*

In the first part of the experiment, participants were asked to explicitly express the perceived degree of innovativeness in the two COOs compared on a seven-point Osgood scale. (where 1="traditional" and 7="innovative"). With reference to the COO label "Made in Germany," we recorded a mean score of 4.02(SD=1.27). Relative to the "Made in Japan" label, on the other hand, there was a mean Osgood scale value of 5.40(SD=1.47). To assess whether the differences between the two mean scores associated with the two COO labels differed to a statistically significant extent, we conducted a dependent samples t-test, which proved to be statistically significant [t(49)=5.438; p<0.001; Cohen's d=0.769].

With regard to the IAT, in accordance with our working hypothesis, the analyses showed lower mean response times (and higher accuracy rates) at the so-called "compatible" block (mean response time=916 ms and 96% accuracy), compared to what was found at the "incompatible" block (1015 ms and 94%). From the data just presented, a positive IAT-effect emerges (on average, 99 ms).

To understand whether the differences in mean response times and mean accuracy percentages recorded between the two blocks (compatible vs incompatible) were statistically significant and not simply related to chance, we conducted two t-tests for paired samples.

Specifically, the dependent-samples t-test on the average response times highlighted in the two blocks was found to be statistically significant [t(49)=2.194; p<0.05; Cohen's d=0.311], while the dependent-samples t-test conducted on the average percentages of response accuracy was not found to be statistically significant [t(49)= 0.960; n.s.].

At a more detailed level, analysis of the measurements conducted on the explicit level shows that as many as 38 individuals, corresponding to 76 percent of respondents, associate a higher degree of innovativeness with "Made in Japan" products than with "Made in Germany" products. German products are perceived to be more innovative than Japanese products by 10 individuals, corresponding to 20% of the respondents. In comparison, only 2 individuals (4% of the respondents) perceive the same degree of innovativeness for the two COO labels compared.

From the analysis of the measurements conducted on the implicit level, the gaps appear significantly less marked; in fact, only for 29 individuals (58% of the respondents) the association between "Made in Japan" and "Innovation" ("compatible block") was stronger, while for the remaining 21 participants (42% of the respondents) the association between "Made in Germany" and "Innovation" ("incompatible block") was stronger.

A joint analysis between the results that emerged based on what respondents stated in the Questionnaire and the results highlighted by the IAT shows that, not always, there is consistency between what people state on the explicit level and what emerges on the implicit level. Specifically, out of a sample of 50 individuals, consistency emerges between the explicit and implicit associations of 24 individuals (48 percent of the participants). Of these, 21 individuals declare "Made in Japan" to be more innovative on the explicit level, and the association between that COO label and the innovation attribute is also stronger on the unconscious level. The remaining 3 individuals consider "Made in Germany" more innovative on both the explicit and implicit levels. In essence, as many as 26 individuals, or 52% of the participants, expressed inconsistency between what they state explicitly and what emerges on the implicit level through the IAT. Of these, 17 individuals declared "Made in Japan" to be more innovative on the explicit level, but on the unconscious level, the "Made in Germany"-"Innovation" association appeared to be stronger. Another 7 subjects believe that "Made in Germany" is more innovative on the explicit level, but on the unconscious level, the association between "Made in Japan"-"Innovation" is stronger. Finally, 2 individuals declare themselves neutral on the explicit level, but on the unconscious level, for one individual, the association between "Made in Japan"-"Innovation" is stronger, while for the other individual, the association between "Made in Germany"-"Innovation" is stronger.

Research limitations. *All the results illustrated, although characterized, in our opinion, by sufficient degrees of internal validity, were obtained in a laboratory setting using a sample that is not representative of the Italian population and, consequently, may present problems of external validity. To overcome generalizability problems, the*

results we obtained should be confirmed in more realistic contexts, resorting to representative samples of the population of interest and, possibly, establishing selective comparisons between COO labels in terms of perceived innovativeness with reference to specific product categories (e.g., automobiles, consumer electronics products etc.). In fact, our study currently records a kind of "generalized belief" (i.e., not referring to specific product categories) in innovativeness that Japanese products seem to have, in the eyes of Italians, both explicitly and implicitly, compared to German products. Finally, let us recall that the results of our study remain exclusively referable to one of the possible subsets of meanings (innovativeness) conveyed by the two COO labels compared.

Managerial implications. *The results confirmed our hypothesis that the Italians are inclined to more strongly relate the dimension of innovativeness to the COO label "Made in Japan" (relative to that "Made in Germany"). The measurements conducted on an explicit level showed a significant higher degree of perceived innovativeness toward "Made in Japan" products. Measurements on the implicit level also seem to go in the same direction; in fact, the IAT revealed a positive effect (a symptom of the robustness of the "compatible block" as opposed to the "incompatible block"). However, the differences that emerged upon closer joint analysis between implicit and explicit associations highlight the validity of the IAT as a complementary tool of the instruments traditionally used in marketing research. The results lead one to think that it might be useful to complement traditional research instruments (such as, for example, questionnaires) capable of measuring the explicit, consciously accessible component of cognitive and affective constructs of target customers with additional instruments, such as the IAT, capable of measuring the intensity of implicit constructs, unconsciously held by respondents (and potentially conflicting with what they state because of their desire to provide a certain, socially desirable, self-image).*

Regarding the specific topic we examined, the dual explicit-implicit approach should enable managers to obtain the cognitive and affective constructs of interest from time to time complete and reliable data and, therefore, to have a greater awareness of the choice of whether to emphasize (or not) the country of origin of a specific product based on the positive (or negative) association with the country itself and the consequent conceivable positive (or negative) impacts on business KPIs.

Originality of the paper. *Although the existence of country-related beliefs with reference to different product categories has long been known in the literature, we believe that our experiment presents novel elements, if only on the methodological level. Indeed, to the best of our knowledge, this is the first time that the COO-effect has been studied by also exploring the dimension of implicit cognitive and affective constructs (making use, in particular, of an Implicit Associations Test).*

Key words: *Country-of-Origin Effect; Implicit Association Test; Made in Germany; Made in Japan; Perceived Innovativeness*

The Human Rights Cost of Service Value Chains: Outsourced Content Moderation in the Digital Economy

GALO SERJE MORALES[1] MARC OBERHAUSER[2]

Abstract

This work-in-progress study explores human rights abuses in global service value chains (SVCs), using the outsourced content moderation industry in Colombia as a case study. While extensive research has examined manufacturing GVCs, the governance of SVCs-particularly in the business process outsourcing (BPO) industry-remains underexplored. Content moderation, a critical yet largely invisible function in the digital economy, is outsourced to BPO firms, raising concerns about the workers' human rights, corporate accountability, and regulatory oversight. Applying a case study approach, this research investigates how multinational enterprises (MNEs), BPO providers, policymakers, and labor organizations shape the governance of outsourced content moderation. The study will collect qualitative data through semi-structured interviews with key stakeholders, including current and former content moderators, union representatives, and managers. These interviews will form the basis for preliminary findings, presented at the Sinergie-SIMA 2025 Management Conference to refine the study through scholarly discussion and feedback. By extending GVC and International Business (IB) research into the digital service economy, this study contributes to a deeper understanding of human rights issues in the digital economy.

Key words: *Service value chains, business process outsourcing, content moderation, human rights, Colombia, Teleperformance*

1. Introduction

Recent endeavors in international business (IB) research have shed light on the complexities of global value chains (GVCs) and associated human rights issues (Narula, 2019), such as forced labor, child labor, and unsafe working conditions (Caruana et al., 2021; Stringer & Michailova, 2018). Within this research stream, there is growing recognition that socially questionable practices often occur at lower-tier suppliers of multinational enterprises (MNEs) (Barrientos et al., 2011; Lund-Thomsen, 2020), requiring social upgrading, which refers to improving the labor conditions within GVCs while promoting the inclusion of underprivileged communities in economic activities (Gereffi & Lee, 2016). Infamous cases of human rights violations at Apple's Taiwanese supplier Foxconn (Lee et al., 2016; Mol & Lee, 2023), the Rana Plaza disaster in Bangladesh (Huber & Schormair, 2021), and child labor at Rangan Export, an Indian supplier of Ikea, (Bartlett et al., 2006) underscore the urgent need for interventions at the supplier level. A common feature of these examples is that they all relate to manufacturing in GVCs. However, considering the process of tertiarization, one of the most salient structural changes of the global economy (Jorgenson & Timmer, 2011), we argue that research may be overlooking facets unrelated to lower-tier manufacturing suppliers.

The overall growth of the service industry created the basis for establishing the global business process outsourcing (BPO) industry. Some of the most common services the BPO industry provided historically are customer service, sales, business development, customer retention, accounting and finance, and less frequently, more highly skilled functions, such as research and development (Lacity et al., 2011). Driven by digitization and the rise of social media, content moderation was added to the services. Content moderation refers to the screening of user-generated content (UGC) to guarantee compliance with the safety guidelines of social media, platforms, and websites that rely on UGC (Gillespie, 2020). It safeguards the companies' brand reputation while preventing operational disruptions caused by UGC that may be illegal, disturbing, or controversial. Content moderation is crucial for the general public as it significantly impacts user experience, and also influences freedom of speech (Eastwood, 2023; Jones, 2024). Although Artificial Intelligence (AI) has dramatically increased its capabilities, it is still far from being able to completely take over such an important, critical, and delicate job. Organizations still rely on humans to complete the parts of the job where AI falls short (Gillespie, 2020). However, content moderation has been colloquially defined as the "dirty work" of digital labor

(Roberts, 2016) since in the back offices of Meta's, TikTok's, and Google's subcontracted BPOs, thousands of content moderators are forced to watch graphic and disturbing content such as child abuse, extreme violence, and animal cruelty (Eastwood, 2023; Jones, 2024; Roberts, 2016; Wamai & Kalume, 2023).

A landmark case highlighting the human rights risks in outsourced content moderation emerged in Kenya, where content moderators employed by Sama-a third-party BPO-were tasked with reviewing graphic and violent content for Facebook. These workers, many of whom were migrants and refugees, were exposed to distressing UGC daily with inadequate psychological support, leading to widespread reports of post-traumatic stress disorder (PTSD), anxiety, and depression (Booth, 2024; Hellerstein, 2023). When moderators attempted to unionize to demand better conditions, they faced employer resistance and blacklisting (Hellerstein, 2023; Reuters, 2023). In response, they filed a class action lawsuit against both Sama and Meta, challenging Meta's claim that it bore no responsibility as it had no direct employment relationship with the moderators (Kiplagat, 2024). Meta initially tried to circumvent the legal action, claiming it had no physical offices in Kenya and that was not the direct employer of the moderators, who were contracted by Sama (Kiplagat, 2024). Meta also attempted to shift operations to another provider, Majorel, and blacklisted former Sama employees from being rehired, but this move was blocked by the Kenyan government (Hellerstein, 2023; Reuters, 2023). Recently, a Kenyan court ruled that Meta, as the primary employer, was liable for the moderators' working conditions, setting a precedent for corporate accountability in outsourced digital labor (Hellerstein, 2023). However, the case is ongoing, with the potential to significantly impact the service value chains used by Big Tech companies in Kenya, as it seeks to hold Meta accountable for the well-being and human rights abuses of its content moderators. The legal battle highlights the struggle for fair labor practices and the responsibility of MNEs regarding the welfare of workers in their global service supply chains.

While GVC research has extensively examined human rights issues in manufacturing, the outsourcing of service labor-particularly content moderation-remains a largely overlooked area. Content moderation is a key function in the digital economy, yet the implications of its outsourcing, especially regarding human rights, and ethical and regulatory frameworks, are still not fully understood. Given the severe psychological toll on digital workers and the opaque nature of subcontracting arrangements, there is a pressing need to investigate how MNEs govern these outsourced service activities. Therefore, this study aims to explore the governance of outsourced content moderation within global SVCs, focusing on human rights issues, and regulatory implications. By extending GVC and IB research into the digital service economy, we contribute to a more comprehensive understanding of human rights and accountability in global outsourcing practices.

2. Theoretical framework

2.1 Conceptualizing the global service value chain

GVCs involve interconnected production steps spanning multiple countries, where firms add value at any stage. These networks vary in structure, with some resembling "spiders," where components are assembled in one location, and others functioning like "snakes," with sequential production across borders (Antràs & Chor, 2022). GVC research spans multiple disciplines, emphasizing governance structures from firm-level strategies to institutional frameworks (Kano et al., 2020). The global commodity chain framework, developed in the 1990s, categorized production networks into producer-driven and buyer-driven models based on power distribution (Gereffi & Korzeniewicz, 1994). Another framework identifies five governance types-market, modular, relational, captive, and hierarchical-shaped by transaction complexity, codifiability, and supplier capabilities. Industries often transition between these types, as seen in apparel and electronics (Gereffi et al., 2005).

The global production network (GPN) framework shifts focus from economics to the spatial and social dimensions of economic development. It highlights firm-region-global economy interactions, emphasizing the spatial organization of production and its role in global inequalities (Henderson et al., 2002). Building on this, the "GPN 2.0" model refines the approach, integrating both manufacturing GVCs and SVCs. It underscores competitive dynamics and firm-specific strategies, including intra-firm coordination, inter-firm control, and partnerships, to explain global production (Yeung & Coe, 2015).

The common aspect of previous research endeavors is that they are dominated by manufacturing-oriented perspectives. However, services account for approximately 70% of global GDP and an increasing share of international trade, signaling their growing importance in GVCs (Low, 2013). Despite these numbers, some authors argue that a distinction between services and manufacturing GVCs is irrelevant since production processes are interconnected, and it is difficult to separate manufacturing from service activities (Miroudot, 2019). In modern GVCs, goods are often produced with services, and services rely on manufactured goods, complicating their separation. Additionally, many manufacturing firms now operate as "factory-less" producers, focusing on design and branding while outsourcing production. While we agree with Miroudot (2019) that a differentiation between service and manufacturing GVCs could be considered obsolete from the perspective of income, comparative advantage, and productivity, we argue that from a social upgrading and human rights perspective, his assertion does not hold for three main reasons.

First, many contemporary supply chain laws are very specific with a focus on manufacturing GVCs, such as the European Conflict Minerals Regulation, rather than establishing holistic transparency requirements (Cobbe et al., 2020).

While the new EU Corporate Sustainability Due Diligence Directive (CSDDD) stands out in this regard and includes manufacturing GVCs and SVCs, the practical implementation of due diligence obligations varies significantly between the two sectors. In manufacturing GVCs, transparency has been a key focus of regulatory initiatives, corporate social responsibility (CSR) efforts, and technological advancements such as blockchain-enabled supply chain tracking (Sunny et al., 2020). However, unlike manufacturing GVCs, which involve trackable physical goods and traceable human rights abuses (e.g., forced labor and child labor), SVCs deal with intangible outputs such as digital labor, knowledge work, and BPO. Related human rights abuses, such as psychological distress, real-time worker surveillance, and precarious contractual arrangements, are unique to service industries and are not always adequately addressed within existing legal frameworks.

Second, governance structures within SVCs pose distinct challenges that further justify differentiating them from manufacturing GVCs. In manufacturing, governance models have been well-documented through frameworks such as buyer-driven and producer-driven GVCs, which describe how power is distributed among firms (Gereffi et al., 2005). However, governance in SVCs often involves more complex relational and captive governance structures, where service providers operate under significant control from lead firms without direct employment relationships.

Based on these two main premises, fostering the development of SVCs requires a differentiated policy strategy that prioritizes regulatory cooperation to address issues like regulatory divergence rather than solely relying on the reciprocal market-opening approaches typically applied to goods trade. On the contrary, leaving SVCs unaddressed creates a substantial gap in accountability for technology companies and digital service providers. This omission is particularly concerning given the increasing centralization of digital infrastructure and the growing reliance on complex SVCs. Additionally, the ambiguity surrounding technology companies' GVC practices limits regulatory oversight and consumer awareness. Therefore, the unique delivery modes, enabling roles, policy challenges, and measurement considerations collectively underscore the necessity of differentiating between service and manufacturing GVCs in analysis (Amador & Cabral, 2016; Heuser & Mattoo, 2017; Maurer et al., 2016).

The discourse on Business and Human Rights (BHR) has gained prominence in global policy over the past two decades. The United Nations (UN) defines BHR as the responsibility of states to protect human rights and businesses to respect them while ensuring remedies for victims. The Ruggie Framework and UN Guiding Principles emphasize corporate responsibility in business operations and relationships (Ruggie, 2011; Sanders, 2015). To meet this obligation, businesses must conduct human rights due diligence-identifying, preventing, mitigating, and addressing adverse impacts across their value chains. This process includes impact assessment, integration into operations, response tracking, and transparent communication. State-driven encouragement or regulation enhances GVC transparency, allowing stakeholders to evaluate corporate human rights performance (Ruggie, 2011; Sanders, 2015).

2.2 Global service value chains and the BPO industry

BPO is a practice where organizations outsource specific functions or tasks to third parties instead of handling them in-house. (Lacity et al., 2011). The BPO industry is overly complex, multifaceted, and growing constantly. Lacity et al. (2011) reviewed 87 articles about the BPO industry between 1996 and 2011 and identified that the most common reason organizations decided to outsource was, unsurprisingly, cost reduction. Furthermore, the secondary group of most relevant motivations included the possibility of focusing on core business, easy access to expertise, the need to improve performance, and the flexibility to scale the workforce up or down (Lacity et al., 2011).

The BPO market presents significant economic opportunities for organizations and governments, with substantial market capitalization and promising growth forecasts. The global BPO market is projected to reach US$414.81 billion in 2025 (Statista Market Insights, 2024). This indicates both a large current market size and a consistent expansion into the future. In addition, the importance of the BPO industry can be further emphasized by comparing it to other major and more visible sectors. For instance, while the global aerospace and defense industry reached about 0.8 trillion USD in revenue in 2023 (Statista Research Department, 2024), and the communication services market reached about 1.4 trillion in 2024 (Statista Research Department, 2024), the BPO market's growth and substantial size shows that it is not an industry to be overlooked.

Historically, the BPO sector has been dominated by India. Nonetheless, in 2010, India was surpassed by the Philippines, which has become the largest exporter of call center services in the world. The Philippines had a surprising growth from almost zero at the beginning of the millennium to almost 6 billion USD in 2010 and an astonishing compound annual growth rate (CAGR) of 65% in the first decade of the 2000s (Palugod & Palugod, 2011). As of 2022, the BPO industry in the Philippines employed between 3% and 4% of the national workforce and contributed to 7.5% of the Philippines' GDP (IBPAP, 2022). In addition, the IT and Business Process Association of the Philippines (IBPAP) forecasted that by 2028, the industry will employ an additional 1.1 million direct employees and double its revenue by 2028. This projected growth is expected to increase the industry's contribution to 8.9% of the country's GDP, making it the largest source of foreign exchange earnings in the Philippines (IBPAP, 2022). Moreover, each BPO job creates 2.5 indirect jobs, so the projected 1.1 million new direct jobs by 2028 could generate 2.7 million indirect jobs as well. (IBPAP, 2022). In conclusion, the remarkable growth of the BPO industry in the Philippines has solidified its position as a global leader in BPO services. With its substantial contribution to employment and GDP, this sector plays a crucial role in the country's economic development.

Another region that has seen explosive growth in its BPO industry is Latin America, but more specifically, Colombia. According to a recent report published by the Colombian "Ventanilla Única de Inversión", a public initiative managed by Colombia's Ministry of Commerce, Industry, and Tourism in collaboration with ProColombia (the country's investment promotion agency) and other governmental entities, as of 2023, the South American country became the third largest player in the BPO industry in the LATAM region, coming just right after Mexico and Brazil. The Colombian BPO industry contributes 3.5% of its GPD and generates more than 750,000 direct jobs (VUI, 2024). Colombia's appeal as a BPO destination is multidimensional, stemming from its strategic location being close to the United States and, therefore, having a similar time zone. Colombia boasts a large, skilled, and bilingual workforce capable of meeting the demands of the BPO sector, in addition to a growing Information and Communication Technology (ICT) sector (DTDA, 2023). While the minimum wage relative to the median and mean wages is high, the country still offers competitive labor costs compared to other more advanced economies (DTDA, 2023). Furthermore, government support is evident through active promotion of the sector, investment incentives, and programs designed to formalize jobs (VUI, 2024). These combined elements contribute to Colombia's attractiveness to BPO companies seeking a blend of strategic location, affordable and skilled workforce, and a reassuring economic, political, and regulatory landscape.

3. Case study

The French multinational and global market leader Teleperformance employs more than 60,000 employees in the Philippines, 40,000 employees in Colombia, and 400,000 employees globally (CCAP, 2024; Semana, 2024; Teleperformance, 2023). Teleperformance is not a name that most people would recognize, but their clients are certainly familiar to the public. Some include Big Tech powerhouses such as Amazon, Meta, and TikTok. (Eastwood, 2023; Jones, 2024; Suppa & Bureš, 2020). Teleperformance often receives certifications that guarantee they are a "Great Place to Work" (Teleperformance, 2024), but at the same time, there are countless news reports and social media posts that suggest the contrary (Antràs & Chor, 2022).

Conversely to these certifications, the Bureau of Investigative Journalism published a research article about the poor labor conditions and even human rights abuses of Colombian content moderators working for TikTok, subcontracted through Teleperformance. These moderators, who were tasked with reviewing graphic content such as murder, suicide, child abuse, and sexual violence, were found to be working under harsh conditions for as little as 10 USD per day (McIntyre, 2023; Perrigo, 2022).

The moderators reported experiencing occupational trauma and hazardous working conditions that negatively impacted their mental health. They faced inadequate psychological support while being subjected to demanding performance targets, punitive salary deductions, and extensive surveillance. They were expected to review as many as 900 videos daily with strict supervision and timekeeping (McIntyre et al., 2022). The psychological support offered by Teleperformance was mostly described by employees as insufficient, and in some cases, non-existent. The company also utilized extensive surveillance systems, including cameras in employees' homes, to monitor their remote workers. These conditions led to symptoms such as severe depression, anxiety, and sleep loss (McIntyre et al., 2022).

These revelations led to extensive negative media coverage and prompted the Colombian Ministry of Labor to investigate Teleperformance (Perrigo, 2022). Following the announcement of the investigation, Teleperformance's stock price fell by 34%, and trading was temporarily halted. The company responded by announcing a 150 million EUR share buyback, claiming it was a good use of available funds rather than acknowledging it as a crisis mitigation action (Valora Analitik, 2022).

In addition, workers' attempts to unionize and improve their working conditions were met with resistance from Teleperformance, including intimidation and harassment of union organizers. Teleperformance even filed a legal claim against a Colombian union, which was seen as an attempt to intimidate workers (McIntyre, 2023; McIntyre et al., 2022). Despite these actions, Teleperformance eventually signed an agreement assuring its more than 40,000 workers in Colombia the right to form a union (UNI Americas, 2023). The agreement also allowed union organizers access to the workplace and created communication channels with management. This was the first national-level implementation of a global agreement to improve labor rights in the French multinational. This agreement resulted from negotiations between Teleperformance, Utraclaro (a Colombian union representing IT and call center workers), and UNI Global Union (UNI Americas, 2023).

Although, after the scandal, it was reported that Teleperformance would no longer offer content moderation services in Colombia, the role remained active on its career's website, though under a different job title (Cerosetenta, 2023). It was reported that the company has since made some improvements, including more flexible work hours that have impacted the worker's salaries negatively (Cerosetenta, 2023). Despite this, Teleperformance's CEO, Daniel Julien, stated that the allegations against the company were unfounded and had been unfairly criticized (Semana, 2024b). Daniel Julien also stated that Teleperformance has a good relationship with the Colombian government and the Ministry of Labor (Semana, 2024b). The case of Teleperformance in Colombia highlights the significant challenges content moderators face and the potential for exploitation in the BPO industry. Though far from perfect, this case is a model for how unions and BPO companies can work together to improve working conditions.

4. Research outlook

This study is a work-in-progress that aims to deepen the understanding of global SVCs by investigating related human rights issues, governance structures, and regulatory implications in outsourced content moderation. While GVC research largely focuses on manufacturing, we extend this to service industries, particularly the BPO sector. Using a qualitative design, we will conduct semi-structured interviews with current and former workers, unions, civil society organizations, and managers, alongside document analysis and case study methodology. The study will focus on Colombian content moderators subcontracted by Teleperformance, a BPO firm servicing major tech companies like TikTok and Meta. By integrating GVC theory, labor governance, and business and human rights frameworks, this research contributes to discussions on social upgrading in service industries, informing both academic debates and policy on outsourced digital labor.

As part of the next steps, we will refine our theoretical framework and finalize data collection with the aim of presenting preliminary findings at the upcoming Sinergie SIMA Conference.

Sustainability and Global Value Chain Dynamics: Evidence from the Plastic Industry

NUO WANG[1] FRANCESCO MUTIGNANI[2] ANTONELLA ZUCCHELLA[3]

Abstract

Global Value Chains (GVCs) are undergoing significant transformations driven by Environmental Sustainability (ES) pressures. While extensive research has been devoted to the sustainability strategies of multinational enterprises (MNEs), the specific contributions and adaptive responses of Small and Medium-sized Enterprises (SMEs) to these evolving sustainability imperatives remain insufficiently explored. The role of SMEs in sustainable development is not only complementary to the strategies of MNEs but also critical in closing the sustainability loop and ensuring that important supplementary aspects are not overlooked. By adopting a multiple case study approach, we conduct an in-depth longitudinal analysis of three Italian SMEs in the plastic sector-a highly regulated and environmentally scrutinized industry which is undergoing profound changes. The analysis adopts a Reflexive Thematic Analysis (RTA) on interview data to explore how sustainability-related imperatives reshape the value chain in which SMEs are embedded, the technological investments, their business models and supplier-customer relationships. Preliminary findings indicate that sustainability pressures impact SMEs to adopt new strategies in terms of location, governance, and control aspects (Buckley & Strange, 2015). However, our findings highlight also both enabling and constraining factors for SMEs, including tensions between regulatory compliance, cost constraints, and market expectations. This study contributes to International Business (IB) literature by bridging the gap between ES and GVC research, emphasizing the role of SMEs in fostering GVCs' sustainable transitions. By identifying key drivers and barriers to adaptation, this working paper offers insights for policymakers and entrepreneurs seeking to enhance GVC resilience and sustainability. Future research will further examine these dynamics as additional data is going to be collected.

Framing of the research. *GVCs are undergoing profound changes (De Backer & Flaig, 2017; Zhan, 2021) due to an evolving global scenario characterized by the great environmental crisis (Ghauri et al., 2018). As the direct link between MNEs' activities and the deterioration of the global environment (Ghauri et al., 2021; Kolk & van Tulder, 2010) is now largely acknowledged, companies are increasingly confronted with the imperative to adopt ES practices (Carmine & De Marchi, 2023) to reduce their environmental footprint all along the GVC. ES refers to companies' ability to minimize environmental harm while meeting international production and supply standards, involving operations (Le et al., 2024) such as adopting eco-efficient technologies, reducing waste and emissions, and complying with environmental regulations across different countries. In this line of thought, companies often face both pressures and opportunities to innovate sustainably due to the demands of leading firms and global market expectations. However, the way firms embed ES into their strategies is shaped not only by internal resources and network relations (Arevalo et al., 2011; Castaldi et al., 2023) but also by structural decisions around the location, governance and control of their activities.*

Traditionally, MNEs have been seen as the central orchestrators of GVCs governance, setting ESG standards and cascading these requirements down to SME partners, particularly suppliers and customers (Gereffi & Lee, 2016). SMEs in this model are often portrayed as reactive agents, adjusting to external pressures rather than shaping the governance agenda themselves. However, this perspective overlooks the increasing strategic and organizational sophistication of certain SMEs-especially those that operate as micromultinationals (Dimitratos et al., 2003). These firms not only engage in cross-border activities but also actively coordinate international operations, invest in sustainability-driven innovations, and influence upstream and downstream partners. The advent of these alternative orchestrators within the global trade context complicates the conventional GVC's hierarchy and calls for a more nuanced understanding of the decision-making processes concerning location, governance and control, and their evolution in conjunction with the implementation of ES strategies.

Generally, as Fratocchi and Di Stefano (2019) highlight, decisions concerning production activities' location have a large impact on firms' sustainability. Specifically, some companies could be incentivized to reshore their plants to advanced economies (Tate, 2014; Heikkilä et al., 2018) to pursue more sustainable manufacturing by exploiting technological advantages. While, on the contrary, companies operating in highly polluting sectors could find better

DOI 10.7433/SRECP.SP.2025.01

choosing to locate their plants in countries with laxer regulations (Sawhney & Rastogi, 2015). In this way, scholars agree that GVCs' location choices are shaping environmental impact geography (Gereffi, Lim & Lee, 2021).

Governance mechanisms are increasingly embedding ES metrics, influencing both firm behavior and accountability structures (Negri et al., 2021). According to Zhan (2021), ES functions as both a driver and an outcome of GVC evolution, closely intertwined with technological innovation, economic governance, and organizational resilience. Technological advancements such as energy-efficient systems and green solutions are simultaneously enabling and being spurred by ES pressures (Nižetić et al., 2019).

Understanding GVC dynamics requires attention to both the geographical dispersion of activities and the mechanisms through which control is exercised-including ownership, contractual arrangements, and informal coordination (Buckley and Strange, 2015). These control mechanisms significantly influence environmental outcomes, especially in sectors where compliance and standards vary across ways.

Purpose of the paper. *Recent studies have posed increasing attention toward ongoing GVCs' trends and dynamics (e.g. Lee & Gereffi, 2015; Strange & Zucchella, 2017), often taking leading MNEs' perspective (e.g. Barford & Ahmad, 2023; Burritt et al., 2020; Magnani et al., 2019). SMEs that compose the extended network of supplying and supporting activities have been overlooked, with very few articles taking this perspective (e.g. Amal & Rocha Freitag Filho, 2010; Denicolai et al., 2021; Sinkovics et al., 2021). Moreover, the majority of studies focus on firm-suppliers relationships, with less attention given to micromultinationals' development, looking particularly at how sustainability interplays in the relationship with international customers and which tensions and paradoxes arise.*

In the current changing scenario, businesses are perceived following sustainability as a branding tool, constraining it with economic considerations (Trollman & Colwill, 2021), thus facing increasing trade-offs synergies. This raises critical questions about how firms navigate these trade-offs and whether necessary organizational capabilities or governance structures enable them to manage conflicting objectives effectively. Furthermore, debates persist regarding which dimensions - environmental, social, or economic - tend to dominate decision-making processes, particularly under financial or operational constraints.

This study aims to address these research gaps by providing evidence from a representative industry. Hence, this study aims to contribute to IB research by answering the following research question: How does ES influence GVCs dynamics? Specifically, our objective is to investigate GVCs' dynamics in response to ES pressures and, by taking an SMEs perspective, highlight drivers and barriers to strategies' adaptation.

Methodology. *This paper adopts a multiple case study methodology (Edmondson & McManus, 2007; Sinkovics et al., 2008; Aaboen et al., 2012). The qualitative approach has been chosen in light of this research's exploratory nature (Halinen and Törnroos, 2005). Specifically, we conduct an in-depth longitudinal retrospective analysis of three Italian family-owned SMEs operating in the plastic industry. These three family-owned firms stand out for diverging from the traditional family business model. While retaining their entrepreneurial heritage and values, they have evolved into professionally managed organizations with well-defined governance structures that extend beyond the founding families. This blend of familial legacy and professional management enables them to maintain agility while ensuring long-term sustainability and competitiveness in the global dynamic industrial markets.*

The choice of this specific sector is motivated by the relevance and diffusion of this material in every aspect of today's society and business activities. Its characteristics make it easy to produce in large quantities and for multiple purposes, so it is integral to many other industries, such as packaging, automotive, and construction, making its production and consumption patterns vital to GVCs. However, it also faces significant environmental challenges, including pollution, waste management, and reliance on fossil fuels, highlighting the need for sustainability and circular economy initiatives. At the same time, the sector presents opportunities for innovation, with advancements in biodegradable plastics, recycling technologies, and alternative materials addressing environmental pressures. Moreover, stringent regulations and international agreements targeting plastic use and waste management drive organizational adaptation, providing valuable insights into corporate responses to evolving policy (Zucchella et al., 2022). In this context, the present research aims to catch the transition toward ES in the GVCs, highlighting the key factors that enter into play.

Dyer & Wilkins (1991) justify the small number of cases as it allows for a more accurate analysis of the entities under investigation. Purposeful sampling (Patton, 1990; 2014; Dubois & Araujo, 2007) was used to select the cases, leveraging the researchers' professional network to engage with companies in the industry. The adopted selection criteria aim to identify Italian SMEs in the mentioned sector and operate internationally through direct investments and business networks so that we can identify and analyze GVC dynamics from their point of view.

Company A is a small family-owned business established in Northern Italy in 1965, which produces plastic bags for waste collection made of recycled polyethylene, mainly sourced from post-consumer packaging waste. Thanks to this specialization in plastic recycling and recovery, the company has always been ahead of its time in its ES commitment and circular economy practices, gaining over time a robust and recognized reputation. Today, the company remains a family-owned business with a significant international footprint, expanding its supplier network from 70 to 78 partners within the past 5 years, of which 18 are considered particularly reliable. Most of this network is located in Italy, which helps reduce transportation costs given the bulky nature of the materials. Its export-to-sales ratio stands at 80%, with around 68 customers located in France and Germany, alongside newer expansions into Danish and Finnish markets. In these two markets, the demand is mainly driven by local municipalities and public waste collection companies characterized by high levels of environmental awareness and requiring detailed audits concerning production processes and sustainability measures before committing to orders.

Company B is a medium-sized family-owned business established in 1969, now led by the founder's son. It is a key player in expanded polystyrene (EPS) packaging solutions for household apparel and furniture but has expanded its capabilities to also serve the pharmaceutical, food, and construction industries. Company B has developed its technological capabilities to meet large MNEs' demand for high-quality and sustainable packaging solutions and increased the sourcing of materials to provide different combinations of wood, cardboard, and recycled EPS. The company is highly internationalized, with three production plants and a warehouse in northern Italy, one plant in the UK, and another one in southwestern Turkey. In recent years, due to the evolution of household apparel's GVC in which it operates, the company is preparing to close its local manufacturing plant in the UK, empowering its presence in Turkey and entering into a joint venture in Thailand. Their suppliers include large petrochemical MNEs located in Italy, Norway, Germany, Greece, Turkey and China. Company B is almost a one-material business as 80-85% of its suppliers provide liquid chemicals on which EPS production is based, but they also source small quantities of recycled EPS, renewable materials, such Biofoam and cardboard, and accessories such as wood and TCH. Downstream, Company B's primary customers are large MNEs in the domestic appliance industry, followed by smaller customers in the food, pharmaceutical, and construction sectors, with a growing emphasis on high added value insulation products for residential and industrial applications.

Company C is another medium-sized family-owned firm, established in 1972, now led by the second generation, and focused on producing polyolefin films for food and industrial packaging and surface protection. Since its foundation, the company has committed to creating innovative packaging that responds promptly to market trends, social and ethical awareness, environmental protection, and pollution reduction. Every product is thus an effective, sustainable solution to the varying needs of a changing world. To achieve this objective, company C has engaged in continuous product innovation processes, establishing solid partnerships with universities, laboratories, and scientific institutions in Italy and around the world. Even Company C's main suppliers and most significant partners are petrochemical MNEs that provide granules from which polyethylene is made. Downstream, Company C's products are exported worldwide through different channels. Notably, the company has two sales offices in North America and the Russian Federation, while in Europe and Italy –where they generate most of the revenues (55% from Italy)– the company distributes its product with its sales managers; customers in Africa, South America, and Asia are instead managed through intermediaries.

At now, primary data have been collected through multiple semi-structured interviews (Aaboen et al., 2012), conducted over time either face-to-face and video-call meetings with key informants involved in the organizations (Table 1) and lasting between 60 – 90 minutes each. We adopted an interview guide with multiple open-ended questions (Granot et al., 2012) covering companies' evolution, internationalization processes, and sustainability strategies. Each interview was recorded and then transcribed in English and verified by bilingual (Italian and English) speakers. In both cases, we triangulated (Patton, 1999) our evidence with secondary data gathered from websites, corporate sustainability reports, and social media activities. Initial insights are gathered as research reports to be sent to the informants. Clarifications and further details were also requested from them.

Tab. 1: Key informant list. Source: Our elaboration.

Company A		***Company B***		***Company C***	
Year	***Informant Role***	***Year***	***Informant Role***	***Year***	***Informant Role***

				2025	*Sales Manager*

Data Analysis adopted the RTA six-phase approach (Braun & Clarke, 2019, 2021; Byrne, 2022), selected for its flexibility and ability to uncover nuanced insights into complex phenomena. Currently, the researchers immersed themselves in the data during and after collection, repeatedly reading the interviews to gain initial insights. Codes were collaboratively and reflexively generated from the data, forming the foundational building blocks for themes. In the next steps, initial themes will be actively developed through iterative engagement with the codes and further refined and combined to ensure coherence and relevance. Themes will then be renamed and defined to accurately reflect their essence. Finally, the findings are synthesized into a conceptual model that integrates the key themes, providing a comprehensive understanding of sustainability's influence on GVC dynamics. As the work is still in progress and the results are still at a preliminary stage, their presentation is provisionally organized according to Location, Governance, and Control topics.

Results.

– *Location dynamics*

Company A reflects the classical SME's configuration with vertically-integrated production activities localized into a single place, embedded into a network of suppliers and customers. The economy's green transition enabled a significant increase in market opportunities and, in addition to the traditional markets of France and Germany, Company A is now diversifying its sales by exporting in the Scandinavian countries, capitalizing on the growing demand for environmentally responsible products in these regions, where high environmental awareness drives demand for sustainable products.

Company A's decision to keep the majority of its suppliers in Italy helps reduce transportation costs, leveraging geographic proximity for cost efficiency and reducing carbon emissions from transport, also reflecting its ES commitment.

Due to the EPS products' characteristics, Company B adopted a "shop-in-shop" strategy, which implies purposefully locating production plants strictly close or within main customers' premises to minimize transportation costs. From this point of view, Company B's location strategy is affected by external events other than ES as it is chained to customers' location choices. As a matter of fact, Company B is now moving the plants from the UK to Thailand on the way of household apparel companies that changed their strategies to penetrate Southeast Asian and Chinese markets, also benefiting from less stringent environmental policies. Company B also reports significant benefits from having production spread over several countries, as they prove to be not only valuable sales and production hubs but also important supply centres, such as the Turkish ones.

Company C concentrates the production in its single Italian plant and benefits from a well-established European supply chain with a high degree of logistical efficiency. The choice of concentrating the main activities there is also motivated by the growing relevance of the R&D unit, which continuously improves products' quality and specific characteristics, and by a better control over the consultancy and services suppliers' network. Downstream, other than operating through intermediaries in Africa, Asia and South America, Company C possesses two sales offices in the USA and Russia, aiming to penetrate deeper into the market and provide faster and more direct assistance to its customers.

– *Governance dynamics*

Company A's GVC structure reflects a business network composed of small-medium actors without a prominent orchestrator. Specifically, Company A's suppliers are small and medium-sized local companies that supply it with their plastic waste, such as nylon packaging, but also intermediaries active in waste disposal and brokers specialized in collecting this material at the European level play an important role. Company A pointed out that the economy's green transition implied an increasing number of competitors attracted by the fast-growing market, which fostered price-based competition both on product placement and supply sourcing. For this reason, the company also tries to cultivate its relationships with intermediaries as well as with long-standing partners to have a wide range of possibilities to draw on. On the customer side, the situation is not dissimilar, as Company A serves several retailer customers or intermediaries specialized in waste treatment products but also municipal waste collection companies. Again, Company A relies on strong ties with long-term customers, leveraging its renowned identity of "pharmacists of plastic" and competing on quality rather than on price.

On the contrary, GVC structures of both company B and C denote clear power dynamics, as the two companies operate between large orchestrators on both supply and market sides. Specifically, Companies B and C source their oil-derived plastic supplies from the same large petrochemical MNEs. Both companies' respondents remark this is inevitable since these suppliers not only control the production of virgin plastic but, currently, are also the only producers of chemical-recycled plastic, the only recycled material regulations allow for packaging in the food industry. Suppliers of mechanically recycled plastic are therefore excluded from this sector. On the market side, companies B and C offer their packaging services to several large MNEs in multiple sectors. Specifically, Company B is more focused on the household appliances industry while Company C provide packaging solutions for famous brands in the food sector. Both companies point out that doing business with these large MNEs brings great benefits in terms of market opportunities and prestige but, on the other hand, there are considerable pressures in terms of increasing quality and focus on sustainability as well as cost containment. This leads to a paradox in the green transition process led by MNEs, which externalize the costs of sustainability investments onto their suppliers, limiting their profit margins. For this reason, the two companies have adopted a market diversification strategy over time, turning their offerings to other companies and other sectors. For instance, Company B also expanded into the fish market, while Company C entered the furniture and household appliance market.

– *Control dynamics*

Company A controls all the production process of its GVC, providing an end product ready to be sold by intermediaries or used by waste collection public companies. From this point of view, the company proves to be quite autonomous in its choices, although it still has to maintain high standards of sustainability and quality to intercept market demand. The increasing pressure from new competitors, however, makes it essential to maintain strong relationships with both suppliers and major customers so that the company always has a sufficiently large supply base to keep production going and enough revenues to finance its business.

By operating in close relationship and coordination with large MNEs, Company B and C control only those complementary activities to the main products produced by the orchestrators, which externalize packaging manufacturing to specialized suppliers as it is not convenient to integrate it internally. However, Company B notes that its packaging is crucial for the household appliance industry because without it, delicate products could not come off the assembly line or even be stored. The choice to operate via the shop-in-shop strategy we mentioned above therefore proves to be both functional and successful. The same applies to Company C, although it is not necessary to locate production facilities directly within those of MNEs as its product can be easily transported and implemented in customers' machines.

However, all three companies emphasize that sustainability standards are imposed by the customer, which therefore exerts a strong influence on product design and communication style.

Research limitations. *This study has several limitations. First, it is a working paper and the level of analysis can be limited at the moment. However, preliminary information gives us a fairly organic picture with several similarities. Second, the focus on three Italian SMEs in the plastic industry limits the generalizability of findings to other sectors and*

firm sizes. Third, while the qualitative multiple case study approach provides rich insights, it is subject to informant potential bias and interpretation challenges. Additionally, the study's time frame may not fully capture long-term structural shifts.

Managerial implications. *Our findings provide useful examples to entrepreneurs and practitioners who operate in SMEs involved in GVCs, facing the double pressure of increasing sustainability demand and market competition imperatives. Notably, the three successful cases we presented demonstrate how product and process innovations combined with internationally-oriented networked strategies allow even small companies to sustain the growing competition enabled by leading MNEs. The research also aims to encourage SMEs to pursue environmental sustainability even in problematic sectors, such as plastic packaging, as it has now become a prerequisite for entering into business relationships as well as for gaining competitive advantages and taking further steps towards net-zero business models.*

Originality of the paper. *Moving beyond the traditional research focus on large MNEs, this paper provides an overview of SMEs' strategies to embrace the increasing sustainability demand and mitigate the market imperatives that currently characterize GVCs. More in depth, we traced GVCs dynamics from SMEs perspective, particularly looking at their sustainability-oriented strategies. Findings suggests that investments in product and process innovations are driving the evolution of the plastic industry toward green transition, not only by seeking to replace fossil sources with new and sustainable materials but also by improving recycling processes and reducing consumption. In this sense, findings suggest progress have been made, but their costs are still too high to be competitive in global market settings. Specifically, we highlight the paradox of large MNEs' behaviors, which demand increasing ES to their suppliers but are not willing to sustain higher costs, forcing their partners to adopt strategies to mitigate these power dynamics. We saw how SMEs diversify their customers and suppliers network to reduce their dependence and increase the variety of their business activities, eventually extending their presence abroad with FDIs or strengthening relationships with local partners. In doing so, investments in communication and environmental certifications are recognized fundamental, as they increase company's reputation and enhance the establishment of new relationships with customers.*

Delving Into the International Dimension of Activist Entrepreneurship in Fashion

GIULIA MONTEVERDE[1] ANDREA RUNFOLA[2] SIMONE GUERCINI[3]

Abstract

This paper aims to explore the international dimension of activist entrepreneurship. Specifically, the conceptualization of activist entrepreneurship as an unconventional form of entrepreneurship is a relatively recent development in the existing literature. The research presented in this work undertakes an empirical investigation of a qualitative case study involving an activist entrepreneur in the fashion industry. This sector, due to its intrinsic characteristics and the prevailing demand for sustainability, represents a fertile ground for studying activist entrepreneurship. The paper addresses the following research question: How and to what extent does the international dimension shape activist entrepreneurship? Thus, the study offers an original empirical approach to the topic, linking it to the international dimension. The findings reveal that internationalization is characterized by an imbalance favoring activist practices over business growth. However, activist entrepreneurs require a comprehensive cross-border vision to promote their advocated cause.

Framing of the research. *The theme of activism is highly relevant in contemporary times, significantly driven by global concerns such as geopolitical tensions, armed conflicts, the climate crisis, sustainability imperatives, energy transition, and increasing digitalization. Discussing activism requires considering the mobilization of protest movements, the aggregation of individual voices, and organizing collective actions by groups (George and Leidner, 2019). The existing academic literature has explored activism with specific reference to social and consumer movements. Recognizing the pervasive influence of consumption in modern society, consumer movements aim to alter established consumption and marketing paradigms as a specialized subset of social movements. They accomplish this by promoting alternative consumption ideologies that significantly deviate from, and often radicalize, mainstream viewpoints (Kozinets and Handelman, 2004). A conceptual model of social movement ideology proposes three key representational dimensions: the public articulation of the movement's goals, the collective self-representation of its followers, and the characterization of its perceived adversary (Touraine, 1981; Melucci, 1989). For example, Slow Food is a global movement working to ensure good, clean, and fair food for all; this has also spurred the emergence of the Slow Fashion movement, which advocates for sustainable production paradigms as a counterpoint to the rapid-cycle collections prevalent in fast fashion (Pookulangara and Shephard, 2013). The role played by the founder of an activist consumer movement is crucial, as it can be viewed as an orchestrator of members (Barès and Cova, 2023). At the same time, brands and corporations can also participate in activist initiatives, reflecting their core values. The adoption of explicit positions by brands on contentious social issues and actions intended to shape societal evolution constitutes brand activism-a practice capable of inducing significant transformations within both market and societal structures (Sarkar and Kotler, 2018; Vredenburg et al., 2020). Simultaneously, firms that engage in corporate activism demonstrate a clear commitment to fostering societal transformation through the public articulation of positions on social, political, economic, and environmental issues; corporate activism seeks to reshape the attitudes and behaviors of actors within the relevant institutional landscape (Eilert and Nappier Cherup, 2020). Furthermore, existing literature acknowledges CEO sociopolitical activism, as CEOs are increasingly likely to engage in public discourse regarding socially divisive matters (Hambrick and Wowak, 2021).*

In this scenario, recent scholarly work has brought to light the concept of activist entrepreneurship (Monteverde et al., 2024), defined as an unconventional form of entrepreneurship. Beyond the traditional paradigm of rational profit-seeking, an entrepreneur's commitment can stem from various motivations, such as passions related to individual skills and leisure activities (Guercini and Cova, 2018). Activist entrepreneurs take on a dual role: they are both entrepreneurs and activists advocating for a specific cause, often by establishing businesses where profit serves as a means to achieve a greater purpose. These entrepreneurs are the founders of their organizations. They embrace a cause and become its spokesperson, aiming to create change.

Additionally, they build a community of supporters who champion the same cause, linking the individual experience with the collective community. Furthermore, activist entrepreneurs utilize offline and online methods to pursue their goals without geographical limitations, extending beyond the local context (Monteverde et al., 2024). The relationship between entrepreneurship and activism has been explored in academic literature for some time, albeit often in a subtle manner. For example, Vedula et al. (2022) introduce the notion of "entrepreneurship for the public good", while Abebe et al. (2020) depict entrepreneurs as agents of social change, examining the interplay between passionate activism and entrepreneurial skills. Moreover, the concept of "eco-entrepreneurship", as discussed by Mars and Lounsbury (2009), reconciles the two frameworks of market and social activism. In this discussion, Pacheco and Khoury (2023) analyze social movements and their impact on entrepreneurial activities. Another stream of literature considers the political potential of entrepreneurship as a practice of solidarity and social change, examining it as a means to achieve political transformation (Alkhaled, 2021).

Given the increasingly global nature of the causes promoted by activism and the characterization of activist entrepreneurs as operating beyond geographical borders, there is a pressing interest in understanding the significance and role of the international dimension within activist entrepreneurship. In this context, two relatively distinct bodies of literature can be identified: the international dimension of activism and the international dimension of entrepreneurship. Regarding the first, the international character of activism can be traced to the rise of movements that span borders through international mobilization, which Tarrow (2005) refers to as transnational activism. In the framework of transnational activism, internationalization involves multi-level interactions-horizontal and vertical-between state and non-state entities operating at international, national, and subnational levels, creating formal and informal institutional networks (Stanbridge, 2005). From this standpoint, global activism becomes a central theme for examining the international aspect of activism, particularly focusing on global brands that engage in brand activism (Tsougkou et al., 2024). Conversely, the international dimension of entrepreneurship aligns with a different academic discourse. In international entrepreneurship, identifying and exploiting opportunities to create products and services occur across national borders; entrepreneurial founders and companies seek opportunities on a global scale (Oviatt and McDougall, 2005; Zucchella et al., 2023). Firms can operate with a strong global vision, treating the world as their only market reference (Guercini and Ceccarelli, 2020). Therefore, to bridge the gap and contribute to existing literature, this paper investigates the international dimension of activist entrepreneurship.

Purpose of the paper. *The paper aims to answer the following research question: RQ) How and to what extent does the international dimension shape activist entrepreneurship? In other words, while the existing literature offers insights into the international aspects of activism and entrepreneurship separately, we seek to understand how these elements manifest when activism and entrepreneurship intersect. Therefore, the international dimension of activist entrepreneurship could be characterized by a balanced integration of international aspects drawn from both activism and entrepreneurship fields. Conversely, there may be a predominance of one component over the other. Finally, novel perspectives may emerge.*

Methodology. *Given the exploratory aim of this study, a qualitative methodology was deemed appropriate (Voss et al., 2002). Specifically, to address our research question, we employed a single case study design (Eisenhardt, 1989; Yin, 2014), focusing on an Italian activist entrepreneur within the sustainable fashion sector. Unfortunately, the fashion industry is notoriously criticized for its adverse impact on sustainability, making it a central player in the broader call for sustainable practices (Akrout and Guercini, 2022). In particular, fashion ranks among the world's most polluting industries (Mok et al., 2022). The detrimental effects of the fashion system are evident across all three dimensions of sustainability. Indeed, concerns are raised not only regarding environmental issues but also about numerous criticalities that exist at the social and economic levels. This landscape has prompted some entrepreneurs to establish sustainable new ventures within the fashion sector, which are companies founded on sustainable business models from the outset (Runfola and Monteverde, 2023). Similarly, streams of literature such as social entrepreneurship and sustainable entrepreneurship underscore companies' need to generate value beyond mere economic outcomes (Bacq and Janssen, 2011; Shepherd and Patzelt, 2011), including in the fashion context. At the same time, as fashion significantly influences cultural norms, trend dissemination, and consumer behavior, it presents a receptive environment for activist interventions (Lee et al., 2024). In this vein, encompassing individual and collective actions, fashion activism often intersects with social movement initiatives (such as the Slow Fashion movement). Activists, driven by principles of solidarity and a desire for social reform, typically engage in actions that extend beyond personal gain. In the fashion realm, their efforts are directed toward achieving "social justice, environmental stewardship, economic prosperity, and cultural regeneration" (Mazzarella and Black, 2023, p. 234). Therefore, the fashion sector provides a fertile ground for exploring activist entrepreneurship, especially in light of the pressing demands for sustainability.*

This paper focuses on a case study of an activist entrepreneur championing sustainable fashion and founding a sustainable fashion company. We intentionally selected this case study for its potential to reveal insights (Coviello and Joseph, 2012). For confidentiality reasons, we refer to the individual as W.M. and the company as Zeta. Drawing from prior experience in the fashion sector, W.M. co-founded Zeta, an innovative start-up, in 2015. A notable feature of this firm is its capability to dye t-shirts using recovered, non-toxic industrial byproducts. By 2020, the company had evolved, expanding to offer design and consultancy services for brands seeking to incorporate sustainability beyond just the fashion context. Zeta also enhanced its offerings by developing and delivering educational programs and courses designed to spread knowledge about sustainability issues to students, policymakers, and corporate executives.

Meanwhile, W.M.'s commitment to activism remained steadfast. Recently, W.M. has engaged in political advocacy, forging connections and taking on roles within the European Commission. Concurrently, in support of the advocated cause, W.M. organized significant protests, including impactful online mobilizations, such as the one in 2021 against a major multinational corporation that recently launched a new streetwear collection. Furthermore, W.M. has established extensive international ties with a prominent global fashion activism movement; W.M. has been helpful in the movement's expansion into Italy and currently serves as Vice President. Among other initiatives, W.M. contributed to the publication of a book, in collaboration with a United Nations organization, addressing sustainability themes. To maximize outreach, this publication was translated into seven languages. Additionally, W.M. traveled to numerous countries affected by Western overconsumption to produce a television series to raise awareness about the damage inflicted by the current fashion system.

For the data collection phase, we considered multiple sources. Firstly, we realized, recorded, and transcribed verbatim an in-depth, face-to-face, and semi-structured interview with the activist entrepreneur. In addition, we conducted desk research and gathered secondary data from, for instance, already published interviews, news articles, websites, and social media pages. Finally, we relied on non-participant observation of activities conducted on the primary social media platforms used by the activist entrepreneur, the founded company, and the related social movements. The data collection phase spanned from 2021 to 2024. Triangulation between the different sources increased the credibility of the data in this research (Creswell and Miller, 2000). The data analysis generated insights through an abductive approach of systematic combining (Dubois and Gadde, 2002), where data analysis was intertwined with data collection (Eisenhardt, 1989), fostering a continuous interaction between data and theoretical constructs.

Results. *The findings of our empirical investigation show that the international aspect of activist entrepreneurship tends to align more with the internationalization of activist practices-aimed at amplifying the resonance of the advocated cause-rather than with the internationalization of the business and its enterprise. Therefore, internationalization appears to be driven by unconventional motives instead of traditional ones.*

Indeed, activist entrepreneurs engage internationally to strengthen and advance their championed cause. Consequently, the international dimension manifests in the activist entrepreneur's desire and ability to establish international relationships and connect with networks beyond local boundaries to promote the cause, reinforcing the community of followers. These connections predominantly involve social movements, institutional entities, associations, and non-governmental organizations.

This study does not identify an inherently international aspect of the enterprise; the company does not extend its product sales into foreign markets, remaining primarily confined to the domestic context. The enterprise generates profit in pursuit of a higher purpose. It enables activist entrepreneurs to manage a company based on their deeply held values, potentially setting a benchmark for other firms. Moreover, the dual role of entrepreneurs and activists allows these individuals to bridge the business and activist domains, facilitating a comprehensive understanding of both perspectives and enhancing their mobilizations' effectiveness. The activist entrepreneurs' focus is not on expanding their enterprises into international markets but on the global dissemination of the advocated cause; the established company can support this, particularly in building network relationships with business and non-business actors that align with its mission. This does not imply that the company cannot expand internationally; rather, the activist mission takes precedence over entering foreign markets, resulting in a slower growth trajectory abroad. Still, the international dimension is significant and is represented in the figure of the entrepreneur. Activist entrepreneurship exhibits an international dimension to the extent that it primarily facilitates the dissemination and awareness of the advocated cause, as seen in the sustainable fashion cause analyzed in the case study. As an entrepreneur rather than just an activist, it enhances advocacy for the cause. Even without direct international sales, the company possesses a cross-border resonance; this international notoriety aids in bolstering support for the activist cause. Therefore, the company also serves as a tool that promotes international networking activities for the entrepreneur.

Research limitations. *As a first limitation, we acknowledge that this paper concentrates on a single sector. While the fashion industry provides valuable insights and serves as an excellent field for exploring the proposed themes, future research should aim to compare the results of this study with findings from other sectors. A second limitation is the dependence on a single case study. Although the case effectively illustrates the phenomenon under investigation, subsequent studies should conduct a cross-case analysis to yield more comprehensive findings. Finally, despite data being gathered from multiple sources, the qualitative interview was conducted only with the activist entrepreneur. It would be valuable to gather perspectives on the international dimensions of activist entrepreneurship from those who collaborate with activist entrepreneurs, including those within the company and those engaged in social movements.*

Managerial implications. *Our paper presents significant managerial implications. First, the study highlights the necessity for activist entrepreneurs to develop an outlook that goes beyond domestic borders, embracing an international perspective. Instead, these individuals should focus on building international relationships, thus inserting themselves into global networks. However, second, international visibility and reputation are crucial for the company to foster strategic partnerships that further the dedicated activist cause. Ultimately, the empirical findings of this study stress how activist entrepreneurs must consistently reassess and rethink their business models. Given that the enterprise also plays a practical role in supporting activist efforts, the company's activities must evolve significantly, especially in response to the advancement of the cause they champion. From this viewpoint, activist entrepreneurs need to exhibit a willingness to*

change while carefully evaluating potential risks. Indeed, a possible business failure would have serious consequences for the cause they support.

Originality of the paper. *The originality of this work lies in several aspects. First, it offers a comprehensive empirical examination of activist entrepreneurship, which needs further investigation within current scholarly discourse. Additionally, it delves into its international dimension. Indeed, while previous literature has emphasized the transnational nature of activism and limitless action (Monteverde et al., 2024), the internationalization of activist entrepreneurship has not been studied as a distinct component. Furthermore, this paper links activist entrepreneurship to internationalization, aiming to understand unconventional motivations compared to the traditional internationalization factors discussed in the existing literature.*

Key words: *activism; entrepreneurship; activist entrepreneurship; internationalization; fashion industry; case study*

Outsidership/Insidership in international business: looking back and moving forward

MATILDE MILANESI[1] ANDREA RUNFOLA[2] SIMONE GUERCINI[3]

Abstract

Insidership and its opposite outsidership have been key concepts in international business research, since the revised Uppsala model in 2009, with studies exploring its definitions, effects, and implications. This review traces the development of key research areas on outsidership/insidership, with a focus on the latter: what is network insidership, how to become an insider, the liability of insidership, and how firms respond to the outsidership/insidership issues. The study advocates for a clearer conceptual framework for insidership, better integration of the liability and asset perspectives, and greater focus on the diverse strategies firms employ to navigate outsidership. It also encourages expanding research into underexplored areas such as digital transformation, and de-globalization.

Framing of the research. *The groundbreaking paper by Johanson and Vahlne (2009), which revisited the Uppsala model of internationalization published by the two authors in 1977, advanced the network perspective on internationalization by proposing that the primary challenge for internationalizing firms is not foreignness, but rather network outsidership. They argued that success in foreign markets hinges on firms developing an insidership position within key networks. This view has significantly influenced subsequent studies, which demonstrated that network insiders have access to valuable knowledge, identify new opportunities more effectively, and outperform outsider firms (Hilmersson & Jansson, 2012; Vahlne et al. 2012; Blankenburg Holm et al., 2015). Insidership has thus become widely regarded as an asset for firms pursuing internationalization, seen as essential for navigating foreign markets and achieving sustained growth (Li and Fleury, 2020).*

Johanson and Vahlne's (2009) updated Uppsala model highlights that firms operating as outsiders to established networks face heightened uncertainty and risk when entering foreign markets. These firms have limited knowledge of foreign environments and lack connections with key local stakeholders, such as partners, customers, and suppliers. The model posits that achieving insidership within a network is essential for successful internationalization, making the process of expansion largely about overcoming outsidership (Johanson & Vahlne, 2009). The liability of outsidership suggests that firms struggle to operate in unfamiliar networks due to their restricted understanding of local market dynamics. When entering a new geographic market, firms must expand their networks and strategically position themselves within new business ecosystems. This process involves transitioning from outsidership to insidership, a critical step for long-term success (Johanson & Vahlne, 2009; Hilmersson & Jansson, 2012). To secure an insider position, firms must align and integrate with the local business network, ensuring synchronization with its structures and practices (Johanson & Johanson, 2021). Synchronization occurs through modifications and adaptations, requiring firms to allocate resources to local conditions and invest in strengthening their network position. Hilmersson (2013) demonstrated that insidership in local networks is achieved once a firm establishes multiple relationships characterized by mutual commitment. Johanson and Johanson (2021) further argued that these relationships extend beyond business interactions to include social and institutional ties. As firms commit to these relationships, they become increasingly embedded within the network, solidifying their insidership position and enhancing their ability to operate effectively in foreign markets.

Firms can achieve insidership by initiating their first relationship with a partner in a foreign business network. As they strengthen existing ties or establish new ones within the same network, their level of insidership deepens (Hilmersson & Jansson, 2012). This concept emphasizes the critical role of relationship-building in successful internationalization. By fostering strong connections with local partners, customers, suppliers, and other key stakeholders, firms gain access to valuable resources, market intelligence, and supportive networks (Brouthers et al., 2022). These relationships not only build trust but also facilitate knowledge sharing, ultimately enhancing the firm's market position and performance (Almodovar & Rugman, 2015).

Purpose of the paper. *This review examines the evolution of key research areas related to insidership, including the meaning of network insidership, the process of becoming an insider, the challenges of insidership, and firms' strategic*

responses to the outsidership/insidership dynamic. The study calls for a more refined conceptual framework for insidership, stronger integration of the liability and asset perspectives, and increased attention to the diverse strategies firms use to overcome outsidership. Additionally, it highlights the need to extend research into underexplored areas, such as digital transformation and de-globalization. In particular, the paper identifies possible future lines of research on the topic of insidership, which are considered particularly relevant in the current international context characterized by growing geopolitical tensions, where being an insider or outsider in certain markets could take on a new significance.

Methodology. *We conducted an in-depth examination of existing academic knowledge regarding the concept of insidership through a systematic literature review. This research approach involves a thorough analysis of published works, employing a rigorous and transparent methodology to synthesize the available data comprehensively (Paul and Criado, 2020), providing "collective insights through theoretical synthesis into the fields and sub-fields" (Tranfield et al., 2003, p. 220). Moreover, it delivers a comprehensive overview of the current state of research within the field and helps identify research gaps (Kraus et al., 2020, p. 1028). To conduct this systematic review, we adhered to the 3As model, which involves three key stages: assembly, arranging, and assessing existing literature, wherein "assembling refers to the identification and acquisition of literature, arranging pertains to the organization and purification of literature, and assessing relates to the evaluation and reporting of literature" (Paul et al., 2021, p. 2).*

Phase 1: assembling. To build our database, we retrieved articles in Scopus - the largest citation database of peer-reviewed literature - using a focused research query that included only:

- *Articles containing the words "insidership" (44 papers) or "outsidership" (129 papers): we followed a keyword approach to identify the articles, and the Scopus database was queried for keywords in the title, abstract, or keywords list - using this explicit mention as a proxy for the centrality of the topic to the paper. We decided to use the keyword "outsidership", despite insidership being the focus of this study, because we verified that the papers that deal with the liability of outsidership inevitably analyze aspects of insidership (for example, the strategies for acquiring an insider position in the foreign market, thus overcoming the liability).*
- *Journal articles: we focused on articles published in internationally renowned journals and excluded other publication outlets such as monographs, books, book chapters, conference proceedings, and commentary essays from the analysis. Journal quality was taken as an indicator of study quality (e.g. Guercini & Milanesi, 2020). Additionally, we focused on high-quality peer-reviewed academic outlets and excluded practitioner journals from further consideration (Schmeisser, 2013).*
- *Business, management, and accounting as subject area.*
- *Articles written in English.*

The final search to complete the database was performed in March 2025. From the keyword search we obtained a total of 173 publications net of duplications. The other filters (source and document type, subject area, and language) led to the identification of 96 articles. We did not include a time limit; however, we expected the articles to be no earlier than 2009, the year in which Johanson and Vahlne's paper was published which introduced the concept of liability of outsidership and, conversely, that of insidership.

Phase 2: arranging. The second step of the systematic literature review was arranging, which pertains to the organization and purification of the literature. The screening of the selected articles consisted of an eligibility stage based on journal relevance and content relevance. Regarding journal relevance, we selected journals that are rated at least in one of the two independent systems: ABS (Chartered Association of Business Schools academic journal guide 2024) and ABDC (Australian Business Dean's Council academic journal ranking 2022). This led to the exclusion of 6 journals and the related papers. As for content relevance. We screened the titles, the abstracts, and, when necessary, the content of each of the remaining 90 articles to decide whether they addressed our intended issue. In total, 9 articles were excluded as they did not meet the eligibility assessment of content relevance: the keywords were used either with a generic meaning or without these articles addressing the topic under study. The screening was conducted independently by the members of the research team, who reached a complete agreement on a final list of 81 articles, and some primary data (authors, year of publication, journal, abstract) were recorded in an Excel workbook.

Phase 3: assessing. The third step was assessing, namely the analysis and reporting of literature. We decided to analyze the papers both descriptively and thematically. The descriptive analysis was processed to classify, organize, and describe the sample of selected articles. In contrast, the thematic analysis was processed to investigate themes, conceptualizations, results, and research methods.

Results. *The review aims to organize the findings around several key themes. First and foremost, the definition and conceptualization of insidership. While the literature clearly establishes, starting from Johanson and Vahlne's 2009 contribution, a definition of outsidership as a liability in internationalization processes, the definition of insidership remains vague, with no significant attempts to further develop the concept.*

Secondly, most of the literature focuses on proposing possible strategies to overcome the liability of outsidership and, consequently, suggests how to establish an insider position in a foreign market. In this context, it is possible to identify a range of key actors that are crucial for foreign firms in establishing an insider position in a foreign market: (i) strategic alliances & partnerships: collaborating with local firms, suppliers, and distributors can facilitate knowledge transfer and legitimacy; (ii) industry associations & business groups: joining trade associations or participating in industry events can enhance credibility and access to critical resources; (iii) institutional connections: Engaging with government bodies and regulatory agencies helps firms navigate bureaucratic hurdles and gain legitimacy.

Thirdly, it is possible to distinguish between studies that analyze this topic in relation to multinational enterprises (MNEs) and small and medium-sized enterprises (SMEs), as well as those that examine the establishment of an insider position in mature versus emerging markets, or by firms originating from mature versus emerging economies.

Fourthly, it is interesting to note that most contributions view insidership as an asset, capable of providing numerous benefits to firms. However, especially in recent years, there have been contributions highlighting some of the challenges associated with insidership. For example, in his commentary on the revised Uppsala model, Forsgren (2016) took an entrepreneurial perspective and proposed the concept of a "liability of insidership" for firms that are deeply embedded within business networks. This perspective challenges the traditional view of insidership as a purely beneficial asset, highlighting the potential drawbacks and complexities of being tightly integrated into these networks. Due to mutual commitment and investments specific to the relationship, there is limited flexibility, making it costly for insiders to sever business ties. As investments become more relationship-specific, the transferability of resources decreases. Consequently, insiders may find themselves locked into the network they are part of, reducing their autonomy and flexibility. In summary, recent studies have highlighted the existence of a liability of insidership. However, this concept remains underdeveloped in the international business literature, with insights primarily drawn from research on network embeddedness. It is acknowledged that excessive dependence on a network can create vulnerability, especially during disruptions or economic downturns. Additionally, research suggests that the rigidity of information flow within tightly connected networks may impede adaptability and innovation, while the risk of groupthink can obstruct critical decision-making. The lack of diverse perspectives within a close-knit network may also hinder creative problem-solving. Given that firms embedded in networks are typically seen as adapting slowly to change, concerns about over-embeddedness are heightened during times of transformation. These insights emphasize the need for a more nuanced understanding of the potential downsides of insidership, particularly in dynamic and rapidly changing environments.

Finally, the current state of research on insidership seems to overlook some major trends, such as digitalization, and the dynamics at play in the global context. These include the significant uncertainty arising from geopolitical tensions, as well as more general phenomena like deglobalization and decoupling, which open up new international scenarios and could provide fresh impetus for research on insidership.

Research limitations. *The paper is still a work-in-progress, further research is needed to conduct an in-depth analysis of the selected papers.*

Managerial implications. *A deep understanding of insidership can undoubtedly provide managers with valuable tools to: (1) comprehend how to build and maintain an insider position in a foreign market, (2) identify key actors with whom to establish partnerships and long-term relationships, (3) recognize the potential drawbacks of insidership, and (4) develop strategies to reduce insidership when necessary, particularly in light of current tensions and shifts in the international business landscape.*

Originality of the paper. *While the international business literature has primarily focused on outsidership, particularly the liability of outsidership, the concept of insidership has often been taken for granted as merely its opposite. This paper aims to explore the meaning of insidership in greater depth. Furthermore, while insidership has traditionally been viewed as an asset, this study highlights its darker aspects, advocating for a more balanced perspective that considers both its benefits and drawbacks. Finally, the paper suggests that future research should incorporate the contextual conditions in which firms operate internationally, integrating major themes such as digitalization and deglobalization into the study of outsidership and insidership.*

Key words: *insidership, outsidership, international business, review.*

Management Case Studies

Digital healthcare platforms for engaging chronic patients: The case of ASL Caserta's Chronic Plus Platform

RAFFAELLA MONTERA[1] ADELAIDE IPPOLITO[2] CARMELA DI GUIDA[3] FRANCESCA LANDOLFI[4] LEONARDO PAONE[5]

Abstract

Managing chronic patients represents a complex challenge for advanced economies, where fragmented healthcare systems impede patient engagement, drive up costs, and lower compliance rates. This study examines how digital health platforms influence the engagement of chronic patients across different stages of the care process, presenting itself as a potential solution to the issue of lacking a continuous, patient-centered care pathway.

Using a case study approach, we investigate the CHS Chronic Plus Platform, a digital healthcare solution implemented by the ASL Caserta, recognized as one of Italy's most innovative platforms for chronic disease management. Data derived from 20 in-depth interviews with healthcare managers and professionals of the ASL Caserta were analyzed through thematic analysis. The findings reveal that the platform functions as a vital service touchpoint within healthcare operations, as its specific features enhance patient engagement across behavioral, emotional, and cognitive dimensions at every stage of the care pathway. This improvement leads to better healthcare access, greater adherence to treatment plans, and higher patient satisfaction.

These results pave the way for the broader adoption of digital platforms in the healthcare sector while providing a strong foundation for future studies on this topic, fostering greater interdisciplinarity between services marketing and health management in the digital domain.

Key words: *patient engagement; digital health platforms; care pathway; case study*

Framing of the research. *By 2030, it is estimated that 70% of the global burden of diseases will be due to chronic conditions such as heart disease, diabetes and cancer (WHO, 2020). The rise in chronic patients, exacerbated by the aging population, make the design of healthcare services more complex and demands improved continuity of care because long-term health conditions impact not only the physical but also the cognitive, social, and emotional aspects of a patient's life (Vansimaeys et al., 2021).*

Progress in addressing these challenges is hampered by the intricate nature of healthcare systems, which involve multiple stakeholders and have a multilayered structure (Carlini et al., 2024), and by the lack of a continuous, patient-centered care pathway (Rocco et al., 2024). This fragmentation adversely affects patient compliance and increases the financial burden of managing these diseases on national budgets. For instance, in 2020, healthcare expenditure in the USA amounted to 18.82% of GDP, and this figure is expected to grow (The World Bank, 2023).

In this setting, digital health can offer innovative solutions to improve patient health and the efficiency of healthcare organizations. Digital health encompasses a variety of solutions that, delivered through technologies like 5G, blockchain, Internet of Things and Artificial Intelligence, serve different contexts, health aims, and users, including patients and providers (Chaturvedi, et al., 2025). From a patient's perspective, digital health technologies mainly include online platforms and mobile and wearable devices (Šmahel et al., 2018).

Digital healthcare platforms primarily function as transaction platforms, connecting patients with medical professionals. Additionally, they integrate aspects of innovation platforms, linking various complementary services and technologies utilized by diverse healthcare providers, including traditional public primary care organizations. healthcare platform firms, like the 24Health group in Europe, embrace these dual perspectives by separating their transaction platform operations from their technological innovation platform activities (Björkdahl et al., 2024).

Platforms facilitate digital matching between patients and medical professionals and incorporate platform technologies, data analytics, telemedicine, and electronic health records to improve various facets of healthcare. Although digital platforms are often regarded as catalysts for new ecosystems, in the healthcare sector they are integrated into existing systems (i.e., platform grafting) since healthcare services are rigorously regulated, and digital services cannot entirely replace in-person consultations and treatments but must often be supplemented with physical care (Björkdahl et al., 2024).

The advantages of healthcare digitalization are substantial: they improve the speed and quality of services, seamlessly connect patients with medical professionals, and facilitate access to complementary services. For healthcare providers, these platforms reduce the need for expensive physical facilities, simplify the matching and communication between patients, doctors, and nurses, and balance demand across different regions. For patients, digital platforms offer the convenience of accessing healthcare without traveling to distant centres and spending hours in waiting rooms with other potentially contagious patients (Björkdahl et al., 2024).

Purpose of the paper. *Recent advancements in digital healthcare have transformed the nature and significance of patient engagement (Kickbusch et al., 2021). It is understood as a management approach that, by promoting health education and health-friendly behaviors, equips individuals with essential tools to make better decisions for their well-being, thereby reducing cultural and social inequalities (Ippolito et al., 2020). Empowerment has multifaceted effects on patients, granting them greater rights and responsibilities in healthcare decisions. This poses a challenge for providers due to information asymmetries, patients' limited interest in the economic impact of care, and their reluctance to participate since perceived as an obligation (Berry and Bendapudi, 2007). Moreover, empowerment shifts the focus from illness to overall well-being, including physical, psychological, and existential dimensions (Engström and Elg, 2015). Empowerment also plays a critical role in healthcare policy, promoting patient-centered care and improving outcomes (Chen et al., 2013).*

Digital tools enabling patients to engage with their health data are increasingly integrated into digital systems, creating a direct link between access to these systems and a patient's ability to engage (European Patients' Forum, 2017). Patient engagement with their health data covers both patient access to and active utilisation of their health data during healthcare trajectories (van Kessel et al., 2024), including prevention, diagnosis, care and rehabilitation.

Within the realm of healthcare digital platforms, Patient Engagement Platforms (PEPs) stand out as digital health applications designed to automate patient outreach and maintain engagement throughout their care journey (Campbell et al., 2020). These platforms encompass patient portals, mobile apps, and messaging chatbots, which can be accessed via smartphones, tablets, or computers. PEPs can undertake tasks typically performed by clinicians, such as delivering educational content, sending treatment reminders, reporting pain scores, and managing health outcomes. They enhance patient experience and satisfaction by fostering a sense of connection and care. PEPs also provide significant benefits to physicians by improving referral processes, expanding their practice, boosting care team efficiency, and automating data collection. They can generate revenue through Remote Patient Monitoring and help practices earn full credit for Improvement Activities under the Merit-based Incentive Payment System. The primary advantage of PEPs lies in their ability to enhance patient outcomes and reduce healthcare costs. Research shows they can shorten hospital stays, reduce postoperative emergency room visits, lower readmission rates, and decrease clinic visits. Additionally, PEPs reduce the need for therapy and home care services, increase patient satisfaction, and decrease the volume of patient-initiated calls to healthcare offices.

The predominance of healthcare and nursing literature addressing the PEPs highlights a significant current gap in empirical research within the field of management (Ippolito et al., 2020). Thus, an essential trajectory for future research is the deeper exploration of patient engagement issues in remote consultation through digital tools (Liu et al., 2024). Another significant shortcoming is the lack of integration in care pathways, resulting in fragmented care that fails to ensure continuous, patient-centered care for chronic patients. Rocco et al. (2024) assert that the implementation of diagnostic-therapeutic assistance pathways is incomplete, preventing a unified model for managing patients with chronic diseases. Additionally, managing multidisciplinary clinical cases is challenging due to the absence of a holistic approach, and there is a lack of comprehensive, real-time shared health information for the patient (Filippini and Vinceti, 2021).

Building on these research gaps, the paper aims to explore the role of digital technologies in patient interaction with healthcare services, from prevention and diagnosis to treatment and follow-up. Particularly the research question addressed is: How do the digital health platforms affect the patient engagement along the different stages of the care pathway?

To address this research question, patient engagement is conceptualized as comprising multiple dimensions that capture the spectrum of patient behaviors and attitudes toward healthcare, including behavioral, emotional, and cognitive aspects (Liu et al., 2024). Specifically, the behavioral dimension pertains to a user's actions related to participation and transactions; the emotional dimension focuses on the user's experiences and feelings; while the cognitive dimension encompasses the user's beliefs and knowledge about the system or service (Vargo and Lusch, 2016).

Drawing on Lemon and Verhoef (2016), we designed the care pathway to mirror a customer's interaction with a firm, categorizing it into three distinct stages: the prepurchase phase aligns with the period before receiving healthcare services, the purchase phase corresponds to during the service experience, and the postpurchase phase reflects the period following the service.

Methodology. *The study utilizes case study methodology (Yin, 2003) to comprehensively analyze and describe the phenomenon under investigation, while also laying a foundation for future research. This approach is particularly suited for exploring complex issues where forming hypotheses beforehand is challenging, and it effectively addresses 'how' research questions (George and Bennett, 2005). Using a non-probabilistic technique (Newman, 2000) and choosing a purposing case, CHS Chronic Plus Platform was selected, because it is considered by the Ministry of Health among the best innovative experiences for managing chronic conditions in Italy (https://www.piattaformacronicita.salute.gov.it). CHS also stands out for having been implemented by a Local Health Authority, the ASL Caserta: health organizations, in fact, do not always embrace new healthcare technologies with enthusiasm (Bronsoler et al., 2020; Owusu et al., 2021), especially when their adoption entails changes in organizational routines and high initial costs to be sustained (De Domenico et al., 2023). Nonetheless, many healthcare organizations lag behind in digital transformation, failing to align with customer expectations (Anderson et al., 2019). Research also indicates that IT system infrastructures in the healthcare sector remain comparatively underdeveloped when measured against other industries (Ricciardi and Tarricone, 2021).*

Data collection, conducted between November 2024 and January 2025, included 20 in-depth, online interviews with managers, medical and non-medical staff. Each interview, lasting approximately 50 minutes, was structured around open-ended questions divided into two sections. The first section examined the platform's structure and overall functionalities, while the second delved into the dimensions of patient engagement facilitated by the platform at different stages of the care pathway. The interviews were recorded and transcribed verbatim. Secondary data sources, including the corporate website, business documents, and media reports, were also utilized to enhance triangulation.

The data were analysed using thematic analysis, to identify patterns in transcribed conversations through quotes or paraphrased ideas (Braun and Clarke, 2019). The collected data were organized into coherent categories - such as platform characteristics, patient engagement, and stages of the care pathway - to enhance the research's overall reliability (Yin, 2015). Initially, data were reviewed individually and then compared to uncover similarities and differences while avoiding subjective interpretation.

Results. *Preliminary findings have emerged from the ongoing data analysis. The platform's design seamlessly combines technological tools with healthcare services, creating a system that prioritizes patients and their needs throughout the entire care pathway. Each stage of the remote consultation process may exhibit different manifestations of engagement across the dimensions of behaviour, emotion, and cognition, which are divided and presented in the table below (Tab. 1). This reveals that the platform acts as a critical service touchpoint within healthcare operations.*

Tab. 1: The outcome of the CHS Chronic Plus Platform on the patient engagement along the care pathway

Patient engagement	***Platform functionalities***	***Outcome along the care pathway***		
		Before	***During***	***After***
Behavioural	o *personalized health plans* o *reminders for appointments and follow-ups* o *medication schedules*	*Enhancement of the degree to which patients take the initiative to participate in the service*	*Increase in the depth and frequency of the interaction between patient and clinician*	*Stronger patient adherence to prescribed health or medication plans*
Emotional	o *user-friendly design with intuitive interfaces* o *educational resources and support services* o *virtual consultation and telemonitoring* o *electronic health records*	*Mitigation of skepticism towards new modes of health service*	*Reliability in attending future sessions*	*Increase in satisfaction with the health service experience*
Cognitive	o *track personal health data* o *access to detailed clinical reports* o *insights into their medical conditions*	*Recognition of the digital tool as an efficient alternative for providing and accessing healthcare services*	*Development of a comprehensive understanding of the process of health service experience, including its advantages and disadvantages*	*Opportunity to learn from their medical condition*

Source: our elaboration

Before the care pathway begins, behavioral engagement is fostered through personalized health plans that inspire patients to take a proactive role in their care journey. By leveraging population stratification techniques, the platform identifies at-risk patients who require closer monitoring and support. Emotional engagement is enhanced through user-friendly interfaces and comprehensive educational resources, alleviating skepticism and building trust in digital healthcare solutions. Beyond educational initiatives, the platform also offers psychological assistance to encourage patients to actively manage their health. These services aim not only to improve clinical outcomes but also to enhance patients' quality of life while reducing unnecessary reliance on emergency and hospital services. Cognitively, patients are empowered with seamless access to detailed clinical reports and valuable insights, enabling them to better understand the potential of digital tools in analysing and managing their medical conditions.

During treatment, behavioral engagement is maintained through appointment reminders and follow-up notifications, ensuring consistency in patient participation. Furthermore, the platform supports electronic prescriptions and

appointment scheduling, effectively reducing administrative burdens and boosting overall system efficiency. Emotional engagement is strengthened by telemonitoring and virtual consultations, which cultivate trust and reliability in attending sessions. The integration of telemedicine tools minimizes the need for in-person visits while providing continuous oversight of clinical parameters - essential for managing chronic illnesses. Additionally, the platform's digital report delivery system ensures that patients receive their test results quickly and conveniently. Moreover, real-time health data tracking allows patients to feel more involved and in control of their treatment process, further enhancing cognitive engagement.

After the care pathway, adherence to prescribed medication schedules and follow-up plans sustains behavioral engagement. Emotional engagement is deepened as patients continue to feel supported through ongoing access to the health record system, which allows for centralized collection and management of patient data. This ensures healthcare providers have immediate and comprehensive access to patient information, enhancing decision-making and care coordination. At the cognitive level, patients gain a deeper understanding of their health conditions, reinforcing the value of digital tools in managing long-term care and fostering sustained involvement in their health journey.

In summary, CHS Chronic Plus is far more than a technological innovation; it is an integrated healthcare ecosystem that strengthens the local healthcare system. It improves operational efficiency as well as diagnostic accuracy and ensures that care remains patient-centered, providing more well-rounded treatment options and overall health outcomes. Moreover, CHS Chronic Plus seamlessly integrates with existing physical systems, including Chronic Care Centers, which are healthcare facilities where a multidisciplinary team of professionals, such as physicians, nurses, and specialists, collaborates to deliver personalized, high-quality care tailored to individual patient needs. Finally, the platform serves as a crucial resource not only for patients with chronic conditions but also for medical staff, as CHS Chronic Plus has proven to enhance efficiency and effectiveness, particularly in redesigning care protocols, clinical processes, and the documents generated by clinical and administrative activities.

Research limitations. *The study is not without limitations, which present valuable avenues for future exploration. The most significant constraint is the absence of the patient's perspective, a critical factor in evaluating the platform's effectiveness in fostering engagement. As emphasized in the literature, a patient's circumstances and characteristics - such as living in rural areas, age, or level of technological literacy - play a pivotal role in shaping remote consultations (Liu et al., 2024). These elements become especially important in the context of the Caserta province, where more than 40% of the population is 50 or older and 70% of them live in rural towns with less than 10.000 inhabitants (ISTAT, 2024). Thus, future research should focus on conducting interviews with chronic patients and their caregivers, ensuring their perspectives are more comprehensively integrated.*

Moreover, our focus is exclusively on the positive aspects of chronic patient engagement enabled by the CHS Chronic Plus Platform, whereas future studies should also address the challenges associated with the use of digital technologies in healthcare, such as data security and privacy risks.

Another notable limitation of this study is that its findings are derived from a single case study, which limits their applicability to broader contexts. Future research could expand on these insights by undertaking additional case studies that explore diverse innovative approaches to managing chronic conditions, as well as differing institutional frameworks beyond the Italian setting.

Managerial implications. *Though still preliminary, our findings hold significant implications for public health sector managers. Patient engagement requires to be considered both an ethical and practical priority for ensuring the long-term sustainability of the National Health Service (NHS). Ethically, it underscores a commitment to recognizing patients as active participants in their healthcare journeys, valuing their contributions, and enhancing their autonomy. Practically, patient engagement aids in optimizing healthcare resources by promoting better adherence to treatment plans, improving health outcomes, and minimizing avoidable hospitalizations. By empowering patients and involving them in care processes through platforms like CHS Chronic Plus, healthcare systems can foster trust, encourage preventive care, and adapt more effectively to the evolving challenges of managing chronic diseases. Such an approach is essential for establishing a resilient and sustainable healthcare system, where e-health solutions and territorial health units, such as the ASL, work in unison as an integrated network to manage patients, particularly those who are frail or living with one or more chronic conditions (Bitar and Alismail, 2021). The CHS Chronic Plus Platform stands out as a scalable best practice within the Italian healthcare landscape, addressing inefficiencies caused by the lack of a strategic direction, which hampers patient care and increases healthcare costs (Ferraresi et al., 2021).*

Originality of the paper. *This paper contributes to the growing body of research on digital healthcare by offering a novel perspective that integrates patient engagement with healthcare management and digital transformation. Unlike previous studies, which predominantly focus on clinical or nursing aspects, this research adopts a managerial viewpoint, addressing the strategic and operational implications of digital platforms in chronic disease management.*

A key originality of the study lies in its interdisciplinary approach, bridging the literature on services marketing and health management. While patient engagement has been widely discussed in healthcare research, it has often been examined from the provider or policy perspective (Agarwal et al., 2020) rather than through a structured analysis of engagement dynamics across the entire care pathway. By conceptualizing patient engagement through behavioral, emotional, and cognitive dimensions and mapping these onto different stages of care (before, during, and after treatment), this paper adopts a comprehensive framework for understanding engagement in digital healthcare contexts.

From an empirical standpoint, this study focuses on a public healthcare initiative - the CHS Chronic Plus Platform - rather than private-sector digital health solutions, which have traditionally dominated research in this field. By examining

a platform implemented by a Local Health Authority (ASL Caserta), this paper sheds light on the opportunities of digital transformation within publicly funded healthcare systems, where adoption barriers and institutional constraints are often more pronounced.

Funded by Pegaso University, Department of Information Science and Technology (FRC 2024 Grant titled "La trasformazione digitale per la gestione del paziente cronico: L'esperienza dell'ASL Caserta", CUP: FRC2024013

Integrating corporate industrial heritage, digital transformation, and social sustainability: the "Dublo Fashion Heritage project"

SABRINA RESTANTE[1] DANIELA CAVALLO[2] ROSSELLA BARATTA[3] FRANCESCO MERCURI[4]

Abstract

This study examines the role of corporate industrial heritage in strengthening territorial identity and promoting sustainability by integrating corporate memory, innovation, and community engagement. Through the Dublo Fashion Heritage project, it explores how heritage preservation fosters connections between businesses, local communities, and sustainable development. Using a multi-stakeholder approach and the Delphi method, the research highlights the significance of digital transformation in preserving corporate heritage, enhancing social sustainability, and reinforcing territorial identity. Findings demonstrate that digital archives and innovative storytelling can turn industrial heritage into a dynamic asset for cultural and economic development, providing actionable insights for organizations and policymakers seeking to align heritage conservation with contemporary sustainability objectives.

Framing of the research. *Corporate industrial heritage represents the enduring attributes and qualities that define an organization's identity, linking its past, present, and future in ways that resonate with both internal and external stakeholders (Balmer, 2011; Burghausen, 2024). This heritage extends beyond the corporation itself, influencing the surrounding territories, communities, and cultural narratives, becoming a critical asset for corporate identity and communication (Spielmann et at., 2021: Montella, 2024). The geographical rootedness of corporate heritage in specific locations contributes to a distinct sense of identity for organizations and their communities, fostering mutual enrichment over time (Balmer, 2013; Balmer and Burghausen, 2015). Furthermore, companies often leverage corporate heritage as an intangible asset to enhance brand value, strengthen stakeholder relationships, and gain a competitive advantage (Al-Amad et al., 2024; Montella, 2024).*

The integration of corporate industrial heritage with contemporary advancements plays a crucial role in territorial development and sustainability. Heritage conservation initiatives often align with corporate social responsibility strategies, recognizing the cultural significance of industrial and historical roots in shaping organizational identity and enhancing the vitality of local communities (Mohanty et al., 2024; Lueg, 2023). For industrial heritage to contribute effectively to sustainability, it must not only preserve historical and cultural values but also promote innovation that builds on these foundations (Pironti et al., 2016). Digital technologies have emerged as transformative tools in this regard, enabling the documentation, management, and cultural promotion of industrial heritage while making it accessible to broader audiences (Pardo Abad, 2019; Chatzi Rodopoulou, 2023). By digitizing tangible and intangible heritage elements, companies can bridge the past with the future, repurposing historical assets for education, tourism, and economic development.

Social sustainability is inherently tied to corporate industrial heritage, as both emphasize the importance of fostering well-being, strengthening social relationships, and engaging communities. Social sustainability prioritizes equity, participation, and inclusion, and it is closely linked to the sense of place-defined as the emotional and cultural bonds individuals form with their environment (Dempsey et al., 2011; Relph, 1976). Community engagement, as a cornerstone of social sustainability, is essential for fostering collective identity, building trust, and ensuring the long-term resilience of communities (Stevenson, 2021; Fredline et al., 2003). These social dynamics are particularly important in the context of industrial heritage, as the preservation and reinterpretation of corporate memory can strengthen territorial identity, foster community pride, and generate opportunities for cultural and economic development (Scaffidi et al., 2025).

Innovation serves as a bridge between corporate industrial heritage and social sustainability, driving both territorial and organizational progress. Social innovation involves implementing new solutions to improve the well-being of individuals and communities (Zahra et al., 2009) and respond to currently unmet social needs (Phills et al., 2008). For industrial heritage, this can take the form of digital transformation, innovative cultural programming, or regeneration

projects that combine heritage preservation with social and economic renewal (Scaffidi, 2024; Pardo Abad, 2019; Chatzi Rodopoulou, 2023). The creation of digital archives is also a valuable tool for preserving corporate history. Corporate archives serve as repositories of traditions, stories, and values associated with companies and their products. They embody the cultural capital of a brand, reflecting its evolution and significance within the broader cultural context (Vacca, 2024; Chatzi Rodopoulou, 2023). By fostering innovation and adapting to changing environments, corporations can sustain their success while contributing to the vitality and resilience of the regions in which they operate (Sammour et al., 2020; Pironti et al., 2016).

In summary, corporate industrial heritage, social sustainability, and innovation are deeply interconnected. Together, they can enable organizations to preserve their legacy, engage stakeholders, and foster sustainable development that benefits both businesses and communities.

This is particularly relevant in the fashion industry, where brands must balance artisanal craftsmanship and tradition with the demands of digitalization and sustainability (Zacheo et al., 2024). Fashion archives often document techniques and craftsmanship that are no longer widely practiced. By maintaining these digital records, brands can preserve and promote traditional skills, ensuring that valuable expertise is passed down to future generations. These archives evolve from mere custodians of the past into active contributors to a brand's ongoing narrative and identity (Vacca, 2024). Moreover, the fashion industry faces challenges such as resource depletion and globalization, and the preservation of cultural heritage can play a significant role in maintaining identity and promoting sustainable practices within the fashion system (Brown and Vacca, 2022)

Purpose of the paper. *This research uses the Dublo Fashion Heritage project as a case study to explore the role of industrial cultural heritage in enhancing territorial identity and promoting sustainability, integrating corporate memory, innovation, and community engagement. The Dublo Fashion Heritage project focuses on the cataloging and valorization of the historical archive of Dublo Srl, an Italian textile company founded in 1937. The project aims to preserve and promote the company's industrial and cultural heritage by organizing its extensive archive of hosiery samples and historical documents. This initiative involves the development of a digital catalog system, making the archive accessible for research, education, and cultural promotion. Additionally, the project emphasizes community engagement by collaborating with students, local institutions, and strategic partners to highlight the company's historical ties to the region. It seeks to integrate heritage conservation with innovation by creating digital tools and fostering creative storytelling through multimedia formats such as short films and interviews. The overarching goal is to strengthen Dublo's brand identity, enhance its relationship with the territory, and contribute to the collective memory and cultural development of the region.*

While corporate industrial heritage has been extensively studied as an intangible asset contributing to organizational identity, branding, and competitive advantage (Balmer, 2011; Montella, 2024), its broader potential to enhance territorial identity, foster social sustainability, and digital transition remain underexplored. Existing literature acknowledges the role of heritage conservation in corporate social responsibility strategies and territorial development (Mohanty et al., 2024; Pironti et al., 2016; Scaffidi, 2024); however, there is limited empirical research on how industrial heritage can simultaneously integrate corporate memory, community engagement, and innovation to create sustainable and resilient local ecosystems. Furthermore, although digitization has been identified as a promising avenue for heritage promotion and management (Pardo Abad, 2019; Chatzi Rodopoulou, 2023), there is a lack of comprehensive frameworks for leveraging digital tools to bridge industrial heritage with contemporary sustainability practices and stakeholder participation.

This research addresses these gaps by using the Dublo Fashion Heritage project as a case study to examine the intersection of corporate industrial heritage, social sustainability, and innovation. Specifically, the study aims to:

1. *Identify effective strategies for conserving and valorizing industrial heritage and corporate memory.*
2. *Explore how corporate heritage initiatives can strengthen territorial identity and the sense of place.*
3. *Evaluate the role of community engagement in fostering social sustainability through industrial heritage projects.*
4. *Investigate the integration of digital tools and innovation in promoting corporate heritage and achieving sustainable development goals.*

By addressing these objectives, this research seeks to contribute to the growing discourse on the multidimensional value of industrial heritage and propose actionable insights for organizations and policymakers aiming to align corporate heritage initiatives with social sustainability.

Methodology. *The study employed the Delphi method, a well-established qualitative research approach aimed at achieving expert consensus on complex topics where knowledge may be fragmented or incomplete (Ametepey and Aigbavboa, 2019; Huang et al., 2019). Studies show that this approach is useful for (i) getting experts from different regions to agree on a specific topic (Imang and Ngah, 2012) and (ii) reaching consensus on a complicated issue from experts in fields with limited knowledge (Hauck et al., 2007). The methodology was selected due to its iterative nature, allowing experts to reflect on their responses and progressively refine their opinions, thus enhancing the reliability of the findings (Tseng et al., 2023; Sourani and Sohail, 2015) and it has been widely applied in sustainability research, particularly in industrial and urban heritage projects, where diverse stakeholder insights contribute to holistic governance models (Meijering et al., 2018; Rasouli et al., 2009; Chatterjee and Rose, 2012).*

Data Collection and Sample

Data collection was carried out in three iterative rounds. The Delphi panel was composed of a purposive sample of eight individuals representing different stakeholder categories reflecting a broad spectrum of interests in industrial heritage, sustainability, and territorial identity. Rather than being limited to disciplinary key-stakeholders, the panel included:

- *Public sector representatives (municipal and regional policymakers, cultural heritage officers)*
- *Business leaders and industry experts (managers from historical brands, sustainability officers, representatives of business associations)*
- *Academics and researchers (scholars specializing in industrial heritage, sustainability, and governance models)*
- *Cultural organizations and NGOs (heritage foundations, tourism development agencies, industrial heritage advocacy groups)*
- *Local community members (citizens actively involved in preservation efforts, neighborhood committees, student representatives)*

The selected stakeholders were from near geographic locations in order to evaluate how local citizens perceived the value of a historical brand in terms of sustainability (Shukor and Ng, 2022). The inclusion of university students aimed to capture the perceptions and expectations of younger generations, particularly concerning the educational, cultural, and professional value of industrial heritage. This approach enabled a more inclusive assessment of how historic corporate assets are perceived and valorized within the broader regional ecosystem (Yoopetch et al., 2022).

This stakeholder composition ensured the collection of heterogeneous yet complementary insights, supporting the identification of convergences and divergences across institutional, professional, academic, and civic perspectives.

Data analysis

The Delphi method facilitated the progressive refinement of expert opinions through iterative rounds, enabling participants to reassess their responses based on group feedback (Zharta et al., 2019). This structured approach mitigated individual biases and ensured a balanced representation of stakeholder perspectives. By integrating expert consensus with structured dialogue, the process enhanced the validity and reliability of the findings, offering a comprehensive framework for understanding stakeholder perceptions of sustainable industrial heritage (Musa et al., 2015).

By structuring insights from expert opinions, Content Analysis clarifies the interconnections between corporate memory, digital transformation, and social sustainability, contributing to a replicable model for the valorization of industrial heritage.

The analytical process consists of:

- *Transcription and anonymization of expert responses to ensure reliability and comparability.*
- *Identifying key concepts and patterns.*
- *Analysis of convergence and divergence to highlight interdisciplinary perspectives.*
- *Triangulation with literature and secondary data to validate findings and formulate strategic recommendations.*

Validity and reliability

The validity and reliability of the research model are undergoing continuous refinement, as the study remains in progress. The adoption of the Delphi Method ensures methodological rigor (Belton et al., 2019) by progressively refining expert judgments through iterative rounds, thereby mitigating potential biases and enhancing the credibility of the findings. Nonetheless, as the research advances, additional verification measures are being implemented to further strengthen the reliability of the Content Analysis approach.

Results. *The key-stakeholders interviews conducted offer a comprehensive perspective on the relationship between corporate industrial heritage, sustainability, and territorial identity. By analyzing their responses, key themes emerge shedding light on the strategies that businesses can adopt to integrate heritage conservation with innovation, digital transformation, and social sustainability.*

Preserving and enhancing industrial heritage: key strategies

A central theme emerging from the interviews is the pivotal role of digitalization in preserving corporate memory. The selected stakeholders unanimously acknowledge that tools such as digital archives, virtual museums, and interactive platforms enhance accessibility while safeguarding industrial heritage for future generations. As one interviewee noted, "Digitalization plays a fundamental role in the conservation and valorization of corporate heritage, making it accessible to a broader audience. However, they emphasize that digital tools should complement, rather than replace, direct engagement with historical artifacts and industrial sites (Cimadomo and Varagnoli, 2023).

Furthermore, the integration of circular economy principles into industrial heritage management is highlighted as a crucial strategy. In industries such as fashion, the revival of traditional production techniques and the use of sustainable materials provide pathways to maintaining continuity with historical craftsmanship while reducing environmental impact (Beltramo et al., 2021). This aligns with insights from the interviews, where sustainability is framed as inseparable from quality and durability: "Sustainability in manufacturing enterprises aligns with care and attention towards high-quality and durable products". Research further underscores the importance of preserving expertise and craftsmanship skills,

which are often deeply embedded within local communities and constitute a competitive advantage for businesses while reinforcing cultural sustainability (Bellia et al., 2022).

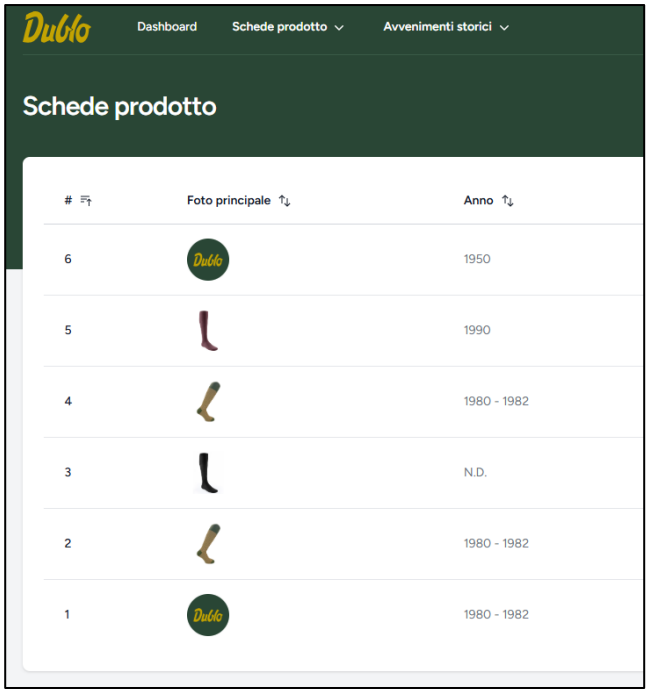
From a governance perspective, interview findings highlight that a participatory, multi-stakeholder model is essential for the sustainable management of industrial heritage. As one respondent emphasized, "The most effective approach is a collaborative and multi-stakeholder one, involving both public and private actors in the management of industrial heritage". Engaging businesses, public institutions, academia, and local communities ensures a shared approach to conservation, transforming corporate heritage from a mere business asset into a collective cultural resource with positive territorial impacts (Duglio et al., 2019).

Corporate heritage as a pillar of territorial identity

"Corporate heritage plays a crucial role in narrating the industrial and cultural history of a region, reinforcing local identity": the strong connection between corporate heritage and territorial identity is a recurring theme in the interviews. Many stakeholders emphasize the role of historic businesses in shaping collective memory, as they function not only as economic drivers but also as custodians of traditions and expertise that define local cultural identity (Maspoli, 2024). In this regard, corporate museums, heritage trails, and storytelling initiatives serve as effective instruments for communicating the historical significance of industrial heritage, fostering a sense of place, and reinforcing social cohesion (Alavi et al., 2024). Moreover, industrial heritage is increasingly regarded as a catalyst for urban regeneration, with the adaptive reuse of decommissioned industrial sites into cultural hubs, educational spaces, or innovation centers offering opportunities to preserve their historical significance while attracting investment and stimulating the growth of creative industries (Coscia et al., 2024).

Community engagement and social sustainability

The integration of corporate heritage into community engagement strategies is another prominent theme emerging from the interviews. Stakeholders agree that heritage conservation should not be an isolated effort but rather a collaborative process actively involving local communities. As one interviewee emphasized, "Businesses can promote thematic festivals, educational programs, and co-creation projects that encourage active citizen participation in heritage conservation". Initiatives such as open factory days, heritage festivals, and digital storytelling projects are identified as effective means of increasing public interest in industrial heritage, fostering a sense of belonging, and encouraging active participation (Li et al., 2021). The intergenerational transfer of skills and knowledge is another fundamental aspect. According to key-stakeholders, structured mentorship programs, educational workshops, and collaborations between industry and universities are key to ensuring that traditional manufacturing expertise is transmitted to new generations (Tseng et al., 2022). This aligns with insights from the interviews, where one respondent noted, "The tradition of industrial craftsmanship is deeply linked to the transmission of knowledge. Establishing training programs in collaboration with schools and universities ensures the continuity of specialized skills". Investing in vocational training programs can contribute to building a resilient workforce and strengthening local professional capacities. Furthermore, industrial heritage is increasingly being integrated into regional tourism strategies. The rising interest in industrial tourism, encompassing corporate museums, factory tours, and interactive exhibitions, creates opportunities for leveraging corporate heritage as an economic and cultural asset (Liu et al., 2018).



Digital innovation as a catalyst for heritage promotion

One of the most transformative aspects emerging from the interviews is the role of digital technologies in managing and promoting industrial heritage. Digital archives are considered essential tools for improving accessibility and facilitating the dissemination of historical documentation. Some stakeholders also propose leveraging blockchain technology to enhance the security and traceability of heritage records, thereby preserving their authenticity over time (Tseng et al., 2022). Augmented reality (AR) and virtual reality (VR) are also reshaping the way industrial heritage is experienced, allowing for immersive interactions with corporate history. Virtual reconstructions of historic factories and interactive museum exhibits provide engaging experiences for diverse audiences. However, stakeholders caution that excessive reliance on digital tools could undermine the authenticity of industrial heritage experiences, stressing the importance of balancing innovation with tradition (Li et al., 2021). Digital transformation extends beyond conservation, fostering environmental sustainability through automated archival processes, resource optimization, and waste reduction. The study underscores corporate industrial heritage as a strategic asset for sustainability, urban regeneration, and economic development. Its preservation and transmission rely on community engagement, digitalization, and circular economy strategies.

A key example is the Dublo Heritage digital archive, a platform that organizes technical sheets of all Dublo products, ensuring accessibility for research, education, and cultural promotion, providing a publicly accessible historical archive available on the web (see Figure 1). The development of the archiving system considered the practices used within the company, suggestions from workers, the needs of researchers in the fashion industry, and the ministerial codes for archiving, ensuring that all material becomes open data and is accessible in real time. Each technical sheet includes detailed information such as the year of production, line and season, and an interactive photo gallery. This collaborative approach enables not only to transmit heritage to future generations, but also to strengthen community engagement. The technical sheet of each product also displays significant historical events, selected based on the year of production, to provide historical and cultural context, and in this sense the digital archive also contributes to reinforcing territorial

identity. As mentioned by the interviewees, "Dublo Heritage aims to be the bridge between the past and the future, between archiving and digitalization, for a present that is always aware of the company's value".

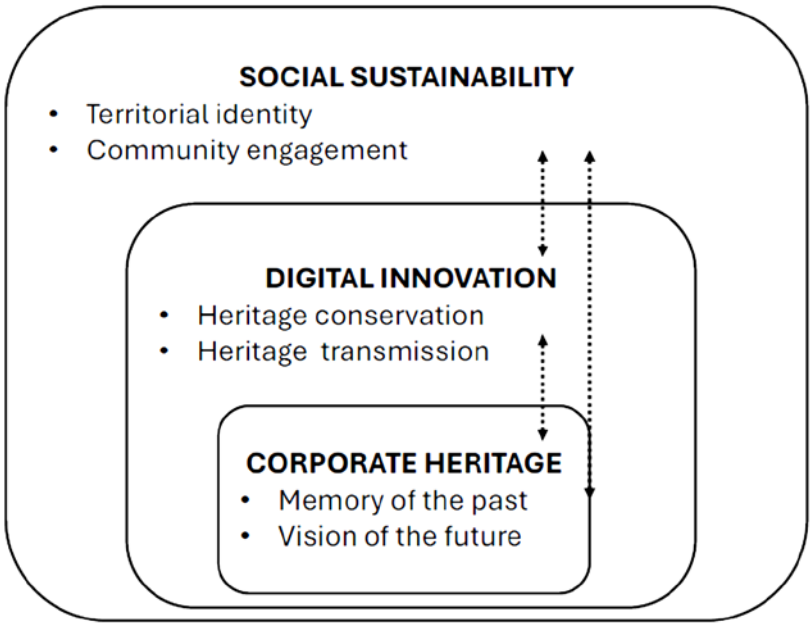


Fig. 1: Dublo Heritage digital archive

Source: https://dubloheritage.it/admin/prodotti

The preliminary findings of this research, therefore, enable the development of a model for good practice in corporate heritage management, leveraging innovation and social sustainability (see Figure 2).

Figure 2. A model for integrating corporate industrial heritage, digital transformation, and social sustainability

Source: authors' elaboration

Research limitations. *This study offers valuable insights into the role of corporate industrial heritage in sustainability and innovation, but it presents certain limitations. The findings are based on a single case study, Dublo Srl, limiting their generalizability to other industries and cultural contexts (Balmer, 2013; Scaffidi, 2024). Additionally, the Delphi method,*

while effective for key-stakeholders consensus, relies on subjective insights rather than quantitative data, which may introduce bias (Hauck et al., 2007; Ametepey and Aigbavboa, 2019).

The research primarily considers corporate-led heritage strategies, overlooking grassroots initiatives and non-corporate actors that may play a crucial role in heritage-driven innovation (Spielmann et al., 2021; Mohanty et al., 2024). Furthermore, while digitalization is a key theme, the study does not fully address technological challenges such as data ownership, preservation, and accessibility (Pardo Abad, 2019; Chatzi Rodopoulou, 2023).

Despite these limitations, the study provides a solid foundation for future research. Expanding sectoral comparisons, integrating quantitative analysis, and exploring the broader socio-economic impacts of industrial heritage would enhance the robustness and applicability of the findings.

Managerial implications. *The Dublo Fashion Heritage project provides actionable insights for managers and policymakers aiming to leverage industrial heritage for sustainable development. A key implication is the importance of digital transformation, particularly through the creation of digital archives. By investing in digital tools, companies can preserve and promote their heritage, making it accessible for education, research, and cultural tourism (Pardo Abad, 2019; Chatzi Rodopoulou, 2023). This not only strengthens brand identity but also enhances the company's connection to its historical roots.*

Another critical implication is the value of community engagement. Involving local stakeholders, such as residents, students, and cultural organizations, in heritage projects fosters social sustainability and builds trust (Dempsey et al., 2011; Stevenson, 2021). This collaborative approach strengthens the company's relationship with the territory and ensures that heritage initiatives resonate with the community. Additionally, innovative storytelling through multimedia formats, such as short films and interactive exhibits, can effectively communicate corporate history. This strategy differentiates the brand and appeals to both traditional and modern audiences, blending the past with contemporary relevance (Vacca, 2024; Zacheo et al., 2024).

The development of inclusive and adaptive governance models is crucial for the long-term success of heritage projects. Collaboration with policymakers and cultural organizations ensures transparent, participatory management that adapts to evolving social and technological contexts (Mohanty et al., 2024; Scaffidi, 2024). The Dublo project illustrates how industrial heritage can become a dynamic asset that drives innovation, strengthens community sustainability, and enhances competitive advantage-particularly in industries with strong historical foundations, such as fashion and manufacturing, where balancing tradition and innovation is key to sustainable growth.

Originality of the paper. *The originality of this paper lies in its ability to reinterpret corporate industrial heritage as a strategic lever for social sustainability and digital innovation, moving beyond the traditional conception of corporate heritage as mere preservation of the past. The interdisciplinary approach integrates heritage management, territorial governance, and digital transformation, proposing a model that enhances the connection between corporate identity, community, and sustainable development (Balmer, 2011; Montella, 2024).*

From an academic perspective, the paper introduces an innovative application of the Delphi method to analyze the role of corporate heritage in strengthening territorial identity and promoting social participation. While the Delphi method has already been employed in governance studies, its application to the sustainability of historic brands represents a significant contribution, particularly in the fashion industry, where balancing craftsmanship, digitalization, and sustainability is crucial (Scaffidi, 2024; Chatzi Rodopoulou, 2023). From a managerial perspective, the study highlights how the digitalization of corporate archives, as exemplified by the Dublo Fashion Heritage project, transforms corporate memory into a dynamic asset, generating value through education, cultural tourism, and corporate storytelling. This approach not only preserves the cultural capital of firms but also strengthens their competitive positioning and connection with the local territory (Pardo Abad, 2019; Vacca, 2024). The adoption of a multi-stakeholder approach further reinforces the social sustainability of corporate heritage, fostering collaboration among businesses, institutions, and local communities (Spielmann et al., 2021).

The paper proposes a replicable model for enhancing corporate heritage through the integration of digital innovation, territorial identity, and social sustainability, contributing to the scientific debate and offering practical insights for managers and policymakers engaged in the management of industrial heritage (Mohanty et al., 2024).

Key words: *Corporate Industrial Heritage; Social Sustainability; Territorial Identity; Innovation; Community Engagement; Digitalization.*

L’approccio strategico alla catena di fornitura: il caso ERG S.p.A.

CHIARA DE BERNARDI[1] MARCO FREY[2]

Abstract

La gestione della catena di fornitura è un tema centrale nel contesto attuale, che spinge le imprese a monitorare e valutare i propri fornitori. Oggi, l'integrazione di criteri di sostenibilità nella supply chain non è più un'opzione, ma una necessità.

Il caso analizza l’esperienza di ERG S.p.A., azienda che ha fatto della gestione sostenibile della catena di fornitura un elemento di governance, prima che ambientale e sociale. Il raggiungimento dei suoi obiettivi ESG al 2040 passa necessariamente dalla transizione verso un modello sostenibile di tutti i suoi fornitori, nonché dal loro coinvolgimento.

Obiettivi e risultati di apprendimento. *Il caso si propone di:*

1. *conoscere ERG S.p.A., una realtà che ha fatto della gestione sostenibile della propria catena di fornitura una scelta di governance strategica di lungo periodo;*
2. *comprendere a fondo il tema della catena di fornitura, sempre più rilevante nel contesto attuale e normativo;*
3. *capire i benefici che la considerazione della propria catena di fornitura comporta per il proprio business;*
4. *comprendere cosa significa, concretamente, coinvolgere i fornitori nella gestione della loro transizione verso la sostenibilità;*
5. *stimolare la discussione e sviluppare competenze critiche sui benefici e sulle sfide derivanti da progetti di gestione della catena di fornitura.*

Introduzione. *È il 20 dicembre 2024 e per Gianluca Gramegna, Head of Environmental, Social & Governance di ERG S.p.A., è tempo di bilanci: gli obiettivi prefissati sono stati raggiunti? Nell’anno in corso, l’azienda ha continuato, in modo virtuoso, il suo impegno nella gestione e valorizzazione della propria catena di fornitura, da un punto di vista sociale, ambientale, e di governance. Se da un lato è riuscita a coinvolgere più fornitori dell’anno precedente, dall’altro ha implementato nuovi meccanismi premianti per i suppliers più sostenibili.*

Il bilancio, secondo Gramegna, è quindi più che positivo. Soddisfatto, si prepara al nuovo anno ma, soprattutto, alle nuove sfide che esso porterà.

La storia di ERG: dalle fonti fossili alle rinnovabili. *La storia di ERG ha inizio a Genova nel 1938, con Edoardo Garrone, come azienda specializzata nella raffinazione e distribuzione di prodotti petroliferi. L’evoluzione di ERG, dalla fondazione fino ai nostri giorni, vede tre tappe fondamentali. Se per i primi settant’anni cresce nel settore petrolifero, a partire dal nuovo millennio inizia un percorso di transizione verso le rinnovabili, fino ad arrivare ai nostri giorni, con l’obiettivo di affermarsi come leader di mercato nella transizione energetica. Vediamole più nel dettaglio.*

In primis, durante il Dopoguerra, con l'obiettivo di contribuire alla ripresa economica e sociale del Paese, ERG avvia la Raffineria di Genova San Quirico, rispondendo alla crescente domanda di combustibili. Nei successivi sessant'anni, opera nel settore oil, diventando uno dei principali player del mercato e il primo gruppo petrolifero privato italiano, con una vasta rete di distributori in tutta Europa. Inoltre, nel 1993, l'azienda entra nel mercato della produzione elettrica fondando ISAB Energy, società dedicata alla realizzazione del primo impianto italiano di gassificazione degli oli pesanti per la produzione di energia elettrica.

Ascolta i **podcast** sulla storia di ERG!
La fondazione (1938-1963)
Gli anni dello sviluppo industriale (1963-1980)
L'ingresso nel mercato energetico (1980-2001)

Nel corso degli anni, la società ha saputo interpretare i mutamenti del mercato, evolvendosi senza mai rinnegare le proprie radici. A partire dal 2008, ERG ha avviato infatti un processo di trasformazione da compagnia petrolifera tradizionale a operatore multi-energy, con l'obiettivo di consolidare la propria presenza nel settore delle energie rinnovabili. Questa scelta non è stata dettata da ragioni di immagine, rappresentando una scelta industriale mirata a garantire una crescita sostenibile. Ma non è tutto. Nel tempo, il gruppo ha poi adottato una decisione ancora più radicale: dismettere progressivamente le attività legate al petrolio per concentrarsi esclusivamente sulle fonti rinnovabili. Tale transizione ha richiesto una ridefinizione del core business e una trasformazione strutturale del modello operativo, mantenendo come elemento guida il concetto di "fare energia". I proventi derivanti dalla cessione delle attività petrolifere sono stati reinvestiti nello sviluppo delle fonti rinnovabili, con particolare attenzione all'eolico e all'idroelettrico. L'obiettivo? Ridefinire il posizion amento e il core business aziendale.

Ascolta il **podcast** sulla storia di ERG!
Dalla seconda alla terza generazione (2001-2013)

Negli ultimi anni, ERG completa la transizione verso una struttura interamente basata sulle energie rinnovabili, adottando il modello "Wind&Solar". Nel 2021, avvia la riorganizzazione del portafoglio investimenti e nel 2022 cede le attività idroelettriche a Enel Produzione, seguite nel 2023 dalla cessione delle attività termoelettriche ad Achernar Assets AG. Grazie a questa strategia, ERG si allinea pienamente ai principi ESG e agli obiettivi di sviluppo sostenibile delle Nazioni Unite, diventando un operatore esclusivamente dedicato alle energie rinnovabili (100%) (Figura 1).

Fig. 1: L'evoluzione del modello ERG S.p.A

Fonte: elaborazione ERG

Anticipare le tendenze di mercato e rinnovare profondamente la propria strategia aziendale: questi sono i due punti cardine di ERG per diventare leader nel settore delle rinnovabili, sia a livello nazionale che europeo.

Oggi, ERG continua a investire nelle proprie aree strategiche per rafforzare il proprio ruolo in Italia e in Europa. Come afferma il Presidente Edoardo Garrone "oggi che siamo uno dei primi produttori europei indipendenti di energia elettrica da fonti rinnovabili, posso dire che oltre a essere stati capaci di anticipare i tempi, ci inorgoglisce il fatto di svolgere un ruolo da protagonisti fra gli operatori industriali nella costruzione di un mondo rispettoso dell'ambiente e attento alle generazioni future". Sebbene sia già protagonista del processo di decarbonizzazione in atto a livello globale, ERG intende proseguire nel suo percorso di crescita, continuando a investire nei suoi ambiti strategici per consolidare ulteriormente il suo ruolo di riferimento in Italia e in Europa.

La transizione di ERG verso un modello interamente basato su energia eolica e solare ha comportato una gestione diretta degli impianti e una presenza capillare sul territorio. In questo contesto, la creazione di valore sostenibile per tutti gli stakeholder e l'integrazione di un approccio ESG sono stati elementi centrali nella strategia aziendale. La sostenibilità in ERG si fonda su quattro pilastri, strettamente connessi e integrati nel modello di business (Figura 2):

1. *Planet: contrasto al cambiamento climatico;*
2. *Engagement: supporto ai territori e alle comunità locali;*
3. *People: attenzione alla crescita e al benessere dei dipendenti;*
4. *Governance: adozione di principi e organi di gestione ispirati alle best practice internazionali.*

Fig. 2: Strategia ESG 2025-2029

Fonte: sito ERG
(https://www.erg.eu/it/sostenibilita/esg-at-the-core-of-erg-strategy)

Questi elementi sono pienamente allineati con gli obiettivi dell'Agenda 2030 delle Nazioni Unite per lo sviluppo sostenibile. "Stiamo implementando il nostro piano ESG, che contiene al suo interno numerosi obiettivi di sostenibilità. Nello specifico, abbiamo assunto l'impegno di diventare Net Zero entro il 2040, dieci anni prima dei target fissati a livello europeo" spiega Garrone. A maggio 2024, il Consiglio di Amministrazione di ERG ha approvato l'aggiornamento del piano industriale 2024-2026, che integra al suo interno il piano ESG (Environmental, Social e Governance).

Per garantire una piena sinergia tra business e sostenibilità, ERG è fortemente impegnata nello sviluppo di un sistema di governance della sostenibilità, dotato di strutture e organismi operativi dedicati al monitoraggio e allo sviluppo delle attività sostenibili, che permettono il raggiungimento degli obiettivi e del percorso strategico, articolato in tre fasi chiave:

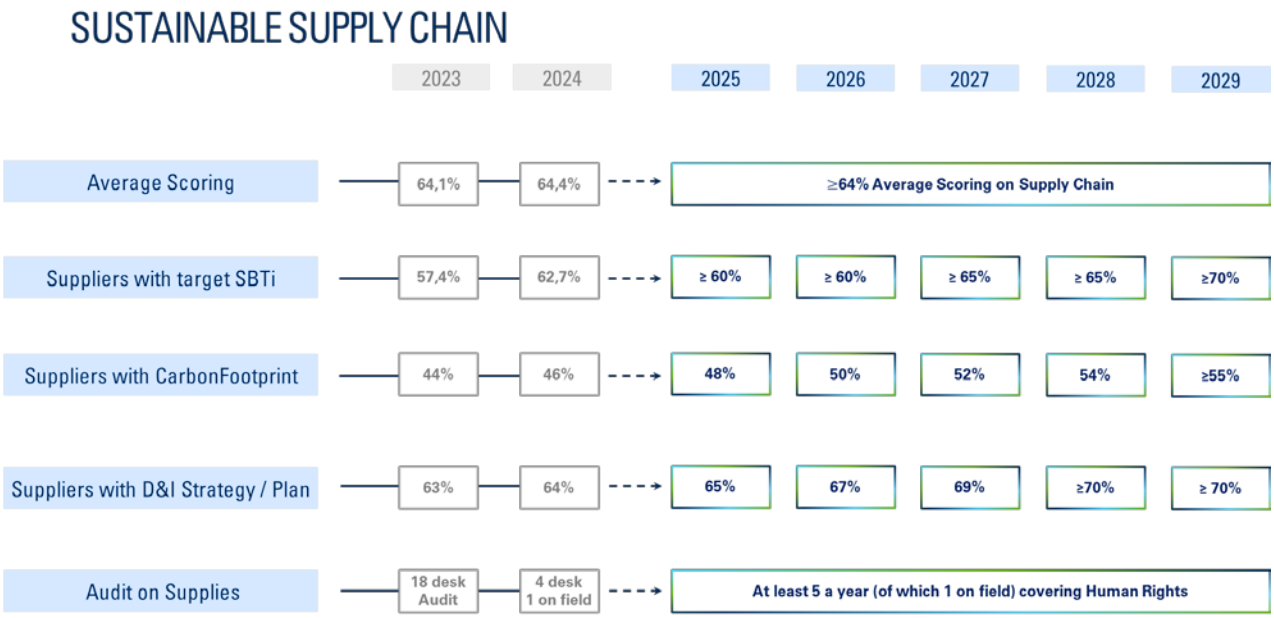
- *produzione e vendita di energia al 100% da fonti rinnovabili*
- *consumo energetico basato al 100% su fonti rinnovabili*
- *collaborazione e consolidamento dei rapporti con i principali stakeholder.*

Partendo da questo terzo obiettivo, il caso si focalizza su una categoria specifica di stakeholder: i fornitori. Per ERG la catena di fornitura è un elemento fondamentale per il raggiungimento dei propri obiettivi di sviluppo sostenibile. Composta principalmente da fornitori di componenti principali per parchi eolici e solari, appaltatori di opere civili, elettriche e strumentali, oltre a fornitori di servizi informatici, di gestione delle infrastrutture e di supporto alle attività di business e staff, essa è fondamentale per una gestione etica e sostenibile.

La catena di fornitura. *La trasformazione del sistema energetico, accompagnata dall'innovazione digitale, sta ridefinendo le modalità di esecuzione dei lavori e di fornitura di beni e servizi, rendendo i fornitori partner essenziali per garantire uno sviluppo sostenibile nell'ambito in cui ERG opera.*

Secondo l'analisi di materialità condotta da ERG nel 2023[3], la catena di fornitura risulta un tema rilevante, nonché pilastro fondamentale della strategia ESG. A titolo di esempio, infatti, se dal punto della materialità d'impatto (impact materiality), un rischio potrebbe essere quello di non gestire i fornitori secondo logiche di Governance che prevedono, ad esempio, la sottoscrizione del Codice Etico o del Codice di Condotta Fornitori, un'opportunità è invece rappresentata dalla possibilità di avviare procedure di selezione e gestione dei fornitori che valutino i temi ESG. Dal punto di vista della materialità finanziaria (financial materiality), invece, un rischio è rappresentato dagli eventi metereologici estremi che possono causare danni a impianti / infrastrutture o interruzione nella supply chain, o ancora il subire impatti reputazionali causati dall'inadeguata gestione dei diritti dei lavoratori (es. incidenti HSE; human rights); al contrario,

[3] La dichiarazione di carattere non finanziario di ERG è disponibile al sito: https://www.erg.eu/c/document_library/get_file?uuid=f023be95-9358-fd6e-0a91-8f5d8ab7c9dd&groupId=10181&version=1.0. Analisi materialità a pagina 30.



le opportunità possono essere la creazione di una supply chain virtuosa che ha un piano ESG o ha definito specifici obiettivi (es. D&I, diritti umani), o addirittura poter certificare l'intera catena di fornitura.

Questa prospettiva, adottata da ERG, e che vede le imprese assumere un ruolo proattivo nell'attuazione di programmi di sostenibilità nella supply chain, costituisce il fondamento delle più recenti normative europee (es. CSRD[4], CSDDD[5]). Infatti, integrare strategie e obiettivi di sostenibilità nella gestione della catena di approvvigionamento sta diventando non solo sempre più rilevante per il settore privato, ma anche essenziale. Negli ultimi anni, l'integrazione delle questioni ambientali e sociali nella gestione della catena di fornitura e, più in generale, nella catena del valore, ha ricevuto una crescente attenzione (Gualandris et al., 2015). Di conseguenza, le imprese hanno progressivamente adottato pratiche che, anche in risposta agli sviluppi normativi più recenti, si sono evolute nel tempo. Se inizialmente l'attenzione era rivolta principalmente agli stakeholder interni, oggi le operazioni esterne assumono un ruolo sempre più rilevante (Gualandris & Kalchschmidt, 2014; Pagell & Wu, 2009). Lo conferma il numero di imprese impegnate nell'integrazione della sostenibilità, non solo all'interno dei propri stabilimenti, ma anche lungo l'intera filiera - includendo fornitori e clienti - cresciuto in modo significativo. Inoltre, sebbene le catene di fornitura globali siano dominate da imprese multinazionali (MNE), le piccole e medie imprese (PMI) vi giocano un ruolo sempre più rilevante (Amighini et al., 2023). Questo fenomeno è ancora più evidente nel contesto europeo, dove le PMI rappresentano il 99% delle imprese (Note sintetiche sull'Unione europea, 2024).

Data la rilevanza della supply chain e della funzione procurement, nei prossimi paragrafi vedremo come si è evoluto l'impegno di ERG verso i suoi fornitori, sempre nell'ottica della creazione di valore, dal punto di vista ambientale, sociale, e di governance. ERG, infatti, nel 2023 dichiara il suo impegno al raggiungimento del Net Zero entro il 2040[6] attraverso alcune azioni sia sul breve al 2027 (near-term target), che nel lungo periodo (long-term target). Per raggiungere questi obiettivi, la gestione della catena di fornitura non è un'opzione, ma una necessità.

Partendo dalla Figura 3, che rappresenta gli obiettivi strategici della supply chain, capiremo come l'azienda abbia fatto della gestione della catena di fornitura un elemento di governance strategica.

Fig. 3: Gli obiettivi di sostenibilità nella gestione della catena di fornitura

Fonte: elaborazione ERG

I cinque obiettivi indicati in Figura rappresentano dei veri e propri main streams che ERG adotta per, da un lato, implementare e, dall'altro, monitorare, l'integrazione della sostenibilità all'interno della supply chain. Vediamoli:

1. *average scoring: si tratta di un punteggio di sostenibilità della catena di fornitura. In altre parole, significa garantire che la supply chain abbia un punteggio medio sopra una certa soglia. Nel 2024 era 64,4%. Nei paragrafi seguenti, vedremo come ERG si impegna nel miglioramento continuo di questo obiettivo;*
2. *suppliers with target SBTi: indica la percentuale di fornitori che hanno approvato i loro obiettivi di decarbonizzazione. Al 2024, sono il 62,7%. Ma ERG mira ad arrivare a circa il 70% al 2030/2035. Dato l'obiettivo*

4 CSRD – Corporate Sustainability Reporting Directive
5 CSDDD – Corporate Sustainability Due Diligence Directive
6 I target di riduzione delle emissioni di gas a effetto serra (GHG) del Gruppo ERG, in linea con la soglia necessaria a mantenere l'aumento della temperatura globale entro 1.5°C, sono stati approvati dalla Science Based Target initiative (SBTi) – organizzazione internazionale che supporta le aziende di tutto il mondo nella definizione di strategie efficaci per la riduzione delle emissioni di gas serra a favore della lotta contro il cambiamento climatico.

di lungo termine, è essenziale monitorare questo dato. ERG vuole essere consapevole di cosa fanno i propri suppliers. Avere un target approvato, significa sviluppare, conseguentemente, una strategia per attuarlo;

3. *suppliers with Carbon Footprint: diversa dal punto 2, la percentuale del 46% al 2024 indica tutti quei fornitori che già eseguono il calcolo della carbon footprint (es. di organizzazione, di prodotto). Negli anni, ERG mira ad incrementare questo numero: nei prossimi paragrafi è descritto come;*
4. *suppliers with D&I Strategy/Plan: un elemento di differenziazione rispetto alle strategie di gestione della catena di fornitura di molto aziende, è l'attenzione alla componente sociale di Diversity & Inclusion. Elemento fondamentale per ERG, l'azienda vuole assicurare che lungo la propria supply chain sia garantita la stessa stessa parità retributiva, le stesse opportunità per uomini e donne, e così via; nel 2024 questo dato si attesta al 64%*
5. *audit on suppliers: come vedremo nei prossimi paragrafi, ERG svolge audit periodici presso i propri fornitori. Per capire cosa realmente fanno i diversi partner, ERG "entra in casa loro", va in campo.*

Nei paragrafi seguenti, partendo dai progetti messi in campo da ERG, capiremo come l'azienda si impegni nel raggiungimento di questi obiettivi. Le parole di Gianluca Gramegna, ci aiuteranno nella comprensione.

Il Codice di Condotta per i Fornitori

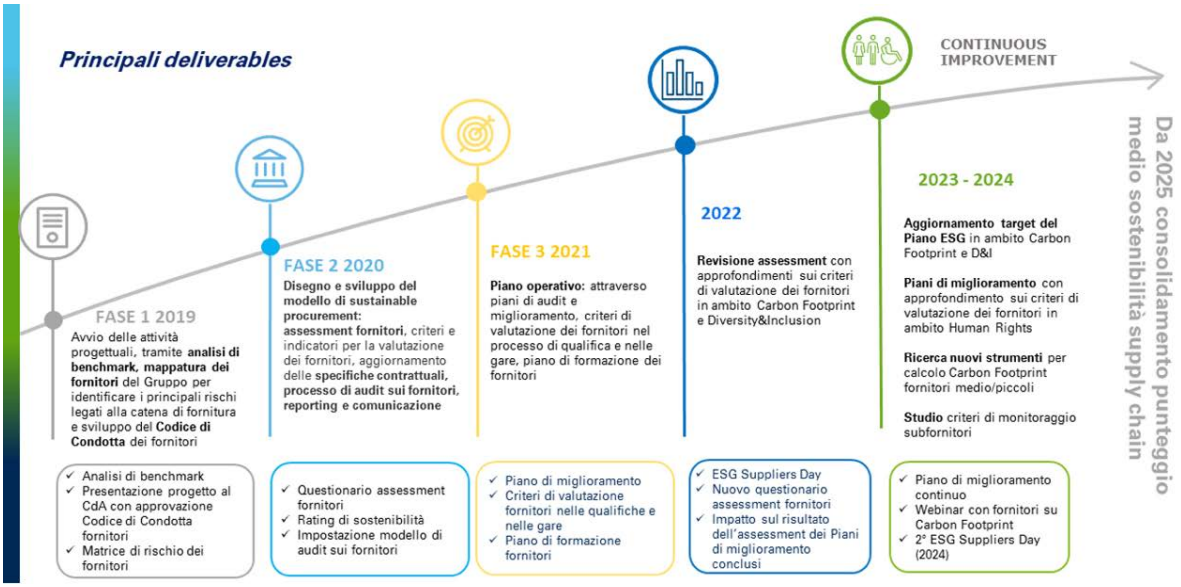
Con l'obiettivo strategico di rafforzare la sostenibilità all'interno della catena di fornitura, ERG ha capito che è essenziale che le proprie aspettative vengano tradotte in direttive chiare e concrete per i fornitori. Come requisito minimo, a questi ultimi è richiesto il rispetto delle normative nazionali vigenti e, in aggiunta, l'adozione di misure proattive per prevenire danni ambientali e sociali, nonché l'implementazione di meccanismi di rimedio in caso di eventuali impatti negativi. Uno strumento pratico che definisce gli standard di riferimento nelle relazioni commerciali tra azienda e fornitori è il Codice di Condotta per i Fornitori.

Se da un lato esso rappresenta che i supplier aderiscano a tali standard, dall'altro, permette all'azienda di prevenire e mitigare gli impatti negativi più rilevanti sui diritti umani, sul lavoro e sull'ambiente lungo la supply chain. Il Codice crea dunque una base condivisa di aspettative in termini di gestione sostenibile e competitiva della catena di approvvigionamento, assicurando che fornitori, subappaltatori e filiali adottino valori comuni in materia di condizioni di lavoro, salute e sicurezza, impatti ambientali ed etica aziendale.

Nel novembre 2024, il Network Italiano del Global Compact ha pubblicato le **Linee Guida per la stesura del Codice di Condotta Fornitori**, un documento strategico volto a coinvolgere i fornitori e a generare un **impatto positivo lungo le filiere produttive**.
Consulta QUI il documento!

Dal momento che ERG attribuisce grande importanza alla costruzione di relazioni trasparenti e durature con i propri partner di filiera, promuovendo i valori e i principi sanciti nel Codice Etico che guida le attività aziendali, nel 2019, ERG ha introdotto il Codice di Condotta Fornitori, che definisce le norme e i comportamenti da adottare lungo l'intera catena di approvvigionamento. Le disposizioni del Codice si basano sui principi delle Convenzioni fondamentali dell'Organizzazione Internazionale del Lavoro (ILO), sulla Dichiarazione Universale dei Diritti Umani e sui dieci principi del Global Compact delle Nazioni Unite.

Consulta QUI il **Codice di Condotta Fornitori** di ERG.



La funzione Procurement è responsabile dell'aggiornamento periodico del Codice, in collaborazione con le unità competenti, per garantirne l'adeguamento alle normative vigenti e alle nuove esigenze aziendali. Il rispetto di tali regole è vincolante per tutti gli appaltatori, subappaltatori e partner commerciali, che si impegnano ad aderire ai valori del Gruppo lungo l'intera filiera. Attraverso la funzione Procurement, che è responsabile dell'aggiornamento periodico del Codice per garantirne l'adeguamento alle normative vigenti e alle nuove esigenze aziendali, ERG mira al rispetto di tali regole da parte di tutti gli appaltatori, subappaltatori e partner commerciali, che si impegnano ad aderire ai valori del Gruppo lungo l'intera filiera.

Importante è sottolineare come il Codice di Condotta non debba essere un elemento isolato, ma uno strumento integrato con le policy aziendali in materia di sostenibilità e richiede l'implementazione di meccanismi di due diligence e controllo, affinché la sua applicazione sia effettiva e concreta.

Il progetto "Sustainable Procurement"

Una delle iniziative di cui Gramegna è più orgoglioso è il progetto "Sustainable procurement", un piano strategico volto a integrare criteri di sostenibilità nei processi di valutazione e selezione della filiera, in linea con il modello di business di ERG. Come si evince dalla Figura 4, il progetto è iniziato nel 2019, quando viene approvato dal CdA il Codice di Condotta fornitori e viene svolta una prima mappatura dei fornitori del Gruppo per identificare i principali rischi legati alla catena di fornitura.

Fig. 4: Il progetto "Sustainable Procurement"

Fonte: sito ERG
(https://www.erg.eu/it/fornitori/sustainable-procurement)

L'iniziativa si propone di individuare eventuali criticità attraverso strumenti di monitoraggio e piani di miglioramento mirati, nonché di valorizzare e premiare i fornitori che adottano pratiche esemplari in ambito di sostenibilità. Per farlo, negli anni, la funzione Procurement ha sviluppato una metodologia ad hoc per valutare la supply chain. Se nel 2020 ha ideato un questionario (di circa 100 domande) per la valutazione dei fornitori, nonché impostato un modello di audit, nel 2021 ha invece sviluppato un piano di miglioramento e un piano di formazione per i fornitori.

Con cadenza annuale, ERG effettua una selezione di fornitori con cui ha collaborato negli ultimi due anni. Tali fornitori vengono invitati a compilare il questionario per valutare la loro performance in termini di sostenibilità, con l'obiettivo di attribuire loro un punteggio da utilizzare come criterio nelle gare d'appalto. Un significativo passo avanti è avvenuto nel 2021, quando l'azienda ha ampliato il perimetro di valutazione della sostenibilità, includendo 150 fornitori strategici che rappresentano circa l'80% del volume d'affari. L'adesione è stata elevata (89% dei fornitori invitati) ed è avvenuta su base volontaria. Ha visto un rating medio di sostenibilità in crescita significativa rispetto all'anno precedente. In particolare, nel 2023 il rating medio ha raggiunto il 64,1%, con un incremento di 3 punti percentuali rispetto al 2022 e di 14,4 punti rispetto al 2020, primo anno di valutazione. Tale progresso rappresenta un traguardo chiave per l'azienda, in linea con gli obiettivi stabiliti dal Top Management e approvati dall'ESG Committee e dal Consiglio di Amministrazione. Questi risultati evidenziano come l'evoluzione del contesto e le azioni intraprese da ERG abbiano incentivato un numero crescente di fornitori ad adottare politiche di sostenibilità.

Non da ultimo, un elemento di novità è stato l'ampliamento delle tematiche dell'indagine. Nel 2022 e nel 2023, infatti, in aggiunta agli ambiti della gestione aziendale, diritti dei lavoratori, tematiche sociali e ambientali, sicurezza sul lavoro, gestione della catena di fornitura e impegno per la diversità e l'inclusione, si è riservata un'attenzione particolare alla carbon footprint e alla Diversity & Inclusion, utilizzando una scala di valutazione allineata alle best practice di settore. I risultati? In entrambe le aree sono stati soddisfacenti, soprattutto per le aziende di maggior dimensione che movimentano con ERG volumi di acquisto significativi. Per incentivare un miglioramento continuo della performance dei fornitori in questi ambiti strategici, nel 2024, oltre a

> *"Come raggiungiamo quel 64%? Ingaggiamo tutta la nostra catena di fornitura e **chiediamo di compilare un questionario** di self-assessment. Una volta che viene fatto assessment, **ogni fornitore riceve uno scoring**.*
> *Ai fornitori con uno scoring basso, chiediamo di attuare delle strategie di miglioramento, e l'anno successivo, andiamo a monitorarli attraverso degli audit, dei momenti in cui il fornitore ci fa entrare in casa sua, e noi capiamo davvero cosa sta facendo. I fornitori non si autocertificano, ma è una nostra strategia per toccare con mano ciò che realmente dichiarano. Andiamo direttamente in campo.*
> *Ma la cosa interessante è i fornitori, in tutto questo processo, non pagano niente. Allora perché lo facciamo? È una scelta strategica. Perché ci serve. Con l'obiettivo di diventare net zero, siamo obbligati a coinvolgere i fornitori per permettere loro di **cambiare la loro cultura sulla sostenibilità**. E loro sono interessati a farlo: hanno tutti scelto partecipare all'assessment in modo **volontario**, non sono stati obbligati. Abbiamo raggiunto una **retention del 86%...** è incredibile"*

realizzare nuove campagne di sensibilizzazione e formazione, ERG ha introdotto un concorso dedicato a queste due tematiche, con l'obiettivo di promuovere best practice e premiare le aziende che si distinguono per l'eccellenza nelle performance di sostenibilità.

Sempre nel quadro del progetto Sustainable Procurement, un'iniziativa di successo che merita attenzione è l' "ERG ESG Suppliers Day", un evento dedicato al coinvolgimento e alla premiazione dei fornitori più virtuosi in ambito di sostenibilità, partito nel 2022 e ripetuto nel 2024.

Le emissioni lungo la supply chain

Un elemento chiave della strategia di sostenibilità di ERG riguarda la gestione delle emissioni lungo la catena di fornitura. L'impegno dell'azienda nella lotta al cambiamento climatico si concretizza, in primo luogo, attraverso la misurazione delle emissioni dirette (Scope 1) e indirette (Scope 2 e 3) e, successivamente, mediante strategie di riduzione e compensazione. Le emissioni di Scope 3 rappresentano oltre il 99% del totale, con la quasi totalità attribuibile alla supply chain: ciò evidenzia l'importanza di un approccio integrato che coinvolga l'intero ecosistema dei fornitori.

Con l'obiettivo di migliorare la misurazione delle emissioni lungo la catena del valore, ERG ha adottato un approccio basato sugli studi LCA (Life Cycle Assessment) forniti dai fornitori stessi per il calcolo delle emissioni di Scope 3 nei settori eolico e fotovoltaico. Per quanto concerne le emissioni generate dai viaggi aziendali (ad esempio, trasporti aerei e ferroviari), il calcolo è affidato a un'agenzia specializzata che opera secondo metodologie certificate. Inoltre, grazie a una collaborazione con il corriere responsabile della logistica aziendale, ERG ha potuto quantificare e compensare le emissioni legate al trasporto dei materiali mediante progetti di tutela climatica.

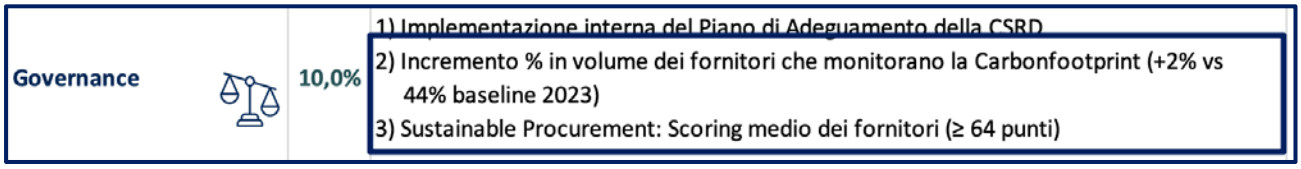
> *"Abbiamo dichiarato di diventare net zero al 2040: **non possiamo farlo senza catena fornitura**. Se i miei fornitori non hanno un target approvato, devo mettere in atto strategie, oppure devo cambiare fornitori. […] La nostra strategia di sostenibilità prevede dunque di **selezionare sempre più fornitori che abbiano performance di sostenibilità** che vadano nella direzione di definire e certificare gli obiettivi di Carbon Footprint. […]*
> *Se da un lato ci sono i fornitori che hanno quindi **un target approvato**, ma che non hanno necessariamente già **calcolato** la propria **carbon footprint**, dall'altro ci sono quelli che l'hanno fatto. Il nostro obiettivo è di migliorarci anno su anno, e incrementare la % di fornitori che eseguono questo calcolo. Come lo facciamo? In questo caso, sono due anni che attuiamo un **programma** in cui con i fornitori che vogliono partecipare, facciamo un **webinar** in cui spieghiamo cosa vuol dire calcolare la CF nello scope 1, 2, e 3 e come implementare tale processo di misurazione. Ma più importante, diamo loro **strumenti di misurazione**. Stiamo anche cercando di individuare un software, per fornitori, in grado di aiutarli a calcolare la CF. Posso garantire che soprattutto le PMI devono fare investimenti importanti per poter calcolare la CF e noi vogliamo supportarli da questo punto di vista".*

Sulla base di questi dati, ERG intende implementare ulteriori misure di riduzione delle emissioni nei prossimi anni, privilegiando fornitori con performance ambientali avanzate e promuovendo iniziative di decarbonizzazione. Ad esempio, tra gli obiettivi strategici, ve ne è uno chiaro: l'incremento della percentuale di fornitori che monitorano la propria carbon footprint, con un aumento del 2% rispetto al valore di riferimento del 44% registrato nel 2023.

La due diligence dei fornitori

Un ulteriore aspetto degno di nota è l'implementazione della due diligence di terze parti. Infatti, tutti i fornitori ma, più in generale, le terze parti, con cui ERG si interfaccia, o desidera farlo, sono soggette ad uno screening relativo ai rischi finanziari e i rischi ESG/reputazionali.

> *" Quando selezioniamo i fornitori, la componente economica ormai è fissa, è quasi data per scontata. **Sono altre le variabili in gioco**: la reputazione, i procedimenti giudiziari sulla società e/o su amministratori e manager, e molto altro. Diamo un **peso rilevantissimo** alle componenti ESG"*



Questo processo è per ERG cruciale perché, nel momento in cui viene a mancare la sostenibilità economico-finanziaria, la controparte rischia di minare la relazione con l'azienda. Inoltre, abbracciando il nuovo modello di business orientato alle rinnovabili, ERG, anche per questioni reputazionali, deve scegliere accuratamente i propri fornitori. Per questo motivo, tutti i fornitori sono sottoposti a un rigoroso processo di valutazione della reputazione, che comprende un monitoraggio continuo a livello globale. Vengono analizzate sanzioni e segnalazioni relative a rischi ambientali, finanziari, informatici, legali e sociali (tra cui il rispetto dei diritti umani e le norme sul lavoro). Tale valutazione, che si estende per tutta la durata del contratto, è finalizzata a garantire la conformità ai principi etici e normativi da noi adottati. La violazione di tali principi comporta l'immediata interruzione di qualsiasi rapporto contrattuale e l'esclusione dalla Vendor List

Il procurement come elemento di governance. *Le iniziative analizzate ci fanno comprendere come ERG riconosca la catena di fornitura come un elemento chiave per il raggiungimento dei suoi obiettivi di sviluppo sostenibile e, in particolare, di Net Zero, al 2040.*

Come ha sottolineato Gramegna, l'engagement della supply chain diventa una necessità che deve essere "governata". Per questo motivo, essa è, a tutti gli effetti, un elemento di governance. Come si può vedere dalla Figura infatti, la sustainable supply chain rientra nel quarto pilastro della strategia ESG di ERG. Sebbene i progetti descritti riguardino soprattutto le dimensioni ambientale (es. emissioni e carbon footprint) e sociale (es. D&I), la dimensione della governance diventa indispensabile per una corretta pianificazione e implementazione.

Quanto la gestione della supply chain sia integrata nella governance è visibile dalla Figura 5, che ci mostra come l'MBO (management by objective) del 2024 sia legato ad obiettivi di sostenibilità.

Fig. 5: Obiettivo Sostenibilità - MBO 2024

Fonte: elaborazione ERG

Ma di cosa si tratta? Significa che ciascuno dei componenti del top e middle management all'interno dell'azienda, nel concordare gli obiettivi che dovrà raggiungere nel corso dell'anno e che costituiscono la componente premiante della sua retribuzione, tiene conto della sostenibilità e, in particolare, della catena di fornitura. Ecco che l'MBO diventa quindi uno strumento importantissimo: la sostenibilità prende corpo davvero all'interno della logica di ricaduta dentro l'impresa quando i sistemi classici, proprio come l'MBO, includono obiettivi di tipo ambientale. A cosa serve dunque, concretamente? Ad allineare le scelte che fa il singolo manager alle strategie aziendali. In altri termini, a spingere egli/ella nella selezione dei fornitori sulla base di requisiti di sostenibilità e non solo economici. Il piano strategico e, a cascata, le singole strategie operative, devono essere allineate. Gli obiettivi della gestione della supply chain vengono integrati, diventano obiettivi trasversali all'azienda.

La governance, dunque, mostra due tipologie di obiettivi (Figura 5): in primis, la CSRD, quindi la rendicontazione. In secundis, il procurement. Questo significa che la rendicontazione e il procurement diventano elementi di governance applicata. Se la governance, ad un più alto livello, ci dice che come è formato il board, quali sono i comitati, come un'impresa paga le tasse, ecc. - in altri termini, tutti gli aspetti che riguardano i vertici dell'azienda -, quando essa è calata dentro la struttura organizzativa entra nel merito di alcuni processi fondamentali. Uno di questi, per ERG, è la gestione della catena di fornitura. Sebbene essa potrebbe essere trasversale anche alla dimensionale E (environment) o a quella S (social), viene però inquadrata come processo di governance: è così importante per gli obiettivi strategici aziendali, in particolare la decarbonizzazione, che ERG deve governance quel percorso. Non può permettersi di non raggiungere i risultati prefissati.

Conclusione. *L'impegno di ERG nella creazione di una catena di fornitura sostenibile si concretizza in diverse forme. Per rafforzare la sostenibilità all'interno della catena di fornitura, l'azienda ha capito che è essenziale che le proprie aspettative vengano tradotte in direttive chiare e concrete per i fornitori, ma soprattutto che quest'ultimi vengano accompagnati nella transizione. Se infatti le percentuali di engagement dei fornitori, calcolo della carbon footprint, ecc., già raggiunte da ERG siano elevate, bisogna anche considerare che, nella maggior parte dei casi, i fornitori analizzati o che hanno partecipato alle iniziative sono soggetti di grandi dimensioni, che hanno quindi una certa consapevolezza del tema e, nella maggior parte dei casi, una strategia propria di sostenibilità. La vera sfida, nei prossimi anni, è andare oltre, è conquistare quei punti percentuali aggiuntivi: sfida molto difficile, ma estremamente significativa perché, in questo modo, occorre mettere in moto il sistema complessivo, coinvolgendo anche le imprese più piccole.*

Per Gramegna, l'anno nuovo è anche tempo di buoni propositi. Il successo delle iniziative ha aperto la strada a nuove sfide, su cui il manager si interroga. Come può ERG continuare a migliorarsi? Potrebbe introdurre controlli mirati su tematiche specifiche, come il rispetto dei diritti umani, alla luce dell'approvazione della CSDDD? Potrebbe esaminare la sostenibilità dei subfornitori all'interno della catena di approvvigionamento dei principali fornitori strategici?

Domande per la discussione? ***(le risposte saranno sviluppate nelle TN: si riporta qui una breve ipotesi)***

1. Quali possono essere state, a tuo parere, le sfide affrontate da ERG nell'implementazione dei progetti di sustainable procurement?

   La risposta sarà costruita fornendo alcuni spunti di riflessione. Probabilmente sarà condotta un'altra intervista ad hoc a Gianluca Gramegna.

2. Partendo dal racconto di ERG, perché, secondo te, può essere strategico adottare un Codice di Condotta per Fornitori?

   Esempio risposta:
   L'adozione del Codice può portare vantaggi significativi per l'azienda:
   - *migliorare la gestione del rischio con fornitori qualificati secondo criteri ESG;*
   - *rafforzare la brand reputation grazie a una supply chain allineata agli standard aziendali;*
   - *garantire la compliance normativa a tutti i livelli, in conformità con le regolamentazioni vigenti;*
   - *potenziare il reporting e i KPIs per rispondere alle nuove direttive;*
   - *promuovere la sostenibilità tra i fornitori, supportandoli nell'innovazione e nello sviluppo di modelli di governance sostenibili;*
   - *ecc.*

3. Il Network Italiano del Global Compact ha pubblicato, nel 2022 il position paper intitolato "La gestione sostenibile delle catene di fornitura: tra responsabilità e opportunità per le imprese". All'interno del documento, vengono descritte le fasi per una gestione sostenibile (figura). Come si è comportata ERG con riferimento ad ognuna di esse? Ci sono margini di miglioramento?

   La risposta sarà costruita indicando per ciascuna fase le azioni di ERG.

4. Immagina di essere un fornitore di ERG di piccole-medie dimensioni. Quali sono le tue necessità per implementare azioni di sostenibilità e come può aiutarti ERG?

   La risposta sarà costruita fornendo alcuni spunti di riflessione.
   Sarà fornita anche un'ipotesi di svolgimento in cui il docente propone un role playing, in cui si simula un incontro di assessment e discussione fornitori-ERG, dove alcuni studenti rappresentano i fornitori e altri ERG.

5. Al giorno d'oggi si sta affermando una nuova corrente di pensiero secondo cui la catena di fornitura deve essere rigenerativa. Quale evoluzione rispetto ai modelli tradizionali, un approccio rigenerativo genera valore oltre lo zero e richiede un impegno condiviso verso la tutela della natura e della società (Buckton et al., 2023) lungo l'intera catena di fornitura.
   Partendo dallo schema proposto da Gualandris et al. (2024), che individua i tre principi fondamentali per implementare questo approccio, descrivi se e come la strategia di ERG rispecchi tali principi. Ci sono margini di miglioramento?

   La domanda viene formulata dopo che il docente descrive, brevemente, alla classe, il concetto di catena di fornitura rigenerativa e i 3 principi descritti dagli autori citati (figura). Dopodiché si discute della situazione di ERG.

	Proporzionalità	**Reciprocità**	**Poli-ritmicità**
Paradigmi tradizionali	Le catene di approvvigionamento contemporanee sono progettate e gestite per ottenere efficienza attraverso la scalabilità e la specializzazione, con poca considerazione per l'equilibrio dei sistemi socio-ecologici.	Le catene di fornitura sono progettate e gestite dall'alto verso il basso da attori potenti, con scarsa considerazione per la qualità delle relazioni reciproche con gli altri membri della catena di fornitura, con le comunità locali e con gli ecosistemi.	Le catene di approvvigionamento sono progettate e gestite per un'elevata reattività alla domanda finale, con scarsa considerazione per i ritmi e i modelli dinamici dei sistemi socio-ecologici
Principi rigenerativi	Gli attori della catena di approvvigionamento identificano e ripristinano una varietà adeguata ed equilibrata di organismi e specie autoctone e adattano la scalabilità e la portata della produzione e del consumo entro le proporzioni che i sistemi socio-ecologici possono meglio tollerare.	I membri della catena di fornitura considerano e co-gestiscono l'impatto reciproco delle loro attività sui sistemi socio-ecologici e viceversa in diverse aree geografiche (compresi i contesti del "Nord globale" e del "Sud globale"), a più livelli (locale e globale) e attraverso orizzonti temporali (breve e lungo termine).	I membri della catena di fornitura considerano la molteplicità dei ritmi simultanei che caratterizzano i sistemi socio-ecologici e prendono decisioni strategiche, tattiche e operative che si allineano con tali modelli ritmici.

Punti di svolta e passaggi critici nell'evoluzione di Enel: una analisi multidimensionale

MARIO BRUNETTI[1] GIANLUCA VAGNANI[2]

Abstract

Il presente lavoro propone un approccio di analisi statistica multidimensionale della dinamica della vita delle imprese, ed in particolare se questa metodica consente di rilevare particolari cambiamenti e punti critici vissuti. La metodologia proposta è stata applicata ad un'impresa di grandi dimensioni (ENEL S.p.A) che ha attraversato anche forti cambiamenti nella sua storia. I risultati, attrverso l'analisi multidimensionale identificano i punti di svolta critici legati a cambiamenti strategici e contestuali, come la liberalizzazione del mercato e l'internazionalizzazione, con i suoi effetti sulla dinamica dell'efficienza e del dimensionamento delle strutture. Implicazioni teoriche e manageriali sono infine discusse.

Parole chiave: *cambiamenti di contesto, dinamica evolutiva dell'impresa, punti di svolta e passaggi critici*

Inquadramento della ricerca. *Lo studio si inquadra nel tema della crescita dell'impresa, affondando le sue radici nello studio di Penrose (1995) secondo cui la crescita dell'impresa non è considerata un mero aggiustamento verso una dimensione aziendale considerata appropriata, se non anche ottima, ma un processo interno caratterizzato da movimenti cumulativi, in parte incrementali, in parte discontinui, lungo una certa traiettoria di sviluppo. Rispetto a questo inquadramento, la ricerca corrente ha affrontato soprattutto i temi legati alla velocità delle crescita dell'impresa (Sterk, Petr, & Pugsley, 2021) e alla sua potenziale accellerazione (Belitski, Stettler, Wales, & Martin, 2023), ovvero alla capacità dell'impresa stessa di sostenere un prestabilito tasso di crescita per un periodo più o meno lungo, senza peraltro compromettere l'equilibrio economico e quello finanziario (Edwards, 2021), così come le determinanti della crescita, anche nelle imprese di minore (Golinelli, 1974; Lorenzoni, 1990), di più grande dimensione (Vaccà, 1986) e internazionali (Rullani, 1973). Nell'ambito dei richiamati studi, la crescita viene concettualizzata come un processo multidimensionale, ovvero costruito rispetto a dimensioni diverse, per esempio le vendite, la produttività, gli addetti (Belitski et al., 2023).. Oltre a essere un processo multidimensionale, la crescita dell'impresa implica correlazioni più o meno rilevanti tra le dimensioni considerate. Dunque, il processo è multidimensionale e correlato. Infine, il processo di crescita non è regolare, ma dinamico, presentando momenti di cambiamento, sinanco discontinui rispetto al passato. In altre parole, la crescita dell'impresa riguarda dimensioni diverse, interrelated tra loro su percorsi caratterizzati da discontinuità.*

Obiettivo del paper. *Adottando la prospettiva che vede la crescita dell'impresa come fenomeno multidimensionale, interrelato e dinamico, il presente studio si concentra su una grande impresa italiana ENEL, e ne approfondisce la dinamica attraverso oltre mezzo secolo di storia. Questa storia abbraccia un lungo periodo iniziale di circa trenta anni incentrato su continui cambiamenti tesi all'efficientamento di strutture e processi (ambito Italia) e successivamente una intensa fase di espansione estera, che ha generato forti impatti tanto da riconfigurare nel profondo l'assetto complessivo per far fronte a nuove sfide globali. In questo senso, obiettivo del lavoro è cogliere le varie dimensioni della storia di crescita di una impresa, raccontandone i molti fatti accaduti. Quanto raccontiamo è una storia di lavoro e di sacrifici di generazioni di uomini e donne, di scelte strategiche e rischi, di tecnica e innovazioni tecnologiche, di politica e numeri che difficilmente, si ritiene, possano essere rappresentati adeguatamente da una sola variabile o misura di risultato. Orbene, in questa storia lunga d'impresa, utilizzando tecniche multidimensionali di analisi dei dati, si cercherà di cogliere la complessità della crescita dell'impresa, indagandone anche i punti di svolta e passaggi critici. Già a partire dalla semplice osservazione dei grafici riportati in Figura 1 (dinamica degli investimenti e dinamica del personale) si possono evidenziare dei punti di svolta della traiettoria di ENEL nel tempo. Punti di svolta che corrispondono in questo caso ai punti di cambiamento delle relazioni tra capitale (investimenti) e lavoro (personale). È noto che il punto di*

equilibrio tra investimenti e personale é sempre caratterizzato, nel tempo, da elevata variabilità, ed é naturale, pertanto, immaginare l'espandersi di tale relazione ad altri aspetti registrati dai valori di altri indicatori.

L'analisi dei sistemi suggerisce che i periodi di transizione siano preceduti da un deciso aumento delle correlazioni tra le variabili descriventi il sistema rispetto a periodi di esistenza stabile dove le variazioni sono relativamente limitate e confinate all'interno di una zona di 'comfort'. Con l'aiuto delle teniche multivariate dei dati si cercherà così di indagare se queste transizioni del sistema sono limitate alle sole due variabili esaminate (occupazione e investimenti), oppure se non si sia trattato di un fenomeno ben più vasto e complesso, che ha interessato altre componenti importanti del sistema aziendale (clienti, impianti, energia venduta, ricavi, etc.).

Fig. 1: I due grafici riportano il tortuoso tracciato degli investimenti (riquadro a sinistra) e del personale (a destra) riferiti all'intero periodo di indagine (1963-2018).

Metodologia. *In un contesto di analisi di casi di studio (Eisenhardt, 1989; Yin, 2018), un approccio universale dell'analisi dei sistemi suggerisce che in prossimità di una transizione di fase, il sistema si trova sottoposto a un parametro d'ordine che orienta in una direzione specifica i suoi costituenti e facendo quindi passare il sistema da un regime di bassa correlazione (piccole variazioni randomiche) a in regime ad alta correlazione (insorgere di una direzione collettiva di cambiamento). Quest'aumento di correlazione, che precede il vero e proprio cambiamento brusco e massivo dei parametri rilevanti del sistema: da una parte, causato da una "resistenza" del sistema stesso al cambiamento, dall'altra è conseguenza del fatto che la perturbazione influenza contemporaneamente diversi aspetti di contesto esterno cui rispondono. Nel caso delle transizioni di fase però l'aumento di correlazione pone il sistema in una situazione molto critica, poiché uno stato fortemente connesso è molto sensibile alle perturbazioni, in quanto il cambiamento di una parte si ripercuote sull'intero insieme (Gorban, Smirnova, Tyukina, 2010). Si tratta quindi di verificare se questi principi molto generali siano riconoscibili nell'evoluzione temporale dell'azienda attraverso l'analisi delle serie storiche di un insieme di variabili indicative dell'evoluzione del sistema Enel trovano nei dati un effettivo riscontro: a tale riguardo il lavoro prende a riferimento una matrice di oltre 2000 dati (trentaquattro variabili per 56 anni). L'insieme delle variabili vengono suddivise in "famiglie" omogenee per contenuto d'informazione: Addetti, Energia venduta, Clienti, Reti, Ricavi, Investimenti, e a loro volta analizzate in maniera congiunta attraverso indicatori di rapporto, come quelli legati alla produttività del lavoro (Energia venduta/Addetti, Clienti/Addetti, ecc.), o relative alle caratteristiche del servizio di distribuzione dell'energia elettrica (Clienti/Rete, Rete/Addetti).*

E' nota la difficoltà implicita nel condurre studi empirici di questo tipo per comprendere i comportamenti spazio-temporali dell'evoluzione degli stati del sistema e in particolare per affrontare il carattere non lineare e l'interazione multifattoriale della dinamica di questi comportamenti. In generale la necessità di un approccio statistico multidimensionale e di ricerca dei punti di svolta del sistema, si scontra spesso nella difficoltà dovuta alla mancanza di disponibilità di dati (es. dati che non sono osservabili o rilevati (dark data) o ancora legata alla difficoltà di costituire una lunga serie di dati omogenei.

La finestra temporale analizzata comprende un lungo periodo dalla nazionalizzazione e quindi dalla nascita di Enel (1963) fino al 2018 (ultime rilevazioni omogenee disponibili) influenzati quindi anche dalla fase di liberalizzazione del mercato dell'energia e dal complesso processo strategico di internazionalizzazione del Gruppo.

La nostra serie è quindi rappresentata da una matrice multivariata che, per essere trattabile, richiede un'operazione di sintesi. Quest'ultima è stata svolta, mediante l'analisi in componenti principali (Principal component analysis o PCA), metodo ampiamente utilizzato negli studi sull'impresa, anche se con un'ottica sostanzialmente descrittiva su variabili statiche (Galbraith & Schendel, 1983; Pam & Thomas, 1990). Si noti che questo studio applica la PCA in modo dinamico, analizzando come le relazioni tra variabili evolvono nel tempo, superando il limite degli approcci statici menzionati in letteratura. La PCA è un algoritmo senza supervisione utilizzato per ridurre la dimensionalità di dati caratterizzate da molteplici variabili e osservazioni, incrementandole l'interpretabilità, minimizzando allo stesso tempo la perdita di informazioni (Jolliffe & Cadima, 2016). A questo fine vengono prima identificati i fattori, utilizzando la regola che nel complesso spieghino una varianza almeno superiore al 50%, soglia fissata per la validità convergente di costrutti (Tinsley & Brown, 2000). Nella PCA vengono individuati dei pesi (factor loading) che rappresentano come le singole variabili contribuiscono alla formazione dello specifico fattore o componente principale. Se i pesi hanno una magnitudine elevata,

normalmente superiore a 0.70, essi indicano che, a seconda del segno, la variabile influenza positivamente/negativamente e in modo significativo il determinato fattore (Kaiser, 1974).

L'analisi che descriviamo in questo lavoro implica che le variabili utilizzate non siano degli "a priori", che mantengono invariato il loro significato indipendentemente dal sistema studiato, ma, corrispondano invece a delle "sonde neutre". In questo senso ciò che ci appare come la stessa variabile, ad esempio 'investimenti totali', nel periodo pre-internazionalizzazione era un proxy di un impegno di modernizzazione e sviluppo industriale nel Paese, mentre dopo il 2002, la stessa variabile si trasforma in larga parte in una misura degli investimenti indirizzati a consolidare il processo di acquisizioni estere. Il cambiamento di significato 'in corsa' dovuto al cambiamento di contesto porterebbe a distorcere quindi l'intera analisi se si assumesse l'invarianza temporale di significato degli indici. Ad esempio se volessimo indagare la dinamica più recente di Enel mantenendo una continuità con il passato dovremo "passare di scala" e limitarci a quello che è accaduto in Italia.

Condurremo pertanto l'analisi seguendo due fasi: un primo lungo periodo storico: dalla nascita di Enel (1963) al 2002 a fare da spartiacque tra la fine degli effetti del processo di liberalizzazione dell'energia sul mercato italiano e l'avvio di una ampia strategia di acquisizioni internazionale, e una seconda fase che dal 2002 si spinge fino al 2018 (ultimi dati disponibili). Questo ci darà modo di analizzare da un diverso punto di vista la complessa dinamica vissuta dal sistema e più puntualmente associare ai possibili punti di svolta i fatti accaduti in un periodo di vita ultracinquantennale.

L'idea di fondo è che le singole variabili non siano altro che viste differenti dello stesso sistema, ci si attende, quindi, che i loro valori si muovano in sincronia nel periodo analizzato quando sottoposte a un parametro d'ordine che trascina il sistema nel suo insieme (e.g. sviluppo dell'azienda). In termini statistici, nell'ambito di questo comportamento corrisponde all'emergere di poche componenti principali in cui si raccoglie gran parte dell'informazione presente nel campo di dati. La mutua correlazione tra le variabili fa sì che l'informazione inizialmente dispersa nella n-upla delle variabili iniziali possa essere condensata in poche componenti che spiegano una parte rilevante dell'informazione globale del sistema, cioè una "maggior proporzione di varianza spiegata". Per questa loro caratteristica di massimizzazione della struttura di correlazione, le componenti ortogonali tra loro per costruzione, non sono altro che gli assi di un nuovo riferimento cartesiano (factor plane) e indicano le direzioni dello spazio delle fasi dove il sistema multidimensionale si correla maggiormente. La PCA è intesa pertanto come una rappresentazione relativistica, dove i posizionamenti nello spazio delle componenti dipendono dalla storia e dalle caratteristiche degli stessi dati esaminati. L'analisi fornisce semplicemente una "rilettura" statistica dei dati per una loro migliore comprensione, senza imporne scelte a priori, lasciando che ogni cosa emergesse dai dati in modo naturale. È in sintesi un cambio di prospettiva è quindi un modo per trarre il miglior aiuto nella interpretazione dei dati. Si noti che la PCA è sensibile alla scala delle variabili. Conseguentemente, per ridurre questo problema, le variabili sono state standardizzate sottraendo a ciascuna la propria media e dividendo il tutto per la deviazione standard.

Risultati. *I dati di Figura 2 mostrano tra l'altro i valori della varianza spiegata cumulativa (cumulative explained variance) al crescere del numero delle componenti estratte.*

Fig. 2: Analisi della varianza spiegata (limitata alle sole prime cinque componenti principali) riferita ai dati Enel relativi al periodo 1963-2002 (tavola a in alto) e al periodo 2002-2018 (tavola b in basso)

Varianza totale spiegata a) Periodo 1963-2002

Varianza totale spiegata b) Periodo 2002-2018

	Autovalori iniziali			Caricamenti somme dei quadrati di estrazione		
Componente	Totale	% di varianza	% cumulativa	Totale	% di varianza	% cumulativa
1	23,898	70,288	70,288	23,898	70,288	70,288
2	3,630	10,676	80,964	3,630	10,676	80,964
3	2,787	8,196	89,160	2,787	8,196	89,160
4	1,809	5,321	94,482			
5	0,565	1,660	96,142			

In particolare per il periodo 1963-2002 le prime tre componenti principali spiegano da sole già il 97,2% della variabilità totale del sistema nel primo periodo di analisi contro 89,2% del periodo 2002-2018. I due fattori spiegano una varianza che è ampiamente al di sopra della soglia del 50% che supporta la validità convergenze delle scale di misurazione (Hair et. al. 2019). Osserviamo ancora dal confronto delle due tabelle della varianza spiegata come mentre la prima componente conserva il suo peso esplicativo, la seconda componente si riduce di molto passando da 23,4% al

10,7%, al contrario della terza che si rafforza. Torneremo su queste prime osservazioni in avanti quando affronteremo le analisi di dettaglio Ciò che va considerato ancora è che una diminuzione di complessità del sistema porterà a una maggiore concentrazione della varianza su una sola o poche componenti principali, in questo caso è evidente come il periodo 2002-2018 ci rimandi l'immagine di una maggiore complessità (la prime tre componenti danno conto del 89% circa dell'informazione totale mentre nel periodo precedente spiegavano ben il 97% della variabilità totale.

Fig. 3: Matrice dei factor loadings: coefficienti di correlazione fra variabili originali e componenti (Factor). In tabella non indicati i valori della terza componente e solo ai fini di una migliore rappresentazione dei risultati le variabili maggiormente correlate per l'interpretazione dei fattori sono riportate in grassetto, mentre in corsivo quelle di media importanza.

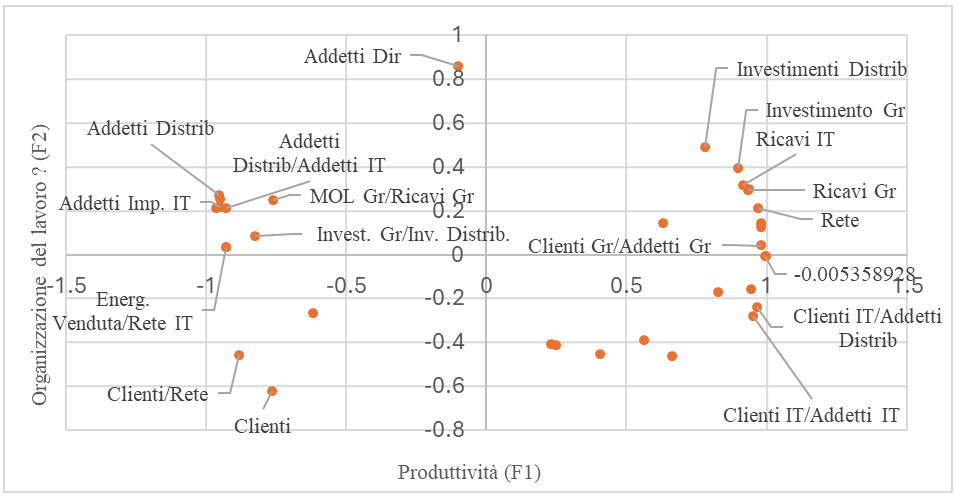
Esaminando meglio i risultati della matrice dei factor loadings (figura 3) si sottolinea come la prima componente principale F1 (70,7%) nella nostra interpretazione è da considerare come indice di efficienza. Ad esempio, il caricamento elevato di "Energia venduta/Addetti" (0,998) su F1 riflette un miglioramento nell'output per lavoratore, coerentemente con la riduzione degli operai (-0,800), suggerendo un passaggio a processi più efficienti, anche legati a una minore intensità di lavoro. In particolare mostra la crescita di efficienza attraverso i seguenti punti: a) Energia venduta/addetti (sia totali che Addetti area distribuzione) pari a 0,998: indici da mettere anche in relazione alla diminuzione degli operai (-0,800); b) Energia venduta /Rete (0,814) che assume ancora maggiore significatività se messa in relazione alla densità di rete per cliente (-0,884) e all'estensione della rete (0,932) oltre che all'aumento dei clienti (0,898); Clienti/Addetti Distribuzione (0,964) e vs. Addetti totali (0,975) da mettere in relazione all'aumento dei clienti. Infine si rileva una marcata correlazione con la variabile Ricavi/Investimenti Distribuzione pari a (0,876) correlati positivamente sia con i ricavi (0,915) che con gli investimenti in area Distribuzione (0,908).

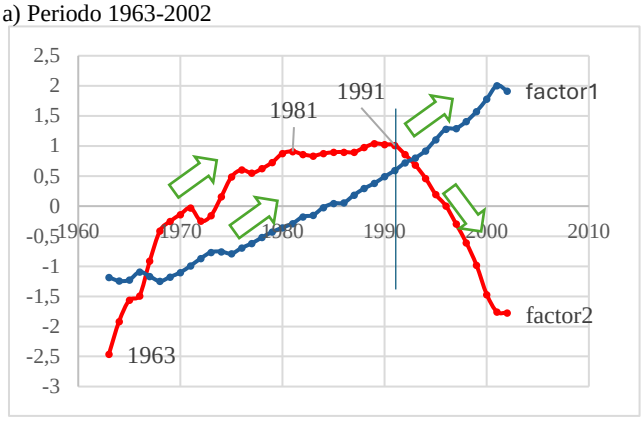


Per quanto riguarda la seconda componente F2 (23,3%) individuata come misura dell'organizzazione del lavoro si sottolineano le alte correlazioni con gli addetti sia impiegati totali (0,922) sia con gli Addetti relativi all'area Distribuzione (0,872); a queste indicazioni si aggiunge una notazione valida solo per gli operai che marcano con questa componente una minore correlazione (0,549). La terza componente, di "peso" decisamente trascurabile (3,33%) e quindi meno significativa, tanto da poter essere considerata come rumore di fondo della dinamica del sistema, si segnala solo la relazione con la variabile rapporto Addetti Distribuzione/Addetti totale (0,644).

Fig. 4: I due grafici illustrano le correlazioni nel primo piano fattoriale (F1-F2) riferiti al primo periodo di analisi 1963-2002 (riquadro in alto) e 2002-2028 (in basso). Inoltre per maggiore chiarezza espositiva sono descritte in chiaro le sole relazioni "forti", (>0,7).

a) Periodo 1963-2002

a) Periodo 2002-2018



La nuova analisi riferita al periodo 2002-2018 riportata in Figura 3b, include nuove variabili per un totale di trentaquattro che comprendono i dati relativi alle acquisizioni estere e quindi consolidano i dati a livello di Gruppo. Ora come si può osservare dalla matrice dei factor loading la nuova prima componente rivela una caratteristica importante in quanto dalla sua interpretazione si riscontra quello che nella prima analisi era definita dai primi due fattori in modo indipendente e quindi ortogonali. Il tutto è reso maggiormente esplicativo attraverso l'analisi delle correlazioni nel primo piano fattoriale (F1-F2) riferiti al primo periodo di analisi 1963-2002 (riquadro in alto) e 2002-2028 (in basso) di Figura 4.

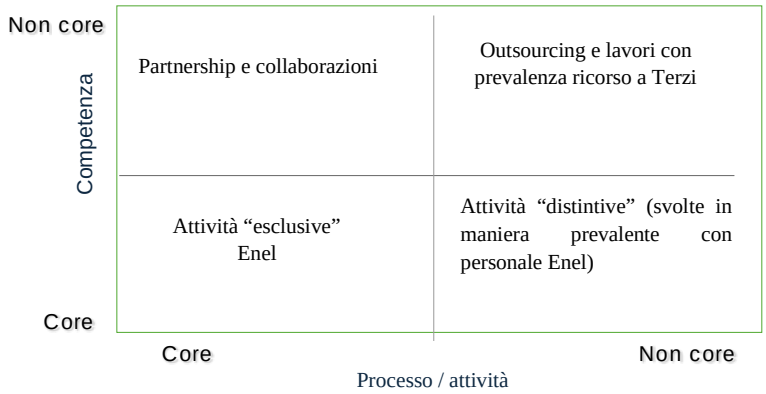
Da un rapido confronto dei due grafici si nota come nei due periodi le variabili correlate con la F1 con relazioni "forti" (> 0,7) suggeriscono di interpretare la stessa come sintesi della produttività aziendale per entrambi i periodi di analisi dati, mentre per quanto riguarda la seconda componente (F2) nel primo periodo viste le alte correlazioni con gli addetti si conferma come organizzazione del lavoro, mentre in questo secondo caso questa componente oltre a perdere di importanza (la sua varianza spiegata si riduce, passando da 23,4% al 10,67%) viene "assorbita" dalla F1; la nuova componente F2 ora diventa qualcos'altro. Sembra che l'organizzazione del lavoro messa così bene in evidenza nel primo periodo, con l'internazionalizzazione perde di intensità tanto da non essere più rilevata con una componente distinta. Infatti troviamo i valori relativi agli addetti sia su perimetro Italia che di Gruppo tutti con valori negativi nella prima componente. Ora i valori delle singole variabili della nuova prima componente si nota bene come si sono unificate in un unico flusso ma contrapposto. In particolare gli Addetti fortemente correlati con segno negativo, mentre in generale le variabili rapporto e quindi l'efficienza con segno opposto. Possiamo in sintesi osservare che il sistema pur dimensionalmente molto più grande da questa prospettiva di analisi è diventato più semplice e quindi anche più fragile. In ogni caso si ha dai dati la conferma che l'impresa è fortemente cambiata, si è ora in presenza di un sistema molto diverso dal precedente periodo che va dalla sua nascita al primo punto di svolta registrato intorno agli anni novanta

(1991) e successivamente intorno al 2002 a fare da spartiacque. Una ulteriore rappresentazione di quanto sopra osservato può essere più utilmente riscontrata negli andamenti delle prime due componenti principali (Factor1 in blu) e Factor 2 (in rosso) dell'analisi su macroscala degli indicatori riferiti al perimetro Italia (a sinistra) e fase di internazionalizzazione (grafico a destra) (Figura 5).

Fig. 5: Andamento dei punteggi (scores) delle prime due componenti principali (Factor1 in blu) e factor 2 (in rosso) dell'analisi su macroscala degli indicatori riferiti al perimetro Italia (a sinistra) e fase di internazionalizzazione (grafico a destra).

a) Periodo 1963-2002

b) Periodo 2002-2018



La Figura 5 mette bene in evidenza che i primi anni novanta (1990-1992) marca un equilibrio instabile del sistema, una "cima di collina" da cui il sistema inizia una storia differente. Questa caratteristica di 'cima' è evidente nel pannello di Figura 5 (grafico a sinistra) che mostra l'andamento della seconda componente principale dell'analisi su macro-scala (perimetro Italia) che, intorno al 1991, raggiunge un massimo per poi decrescere. Questa componente ha a che vedere con il numero degli addetti e quindi è esplicativa della dimensione e dell'organizzazione del lavoro; si nota bene, infatti, un valore elevato dei coefficienti di correlazione delle variabili che registrano il numero di addetti sulla componente stessa. Nel successivo periodo (2002-2018) (grafico di Figura 5 a destra) si riscontra ancora un punto di svolta, una valle intorno al 2008 dove i flussi si invertono. Ci si chiede cosa è successo nella realtà quegli anni: sono gli anni in cui s'innesca il disaccoppiamento tra la crescita dell'azienda in termini nella produttività del lavoro, crescita misurata dalla prima componente (Factor1), che mostra un andamento crescente nel tempo (curva in blu), e Factor2 che abbiamo già identificato in termini di organizzazione del lavoro (curva in rosso). La crescita di produttività continua mentre gli addetti diminuiscono. Si è insomma rotta la proporzionalità diretta tra crescita dei servizi e aumento degli addetti, per essere sostituita da un modello diverso sul quale indagheremo in avanti. Questa interpretazione è confermata dal fatto che la correlazione tra Factor1 (Efficienza) e Factor 2 (Organizzazione del lavoro) è positiva nel periodo 1963-1991 ed è negativa tra il 1992 e il 2002.

*Fig. 6: Correlazione tra fattori distinti per le due categorie A (1963-1991) e (1992-2002). Pearson Correlation Coefficients, N =29. Prob > r under H0: Rho= 0, with ** p<.001; * p<.05*

	primo periodo: 1963-1991 (29 valori)			secondo periodo: 1992-2002 (11 valori)		
	Factor1	*Factor2*	*Factor3*	*Factor1*	*Factor2*	*Factor3*
Factor1	1,000			1,000		
Factor2	0,803**	1,000		-0,992**	1,000	
Factor3	-0,140	*0,352*	1,000	0,685*	*-0,743***	1,000

Come evidenziato in Figura 6, le prime due componenti sono correlate positivamente nel primo periodo (r = 0,803) e negativamente nel secondo (r=-0,992), mentre globalmente sull'intero periodo sappiamo sono indipendenti per costruzione, e tutto ciò conferma in termini quantitativi l'esistenza di un punto di svolta, con una singolarità marcata intorno al 1991. Infatti, dal 1963 al 1991 la componente efficienza (Factor1) va nello stesso verso della componente dimensione (Factor2), mentre nel periodo successivo il trend si inverte con Factor1 che cresce e Factor2 che diminuisce. La cima di montagna messa in evidenza agli inizi degli anni novanta riflette in modo semplice un periodo di forte evoluzione dello scenario esterno connesso alla liberalizzazione del mercato dell'energia, di cui si richiamano solo alcune tappe importanti (dismissione da parte di Enel della sua capacità produttiva, cessazione delle reti di distribuzione in alcune grandi aree metropolitane, ecc..).

Fig. 7: Matrice "Processi/attività-competenze: schema di massima tra attività riservate all'interno per preservare esperienze e competenze acquisite e ricorso all'outsourcing.

In breve un insieme di azioni che andavano ad incidere negativamente sulle quote di mercato di Enel. Un rapido e brusco cambiamento che imponeva di confrontarsi con nuove regole di mercato e nuovi attori. Tutto ciò richiedeva una incisiva diversità di azioni strategiche-gestionali e operative come per esempio recuperare il gap esistente con le best practis delle maggiori utilities internazionali e concentrare le proprie risorse finanziarie e umane sui processi core e aprendo all'outosourcing (Figura 7). Il mutato quadro normativo, gli indirizzi sul livello di outsourcing, peraltro non facile da calibrare per le singole differenti situazioni sul territorio che si correlavano alla innovativa introduzione del contatore elettronico e della telegestione dei guasti e della misura, nonché la messa a punto di sistemi di telecontrollo della rete, nell'arco di pochi anni incidevano pesantemente sulle attività operative e quindi sul dimensionamento della risorsa personale.

Lo schema di massima di Figura 7 definisce dei quadranti solo a titolo di riferimento e pertanto non hanno una dimensione del "peso" delle singole macro-classificazioni di attività. Lo schema è comunque indicativo del fatto che i due quadranti inferiori considerati core in questa fase, perderanno progressivamente di consistenza a favore di un sempre maggiore ricorso all'esterno. Si è detto già in parte come il lungo periodo a sinistra della curva (1963-2002) è da associare al periodo di vita in regime di monopolio, ma che a ben conoscere la storia e i dati ci si accorge che non è stato affatto una fase stagnante e statica. Un periodo che ha attraversato una crisi petrolifera e finanziaria, intense azioni indirizzate al risanamento di bilancio (1982), continue riorganizzazioni territoriali alla ricerca di efficientamento di strutture e processi operativi, fino ad affrontare le sfide legate al mutare del contesto esterno (liberalizzazione del mercato dell'energia). Vedremo come la vetta raggiunta non offriva molto tempo per poter decidere con calma dove dirigersi. Incertezze e dubbi segnavano l'avvio di un vasto processo di espansione su scala globale con l'acquisizione di società estere anche di grandi dimensioni (es. Endesa). Ma ora aiutati dalla statistica proviamo ancora ad analizzare la dinamica di questa seconda fase storica di Enel. E bene tornare al grafico iniziale di figura 5 dove questo secondo periodo che giunge fino al 2018 (ultimi dati disponibili) mostra una rapida china conre ancora un punto di discontinuità e cambio di pendenza che intorno al 2008 riporta il sistema giù in fondo ad una valle forse per l'inizio di una nuova transizione.

Limiti. *Si è nel lavoro in più di una occasione sottolineato come il caso di studio ha un carattere di 'generazione di ipotesi' a partire dalla modifica dei pattern di correlazione emergenti dai dati e indici statistici legati a vari aspetti economici e organizzativi dell'azienda (quindi senza l'utilizzo di ipotesi a priori). I punti critici che emergono con l'analisi in modo naturale senza nessuna forzatura come variazioni della struttura di relazione di detti indici pongono naturalmente qualche riflessione. Ci si è mossi convinti del fatto che è il sistema (nel nostro caso ENEL) "che guida" ed è ancora lo stesso il luogo dove cercare e poi interrogarsi sulle ragioni di eventuali omogeneità o punti di svolta che emergono. Lo studio presentato vuole privilegiare il reale rispetto alla astrazione, "le leggi" in questo caso non esistono "a priori" ma sono "generate" dalle correlazioni particolari presenti e nascoste nei dati. Dunque, quanto presentato è solo qualcosa di limitato e non esauriente, ma sarebbe ugualmente sbagliato lavorare per frammenti disgiunti, frazionare i problemi, unidimensionalizzare ciò che non lo è.*

Implicazioni manageriali. L'idea di fondo dello studio è di comprendere meglio la dinamica evolutiva di un lungo periodo di vita *di un'impresa di grandi dimensioni e molto articolata (caso Enel). È emersa una storia che si è mossa in uno spazio multidimensionale che rileva una dinamica internamente molto auto-correlata. Poche componenti principali (Factor loading) hanno reso esplicativa una lunga storia misurata attraverso un grande numero di variabili che abbracciano i livelli occupazionali, le dimensioni del sistema industriale, volumi prodotti e bacini di utenza, stati economici-finanziari. Entrambe le fasi di analisi, come ci si attendeva, hanno messo in luce dinamiche non lineari con punti svolta che segnano per il sistema passaggi verso nuove transizioni. La modellizzazione statistica ex post è rafforzata dal fatto che quanto raccontato è accaduto davvero, ma ora la stessa segna il passo anche a causa della necessità di disporre di dati più recenti per poter comprendere e riconoscere in anticipo se siamo in prossimità di nuovi cambiamenti e passaggi critici. Ad esempio, il calo della correlazione tra componenti potrebbe segnalare l'insorgere di tensioni organizzative, richiedendo interventi proattivi per evitare crisi. In conclusione non resta che un invito ai responsabili e*

ai manager interessati di fare le mosse giuste strategiche e organizzative ponendo lo sguardo sull'emergere da future analisi di quei segnali deboli da tenere attenzionati e che potrebbero far sentire presto i propri effetti piccoli o molto intensi.

Originalità del paper. *Il lavoro propone un approccio di indagine multidimensionale della dinamica evolutiva di Enel e in particolare verificare se e in che misura questo approccio metodologico consente di fare emergere punti di discontinuità con cambiamenti di percorso del processo evolutivo e successivamente dalla conoscenza del sistema riuscire ad associare ad essi i reali fatti accaduti che in qualche misura hanno concorso a determinarli. Quello che interessa ancora sottolineare è come l'applicazione di un metodo tipico della chimica-fisica appena utilizzato (es. analisi delle transizioni di fase) possa far emergere qualcosa di interessante per lo studio delle organizzazioni e delle imprese, cioè portare allo scoperto come cambia la struttura di relazione del sistema ("la forma"), mentre le caratteristiche specifiche restano naturalmente legate al singolo caso.*

From Table to Closet: Exploring Italian Consumers' Willingness to Embrace Food Waste Fashion

DOMENICO MORRONE[1] ANNUNZIATA TARULLI[2] ALESSIA ANNA DITRANI[3]
RAFFAELE SILVESTRI[4]

Abstract

Food waste fashion represents a novel frontier in sustainable fashion, leveraging circular economy principles to convert food industry by-products - such as citrus peels, grape skins, or coffee grounds - into innovative textile fibres. This emergent domain offers a radical alternative to the dominant fast fashion model - characterised by mass production, short product lifecycles, and significant environmental degradation - which contributes disproportionately to water scarcity, carbon emissions, and textile waste, fuelling unsustainable consumption patterns. In contrast, food waste fashion reclaims organic residues, transforming them into value-added garments that align with both ecological goals and ethical consumption. Although this paradigm shift is gaining momentum in industry and media narratives, academic research remains scarce - particularly regarding consumer responses to outfits made from food-derived materials. Most existing studies prioritise technological innovation and environmental metrics, leaving a critical gap in understanding consumer attitudes, perceptions, and behavioural intentions. In particular, the emotional, symbolic, and moral dimensions of engaging with circular fashion alternatives remain underexplored. This study addresses this gap by investigating how Italian consumers perceive and evaluate fashion products made from food waste. Drawing on data collected through an online questionnaire, an Exploratory Factor Analysis (EFA) was employed to identify the latent components underlying consumer attitudes. Results provide preliminary insights into how sustainable values, novelty perception, and material-related concerns influence openness to food waste fashion. By capturing these dimensions, it seeks to contribute to the broader discourse on sustainable consumption and shed light on actionable managerial insights that shape public receptiveness to circular innovation in the fashion industry.

Framing of the research. *The increasing environmental impact of the global fashion industry has driven urgent calls for more sustainable and circular production models. Traditional and fast fashion systems - characterised by rapid production cycles, overconsumption, and high resource depletion - have become emblematic of unsustainable linear economies. According to Niinimäki et al. (2020), the fashion industry accounts for substantial water use, chemical pollution, and carbon emissions, with over 92 million tonnes of textile waste generated annually worldwide. Fast fashion, in particular, promotes disposability and excessive consumption, thereby intensifying ecological degradation and exacerbating social inequalities in global production networks (Niinimäki et al., 2020; Bick et al., 2018). In contrast, sustainable and circular fashion models aim to minimise environmental footprints, extend product life cycles, and valorise waste as a resource (Schiaroli et al., 2025). Within this evolving paradigm, food waste fashion has emerged as a novel innovation that exemplifies circular economy principles by transforming agricultural and food by-products - such as citrus peels, coffee grounds, or grape skins - into textile fibres and clothing. This approach not only diverts organic waste from landfill but also reduces reliance on virgin fibres and synthetic materials, thus responding simultaneously to challenges in the fashion and agri-food sectors (Chi, 2015; Jung and Jin, 2014; Provin and de Aguiar Dutra, 2021; Shen, 2014). For example, Orange Fiber, an Italian company producing fabric from citrus waste, collaborates with luxury fashion brands to create garments that merge environmental responsibility with aesthetic appeal, signalling a shift towards more regenerative material flows (Gain et al., 2024; Karaosman et al., 2020; Shen, 2014). These innovations are increasingly capturing the interest of both brands and consumers, particularly among younger demographics attuned to environmental and ethical concerns. A study by Joy et al. (2012) highlighted that Millennials and Gen Z consumers are more likely to express support for sustainable fashion initiatives, especially when they are perceived as authentic and aligned with personal values. However, actual purchasing behaviour often lags behind stated intentions - i.e., a*

phenomenon widely referred to as the "attitude-behaviour gap" (McNeill and Moore, 2015). While many consumers report concern for environmental issues, decisions at the point of purchase continue to be driven by convenience, price, style, and perceived quality (Achabou and Dekhili, 2013). In the context of food waste fashion, this gap may be further exacerbated by unfamiliarity with materials, concerns about durability, or scepticism regarding the transformation of "waste" into fashion. As noted by Henninger et al. (2016), consumers often associate recycled or upcycled garments with lower quality or aesthetics, which can impede adoption despite favourable attitudes towards sustainability. Moreover, empirical studies specifically exploring consumer attitudes towards food waste-derived textiles remain limited. Although recent surveys have indicated high levels of openness towards fibres made from fruit waste among Italian consumers (Busalim et al., 2022; Hur and Cassidy, 2019), such findings are often based on small samples or exploratory frameworks and lack the analytical depth needed to capture the multidimensional nature of consumer perception. In addition, most studies tend to focus on broader categories like "sustainable fashion" or "eco-textiles", without disaggregating the nuances associated with different types of circular innovations, such as food waste-based garments (Thorisdottir et al., 2024). As a result, it emerges a clear gap in the literature: there is a need for more targeted, data-driven research that investigates consumer motivations, hesitations, and levels of awareness regarding food waste fashion. Furthermore, the Italian context remains underexplored, despite being a particularly relevant case: Italy not only holds a globally influential fashion industry, but also plays a significant role in agri-food production, including citrus and grape by-products used in textile innovation. The convergence of these two sectors makes Italian consumers especially relevant for studying the social acceptance of food waste fashion. To date, no large-scale empirical study has employed robust quantitative methods - such as Exploratory Factor Analysis (EFA) - to examine how consumers in Italy perceive, interpret, and engage with garments made from food by-products. Addressing this gap is critical for both academic and managerial purposes: understanding consumer attitudes can guide sustainable product development, enhance marketing strategies, and support policy measures aimed at promoting circular economy solutions.

Purpose of the paper. *In this context, this study aims to examine Italian consumers' awareness, perceptions, and behavioural inclinations toward food waste fashion as an innovative expression of circular and sustainable fashion. Specifically, the research investigates how sustainability values, openness to material innovation, and sensory-related expectations influence consumer acceptance of garments made from food industry by-products. For this purpose, the following three research questions were addressed:*

RQ1: What are the main drivers and barriers affecting Italian consumers' engagement with food waste fashion?
RQ2: How do sustainability values and innovation-oriented attitudes shape perceptions and adoption of garments made from food-based fibres?
RQ3: What role do digital platforms and brand communication play in fostering awareness and acceptance of food waste-based textiles?

The first research question aims to identify the psychological, ethical, aesthetic, and socio-economic factors that act as enablers or barriers in the decision-making process related to food waste fashion. These include motivations such as environmental concern, interest in innovation, or alignment with personal identity, as well as reservations regarding product quality, pricing, or unfamiliarity with the concept. The second question interrogates the relationship between sustainability-oriented dispositions and the cognitive evaluation of food waste-based clothing, with particular attention to the interplay between normative values and perceived product legitimacy. Finally, the third question puts consumer behaviour within its broader communicative and cultural context, assessing the influence of digital ecosystems - such as social networks, influencers, and sustainability-focused branding - on the normalisation and diffusion of such innovations. By addressing these questions, our study seeks to contribute to the academic discourse on sustainable consumption and provide practical guidance for brands, marketers, and policymakers aiming to support the market diffusion of circular fashion innovations.

Methodology. *To fulfil the research aims, the study employed a quantitative approach based on data collected through an online survey administered to Italian consumers. The primary aim of this study was to investigate consumer perceptions and attitudes towards food waste fashion, with a particular focus on the values, motivations, and potential barriers associated with the acceptance of garments made from food-derived materials. The online survey was designed based on existing academic literature on sustainable consumption, circular fashion, and green innovation adoption. Prior to data collection, a pre-test was conducted to refine the wording and structure of the questionnaire, ensuring conceptual clarity and internal consistency across all items. The final version of the questionnaire was distributed via Google Forms between August and September 2024. The survey included a combination of question formats: several items utilised a five-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree), while others featured open-ended or multiple-choice responses. The data collection process resulted in 421 valid responses, providing a solid empirical foundation for subsequent analysis.*

The questionnaire was structured into four main sections, each designed to capture distinct dimensions of consumer behaviour, awareness, and attitudes towards sustainable fashion derived from food waste. The first section aimed to explore general purchasing behaviours related to clothing, including purchase frequency, the use of both online and offline channels, and the perceived influence of various factors on fashion choices. It also assessed participants' familiarity with the concept of sustainable fashion, a variable increasingly recognised in the literature as central to shaping environmentally responsible consumption (Niinimäki et al., 2020). The second section focused on consumers' knowledge and perceptions of sustainable textiles, such as linen and hemp, and extended this inquiry to the awareness of

garments made from food waste-based fibres. In line with prior research on material-based consumer preferences (Henninger et al., 2020), the section examined participants' willingness to purchase such products, the drivers behind these intentions, and the willingness to pay a premium for garments perceived as ecologically responsible. The third section investigated the role of social media and digital platforms in shaping knowledge and interest in sustainable fashion. Drawing on the growing body of work on digital consumer engagement and green marketing (McNeill and Venter, 2019), this part explored preferred communication channels, responsiveness to sustainability-focused content, and the role of branding and advertising in influencing consumer decision-making. Finally, the fourth section collected socio-demographic data - i.e., gender, age, region, education, occupation, household income, and family structure - to enable segmentation analysis and better understand sample heterogeneity across key variables known to influence sustainable consumption patterns.

Table 1: Sample composition

Gender	*Age*	*Education*	*Occupation*	*Income (€)*
Male, 39	18-25, 42	High school or below, 54	Student, 29	< 999, 33
Female, 60	25-35, 38	College or university, 43	Employed, 56	1.000-1.999, 36
Other, 1	36-50, 15	Postgraduate, 3	Self-employed or entrepreneur, 7	2.000-2.999, 15
	>50, 5		Retired or unemployed, 8	≥ 3.000, 16

Source: our elaboration.

Table 1 outlines the socio-demographic profile of the sample, offering insight into the diversity of respondents. Gender distribution shows a slight female majority, with 60% of women and 39% of men, while the remainder of the sample (1%) identified themselves as non-binary or preferred not to specify. In terms of age, the sample is primarily composed of young adults: 42% are aged 18-25 and 38% fall in the 25-35 range, making Millennials and Gen Z the predominant groups. Participants aged 36-50 represent 15%, while only 5% are over 50, reflecting a youthful profile aligned with the focus on emerging sustainable fashion trends. Educational levels are relatively high: 43% of the respondents hold a university degree and 3% have postgraduate qualifications, while the majority (54%) have completed secondary education or below. This indicates a varied educational background, with a considerable portion potentially still engaged in or recently completing their academic journey. From a professional standpoint, over half of the respondents are currently employed (56%), while 29% are students. A smaller share includes self-employed individuals or entrepreneurs (7%), and retirees or unemployed respondents (8%). This occupational mix reflects both early career stages and transitional employment statuses typical of younger cohorts. Income distribution is consistent with the overall profile. One-third (33%) report earning less than €999 monthly, 36% fall within the €1,000-1,999 range, and 15% report incomes between €2,000-2,999. Only 16% declare earnings of €3,000 or above. Notably, the sample is predominantly composed of respondents from the Italian Apulia region, which adds a valuable territorial dimension to the analysis. This regional concentration allows for a more nuanced understanding of local sustainability perceptions and may reflect specific cultural, social, and economic factors that shape consumer openness to circular fashion innovations such as food waste-based textiles. Overall, the sample reflects a predominantly young, moderately educated, and economically diverse population, thus offering a meaningful foundation for examining consumer perceptions and behaviours towards food waste fashion.

Results. *IBM SPSS Statistics was used to perform the Exploratory Factor Analysis (EFA), which enabled the identification of latent dimensions underlying Italian consumers' attitudes and behaviours towards food waste fashion (Abdi and Williams, 2010). The correlation analysis confirmed the significance of all variables in explaining the phenomenon, showing low, medium, and high positive values. To ensure the robustness of the analysis and verify the adequacy of the dataset, the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO Test) and Bartlett's Test of Sphericity (BTS) were performed. It emerges that the KMO value exceeded the recommended threshold of 0.7 while the BTS significance level was below 0.05 (Table 2), thus confirming that the subgroups are adequate for further analysis.*

Table 2: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0,920
Bartlett's Test of Sphericity	Approx. Chi-Square	8540,67

Subsequently, communalities were examined to assess the proportion of variance explained by the common factors. The results indicated satisfactory levels, with 67.33% of the total variance explained. Based on these values, six latent

factors were extracted, providing a clear structural interpretation of the underlying dimensions. Table 3 presents a summary of the extracted factors.

Table 3: Summary of the latent factors

	Latent factor	*Description*
1	*Value-Driven Sustainability Orientation*	This factor captures consumers' inclination to support food waste fashion based on ethical, environmental, and personal value systems. It reflects the importance attributed to sustainability certifications, environmental impact reduction, personal ethics, and transparency, as well as openness to technological innovation and alternatives to animal-based materials. The inclusion of variables such as storytelling and educational awareness suggests that consumers are motivated not only by environmental outcomes, but also by the communicative and symbolic dimensions of sustainability-oriented products.
2	*Sustainable Fashion Associations*	This factor reflects how consumers cognitively associate sustainable fashion with a set of core principles related to environmental, ethical, and transparency concerns. It encompasses the recognition of sustainable materials, responsible consumption practices, fair labour conditions, and the importance of eco-certifications and traceable supply chains. The factor suggests that for many consumers, sustainable fashion is defined not only by the final product but by the values embedded in its production process.
3	*Marketing Influence and Communication Levers*	This factor captures the impact of marketing communication on consumer decisions regarding sustainable fashion. It includes diverse promotional tools - such as social media content, limited edition collaborations, customer reviews, video campaigns, and sustainability disclosures - that shape consumer perceptions and purchasing behaviour. The presence of both experiential (e.g., events, storytelling) and informational (e.g., sustainability reports) elements suggests a multidimensional influence of marketing, where emotional engagement and transparency co-exist in reinforcing the appeal of sustainable fashion.
4	*Product Evaluation Criteria*	This factor encompasses the functional and aesthetic considerations that consumers apply when evaluating garments made from food waste-derived fibres. It includes perceived product quality, tactile and sensory attributes, visual appeal, and price sensitivity. These elements reflect the importance of conventional product expectations - such as comfort, design, and value for money - even in the context of sustainable innovation. The factor indicates that, beyond ethical motivations, consumers' adoption of food waste fashion is also strongly influenced by tangible product performance.
5	*Material Sophistication Orientation*	This factor reflects consumers' sensitivity to the nature and quality of fabrics when making purchasing decisions. It captures the appeal of both refined and innovative textiles, suggesting that certain consumer segments value originality, technical advancement, and exclusivity in material composition. The factor implies that fabric characteristics are not merely functional, but contribute to the symbolic and experiential value of fashion products.
6	*Purchase Intention and Willingness to Pay*	This factor captures the consumer's overall propensity to adopt food waste fashion, encompassing both behavioural intention and economic commitment. It reflects a positive disposition toward purchasing garments made from food-derived fibres, as well as a willingness to pay a price premium for such sustainable alternatives. The factor signals a concrete level of engagement that moves beyond attitudes to action-oriented readiness.

Source: our elaboration with IBM SPSS Statistics

The first factor - named "Value-Driven Sustainability Orientation" - emerged as the most comprehensive, bringing together variables linked to ethical values, environmental concern, transparency, innovation, and personal beliefs. It highlights that consumers are deeply influenced by non-material motivations when evaluating garments made from food waste-derived fibres. In particular, they appear to be guided by a coherent set of sustainability-oriented values, including a preference for ethical production, support for environmental certifications, and interest in storytelling and technological innovation. The second component further strengthens this interpretation by showing how consumers cognitively associate sustainable fashion with specific principles, such as fair labour, transparency, responsible consumption, and eco-friendly materials. The strong presence of this dimension suggests that consumers tend to project a holistic view of sustainability onto food waste fashion as well, extending their general understanding of sustainable fashion to this more specific innovation. "Marketing Influence and Communication Levers" factor emerged as third. It addresses the role of external stimuli - such as social media, advertising, events, and promotional content - in shaping consumer decisions. This dimension captures the effectiveness of both emotional and informational marketing strategies, including the relevance of sustainability disclosures and the persuasive power of influencers and brand storytelling. As a result, digital communication plays a strategic role in normalising and promoting food waste fashion, particularly among younger and more digitally engaged consumers. The fourth factor - i.e., "Product Evaluation Criteria" - reflects a more pragmatic dimension of consumer judgement. It includes variables such as product price, aesthetic appeal, sensory characteristics, and perceived quality. It reveals that while ethical and sustainability motivations are significant, consumers also evaluate food waste fashion through conventional lenses. Concerns about price competitiveness, fabric performance, and design coherence remain central. Even environmentally conscious consumers may hesitate if they perceive that a garment does not meet their expectations in terms of comfort, look, or durability. The fifth factor - i.e., "Material Sophistication Orientation" - suggests that fabric selection is not only a technical consideration but also a marker of innovation, exclusivity, and identity. Respondents highlight a preference for refined or cutting-edge textiles, potentially indicating a niche market for food waste fashion when positioned as a high-value, design-forward solution. Finally, "Purchase Intention and Willingness to Pay" component offers a behavioural synthesis of the previous constructs. It captures the readiness of consumers to actively support food waste fashion, both through their willingness to try such garments and their openness to paying a higher price. This dimension signals a shift from attitudinal agreement to actionable commitment.

Our findings paint a nuanced and multidimensional picture of how consumers engage with food waste fashion, revealing the complex interplay between individual values, product expectations, and communication dynamics. Consumers are primarily motivated by ethical and environmental convictions, which operate not as abstract ideals but

as concrete evaluative lenses through which they assess the legitimacy and desirability of sustainable garments. At the same time, interest in innovation and material quality contributes to shaping positive perceptions, particularly when the product is seen as both responsible and aesthetically appealing. However, this value-driven orientation coexists with more pragmatic concerns: doubts about fabric performance, limited familiarity with food-derived textiles, and sensitivity to pricing may hinder broader adoption. Digital communication emerges as a key enabler in this landscape, with social media, sustainability storytelling, and promotional content playing an active role in raising awareness, building trust, and framing food waste fashion as both credible and aspirational. Altogether, the six latent dimensions identified suggest that consumers' acceptance of food waste-based textiles depends on the convergence of personal convictions, tangible product qualities, and effective communication - highlighting the need for integrated strategies that align sustainability values with compelling market offerings.

Research limitations. *This study is not without limitations. The sample does not fully represent the broader Italian population, with an overrepresentation of respondents from the Apulian region. While self-reported data may be subject to social desirability bias, it nonetheless provides a valuable foundation for further exploration of Italians' sustainable consumption behaviours in the fashion industry.*

Managerial implications. *This study offers relevant insights for fashion brands, start-ups, and sustainable textile innovators seeking to promote food waste fashion within the circular economy. Results indicate that a mix of value-driven and product-related motivations influences consumers. To enhance engagement, companies should communicate the ethical, environmental, and innovative aspects of food waste-based garments through transparent messaging, certifications, and compelling storytelling, while also ensuring high standards of quality, aesthetics, and sensory appeal. Marketing strategies should highlight ethical production, environmental benefits, traceability, uniqueness, performance, and contemporary appeal of food-derived fibres. Furthermore, given the strategic role of digital communication, social media and online platforms appears pivotal in delivering engaging and informative content. Limited editions, designer collaborations, and experiential initiatives can further increase the perceived value and originality of these garments.*

Originality of the paper. *This study advances the literature on circular fashion by investigating consumer responses to food waste-based textiles - an area still largely underexplored. By focusing on Italian consumers, it reveals how sustainability values, product perceptions, and digital communication jointly influence acceptance of garments made from food by-products. Moreover, the use of Exploratory Factor Analysis offers a structured view of the underlying motivational and perceptual dimensions, offering a foundation for future research on consumer engagement in this context.*

Key words: *Food waste fashion; sustainable fashion; circular economy; sustainable consumption; consumer behaviour.*

Vintage Vibes or Trendy Thrift? Unveiling Generational Shifts in Second-Hand Fashion Consumption Among Early and Late Gen Z

ANNUNZIATA TARULLI[1] DOMENICO MORRONE[2] CHIARA COLAMARTINO[3] GAIA FIORE[4]

Abstract

The rising environmental and social awareness surrounding fast fashion's unsustainable practices has contributed to the growing popularity of second-hand clothing, particularly among younger consumers. Within this context, Generation Z - i.e., individuals born between 1996 and 2012 - has emerged as critical due to its strong values related to sustainability, digital fluency, and a redefinition of consumption to express personal and ethical beliefs. Gen Z's purchasing choices, indeed, increasingly reflect concerns for environmental impact, circular economy models, and authenticity. Existing literature recognises these consumers as pivotal actors in the transition towards sustainable consumption. However, most contributions are either global or Western-centric, with limited empirical insight into the Italian context. Moreover, few studies investigate internal generational differences, such as those between early and late Gen Z, in relation to second-hand fashion practices. Therefore, this research aims to address these gaps by examining how sustainability values influence second-hand fashion consumption among Italian Gen Z, and how motivations, behaviours, and perceived barriers vary across generational subgroups. Based on data from an online questionnaire administered to 428 participants, this study employs an Exploratory Factor Analysis (EFA) to identify key behavioural drivers. Preliminary findings reveal that sustainability, uniqueness, and identity construction are primary motivations for engaging in second-hand fashion, with digital platforms such as Vinted and Depop playing a decisive role. Early Gen Z shows stronger attention to sustainability and product quality, whereas late Gen Z emphasises individual style and diversified purchasing channels. These insights offer practical implications for fashion brands and policymakers promoting responsible and circular consumption.

Framing of the research. *In the contemporary socio-economic landscape, sustainability has evolved from a peripheral concern to a central element in shaping institutional strategies and individual consumption behaviour. On the one hand, businesses adopt ESG frameworks, sustainability certifications, and circular product design models, while governments implement policies such as green public procurement, mandatory sustainability reporting, and incentives for environmentally responsible innovation (Becchetti et al., 2022). On the other hand, individual consumers contribute to advancing circular economy principles and ethical responsibility through their choices, such as opting for second-hand clothing, favouring ethical brands, reducing waste, or using digital re-commerce platforms. In this way, their behaviour becomes an active vehicle for systemic change, reinforcing sustainability across the entire value chain (Calvo-Porral and Viejo-Fernández, 2025; Machado et al., 2019).*

Among the most engaged demographic cohorts, Generation Z (i.e., those individuals born between 1996 and 2012) has emerged as a key driver of this cultural transformation. Unlike previous generations, it has grown up in an era of digital saturation, climate anxiety, and global economic instability. This exposure has shaped a generation characterised by high digital literacy, entrepreneurial attitudes, and strong ethical awareness (Seemiller and Grace, 2018). Gen Z's consumption behaviour is defined by a unique combination of individualistic self-expression and collective responsibility, where values such as transparency, equity, environmental protection, and social justice are prioritised in their purchasing decisions (Dorsey and Villa, 2020; Fromm and Read, 2018). These values are particularly expressed in the second-hand fashion sector. Historically associated with economic necessity or subcultural resistance (Frank, 1997; Romano, 2017), this market has undergone a significant transformation till being perceived as a credible alternative to fast fashion - i.e., an industry criticised for its high environmental impact, resource exploitation, and unsustainable production cycles (Mokyr, 1990; Bocken et al., 2014). The renewed popularity of second-hand fashion is driven not only by sustainability concerns but also by aesthetic motivations (such as uniqueness and vintage appeal), identity construction, and digital accessibility.

Digital platforms - such as Vinted, Depop, and Vestiaire Collective - have been influential in democratising access to second-hand clothing. They have enabled user-friendly re-commerce experiences, increased the perceived legitimacy of used items, and supported peer-to-peer models of exchange that resonate with Gen Z's preference for participatory, decentralised systems (Epifani, 2020; Tovar et al., 2023). Simultaneously, the power of social media influencers and communities has normalised second-hand consumption, positioning it as both environmentally responsible and fashionable. Influencers like Kristina Bazan and Kaitlyn Ham, for example, have helped reframe second-hand fashion as a lifestyle choice aligned with values of individuality and eco-consciousness (Djafarova and Foots, 2022).

From a psychological and cultural perspective, their behaviour is also shaped by complex motivational factors. Studies suggest that identity, social belonging, and perceived behavioural control play a significant role in determining sustainable choices (Ek Styvén and Mariani, 2020; Gilal et al., 2024; Gupta and Ogden, 2009; Koay et al., 2022). The theory of planned behaviour and the S-O-R model support the notion that external stimuli (e.g., social media content) influence internal states (e.g., attitudes, values), which in turn drive behavioural outcomes. In this context, Gen Z's engagement with second-hand fashion can be seen as an active, self-aware practice aimed at constructing a coherent identity that aligns with their ethical beliefs and social expectations (Busalim et al., 2022; Xiao et al., 2023).

While ethical and sustainable consumption has become an increasingly prominent focus in academic discourse, the literature continues to exhibit significant blind spots. Much of the existing research is rooted in Anglo-American or globalised frameworks, often neglecting the cultural specificity of national contexts such as Italy - a country where fashion holds deep economic and symbolic relevance. Although Generation Z is widely acknowledged for its strong ethical orientation and environmental awareness, empirical investigations rarely examine how these values are actually put into practice in the second-hand fashion domain. Even more overlooked is the internal heterogeneity of Gen Z itself. The behavioural distinctions between early and late cohorts - shaped by diverse socio-cultural exposures and digital experiences - remain largely unexplored (Balon, 2024). This limits our ability to grasp the full complexity of their sustainable consumption behaviours. Moreover, while previous studies have highlighted the powerful influence of peer dynamics and social norms on Gen Z's decision-making (Dabija et al., 2019; McDonald and Oates, 2006), little attention has been paid to how these social forces intersect with digital ecosystems. Re-commerce platforms and social media networks not only enable second-hand transactions, but also function as cultural arenas where sustainability values are constructed, shared, and reinforced. At the same time, structural and perceptual barriers - such as concerns about hygiene, trust in online sellers, or the time investment needed to find quality items - continue to limit engagement in second-hand markets (Casalegno et al., 2022; Wood, 2013). Addressing these frictions is crucial for designing effective interventions and communication strategies.

As a result, this research addresses these gaps by adopting an interdisciplinary framework that combines theories from marketing, sustainability, consumer psychology, and digital innovation. Through the lens of the Italian context, it examines how Gen Z navigates the symbolic, functional, and ethical dimensions of second-hand fashion. By analysing the drivers, values, and digital environments that shape second-hand fashion consumption among Italian Gen Z, this study contributes to a deeper understanding of how sustainability is internalised, enacted, and negotiated by a digitally native, value-driven generation. In doing so, it positions second-hand fashion not merely as a consumption trend, but as a structural shift in the way goods are valued, exchanged, and experienced in a changing cultural and ecological landscape.

Purpose of the paper. *Against this background, the present study aims to investigate how sustainability values influence second-hand fashion consumption among Italian Generation Z consumers, shedding light on the motivational, behavioural, and cultural dynamics that underpin this trend. To achieve this, the study addresses the following three research questions:*

RQ1: What are the key factors driving second-hand fashion consumption among Italian Gen Z consumers?
RQ2: How do sustainability values shape Gen Z's perception and adoption of second-hand fashion?
RQ3: What role do digital platforms and social media play in facilitating and reinforcing sustainable fashion choices among Gen Z?

The first research question focuses on identifying the main drivers - such as economic, ethical, aesthetic, and social - that guide Gen Z's second-hand purchasing behaviour. The second question explores the extent to which sustainability-related considerations, such as environmental impact reduction, ethical production, and circular economy awareness, influence these decisions. The third question analyses the digital ecosystem in which this behaviour occurs, evaluating how online platforms and social influencers contribute to normalising and promoting second-hand consumption. By addressing these questions, our study seeks to offer theoretical and practical contributions for fashion brands, digital retailers, and policymakers aiming to engage younger consumers in sustainable consumption models.

Methodology. *To address the research objectives, this study adopted a quantitative methodology using data from an online questionnaire targeting Italian consumers belonging to Generation Z. The primary goal was to explore the relationship between sustainability values and second-hand fashion consumption, investigating the motivations, behavioural patterns, and perceived obstacles that characterise this practice among digitally native and ethically engaged youth. The survey was constructed according to relevant academic literature on sustainable consumption, Gen Z behaviour, and second-hand fashion practices. Before launching data collection, a pre-test was conducted to refine the wording and structure of the questionnaire, ensuring clarity and consistency across all items. The final version of the questionnaire was disseminated through Google Forms from October to December 2024. To measure responses, some*

questions provided a seven-point Likert scale evaluation - with '1' and '7' representing low or high matches, respectively - while other questions employed open or multiple-choice answers. The data collection process yielded a total of 428 valid responses from participants who met the age criteria for Generation Z, offering a robust empirical base for the analysis.

The questionnaire was designed to capture multiple dimensions of consumer behaviour and perception. Participants were first asked to assess their general knowledge and personal importance of sustainability, covering environmental, social, and economic aspects. Subsequent sections investigated purchasing patterns specific to second-hand fashion, including frequency of purchase, preferred channels (both digital and physical), and motivations underpinning these choices. Particular attention was devoted to understanding how sustainability-related values - such as environmental concern, ethical awareness, and identity expression - influence consumers' attitudes towards second-hand clothing. Moreover, the survey explored the influence of social networks, peer groups, and digital platforms on purchasing behaviour - reflecting the increasingly hybrid nature of fashion consumption in Gen Z - as well as possible barriers (i.e., lack of trust in product quality, hygiene concerns, or time constraints) and incentives (i.e., affordability, uniqueness of items, or alignment with community values) to second-hand shopping. Finally, socio-demographic data were collected to allow for segmentation analysis and to assess the internal diversity of the sample in terms of age range, gender, education level, income, and occupation.

Table 1: Sample composition

Gender	*Age*	*Education*	*Occupation*	*Income (€)*
Male, 46.5 Female, 53 Other, 0.5	18-22, 53 23-28, 47	High school or below, 30 College or university, 67 Postgraduate, 3	Student, 51 Employed, 25 Self-employed or entrepreneur, 9 Unemployed, 15	None, 49 < 999, 22 1.000-1.999, 28 ≥ 2.000, 1

Source: our elaboration.

Table 1 summarises the respondents' socio-demographic profile. The gender distribution was relatively balanced, with a slight female majority (53.3%) compared to males (46.5%) and a minimal proportion of respondents who preferred not to declare their gender (0.2%). Regarding age, early Gen Z participants were the most represented group in the sample (53%) while late Gen Z participants accounted for 47%. Educational attainment was notably high: 41.8% held a bachelor's degree, 25.5% had completed a master's degree, and 18.7% had a high school diploma. A smaller segment reported other forms of education, including upper secondary or professional qualifications. Occupationally, the sample reflected the transitional nature of Gen Z's entry into the workforce: 50.9% identified as students, 25.2% were employees, 15% were job seekers, while smaller groups included freelancers (5.1%) and those engaged in other or undeclared work (2.6%). As expected, income levels were generally modest. Nearly half of the respondents (48.6%) reported having no income, 22.2% earned less than €1,000 per month, and 27.8% had monthly earnings between €1,000 and €2,000. Only a small minority (1.4%) reported incomes exceeding €2,000. These figures align with the student-heavy composition of the sample and the early career stage of many participants. Overall, this demographic profile offers a reliable and representative foundation for analysing second-hand fashion consumption and sustainability values among Italian Gen Z, with particular attention to the behavioural differences emerging across subgroups based on age, income, and education.

Results. *IBM SPSS Statistics was used to perform the Exploratory Factor Analysis (EFA), which helped us to identify the latent factors underneath the consumer behaviour of Italians when purchasing products from e-commerce platforms (Abdi and Williams, 2010). To deepen the understanding of the motivational dynamics and perceptions related to second-hand fashion consumption, the sample was divided into two generational subgroups: Early Gen Z (born approximately between 1997 and 2001) and Late Gen Z (born between 2002 and 2006). Although both belong to the same generational cohort, their differing formative experiences and socio-cultural contexts may have shaped distinct attitudes toward sustainability and second-hand purchasing. This segmentation allows for a more nuanced interpretation of the Exploratory Factor Analysis (EFA) results, highlighting not only overall trends within Generation Z but also internal variations.*

Table 2: KMO and Bartlett's Test

Early Gen Z		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0,932
Bartlett's Test of Sphericity	Approx. Chi-Square	9380,74
	df	703
	Sig.	<,001

Late Gen Z		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0,856
Bartlett's Test of Sphericity	Approx. Chi-Square	14342,07
	df	666
	Sig.	<,001

Source: our elaboration with IBM SPSS Statistics.

The correlation analysis confirmed the significance of all variables in explaining the phenomenon for both generational subgroups, showing low, medium, and high positive values. To ensure the robustness of the analysis and verify the adequacy of the two datasets, the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO Test) and Bartlett's Test of Sphericity (BTS) were performed. In both cases, the KMO value exceeded the recommended threshold of 0.7 and the BTS significance level was below 0.05 (Table 2), thus confirming that the subgroups are adequate for further analysis.

Subsequently, communalities were examined to assess the proportion of variance explained by the common factors. The results indicated satisfactory levels, with 75.10% of the total variance explained for the Early Gen Z subgroup and 82.70% for the Late Gen Z subgroup. Based on these values, six latent factors were extracted for Early Gen Z and four for Late Gen Z, providing a clear structural interpretation of the underlying dimensions. A summary of the extracted factors is presented in Table 3.

Table 3: Summary of the latent factors

Early Gen Z		
	Latent factor	*Description*
1	*Motivations for Second-hand Purchase*	Represents the main drivers behind Early Gen Z's interest in second-hand fashion. It highlights the search for an aesthetic linked to sustainability and originality, with attention to the practical benefits of second-hand purchasing.
2	*Quality and Origin of Second-hand Items*	Reflects Early Gen Z's concern for the quality, origin, and brand reputation of purchased items. It includes variables related to trust in product characteristics and economic savings.
3	*Purchase Decision and Trust*	Emphasises the role of trust in the purchasing process. Decisions are influenced by seller reputation, user reviews, and perceived product quality based on available images and information.
4	*Alternative Purchasing Channels*	Refers to second-hand purchasing methods beyond mainstream platforms like Vinted. It captures the importance of availability, convenience, and affordability in the shopping experience.
5	*Community and Sharing*	Explores the relationship between the sense of belonging to a community, individualistic motivations, and the sample's socio-demographic features. It includes variables related to age and gender.
6	*Income*	Represents the economic capacity and mindful purchasing behaviour of Early Gen Z, with a focus on managing limited financial resources.

Late Gen Z		
	Latent factor	*Description*
1	*Motivations for Second-hand Purchase*	Represents the main purchasing motivations of Late Gen Z. It highlights personal identity construction, perceived quality, and a strong connection to sustainability and authenticity through second-hand fashion.
2	*Purchasing Methods*	Refers to more traditional shopping formats, such as flea markets and physical stores. It reflects Late Gen Z's renewed interest in tangible, in-person second-hand shopping experiences.
3	*Sustainability and Alternative Channels*	Emphasises the role of digital and alternative platforms in second-hand purchases, linked to values such as sustainability, convenience, and uniqueness in product selection.
4	*Gender*	Dominated by the socio-demographic variable of gender. The predominance of male respondents suggests potential gender-based differences in second-hand fashion interest and purchasing behaviour.

Source: our elaboration with IBM SPSS Statistics

The analysis revealed distinct behavioural patterns between the two subgroups of Generation Z, offering a nuanced perspective on second-hand fashion consumption. Among Early Gen Z, six latent factors emerged, suggesting a more complex and articulated motivational structure. The dominant factor reflects a multidimensional set of drivers, combining sustainability awareness, aesthetic expression, and practical considerations - consistent with previous research highlighting this group's tendency to align values with consumption choices (Dorsey and Villa, 2020; Fromm and Read, 2018). Other salient factors include attention to product quality and origin, reflecting concerns for transparency and durability (Jakubowska et al., 2024), and trust in the purchasing process, influenced by seller reputation and peer reviews - i.e., elements that align with Gen Z's strong reliance on social proof in digital environments (McDonald and Oates, 2006). Additionally, Early Gen Z displayed sensitivity to alternative purchasing channels, beyond major re-commerce platforms, indicating a search for flexibility and convenience. The emergence of community and value-sharing as a distinct factor suggests a partial orientation toward collective identity and shared ethics, though moderated by individualistic traits. The income-related factor further points to the role of limited financial resources in shaping thoughtful, budget-conscious decision-making.

In contrast, Late Gen Z presented a more streamlined structure, with four latent factors explaining a higher percentage of variance. Here, identity construction and authenticity emerged as dominant themes in second-hand fashion motivations, aligning with recent studies that describe younger Gen Z as highly self-expressive and individualistic in their consumption (Djafarova and Foots, 2022). Unlike their older peers, this subgroup showed a renewed appreciation for traditional shopping experiences, such as physical thrift stores and flea markets—potentially as a form of resistance to digital saturation and a search for tangible, curated experiences. While sustainability remained a central value, Late Gen Z's approach appears more intertwined with alternative and digital channels, combining ethical commitment with the

search for uniqueness and practicality. Notably, gender emerged as a distinct factor, with male participants playing a more active role, possibly signalling shifting gender dynamics in sustainable fashion engagement (Balon, 2024).

Overall, these findings confirm that Generation Z is far from monolithic. Early Gen Z tends to exhibit a more structured and socially influenced pattern of consumption, driven by ethical awareness, trust, and community, while Late Gen Z leans toward individualistic, identity-based motivations, shaped by hybrid shopping habits and emerging values. These insights not only reinforce the importance of internal generational segmentation (Schaefer and Crane, 2005), but also provide actionable guidance for brands and policymakers aiming to foster sustainable behaviour through tailored strategies and messaging.

Research limitations. *This study is not without limitations. The sample does not fully represent the broader Italian Gen Z population, with an overrepresentation of respondents from Southern Italy. Self-reported data may also be influenced by social desirability bias. Nonetheless, these findings offer a meaningful starting point for deeper investigations into Gen Z's sustainable consumption behaviours.*

Managerial implications. *This study provides valuable insights for fashion retailers, re-commerce platforms, and sustainability-oriented brands seeking to better engage Generation Z consumers in the second-hand fashion market. Our findings underline the importance of recognising intra-generational differences within Gen Z - particularly between Early and Late cohorts - when designing communication strategies, product offerings, and user experiences. For Early Gen Z, marketing efforts should emphasise the ethical and collective dimensions of sustainable consumption, including transparency, product origin, and community values. Trust-building elements such as detailed product information, verified seller reputations, and sustainability certifications may enhance perceived reliability and encourage purchase. In contrast, Late Gen Z appears more responsive to messaging focused on individual identity, authenticity, and uniqueness. Brands targeting this segment should highlight the expressive potential of second-hand fashion, promote curated and distinctive items, and offer hybrid experiences that blend digital convenience with physical discovery (e.g., pop-up thrift events, collaborations with content creators). Moreover, both segments value digital platforms as key enablers of sustainable fashion access. Re-commerce businesses can leverage this by enhancing platform usability, offering personalised recommendations, and promoting sustainability-driven narratives across social media. Overall, the study suggests that tailoring strategies to the motivational and behavioural nuances within Gen Z can strengthen consumer engagement, support circular economy practices, and build long-term brand loyalty. Companies that understand and adapt to these differences will be better positioned to lead the shift toward more conscious, value-driven consumption models.*

Originality of the paper. *This study offers a novel contribution to how sustainability values influence second-hand fashion consumption among Italian Generation Z consumers. This study uniquely differentiates between early and late Gen Z cohorts, uncovering intra-generational differences often overlooked in existing literature. By combining sustainability, identity expression, and digital engagement within the specific context of second-hand fashion, the research fills a significant gap in the literature and provides new insights for academics, practitioners, and policymakers interested in sustainable consumption and youth-driven market transformation. As a first step in this direction, our study provides a solid foundation for future research aiming to deepen understanding of youth-led sustainable consumption and the growing relevance of second-hand fashion within circular economy models.*

Key words: *Generation Z; fast fashion; second-hand fashion; sustainable consumption; consumer behaviour.*

Towards an Integrated Winescape Framework: a theoretical synthesis in Wine Tourism research

VALENTINA CASCIO[1]

Abstract

The concept of winescape has emerged as a pivotal framework in wine tourism research, encompassing the physical, cultural, and experiential elements that shape tourists' perceptions of wine destinations. While previous studies have explored various dimensions of winescape, the lack of a unified theoretical model has limited its applicability across different contexts. This paper aims to bridge this gap by conducting a literature review and a systematic meta-analysis of 43 studies, leading to the development of an Integrated Winescape Framework (IWF). The framework synthesizes five primary dimensions: physical winescape (landscape, architecture, accessibility), cultural and historical winescape (terroir, storytelling, local community), sensory and experiential winescape (multisensory engagement, emotional impact), economic and marketing winescape (branding, value-added services, digital integration), and behavioral and psychological winescape (consumer behavior, loyalty, social influence). By integrating these dimensions, the IWF aims to provide a structured template for understanding how winescape influences tourist decision-making, destination attractiveness, and consumer engagement. The study highlights the strategic role of winescape in tourism development and branding, offering insights for both academia and industry practitioners. Future research should focus on empirical validation of the model and explore the underexamined role of winery architecture in shaping visitor experiences.

Framing of the research

1. The genesis of the term 'Winescape'

The concept of winescape originates from the broader theoretical framework of servicescape, a term introduced by Bitner (1992) to describe the physical environment in which a service is delivered and its impact on customer behavior. Servicescape encompasses three principal dimensions: ambient conditions, spatial layout and functionality, and symbolic artifacts. Given its significance in shaping consumer experiences in hospitality and tourism, the servicescape framework has been applied to various industries, leading to adaptations such as festivalscape (Lee et al., 2008), shipscape (Kwortnik, 2008), and ultimately winescape. The term winescape was first introduced by Peters (1997) and later expanded upon by Hall et al. (2002) and Johnson and Bruwer (2007). Hall et al. (2002) broadly defined winescape as the "attributes of a grape wine region," emphasizing its role in shaping visitor perceptions and experiences. Johnson and Bruwer (2007), in one of the most widely cited definitions, described winescape as "the interplay of multiple tangible and intangible elements, including vineyards, wineries, the surrounding physical structures, wines, natural landscapes, cultural heritage, and local communities". The winescape concept is closely tied to the notion of terroir, which emphasizes the unique environmental conditions and cultural characteristics of a wine-producing region. However, while terroir primarily focuses on wine production and its quality, winescape extends beyond this, incorporating tourism, sensory experiences, and the social and cultural aspects of wine consumption. It is particularly relevant in wine tourism studies, as it captures the holistic experience of visiting a wine region, where factors like landscapes, architecture, climate, and people collectively shape the visitor's perception and enjoyment of wine. By the early 2000s, winescape became a central concept in wine tourism research, used to analyze how different environmental factors contribute to the attractiveness of wine destinations. Thus, winescape has evolved from a term describing the physical attributes of a wine region into a multidimensional concept that encompasses environmental, cultural, and experiential factors. Its significance lies in its ability to explain why certain wine destinations are more successful in attracting tourists and fostering positive emotional connections between visitors and the region.

1.1 Differences in scholarly perspectives: the evolution of Winescape models

The models of winescape have evolved significantly over time, each serving a distinct purpose within the broader academic and practical discussion on wine tourism. Some models are definitional and conceptual, aiming to establish what winescape actually is and how it functions within different contexts. Others are behavioral and motivational, focusing on how tourists interact with the winescape and what drives their decisions. A third group consists of strategic and marketing models, which explore how the winescape can be leveraged as an economic or branding tool. Each of these categories has contributed to refining and expanding the winescape framework, making it a more sophisticated and

DOI 10.7433/SRECP.SP.2025.01

multidimensional concept. Studying these frameworks is important to understand how research on the concept of winescape has evolved and which attributes have emerged as fundamental.

The definitional and conceptual models provide the foundation for understanding winescape. One of the earliest was introduced by Peters (1997), who first described winescape as the attributes of a grape-growing region, emphasizing the physical and cultural landscapes that define wine destinations. This idea was soon expanded by Telfer (2000), who broke winescape down into three primary elements: vineyards, winemaking activities, and wineries. Telfer's model was useful in making a clear distinction between the physical components of winescape and the broader experiential factors later introduced by other scholars. Around the same time, Hall et al. (2002) proposed a more comprehensive definition that extended winescape beyond the physical space to include elements of terroir, cultural identity, and heritage. The Johnson and Bruwer (2007) model took this a step further by incorporating additional attributes such as towns, people, and architectural heritage, presenting winescape as a multilayered system that includes both tangible and intangible components. More recently, Sidali, Kastenholz, and Bianchi (2015) refined this idea by explicitly defining winescape as a fusion of tangible (landscape, wineries, physical environment) and intangible (heritage, cultural identity, sensory perception) factors, emphasizing the importance of place attachment. The most recent comprehensive attempt to unify these perspectives comes from Terziyska (2022), who developed a holistic winescape framework that synthesizes previous definitions and classifies winescape into six key elements: destination features, wine, people, wineries, food and dining, and symbols. This framework provides a structured way to understand how winescape operates across different wine regions.

While conceptual models define what winescape is, the behavioral and motivational models explore how wine tourists engage with it. One of the first attempts to study winescape from a behavioral perspective was made by Bruwer and Alant (2009), who argued that winescape plays a hedonic role in wine tourism. Their study was among the first to emphasize how tourists emotionally interact with winescape elements, suggesting that sensory engagement, social interaction, and immersion in the landscape were crucial in shaping tourist satisfaction. Shortly after, Thomas, Quintal, and Phau (2010) proposed a dual-level model that distinguished between macro winescape, which includes regional factors such as culture, history, and facilities, and micro winescape, which focuses on the immediate winery environment, including design, staff, and atmosphere. This distinction proved critical in later research, as it helped explain why tourists might be drawn to a wine region as a whole but also why specific wineries can succeed or fail based on their localized winescape characteristics. In a further refinement, Bruwer, Gross, and Lee (2016) introduced a multilayered winescape model, emphasizing the interaction between cognitive and affective elements in shaping tourist behavior. This approach showed that winescape is not just a physical setting but a complex, immersive experience that can evoke emotions and influence decision-making. Building on these behavioral studies, Quintal, Thomas, and Phau (2015) integrated winescape into the Theory of Planned Behavior (TPB), which is widely used in tourism studies to predict consumer decisions. Their model demonstrated that winescape attributes directly shape attitude toward a winery, which in turn influences tourists' intention to revisit and recommend. This was one of the first empirical studies to systematically link winescape attributes to behavioral intention, confirming that elements such as staff interactions, landscape aesthetics, and the perceived authenticity of the experience all have a measurable impact on wine tourism consumption. More recent studies, such as Kim and Bonn (2016), have further emphasized the importance of authenticity, arguing that tourists are more likely to develop an emotional connection to a destination if the winescape feels genuine and historically rich. Similarly, Brochado, Stoleriu, and Lupu (2019) introduced a multisensory perspective, identifying which sensory dimensions (sight, taste, smell, touch, sound) contribute most to a positive winescape experience.

While behavioral models focus on how tourists perceive and interact with winescape, strategic and marketing models examine how wineries and regions can use winescape as a branding tool or economic asset. One of the earliest contributions in this area came from Getz and Brown (2006), who identified the critical success factors for wine tourism regions, demonstrating that winescape plays a fundamental role in making destinations competitive. Their study showed that wine regions with a strong winescape identity, such as Bordeaux, Tuscany, and Napa Valley, are able to attract more visitors and sustain higher levels of tourism revenue. Later, McFarlane et al. (2016) positioned winescape within the framework of regional sustainability, arguing that it has a spillover effect on local economies by stimulating demand for complementary services such as gastronomy, accommodation, and cultural tourism. This perspective was further expanded by Andrade-Suárez and Caamaño-Franco (2020), who focused on the role of industrial heritage in shaping winescape attractiveness, particularly in historic wine-producing regions.

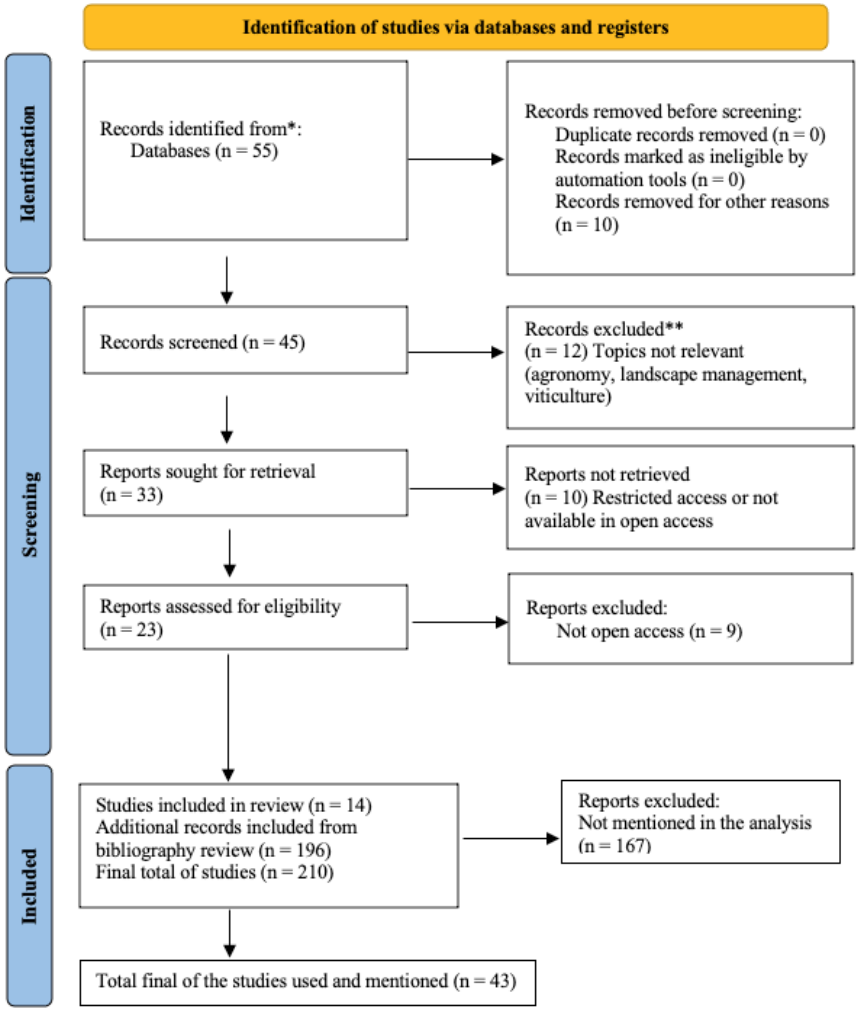
A more business-oriented approach was taken by Santos, Ramos, and Almeida (2019, 2020, 2022), argue that winescape should be seen as a strategic asset, meaning that wineries and regional tourism boards should actively manage and promote specific winescape attributes (such as vineyard aesthetics, historic architecture, and wine storytelling) to create a differentiated market position. Similarly, Kubát, Králiková, and Ryglová (2023) have expanded the winescape model beyond wine tourism to a broader destination branding strategy, showing how the principles of winescape can be applied to rural tourism, gastronomy tourism, and heritage marketing. Together, these models demonstrate that winescape is far more than just a landscape, it is a multidimensional construct that influences tourist perception, business strategy, and regional development.

Purpose of the paper. *The concept of winescape is crucial in wine tourism research because it encapsulates the holistic and multisensory nature of the wine tourism experience. Unlike other forms of tourism, wine tourism is deeply rooted in place-based authenticity, where the physical and cultural environment plays a fundamental role in shaping visitor satisfaction and loyalty.*

Furthermore, winescape plays a key role in differentiating wine destinations. As global competition among wine regions intensifies, destinations must leverage their unique winescape attributes to attract visitors.

Given the importance of winescape in wine tourism, the purpose of this paper is to analyze and systematize the existing contributions on the topic and to provide a unified conceptual model. This model, based on a meta-analysis conducted through a literature review, can also be applied to different wine-related contexts and serves as a consolidated expression of the various models proposed to date.

Methodology. *To ensure a systematic and transparent approach in article selection, the PRISMA methodology (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) was adopted. The research was conducted using the Scopus database, employing the keyword "winescape" without Boolean operators, to obtain the broadest possible range of relevant results. This methodological choice was driven by the need to comprehensively explore existing literature to develop a theoretical framework that identifies the common components of winescape across different studies.*



Phase 1) Identification: the initial search yielded 55 articles. At this stage, books and conference proceedings were excluded, retaining only scientific articles, editorials, and reviews, reducing the number of documents to 45.

Phase 2) Screening: the titles and abstracts of the 45 articles were analyzed to assess their relevance to the concept of winescape within the context of wine tourism, so, using the Boolean operator AND, the word 'tourism' was included. Following this evaluation, 33 articles were deemed relevant, while the remaining ones were excluded as they focused on unrelated topics, such as agronomy, landscape management, and viticulture.

Phase 3) Eligibility: to further refine the selection, an in-depth analysis of the articles was conducted, considering their objectives, methodology, and results. At this stage, only open-access articles were included, further reducing the corpus to 23 documents. Through a manual selection based on thematic relevance, 14 articles specifically focused on wine tourism and wine experience were selected.

Phase 4) Inclusion: one possible limitation of this methodology is the risk of excluding articles discussing the concept of winescape without explicitly using this term in their keywords, thus escaping the adopted search criteria. To address this issue, all relevant articles cited in the bibliography of the 14 selected papers were included in the analysis. This literature review resulted in 250 documents, including papers, conference proceedings, books, and editorials. Their titles and abstracts were analyzed to assess their relevance. The sources were then organized alphabetically, and duplicate records were eliminated, reducing the total number to 196 articles. Adding these to the 14 initial pilot articles, the final number of documents is 210 of these 43 were used and mentioned in the analysis.

Tab. 1: Table PRISMA model application

Results

Quantitative: frequency analysis

Based on the frequency analysis of the bibliography of this specific review, the most prolific author in this dataset appears to be Johan Bruwer, who has co-authored multiple papers on wine tourism, winescapes, and consumer behavior in the wine industry. Other authors with several contributions include Vânia Santos, Beverley Sparks, and Brent Thomas, who have explored various dimensions of wine tourism and consumer experiences. While "The International Journal of Wine Business Research", "Tourism Management", and "Sustainability" are among the most frequently cited journals in this field. These journals focus on wine tourism, sustainable tourism, and the broader hospitality industry, making them key outlets for research on winescapes. Furthermore, the year 2021 stands out as the most productive, with multiple papers published on wine tourism, winescapes, and related topics. This could indicate a growing academic interest in the field, possibly influenced by the evolving landscape of tourism and hospitality post-pandemic.

Qualitative: development of a unified Winescape model: The Integrated Winescape Framework (IWF)

Based on the extensive meta-analysis conducted, the paper proposes an Integrated Winescape Framework (IWF) that unifies existing models, incorporates empirical findings, and allows for broad applicability in various wine-related contexts (e.g., wine tourism, wine branding, and wine marketing). This framework synthesizes the macro-level, micro-level, and experiential dimensions of winescape, ensuring that it serves as a comprehensive and applicable model.

The IWF model integrates insights from previous theoretical models and organizes winescape attributes into five primary interconnected dimensions:

1. The Physical Winescape (Macro and Micro-Level Integration)

This dimension represents the tangible and geographical elements that shape the winescape experience. It includes:

- *Vineyards and natural landscapes - topography, climate, and scenery (Bruwer & Alant, 2009; Johnson & Bruwer, 2007).*
- *Winery Architecture and Facilities - cellar doors, wine storage, and traditional vs. modern winery designs (Thomas et al., 2010; Bufquin et al., 2018; Plaza et al., 2024)*
- *Infrastructure and accessibility - roads, accommodation, signage, and ease of movement within the wine region (Sekhniashvili & Bujdosó, 2023).*

2. The Cultural and Historical Winescape

This component focuses on the heritage, identity, and traditions embedded within wine-producing regions. It includes:

- *Terroir and Wine Heritage - the link between land, tradition, and wine quality (Hall et al., 2002).*
- *Storytelling and Regional Identity - the role of narratives in branding wine regions (Santos et al., 2022).*
- *Local Community and Hospitality - the people who shape the visitor experience through interactions, knowledge sharing, and cultural immersion (Santos et al., 2021).*

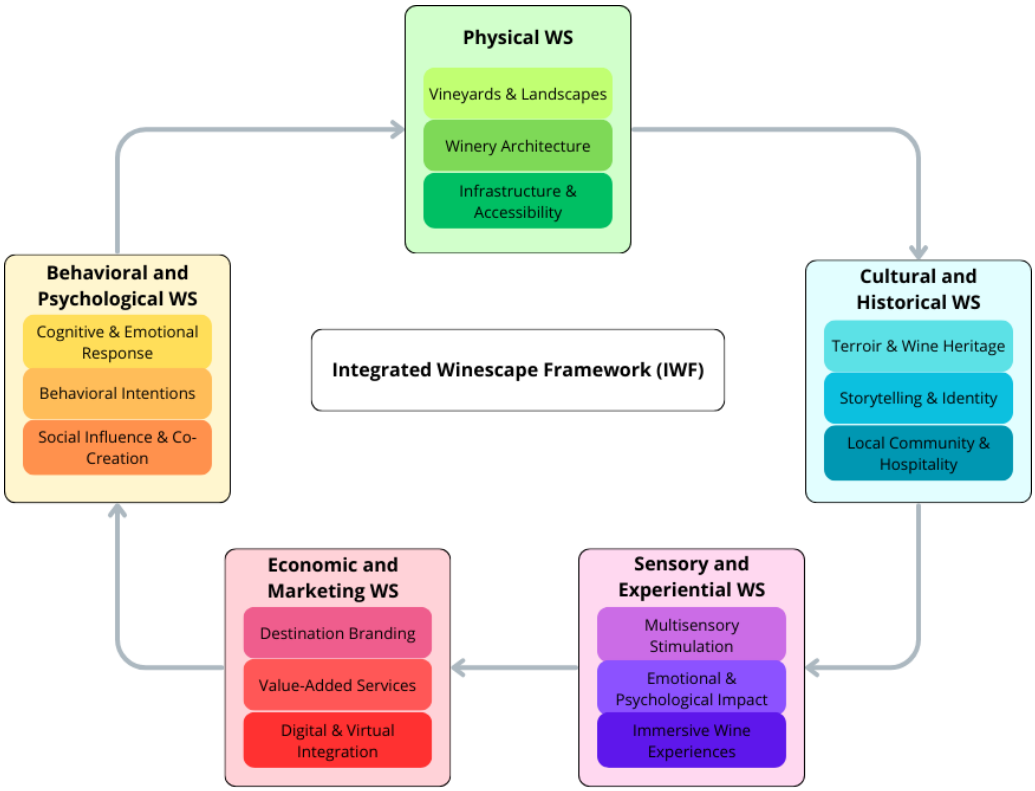
3. The Sensory and Experiential Winescape: drawing on "experienscape" theories (Pizam & Tasci, 2019; Gunasekar et al., 2022)

This dimension includes:

- *Multisensory Stimulation - taste (wine quality, pairing), sight (vineyards, cellar aesthetics), smell (wine aromas), sound (ambient music, nature), and touch (wine textures).*
- *Emotional and Psychological Impact - how sensory cues influence visitor perceptions and memory formation (Brochado et al., 2021; Andrade-Suárez & Caamaño-Franco, 2020).*

- *Immersive Wine Experiences - tasting events, vineyard tours, and interactive wine-making activities (Santos et al., 2020).*

4. *The Economic and Marketing Winescape*
   Recognizing the commercial and strategic role of winescape, this dimension encompasses:



- *Destination Branding and Market Positioning - how winescape contributes to wine region competitiveness (Sekhniashvili & Bujdosó, 2023).*
- *Value-Added Services - complementary offerings such as gourmet food pairings, local crafts, and wellness tourism (Santos et al., 2020).*
- *Digital and Virtual Integration - the use of augmented reality (AR), digital storytelling, and online wine tourism experiences (Bausch et al., 2021).*

5. *The Behavioral and Psychological Winescape*
   This dimension examines how winescape affects consumer behavior and tourism engagement:

- *Cognitive and Emotional Response to Winescape - the psychological processes behind wine excitement, place attachment, and consumer loyalty (Kim & Bonn, 2016; Bruwer et al., 2016).*
- *Behavioral Intentions - the impact of winescape on return visits, word-of-mouth recommendations, and wine purchases (Quintal et al., 2015).*
- *Social Influence and Co-Creation - the role of peer interactions, online reviews, and visitor-generated content in shaping winescape perceptions (Santos et al., 2019).*

The Integrated Winescape Framework (IWF) synthesizes the most significant findings from past studies, offering a comprehensive and adaptable model. Unlike previous frameworks that focus on either supply-side attributes (winery design, infrastructure) or demand-side experiences (tourist perceptions, sensory engagement), the IWF connects both dimensions within a single, unified model. Its adaptability allows for cross-disciplinary applications, from destination branding and tourism development to wine marketing and consumer engagement strategies.

Fig. 1: Integrated Winescape Framework (IWF) by the author, 2025

Research limitations. *One of the primary limitations of this research is that, while the Integrated Winescape Framework (IWF) represents a significant theoretical advancement by consolidating multiple models and measurement scales into a unified structure, it remains untested. This means that, although the framework provides a comprehensive conceptualization of winescape, it has yet to undergo empirical validation to determine which components are most impactful in practice and how they interact to shape consumer behavior. Without systematic testing, it is unclear whether all dimensions of the model contribute equally to the wine tourism experience or whether certain elements exert a stronger influence than others. Additionally, another crucial limitation lies in the lack of understanding regarding how these*

winescape attributes function within the consumer decision-making process. While the framework organizes winescape into physical, cultural, sensory, economic, and behavioral dimensions, it does not clarify at which stage of the decision funnel-awareness, consideration, conversion, or loyalty-each attribute exerts its influence. For instance, it remains unknown whether the natural landscape and architectural aesthetics primarily attract first-time visitors or whether they also play a role in fostering long-term destination loyalty. Similarly, it is uncertain whether sensory elements such as wine tasting and hospitality experiences impact the initial decision to visit or if they are more significant in determining repeat visits and recommendations. Understanding these distinctions is essential, as it would allow for a more targeted application of winescape in both tourism strategy and marketing efforts. As this research is a conceptual work in progress, the next commitment will be to address these limitations, by implementing empirical validation to map each winescape attribute to a specific stage in the consumer decision funnel. This would require a combination of behavioral analysis, survey-based research, and experimental testing to measure the real impact of winescape dimensions on visitor awareness, decision-making, and long-term engagement.

Future Research Directions

Through the meta-analysis conducted in this study, a crucial research gap has emerged: while winescape has been widely explored in relation to natural landscapes, sensory experiences, and cultural elements, the role of winery architecture and spatial design in shaping the wine tourism experience remains significantly underexplored. Despite being theoretically recognized as a fundamental component of winescape, very few empirical studies have examined its direct influence on tourist perceptions, emotions, and behavioral outcomes. In fact, only two notable studies explicitly address this topic, (Plaza et al. 2022) and (Bufquin et al. 2018). The first study explores how the avant-garde architectural design of the Marqués de Riscal winery has reshaped brand perception, transforming the winery into an international attraction where visitors are drawn not only for wine tasting but also for wine-related services and architectural appreciation. This has had a substantial impact on the tourist flows of the entire wine region, demonstrating that winery design can function as a primary driver of destination attractiveness. The second study investigates how architectural congruence, or the perception of a winery's design aligning harmoniously with its surroundings, affects visitors' emotions and behavioral intentions. The findings suggest that when winery architecture is perceived as aesthetically coherent and thematically consistent, it enhances the overall tourism experience, evokes positive emotional responses, and increases visitor loyalty and intention to return. No systematic models integrate winery design into the winescape framework, and its impact across different architectural styles remains unclear. The interaction between architecture and other winescape elements, such as vineyards and visitor experiences, is also unexplored. Future research should develop models that assess winery architecture's role in tourist decision-making. Comparative studies across regions and styles, along with interdisciplinary collaboration, could refine measurement tools for its impact on destination branding.

Originality of the paper. *This paper offers a novel contribution to the study of winescape by constructing an integrated theoretical framework that consolidates and expands upon existing models. Unlike previous research, which has often analyzed winescape through fragmented approaches-focusing on either macro-level destination attributes, micro-level winery experiences, or experiential dimensions in isolation-this study develops a unified model that accounts for the interplay between physical, cultural, sensory, economic, and behavioral elements. By synthesizing insights from multiple disciplines, including wine tourism, marketing, consumer behavior, and environmental psychology, the paper provides a comprehensive and adaptable framework applicable to various wine-related contexts, from tourism development to branding strategies.*

Furthermore, this study advances the field by introducing the decision-making funnel as a new perspective for analyzing winescape attributes. Previous literature has examined winescape elements primarily in terms of their overall contribution to visitor experience, without clarifying at which stage of the consumer journey they exert the most influence. This paper proposes a new research direction, emphasizing the need to empirically test whether different winescape dimensions impact awareness, consideration, conversion, or loyalty. This innovative approach provides both theoretical and practical implications, allowing wine regions, winery operators, and tourism marketers to better tailor their strategies to different stages of consumer engagement.

As a result, this paper contributes to both academic discourse and industry application, providing a structured model that can guide future empirical validation and practical implementation in wine tourism and marketing.

Key words: *Winescape, wine tourism, wine experience, winery architecture, behavioral intentions*

Exploring the Role of Sustainability in Achieving Customer Loyalty via PLS-SEM

PIERFELICE ROSATO[1] SAVINO SANTOVITO[2] MAGDA D'AGOSTINO MASSARELLI[3]
RAFFAELE CAMPO[4] CRESCENZA CALCULLI[5]

Abstract

Given the growing emphasis on sustainability, driven by institutions and governments worldwide, companies can no longer overlook its importance, not only for the essential ethical and social reasons but also as a strategic imperative. Consumers are becoming increasingly attentive to sustainability in their purchasing decisions and brands that adopt sustainable practices often experience higher levels of trust, greater customer satisfaction, and deeper emotional engagement. We developed a model that analyzes the impact of food values, subjective norm and brand preferences on customer loyalty. The model integrates the key components of Keller's Customer-Based Brand Equity model with Ajzen's Theory of Planned Behavior. The purpose of this paper is to test the model's predictive capability and explore the role of sustainability in achieving customer loyalty, given that the constructs identified as potential determinants of customer loyalty include items directly related to the theme of sustainability. We designed and administered a questionnaire through which 510 valid responses were collected. To test our path model, we resorted to Partial Least Squares Structural Equation Modeling (PLS-SEM), which allowed us to estimate the path coefficients and assess the predictive power of our constructs. T*he analysis was conducted using the R software.* Preliminary results provided empirical support for all our seven research hypotheses, with the predictor constructs displaying a moderate explanatory power for customer loyalty (R^2 around 0.4). *The research project is proposed as an ongoing work, with data collection and analysis activities set to continue in the near future.*

Framing of the research. *In September 2015, the United Nations approved the 2030 Agenda for Sustainable Development, a comprehensive action plan aimed at achieving 17 Sustainable Development Goals (SDGs) by 2030 (United Nations, 2015). The objective is to promote prosperity while protecting the planet and people, recognizing the importance of complementing economic growth with a range of social needs that have become true priorities. Within the program's vision, this represents a form of widespread social responsibility and several researchers in the literature emphasize the crucial role of both consumers and businesses in achieving these ambitious goals (e.g. Scheyvens et al. 2016; Van Zanten et al. 2018; Yildirim 2020). Given the growing emphasis on sustainability, driven by institutions and governments worldwide, companies can no longer overlook its importance, not only for the essential ethical and social reasons but also as a strategic imperative. In fact, as the focus on sustainability grows among both consumers and businesses, it becomes a fundamental aspect of brand equity (Ishaq et al. 2020) and customer loyalty, as the latter represents one of its core dimensions (Aaker 1995).*

An increasing body of research indicates that sustainability has a significant positive impact on customer loyalty. This occurs because consumers are increasingly sensitive to sustainability issues, and as a result, their purchasing behavior is influenced by the attention businesses pay to this matter (e.g. Grunert et al. 2011; Sesini et al. 2020). In industries where repeat purchases are common, such as food and related services, building long-term customer relationships through sustainability is particularly crucial. Brands that embrace sustainable practices often experience enhanced trust, greater customer satisfaction and deeper emotional engagement. Initiatives such as eco-friendly packaging, ethical sourcing and corporate environmental responsibility not only strengthen a brand's credibility and authenticity but also

foster long-term customer retention (e.g. Khandai et al. 2023; Vuong et al. 2023; Agu et al. 2024; Carbajal-Rubio et al. 2024).

Since sustainability plays a pivotal role in achieving customer loyalty, many researchers today discuss concepts such as green loyalty and green brand equity (e.g. Gorska-Warsewicz et al. 2021; Zhang et al. 2023; Mirza et al. 2024). According to Chen (2013, p. 297), the concept of green loyalty can be defined as «the level of repurchase intentions prompted by a strong environmental attitude and sustainable commitment towards an object, such as a product, a service, a company, a brand, a group, or so on». When consumers perceive a brand as genuinely committed to environmental or ethical causes, they are more likely to develop strong purchase intentions and engage in advocacy behaviors (Vuong et al. 2023; Carbajal-Rubio et al. 2024). Recently, Martin-Garcia et al. (2023), by studying a sample of 510 consumers, explored the role of sustainability in achieving consumers' loyalty in food retailing, through technological innovation. Interestingly, they found that innovative practices support sustainability and the latter is a relevant element of the store's loyalty. In addition, Yang et al. (2023) investigated - by applying a structural equation modeling - how green cooperation between suppliers and customers affect sustainable consumer behaviors in South Korea, revealing that green cooperation positively affects sustainable behaviors and trust and, moreover, sustainable consumption behaviors can influence loyalty. Furthermore, Lerro et al. (2019) showed that loyalty, along with brand trust, impacts on Millennials' attitude towards sustainable initiatives by food companies.

Purpose of the paper. *We developed a conceptual framework to predict customer loyalty in the pasta food sector (Rosato et al. 2024). The purpose of the paper is to test the predictive capability of the model and explore the role of sustainability in achieving customer loyalty. Our approach was inspired by the work of Izquierdo-Yusta et al. (2022), which analyzes the impact of food values, subjective norm and brand preferences on customer loyalty in another food sector. However, the framework we developed is quite different from that of the Authors, as it establishes the determinants of customer loyalty by integrating Keller's (2001) Customer Based-Brand Equity (CBBE) model with Ajzen's (1991) Theory of Planned Behavior (TPB).*

In particular, we assume that customer loyalty (CL) is determined by the coexistence of both behavioral loyalty and attitudinal loyalty, as explained by Keller (2001) and Kotler (2022). This is one of the five constructs of the model. Behavioral loyalty is understood in terms of the repetitiveness of purchases made over time, the amounts spent and the quantities purchased (Keller 2001). Attitudinal attachment is understood in terms of personal attachment to the brand, which becomes special to the consumer (Keller 2001).

Since studying customer loyalty entails analyzing consumer behavior, we refer to the TPB (Ajzen 1991), as it is one of the most accredited theories for studying human behavior. In our case, the behavior we aim to predict is the loyal behavior of the customer towards their favorite brand. The TPB clearly highlights how, in general, behavior is influenced by an individual's attitude. For this reason, our model includes the constructs cognitive attitude towards behavior (CATB) and emotional attitude towards behavior (EATB). These two constructs are designed to examine the mental and emotional states of individuals towards their favorite brand. Keller (2001) also asserts that brand resonance can only be achieved by stimulating both rational and emotional customer engagement. Consequently, the two constructs have been structured according to the logic of Keller's pyramid. The CATB construct is derived from the summation of measurements related to brand performance and consumer judgments, whereas the EATB construct is based on the summation of measurements related to brand imagery and consumer feelings. Brand preferences are therefore determined by the sum of CATB and EATB.

Finally, the model includes subjective norm (SN) as a construct, understood as the social pressure perceived by an individual when deciding whether to perform a given behavior, as defined by Ajzen (1991). The literature recognizes subjective norm as a reliable predictor of food choices (Povey et al. 2000) and especially healthy ones (Chen, 2016; Van Loo et al. 2017). We assume that the subjective norm, by determining the possibility of amplifying or not the relationship with the brand, can be relevant in terms of repetition of purchasing behaviour over time in terms of loyalty.

In our path model, all the aforementioned constructs are reflective. The only formative construct is food values (FV), in line with the approach of Izquierdo-Yusta (2022). The values associated with food products undoubtedly influence the purchasing decision among the various existing brands and types. The more significant these attributes are to an individual and the more positively they are perceived in relation to the performance of their favorite brand, the greater the assumed potential increase in behavioral loyalty within the sector. Furthermore, since behavior is influenced by both attitude and subjective norm (Fishbein & Ajzen 1975), it is also assumed that these values exert an influence on these variables.

Consequently, based on the explanations outlined (for further details on the model construction, see Rosato et al. 2024), the proposed research hypotheses are as follows:

H1. Food values exert a positive and significant influence on subjective norm.
H2. Food values exert a positive and significant influence on emotional attitude towards behavior.
H3. Food values exert a positive and significant influence on cognitive attitude towards behavior.
H4. Subjective norm exerts a positive and significant influence on customer loyalty.
H5. Subjective norm exerts a positive and significant influence on emotional attitude towards behavior.
H6. Cognitive attitude towards behavior exerts a positive and significant influence on customer loyalty.
H7. Emotional attitude towards behavior exerts a positive and significant influence on customer loyalty.

The constructs used as potential determinants of customer loyalty include items directly related to the theme of sustainability (e.g. genuineness of food, quality and origin of raw material, eco-friendly packaging, environmental impact of production, social pressure for sustainability). This allowed us to understand and highlight the role played by sustainability in the journey the consumer takes towards loyalty. By the way, as to our knowledge, sustainability is not enough considered in loyalty constructs, specifically the typology of product we chose (pasta) is little considered in these kinds of studies, so- through this ongoing research- we try to cover this gap.

Methodology. *We adopted a quantitative methodology to test the model. In particular, a questionnaire was designed with the aim of gathering information primarily on the socio-demographic, geographic and behavioral profile of the respondents, as well as on all five constructs of the model (FV, CATB, EATB, SN, CL). The questionnaire was administered in August 2024 and 510 valid responses were obtained. It is currently open, as the research presented is an ongoing study, part of a broader research whose data collection and analysis will continue in the near future (Rosato et al. 2024). Data were analyzed using the statistical software R.*

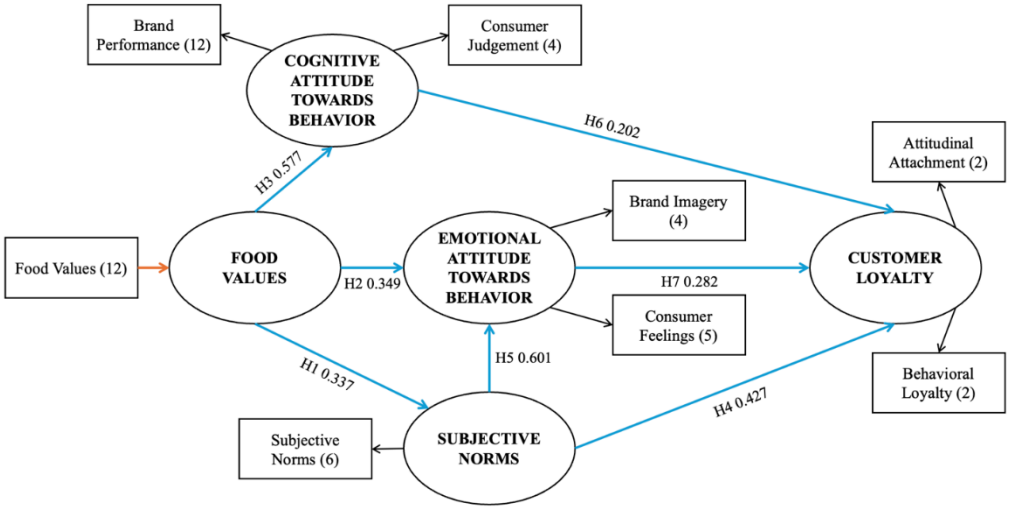
The main characteristics of the sample are presented, with further details on the Exploratory Data Analysis (EDA) conducted and the detailed construction of the questionnaire provided in the previous work (Rosato et al. 2024). The sample is a non-probability and convenience sample. However, the high number of participants ensures that it is representative according to national averages (Istat 2023). Regarding the main socio-demographic and geographic characteristics, the age of 510 respondents ranges from 19 to 87 years old. Most people, however, are between 20 and 30 years old and between 50 and 60 years old. The average age is 45. 67% of the survey participants are female, compared to 33% male. The subjects sampled are mainly located in southern Italy or on the islands (84%), with negligible percentages of residents in the center (7%) and northern Italy (9%). The sample mainly comprises employed persons (322) and students (82). Annual income is distributed as follows: 5% earn €0-€5.000, 15% earn €5.001-€15.000, 34% earn €15.001-€28.000, 33% earn €28.001-€50.000 and 13% earn over €50.000. The largest group (67%) earns between €15.001 and €50.000. As far as the behavioral aspect is concerned, all respondents claim to have a single brand preference for pasta (brand lovers). Each of them was asked to explicit it and the favorite brands by the majority of respondents are: Molisana (24%), Rummo (18%), De Cecco (14%) and Garofalo (11%). Barilla and Divella were preferred by the 10% and the 9% of the sample respectively. Although all survey participants have a brand preference, they do not show the same degree of loyalty to what they claim to prefer. They declare themselves very loyal (hard-core loyals) to their favorite brand in 71 out of 510 (14%): they buy/eat only and always that brand. Of the remaining, 67 out of 510 (13%) say they buy/eat a little all brands (shifting loyals) and 372 out of 510 (73%) buy/eat their favorite brand and at most two or three other brands (split loyals). Most respondents are certainly concentrated in the latter category. The 68% of the sample (349) said that they usually go food shopping for themselves (53), for themselves and their partner (84), for their family (39) and for their family and children (173). Finally, in the sample, 49% of the subjects eat pasta from two to four times a week (average users), 38% five or more times a week (heavy users) and only 13% declared they eat it one time a week (light users).

In order to analyze the impact of food values, subjective norm and brand preferences on customer loyalty in the pasta food sector, it is possible to resort to Structural Equation Modeling (SEM). SEM allows us to study the complex relationships between the variables in our path model. Partial Least Squares (PLS) SEM focuses on explaining the variance in our dependent variables and might perform better than covariance-based SEM when formative constructs are involved in our framework (Sarstedt et al. 2021).

As can be seen in Figure 1, when modeling our questionnaire data, the construct related to food values (FV) was measured using a formative approach. This is consistent with what was done by Izquierdo-Yusta et al. (2022) and is further justified by the fact that a uniform pattern of high correlations was not found among the indicators considered. Indeed, in Figure 2 one can see how indicators like Genuineness, Taste and Price tended to be less correlated with the other indicators for this construct. In contrast, the indicators used to reflectively measure the other constructs showed more homogeneous correlation patterns (charts omitted).

This PLS-SEM model was fitted using the seminr R package (Hair Jr. et al. 2021). Before interpreting the results, several model checks were carried out, as suggested in Hair Jr. et al. (2021). The formative measurement model for FV was assessed in terms of convergent validity and relevance of the indicator weights. The quality of the reflective measurement models, instead, was evaluated with respect to indicator reliability, internal consistency and convergent and discriminant validity. The explanatory and predictive power of the structural model could finally be examined, yielding various insights on the research hypotheses.

Figure 1: Our path model. All constructs apart from Food Values are reflective.
The number of indicators for each concept is reported in the brackets. See Table 5 for the interpretation of path coefficients.



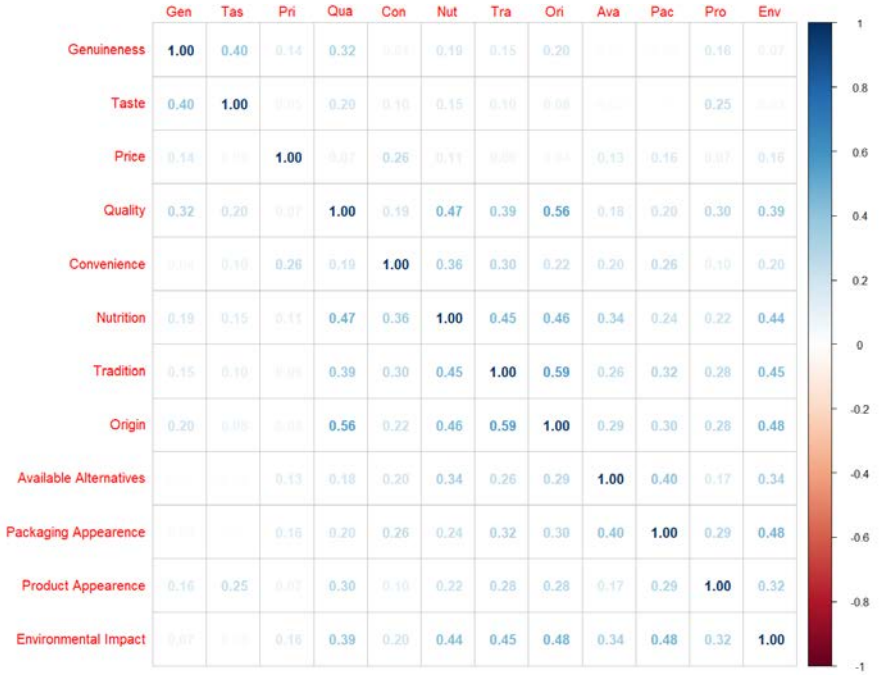


Figure 2: Correlations between the 12 indicators used to measure the FV construct.

Results. *The data analyzed consisted of 510 observations without missing values and the number of indicators underlying each construct can be retrieved in Figure 1. In Table 1, the loadings of all indicators used for reflective constructs are reported. While the reliability of the indicators was high for subjective norm (SN) and customer loyalty (CL), the cognitive and emotional attitude towards behavior (CATB and EATB) were not as effective at explaining the indicators' variance. The latter is given by the squared loadings, thus loadings lower than 0.708 imply that less than 50% of the variance of that indicator is explained by the construct. Although the Convenience item had a loading below 0.4, its removal did not lead to substantial improvements in model reliability, thus all indicators were kept for prediction. It is interesting to note that some of the indicators whose variability is best explained by CATB are connected to the concept of sustainability: Genuineness, Quality of Raw Material, Nutrition Values, Origin of Raw Material and Environmental Impact of Production.*

When it comes to the strength of the association between indicators measuring the same construct, statistics like ρ_A suggested that all reflectively measured constructs have high level of internal consistency reliability (values ranged from 0.820 to 0.885 - see Figure 3). However, the average variance extracted (AVE) was equal to 0.340 for CATB and to 0.394 for EATB, confirming how these constructs did not shine at explaining the variability of their indicators. As is visible in Table 1, this is due to the fact that only some of the many indicators measuring CATB and EATB had large loadings, which in turn may be explained by the fact that both these constructs contain two sub-constructs.

Nevertheless, the distinctions between the constructs included in the model depicted in Figure 1 found empirical support. Bootstrap confidence intervals (10000 replicates) confirmed the model's discriminant validity, with all HTMT ratios below the 0.85 threshold (see Table 2). This supports the distinctiveness of the constructs (Hair Jr. et al. 2021).

The first check for the formative construct in the model was collinearity. The highest VIF among the 12 FV indicators was 2.04, indicating that collinearity is not critical for this data. The significance of FV indicator weights was assessed via bootstrap confidence intervals (see Table 3). Eight out of twelve confidence intervals contained the value zero, suggesting that many indicators had a nonsignificant relative weight on this formative construct. However, this is often due to the fact that many indicators are being used to capture the domain of this construct and the greater their number, the lower their average weight (Hair Jr. et al. 2021). In these scenarios it is beneficial to also check the indicators' absolute contributions to the construct. For FV, these are shown in Table 4: now all bootstrap confidence intervals suggest that no absolute contribution is negligible. In addition, similarly to what happened to the loadings of the CATB reflective construct, some of the strongest contributions are given by indicators that are connected to sustainability, such as Quality of Raw Material, Nutrition Values, Origin of Raw Material and Environmental Impact of Production. This highlights how the information these two constructs bring to the model is largely related to the role played by this topic in the individuals' answers.

A preliminary step before evaluating the efficacy of our path model is to check that there is no sign of collinearity also at the level of the endogenous constructs. This is confirmed by the low VIF values for EATB (1.128 for FV and SN) and for CL (1.515 for CATB, 1.984 for EATB, 1.816 for SN).

Table 1: Loadings of all reflective indicators, arranged by construct.

Now we are ready to examine the estimated path coefficients and assess their significance via bootstrap confidence intervals: the relevant data is reported in Table 5. By looking at the lower boundaries of the confidence intervals, it is easy to see that all our seven hypotheses were confirmed: all impacts quantified by direct path coefficients were positive and significant, even though their magnitude varied. The strongest impacts were those of FV on CATB (0.577) and of SN on EATB (0.601). Since PLS-SEM standardizes the data before estimation, this means that, for example, when the score of SN increases by one standard deviation unit, the score of EATB will increase by 0.601 standard deviation units (Hair Jr. et al. 2021). FV also showed a moderate impact on SN (0.337) and EATB (0.349) and its indirect impact on CL was similar (0.302). Relatively weaker were the impacts of CATB (0.202) and EATB (0.282) on CL. Recall that these two constructs had low AVE, suggesting that there may be room for improvement in their reflective measurement models - which in turn might lead to higher path coefficients.

In terms of explanatory power (or in-sample predictive power), the R^2 coefficient of the four endogenous constructs in the model were weak to moderate: 0.113 for SN, 0.332 for CATB, 0.443 for EATB and 0.396 for CL. Another measure

of the importance of the predictor constructs in the model is given by the f^2 effect size: FV scored 0.498 on CATB, 0.128 on SN and only 0.030 on EATB, whereas SN scored 0.566 on EATB. This suggests that FV was crucial in predicting CATB, consistently with the path coefficient seen above, but not that relevant for EATB, where SN played a major role.

As regards out-of-sample predictive power, the $PLS_{predict}$ procedure was followed, as suggested in Hair Jr. et al. (2021). This procedure relies upon k-fold cross-validation to assess the accuracy of the model at predicting the indicator values of new respondents to the questionnaire. In other words, the model is estimated on a subset of the observations and used to predict the responses of the held-out individuals. A ten-fold scheme was adopted, as it is common in the literature, and the procedure was repeated ten times to alleviate the possible impact of outlying sub-samples. The error measure used was the Root Mean Squared Error (RMSE), since the empirical distribution of predictive errors looked fairly symmetric - see Figure 4; in any case, using the Mean Absolute Error (MAE) did not change the results. These measures obtained from the PLS-SEM model are compared with those from a naive linear regression (LM) model, used as benchmark. On this data, three out of the four RMSE values for the CL construct were lower when using the PLS-SEM model instead of the naive LM model, suggesting a fairly good predictive power even out of sample.

Figure 4: Distribution of the predictive errors for the responses to the four CL indicators, obtained via the $PLS_{predict}$ procedure.

Research limitations. *We have overcome one of the limitations present in our previous study (Rosato et al. 2024). In particular, a more specific statistical analysis was conducted, which allowed for a better exploration of the potential predictive capability of the framework. The path model depicted in Figure 1 and estimated with PLS-SEM on our dataset showed empirical support to the seven research hypotheses on the impact of FV, SN, CATB and EATB on CL in the pasta market. However, some methodological aspects are worth considering for future developments.*

As far as the reflective measurement side is concerned, there are some possible improvements. Both the CATB and EATB constructs scored low AVE values and many of their indicators had indeed low loadings. This can be imputed to these constructs being composed of sub-constructs, leading to a heterogeneity that affected the reliability of some indicators. Izquierdo-Yusta et al. (2022) decided to exclude all reflective indicators with loadings lower than 0.708, a choice that would have led to a large loss of information in our data set. Nonetheless, it may pay off to explore the reliability and validity of a model in which only high-loading indicators are included.

Furthermore, it should be considered that the out-of-sample predictive power of the model could be better, as its relative improvement over the naive LM model was not remarkable. It is possible that a more solid configuration of the predictor constructs, with reliability gains, may lead to more powerful models, also thanks to a wider sample size.

As mentioned, the questionnaire is still open and the research project is ongoing. Therefore, we plan in the near future to increase the sample size while improving its homogeneity, particularly regarding the variables of gender and geographic location. This will allow us to enhance the statistical analysis conducted and, hopefully, generalize the obtained results.

Managerial implications. *The research conducted aims to provide businesses with a practical tool that allows them to quantitatively and qualitatively investigate the relationship established with their customers and their concrete possibility to continue showing loyalty towards the brand. This is made possible through the use of Keller's CBBE model and the measures he suggested for assessing the constructs.*

The data collected through the questionnaire would enable marketing managers to understand the outcomes of the strategies implemented by accurately gathering customer opinions and perceptions regarding business performance. Specifically, companies would be able to detect customers' cognitive and emotional attitudes towards the brand. The

integration of the TPB also allows for a better understanding of the role of subjective norm and, consequently, how crucial it is, for example, to develop strategies that incorporate influencers and opinion leaders for their specific business or to foster positive word-of-mouth.

Moreover, the inclusion of appropriate measures to assess the significance of various sustainability-related aspects makes it possible to understand exactly what customers prioritize and their specific needs connected to this issue. This helps businesses not only to move further along the path of sustainability but also to do so in a way that strategically enhances their brand equity.

Finally, by periodically administering the questionnaire to their customers and analyzing their consumption habits, marketing managers would have access to key numerical values that could help estimate, with good accuracy, future profits generated by already acquired and loyal customers. It is worth noting that the questionnaire can be adapted to specific business needs, making it possible to replicate the analysis in different industries and for other brands, products, or services.

Originality of the paper. *The originality of the research project lies in the characteristics of the proposed framework and in the rigor applied to its design. It integrates one of the most renowned theories in the literature for predicting human behavior (TPB, Ajzen 1991) with one of the most versatile and well-integrated models for defining brand management strategies aimed at achieving brand resonance (CBBE model, Keller 2001). Furthermore, its originality stems from the proposal of new constructs deemed capable of predicting customer loyalty beyond the existing literature (Izquierdo-Yusta 2022) and from the examination of the indirect role of sustainability in achieving customer loyalty through customers' cognitive and emotional evaluations. In addition, the presence of an Italian sample is another element of novelty, along with the product we selected, which are rarely considered in similar studies.*

Key words: *customer loyalty; sustainability; PLS-SEM; CBBE model; planned behavior; brand equity*

Nutri-Score and Food Perception: Insights from an Italian Study

LEOPOLDO TRIESTE[1] ALICE CORTI[2] ORNELLA BONAFEDE[3] ANDREA BAZZANI[4]
GIUSEPPE TURCHETTI[5]

Abstract

Among the key public health policies recommended by the World Health Organization to address the global epidemic of obesity and diet-related noncommunicable diseases is the adoption of front-of-pack nutritional labels (FoPLs). These labeling systems simplify the nutritional information on packaging, making it more accessible to consumers. Their primary objectives are twofold: first, to guide individuals toward healthier food choices, and second, to encourage food manufacturers to improve the nutritional quality of their products.

Among FoPLs, Nutri-Score has emerged as the most widely used in Europe. Designed to provide consumers with a quick and intuitive assessment of a product's nutritional value, it employs a color-coded scale ranging from dark green (healthiest) to red (least healthy), accompanied by corresponding letter grades.

When evaluating such a broad public health initiative, it is crucial to consider the anthropological and sociological significance of food, which is closely tied to health, pleasure, social life, and identity. These aspects are particularly relevant in Italy, where food consumption is often seen as a shared experience rather than a mere functional necessity.

This study explores the impact of Nutri-Score on how food is evaluated by the Italian population. Specifically, it examines whether the presence of Nutri-Score on packaging influences consumers' perceptions of healthiness and the economic value they attribute to food products. Additionally, the study investigates several individual factors that may affect these perceptions, including food literacy, adherence to the Mediterranean diet, chronotype, age, gender, body mass index (BMI), level of education, participation in nutrition-related courses, self-assessment of dietary habits, and prior knowledge of Nutri-Score.

To achieve these objectives, the study employed two complementary research methodologies: an online survey with 204 participants and an eye-tracking analysis involving 53 participants. In both experimental conditions, participants were divided into two groups: one viewed images of food products labeled with Nutri-Score, while the other saw the same products without the label. This approach enabled a direct comparison of perceptual differences between the two conditions, offering insights into whether Nutri-Score influenced consumer judgments.

Findings from both methodologies consistently supported the research hypothesis: Nutri-Score does not significantly alter Italian consumers' perceptions of nutritional quality, or the value attributed to food products. Despite its widespread use and intended purpose, the label did not substantially impact on how participants assessed the healthiness or desirability of the products. Notably, interesting patterns also emerged regarding the relationship between Nutri-Score, chronotype, and perceived value.

Framing of the research. *The proliferation of non-communicable diseases has prompted the implementation of various public health strategies, with FoPLs emerging as a key tool to empower consumers in making informed dietary decisions. These labels aim to simplify nutritional information, thereby encouraging healthier purchasing behaviors and incentivizing food companies to reformulate their products for improved nutritional profiles. The World Health Organization supports the adoption of FoP labels as a crucial policy instrument in the fight against obesity and diet-related illnesses (van der Bend & Lissner, 2019). In this context, the European Commission has expressed its intention to propose a harmonized and mandatory FoPL across the European Union (European Commission, 2020).*

Among the various FoPLs, the Nutri-Score has gained considerable traction and is currently adopted on a voluntary basis in several European countries. Developed by an independent French research group, the Nutri-Score utilizes an algorithm that balances the content of nutrients to limit (energy, sugars, saturated fats, and salt) against those to favor

(proteins, fiber, and the proportion of fruits, vegetables, and legumes). This algorithm generates a summary score that translates into a five-color scale, ranging from A (dark green, indicating the highest nutritional quality) to E (red, indicating the lowest nutritional quality) (Mertz et al., 2024). This directive label aims to facilitate quick comparisons of the nutritional value of similar packaged foods (van der Bend & Lissner, 2019).

Despite the growing adoption and purported benefits of the Nutri-Score, it has also faced criticism and sparked debate. Some studies highlight potential biases in the research supporting the Nutri-Score, as many favorable results originate from its developers or affiliated researchers (Peters & Verhagen, 2024). Furthermore, the real-world impact of Nutri-Score on purchasing behavior in supermarkets appears less pronounced compared to experimental settings (Peters & Verhagen, 2022). Another issue lies in predictive validity studies, which assess Nutri-Score's impact on health. In these studies, Nutri-Score is determined retrospectively, meaning that researchers evaluate the health benefits of a diet consisting of foods with a favorable Nutri-Score. However, this does not prove that Nutri-Score itself improves consumer health (van der Bend et al., 2022).

Independent studies have pointed out limitations in the algorithm, such as its failure to account for serving sizes (van Tongeren & Jansen, 2020) and the fact that the final score assigns greater weight to "unfavorable" nutrients compared to "favorable" ones. This approach contrasts with the latest scientific evidence, which suggests that food policies should focus more on promoting the intake of beneficial nutrients rather than merely reducing those considered harmful (Afshin et al., 2019). Another critical issue is the a priori approach of classifying nutrients and foods into rigid categories of "healthy" and "unhealthy." This method contrasts with the well-established scientific view that diet quality should be assessed as a whole rather than by analyzing individual foods. While some foods have more or fewer optimal nutritional characteristics, the best strategy for preventing or managing overweight, obesity, and non-communicable diseases is based on informed food choices and a balanced combination of foods in appropriate quantities and frequencies. Oversimplifying nutrient profiling and adopting a strict dichotomy on food healthiness should be avoided (Visioli et al., 2022). Furthermore, as an interpretative rather than an informative system, the principles behind the classification are not disclosed, meaning consumers must accept it uncritically (Carruba et al., 2021). This raises concerns about the system's effectiveness in promoting informed food choices in the long run.

FoPLs are a public health measure; as such, their target is the entire population. Therefore, limiting the approach to a purely nutritional perspective would be a mistake - it is essential to also consider the sociological and anthropological dimensions of food. Eating is not just about nutrition; it is a sensory experience that brings pleasure and is essential to human life. It also holds deep symbolic value: just as food is integrated into the body through the act of eating, a shared meal becomes a ritual of social inclusion (Fishler, 1992). Food is a central aspect of collective life and personal identity, as seen in the growing popularity of dietary choices such as vegetarianism and veganism, which are not merely dietary preferences but reflections of ethical and cultural orientations. In the past, what was "good" was also considered "healthy," but today, there is a stark opposition between pleasure and health. The radicalization of these two perspectives has led to a phenomenon known as "food anomie", a state characterized by the absence of clear food norms, resulting in uncertainty and confusion in daily choices (Fishler, 1992). A measure like Nutri-Score cannot solve such a complex issue. Nutrition cannot be reduced to mere nutrient intake, and food choices are neither strictly individual decisions nor purely rational ones (Poulain, 2002). There is a utopian aspect to the contemporary individualistic tendency that assumes every person capable of self-discipline and of making consistently informed and rational decisions. In reality, consumers face immense difficulties when making food choices, as they are constantly bombarded with health and beauty messages and an overwhelming flood of nutritional advice, often contradictory and confusing. Under these conditions, the highly praised idea of rational and individual food choice, so often championed by the scientific community, seems impractical (Fischler, 2004).

This is even more relevant for Italians: nothing defines and represents Italian identity more than food (Giannetti, 2023). For the average Italian, food is synonymous of authenticity and conviviality, which is why great attention is given to ingredient quality and seasonality, with a strong emphasis on local products and regional culinary traditions. This cultural attitude is reflected in the growing interest in practices such as chilometro zero (zero-kilometer food sourcing), solidarity purchasing groups, and traditional weekly markets, as well as in full-fledged movements like Slow Food (Koensler & Meloni, 2018).

Beyond cultural factors, the perceived healthiness and value of food play a critical role in consumer purchasing decisions. When discussing perceived healthiness, it is important to bear in mind that no single food can provide all essential nutrients, which is why dietary variety is crucial (Ministerodellasalute.it). The current scientific consensus is that there is no universal definition of food healthiness, as it can vary based on individual factors such as gender, age, metabolism, obesity, illnesses, and personal sensitivities. Consequently, a nutrient-rich food that is generally considered beneficial to health may be harmful to certain individuals. For this reason, it is more appropriate to speak in terms of an overall suitable or unsuitable diet (Plasek et al., 2020). Nevertheless, consumers tend to categorize certain foods as healthy and others as unhealthy, a distinction influenced by multiple factors, including FoPLs (Plasek et al., 2020). However, no specific studies have analyzed how Nutri-Score affects Italian consumers' perception of food healthiness.

Perceived value refers to an individual's overall assessment of a product or service based on the balance between perceived benefits and sacrifices (Yuan et al., 2020). This evaluation is shaped by numerous factors, including FoPLs (Watanabe et al., 2020). A questionnaire designed to measure perceived value consists of 18 items exploring its four dimensions: functional value, emotional value, economic value, and social value (Nguyen et al., 2015). However, no research to date has specifically examined the impact of Nutri-Score on Italian consumers' perception of food value.

Purpose of the paper. *This paper aims to investigate whether Nutri-Score affects Italian consumers' evaluation of food, considering their distinct food culture. Specifically, it seeks to determine:*

- *Whether Nutri-Score influences the perceived nutritional quality of food products.*
- *Whether Nutri-Score alters the perceived value of food items.*
- *How individual factors such as food literacy, adherence to the Mediterranean diet, chronotype, age, gender, BMI, education level,* self-assessment of diet quality, *participation in nutrition courses, and prior knowledge of Nutri-Score impact consumer evaluations.*

Methodology. *This study employed a mixed-methods approach, combining an online survey and an eye-tracking analysis. This dual methodology allowed for the collection of both subjective perceptions and objective measures of visual attention towards food products with and without the Nutri-Score label.*

Online survey

Two versions of the questionnaire were created using Microsoft Forms; participants accessed them via an online hyperlink. One version presented images of 24 packaged food products without the Nutri-Score, while the other presented the same 24 products with the Nutri-Score. The product images were sourced from online supermarket websites and digitally edited to omit the brand and add the Nutri-Score when necessary. The Nutri-Score was calculated using using the algorithm available on the Nutri-Score blog (Nutri-Score.blog) and the nutritional values provided by the CREA website (Crea.it) to obtain a general score independent of specific brand values.

The questionnaire comprised nine sections: the first two contained conditional questions, which investigated whether the participant was of legal age and whether they provided informed consent regarding privacy.

In the third section, participants' level of food literacy was assessed using the Short Food Literacy Questionnaire (SFLQ) (Krause et al., 2018). Food literacy is defined as a set of knowledge, skills, and competencies that enable individuals to plan, manage, select, prepare, and consume food in a way that meets their nutritional needs and promotes a sustainable diet over time. The SFLQ consists of 12 questions based on Likert scales (ranging from "very difficult" to "very easy" or from "strongly disagree" to "strongly agree"). Scores range from 0 to 52 and allow for classification of food literacy levels as inadequate, problematic, sufficient, or excellent.

The fourth section assessed adherence to the Mediterranean diet using the Mediterranean Diet Adherence Screener (MeDAS) (Schröder et al., 2011). This questionnaire consists of 14 questions focusing on key aspects of the Mediterranean Diet: each response that aligns with Mediterranean Diet guidelines receives 1 point, with a total score ranging from 0 to 14. Based on this, participants are classified as adherent or non-adherent to the Mediterranean diet.

The fifth section included the reduced Morningness - Eveningness Questionnaire (rMEQ) (Adan & Almirall, 1991), which evaluates participants' chronotype. Chronotype reflects an individual's preference for specific times of the day for activities or rest. The questionnaire consists of five questions, with scores ranging from 4 to 25, classifying participants into evening, intermediate, or morning types.

Sections six and seven focused on the study's endpoints: perceived healthiness and perceived value. Perceived healthiness was assessed through the question, "How healthy do you think this product is?" with a five-level response scale, corresponding to the five Nutri-Score's classes.

Regarding perceived value, the standard questionnaire was not used, as it contains 18 questions that would have had to be repeated for each of the 24 food products presented, making the process excessively long and demanding for participants. Instead, based on Konuk's (2019) study, which suggests that consumers tend to assign higher prices to products they perceive as more valuable, participants were asked to estimate the cost of each food product.

In the eighth section, the following data were collected: age, gender, weight, height, education level, self-assessment of diet quality, attendance at nutrition courses, and prior knowledge of Nutri-Score.Eye-tracking

The Tobii Pro Spark eye-tracker was used to record participants' eye movements. Two experimental designs were created using Tobii Pro Lab software, mirroring the online survey: one presenting the 24 food product images with Nutri-Score and the other without.

Each participant received a brief explanation of the task, and then the instrument was calibrated. Afterwards the actual experiment began: every image was displayed for eight seconds, followed by automatic progression to the next stimulus in a randomized order. Since the Tobii Pro Lab software does not support multiple-choice responses, questions were asked verbally. This limitation led to the decision to focus solely on perceived healthiness assessment, using a rating scale from 1 to 5 - the evaluation of perceived value was deemed too cognitively demanding.

After the eye-tracking session, participants completed an online questionnaire, identical to the main survey but excluding the perceived healthiness section.

Statistical Analysis

Data analysis was performed using the statistical software "R". For continuous variables - age, BMI, numerical scores from SFLQ, MeDAS, and rMEQ, and the perceived value of food products - the Kruskal- Wallis test was applied. For categorical variables - gender, education level, participation in nutrition courses, self-assessment of diet, prior knowledge of the Nutri-Score, categorical results from SFLQ, MeDAS, and rMEQ, and perceived healthiness of food products - the chi-square test was used. Linear models were analyzed using the t-test and F-test. Data from the eye-

tracking experiment were analyzed using the Welch Two Sample t-test. Results were considered significant when the p-value was < 0.05.

Results. *The research findings from both the online survey and the eye-tracking analysis provide insights into the impact of Nutri-Score on the evaluation of food products by the Italian population.*

Online Survey Results

*A total of 204 participants completed the online survey, of which 101 completed the survey without Nutri-Score (no-NS) and 103 the one with Nutri-Score (NS). The profiling was generally homogeneous between the two groups, with the only significant difference observed in self-assessment of diet-the group that completed the no-NS questionnaire rated their diet significantly better (p-value = 0.008***). This likely results from the disparity in nutrition-specific education between the two groups, which is near the threshold of significance (p-value = 0.068): in the no-NS group, 49% of participants attended nutrition courses, compared to 35% in the NS group. One might expect food literacy to be significantly different as well, but this was not the case. A possible explanation lies in the generally higher age of the no-NS group (p-value = 0.084), which may "mask" the food literacy levels of younger participants. This hypothesis is supported by the significant negative association between age and nutrition course attendance, as well as between age and SFLQ scores.*

*As far as perceived healthiness is concerned, the NS group's responses reveal that, although the presence of the Nutri-Score might suggest that healthiness evaluations would be immediate, only 31.2% of responses assigned a healthiness level consistent with the Nutri-Score. Furthermore, trust in the Nutri-Score varied based on product classification. For products rated A or B, only 26% of participants assigned a matching healthiness rating, whereas for products rated D or E, this percentage increased to 38%. After these initial observations, we sought to answer one of the main research questions: whether the Nutri-Score influences the perception of food healthiness among the Italian population. Significant differences between the two groups were recorded for 5 out of 24 products, specifically for salmon (p-value = 0.009**), dark chocolate (p-value = 0.008**), Parmigiano (p-value = 0.023*), bell peppers (p-value = 0.022*), and walnuts (p-value = 0.037*). For the first three, which had a negative Nutri-Score, negative healthiness ratings in the NS group increased by 20% for salmon and dark chocolate and by 13% for Parmigiano. Similarly, there was an increase in positive ratings for walnuts and bell peppers, by 18% and 13%, respectively. However, given that these significant differences were limited to a small subset of products, the overall impact of Nutri-Score on perceived healthiness in the online survey was not considered substantial.*

Regarding the perception of value, a statistically significant difference between the two groups was found for only one product: walnuts, with the no-NS group attributing a significantly higher price. This isolated finding suggests that the Nutri-Score did not influence how Italian consumers estimated the price of packaged foods in this study.

Eye-Tracking Results

A separate sample of 53 participants took part in the eye-tracking experiment, of which 26 took part in the experiment without Nutri-Score and 27 in the one with Nutri-Score. *The two groups were homogeneous in terms of sociodemographic characteristics and the results of the SFLQ, MeDAS, and rMEQ questionnaires.*

Only 31.5% of responses in the NS group assigned a healthiness level consistent with the label, and the overall perception of healthiness did not significantly differ between the two groups. The analysis of gaze metrics revealed that the average number of fixations on the product (p-value = 0.070) or the average duration of these fixations (p-value = 0.550) were not significantly different between the two groups. Within the Nutri-Score group, the average number of fixations on the Nutri-Score label was significantly lower than the average number of fixations on the product itself (p-value < 0.001), suggesting that, when making healthiness judgments, participants considered the product as a whole rather than focusing on the Nutri-Score.

*By constructing a linear model with perceived value and chronotype, and considering the average price assigned by participants with an intermediate chronotype as the intercept, it was observed that in the NS group, morning-type individuals assigned a significantly higher price (p-value = 0.020), while evening-type individuals showed a tendency to assign a lower price (p-value = 0.094). In contrast, in the group without Nutri-Score, evening-type participants assigned a significantly higher price compared to the intercept (p-value = 0.014.**). This result was not correlated with other individual variables. To further explore this difference, an additional linear model was constructed, including the time at which the questionnaire was completed. It was found that in the NS group, evening-type participants completed the questionnaire significantly later. A more detailed examination of raw data showed that evening-type participants in the NS group responded on average around 6 PM, while those in the group without the Nutri-Score responded around 2 PM. Assuming that evening-type participants have lunch after 2 PM, it could be hypothesized that the perceived price is higher at 2 PM due to hunger and lower at 6 PM because they are already satiated. The relationship between the Nutri-Score, chronotype, and perceived value is particularly interesting and deserves further investigation. However, the data collected in this study are not sufficient to fully explain the observed results.*

Research limitations. *The findings of this study provide valuable insights into the impact of Nutri-Score in the Italian context; however, several limitations must be considered when interpreting the results.*

First, the sample composition is not fully representative of the Italian population. In the online survey, approximately 80% of participants were female, the average age in both methodologies was relatively low, and most

participants held advanced academic degrees. Additionally, around 40% of online survey respondents attended nutrition-related courses, which may have influenced their perceptions.

Another limitation concerns the methodologies used. Online questionnaires rely on self-reported data, which can be affected by cognitive biases or inaccuracies in recalling dietary choices. Moreover, it is not possible to fully control experimental conditions in an online setting. In contrast, the use of eye-tracking technology ensures controlled conditions but is limited in the number of variables that can be analyzed and the sample size. These two methodologies are therefore complementary, each addressing certain limitations of the other.

Finally, the study was conducted in an experimental setting using images of food products rather than a real-world purchasing environment. This artificial context may have influenced the naturalness of participants' responses and the actual impact of Nutri-Score on their consumption decisions.

Given these limitations, future research should aim to test Nutri-Score with more representative samples of the general population. Additionally, efforts should be made to enhance experimental control in online questionnaires, for example, by restricting access to desktop devices to ensure a clearer view of the presented images. Furthermore, testing Nutri-Score in real purchasing contexts would provide a more accurate understanding of its influence on consumer behavior.

Managerial implications. *The findings of this study have several potential implications for policymakers, food manufacturers, and retailers operating in the Italian market and other regions with strong culinary traditions.*

The results suggest that Nutri-Score may have a limited impact on Italian consumers' evaluations of food healthiness and value, indicating that its effectiveness as a standalone tool is questionable. Policymakers considering its mandatory adoption should recognize that relying solely on Nutri-Score, without complementary strategies, may not achieve the desired public health outcomes. Eye-tracking data further reveal that Italian consumers primarily focus on the food product itself rather than the Nutri-Score label when assessing healthiness. This suggests that intrinsic product characteristics-such as familiarity, perceived quality, ingredients, and brand (even though brands were excluded in this study)-may carry more weight than a summary nutrition label. Additionally, an unexpected finding regarding chronotype suggests a potential interplay between biological rhythms, satiety levels, and price sensitivity in shaping value perceptions. While this relationship requires further investigation, it raises interesting possibilities for retailers and marketers regarding the timing of consumer engagement with nutrition labels and pricing information. However, implementing broad market strategies based on chronotype would be challenging. Finally, the study highlights the critical role of cultural context in shaping food-related decisions. In Italy, where culinary traditions are deeply ingrained, consumers may rely less on simplified labels and more on detailed product information, origin, and preparation methods. Efforts to promote healthier eating should account for these cultural nuances, emphasizing comprehensive food education that empowers consumers to make informed choices based on multiple factors rather than a single front-of-pack label.

Originality of the paper. *This paper contributes to the existing body of knowledge on FoPLs and consumer behavior in several original ways. It addresses a gap in the literature by examining how a standardized nutrition label interacts with the Italian cultural context, where culinary traditions, local ingredients, and the social aspects of eating play a significant role in food choices. Also, the study employs a combined methodological approach, integrating an online survey with an eye-tracking analysis. This mixed-methods design offers a more comprehensive understanding of Nutri-Score's effects by combining subjective perceptions of healthiness and value with objective measures of visual attention toward both food products and the label itself.*

Key words: *Nutri-score; consumer neuroscience; Italian population; perceived healthyness; perceived value; eye-tracker; survey.*

Abstract

In this research, we provide insights into why consumers struggle to adopt high-impact sustainable behaviors in two particular domains: energy usage and food consumption. We conducted two studies using a mixed-method approach that combines quantitative and qualitative research techniques. More particularly, Study 1, an online survey with 347 Italian consumers, revealed that sustainability has a marginal relevance to consumers' decisions and behaviors and that consumers' perceptions about the pro-environmental impact and sacrifice needed to perform certain behaviors is misaligned with actual impact and effort. Study 2, consisting of 12 in-depth interviews with experts and consumers, delved deeper into consumers' perception and indicated laziness as a critical barrier to consumers' engagement in sustainable behaviors. Our findings carry significant implications for policymakers and companies regarding how to make sustainable options and solutions more accessible and easier to perform as a way to increase the salience of sustainability and overcome the cognitive barrier of laziness.

Framing of the research. *Environmental sustainability has become a priority in economic policies and corporate strategies (Goedertier et al., 2024) and encouraging consumers to engage in sustainable behaviors is an imperative (White et al., 2019). Yet some factors may still prevent consumers from engaging in such behaviors. These include the so-called attitude-behavior gap, whereby consumers do not act upon their pro-environmental attitudes, and a possible misperception of the pro-environmental impact of their environmentally friendly actions, in terms of CO_2 emission mitigation potential (Johnstone & Tan, 2015; White et al., 2019). Indeed, sustainable behaviors may substantially differ in this respect. Previous studies (Ivanova et al., 2020; Lembregts and Cadario, 2024) highlight how certain behaviors, such as reducing transportation via plane, avoiding car usage, or transitioning to plant-based diets, have significantly higher CO_2 emission mitigation potential compared other behaviors that, despite their limited pro-environmental impact, are regularly promoted among consumers (e.g., recycling; Catlin and Wang, 2013). Furthermore, behaviors with a low CO_2 emission mitigation potential have also attracted more research attention than those with higher potential (Lembregts and Cadario, 2024).*

High-impact behaviors typically face significant psychological, social, and cultural barriers. Consumers often struggle with the adoption of sustainable behaviors due to cognitive biases (Trudel and Cotte, 2009), emotional resistance (Tanțău and Gavrilescu, 2019), or future discounting (Kempton et al., 1995). Social and cultural norms can shape consumers' choices, and cultural inertia may induce people to indulge in high-consumption lifestyles, making underconsumption socially abnormal (Majer et al., 2021). In addition, misinformation and companies' greenwashing practices also contribute to distrust in environmental claims (Yadav et al., 2019), while sustainability metrics are often too technical, leading to consumer disengagement (Cadario et al., 2016; Pandalaere et al., 2011). Lastly, consumers feel constrained by external and infrastructural factors that may discourage their willingness to engage in sustainable behaviors. Examples include high perceived cost of sustainable options (Elmor et al., 2024), lack of sustainable infrastructures like charging stations for electric vehicles (Axon, 2017), and insufficient incentives (Bazerman and Hoffman, 1999). These barriers can also make consumers feel depowered even when motivated by several drivers that

could facilitate the adoption of sustainable behaviors (Casalegno et al., 2022; Doell et al., 2021; McDonald et al., 2015; Jain et al., 2021).

Purpose of the paper. *Given the aforementioned complexities, promoting sustainable consumption behaviors remains challenging for policymakers and companies. Therefore, this research aims to provide insights into why consumers struggle to adopt high-impact sustainable behaviors in two domains: energy usage and food consumption. The research contributes to explaining why consumers can be reluctant to adopt certain high-impact behaviors, despite their environmental awareness. By assessing perceived effort and mitigation impact, we identify some leverage points for increasing sustainable behavior adoption, which could inspire interventions that make sustainable behaviors more accessible, desirable and intuitive.*

Our research adopts a mixed-methods approach. More particularly, we first administered an online survey to a sample of Italian consumers (Study 1); then we conducted several in-depth interviews to triangulate the preliminary evidence from the literature review process (Study 2).

Study 1 - Methodology. *We administered a structured survey on a sample of 347 Italian consumers. Their socio-demographic profile, in terms of age (M_{age} = 43.17, SD_{age} = 13.23; 29.4% aged 18-34, 31.4% aged 35-49, 39.2% aged 50 and older) and gender distribution (51% males, 48% females, 1% third gender), was not substantially different from that of the general population of reference (ISTAT, 2024), thus ensuring an acceptable level of representativeness of the sample.*

We created two versions of an online questionnaire, one related to the energy usage domain, including some aspects related to how people use means of transportation (Ivanova et al., 2020), while the other version regarded food consumption. The questionnaire started with an open-ended question on the main motives and drivers influencing energy usage and food consumption, depending on the assigned version; two open-ended questions aimed at identifying, respectively, promotive sustainable behaviors (i.e., actions that people should do to exert a positive impact on the environment; e.g., prefer public transportation options over driving a private car) and preventive sustainable behaviors (i.e., actions that people should avoid to inhibit negative environmental consequences; e.g., avoid long-distance flights) (Winterich et al., 2024). The questionnaire also included a list of 32 items centered on 16 behaviors that, according to prior research (Ivanova et al., 2020; Lembregts and Cadario, 2024; Winterich et al., 2024), were identified as having the highest potential for CO_2 emissions mitigation. For each behavior, respondents were asked to indicate the perceived impact in terms of CO_2 emission mitigation potential, and how difficult it could be to adopt the behavior; the scores on this scale were reversed so that higher values indicated greater perceived effort. We then collected socio-demographic data (e.g., gender and age).

Study 1 - Results on energy usage. *One hundred seventy-one respondents participated in the energy usage survey. A thematic analysis was conducted by two coders (percentage of simple agreement = 93.08%; Cohen's k = 0,77 on the total motives) on the responses relative to motives and drivers that could influence consumers' choices regarding energy sources and means of transportation. The results showed that 76% of respondents cited motives unrelated to sustainability (e.g., cost, comfort, wellbeing), while only 24% mentioned sustainability-related concerns (e.g., avoiding waste, reducing environmental impact). When asked about promotive and preventive behaviors, respondents primarily mentioned low-impact, accessible actions (e.g., reducing domestic energy waste, using renewables), thus deprioritizing higher-impact but more effortful behaviors.*

Similar themes emerged in participants' rating of the perceived impact, in terms of CO_2 emission mitigation potential, and effort associated with the 16 examined behaviors (Ivanova et al., 2020; Lembregts and Cadario, 2024). Participants rated adopting active mobility like walking or cycling (M = 5.90, SD = 1.32), using renewable energy (M = 5.89, SD = 1.19), and heating from renewables (M = 5.68, SD = 1.30) as having high mitigation potential, though minimizing air travel (M = 5.08) was underestimated compared to its actual impact. Consistent with the literature (Ivanova et al., 2020), participants perceived the action of minimizing traveling by plane as having a moderately high impact (M = 5.08, SD = 1.53), despite the behavior's real higher impact. Participants then ranked the same behaviors according to the perceived effort required for adoption. Autonomous production of renewable energy (M = 4.95, SD = 1.71), the improvement of home energy efficiency through renovations (M = 4.57, SD = 1.71), and car use avoidance (M = 4.50, SD = 1.88) were perceived as the most effortful for consumers. These findings are probably associated with the accessibility of these solutions, especially in residential areas such as small villages or towns, where limited accessibility can serve as a critical barrier to adoption. A key takeaway is the misalignment between perceived impact and effort, where impactful behaviors are seen as too difficult to adopt, contributing to the attitude-behavior gap. These findings suggest areas policymakers can target to promote sustainable behaviors more effectively.

Study 1 - Results on food consumption. *One hundred seventy-six respondents participated in the food consumption survey. A similar thematic analysis on the responses relative to motives and drivers that could influence consumers' choices (percentage of simple agreement = 93.08%; Cohen's k = 0,77 on the total motives) revealed that 82% of respondents cited motives unrelated to sustainability (e.g., personal taste, nutrition, health), while only 18% mentioned sustainability-related reasons, proving once again that sustainability is not a primary driver in food choices (Winterich et al., 2024). When analyzing promotive and preventive behaviors, we found that respondents display a knowledge gap regarding high-impact CO_2 emissions mitigation strategies. Participants mostly mentioned accessible but lower-impact*

behaviors, such as preferring eco-friendly packaging when purchasing food, while high-impact behaviors like adopting a vegan diet were rarely recalled.

Respondents also showed discrepancies when dealing with the perceived impact and effort associated with sustainable food choices. They considered avoiding red meat consumption (M = 4.67, SD = 1.73), adopting a vegetarian diet (M = 4.33, SD = 1.59), following a Mediterranean diet (M = 4.20, SD = 1.47), and adopting a vegan diet (M = 4.19, SD = 1.83) as moderately impactful. Interestingly, while research indicates veganism as one of the most effective behaviors for CO_2 mitigation, adopting a vegan diet was ranked as the least impactful behavior in the domain of food consumption. However, regarding the perceived sacrifice required to engage in sustainable food consumption, respondents considered adopting a vegan diet (M = 4.70, SD = 1.89) as the most demanding behavior in terms of personal effort, while avoiding red meat consumption and adopting a Mediterranean diet were considered relatively effortless (respectively M = 3.42, SD = 1.86; and M = 2.46, SD = 1.54). The key takeaway is the misalignment between the perceived impact and sacrifice when engaging in sustainable food choices, as the most effective behaviors are also perceived as the most difficult to adopt. This discrepancy constitutes a barrier per se, thus contributing to the attitude behavior gap

Study 2 – Methodology. *To deepen our understanding of consumer attitudes toward and engagement in sustainable consumption, we conducted semi-structured, in-depth interviews (Arsel, 2017). We gathered insights from informants recruited through the convenience sample technique. Previous research has highlighted the existence of knowledge gaps between consumers and experts on sustainability regarding CO_2 emissions reduction and necessary behavioral changes to address climate change (Winterich et al., 2024). To tackle this point, we further recruited a smaller sub-sample of informants whose job, broader professional interest, and background could provide ulterior insights, less accessible to laypeople. Twelve informants constituted our final sample, eight consumers and four experts in sustainability and climate change. The mean age of informants was 37.58 years (age range: 23-63). Regarding socio-cultural characteristics, we selected individuals with different backgrounds to collect meaningful insights on the topic of interest. We conducted all the interviews between December 2024 and January 2025, upon obtaining informed consent from informants. Since our informants were Italian, we translated the verbatim responses into English while preserving their intended meanings, even when originally expressed in a different language. To decode the interviews, we performed an inductive thematic analysis (Braun and Clarke, 2006) to identify patterns (hereafter, themes) within the interviews.*

Study 2 – Preliminary insights. *Findings revealed a complex interplay between values, attitudes, subsequent behaviors, and structural constraints in sustainable consumption. Informants predominantly associated sustainability with vivid natural imagery, often contrasting it with consumerist excess. However, skepticism toward institutional practices and policies emerged, with some informants perceiving regulations and norms as performative rather than transformative. A key tension surfaced between individuals' willingness to engage in sustainable behaviors and the related perceived inaccessibility of such, driven by perceived economic barriers, cultural disbelief, and perceived lack of agency. Most informants framed sustainable choices as an ingrained habit shaped by previous experiences, others acknowledged the existence of cognitive dissonance, as they value sustainability but, at the same time, struggle to align their behaviors accordingly.*

One of the most interesting, yet under-investigated, psychological barriers to sustainable consumption that emerged from this analysis is laziness. *Informants described laziness as a threefold concept: lack of willingness to make an effort, that is, the perception of being able to make sustainable choices and, at the same time, the lack of motivation or willingness to change their rooted habits. Also, they emphasized the inherent sacrifice of adopting sustainable behavior, a sort of "*sunk cost of sustainability*", that is, a diffused belief that sustainable behaviors are inconvenient or requiring too much effort, making people less likely to adopt them. Lastly, some informants recognized their* inertia, *framed as the need for sustainable actions while finding themselves stuck in old habits due to a lack of immediate incentive to change. Especially in context of resource scarcity and ego depletion, even informed consumers default to unsustainable choices due to this intrinsic laziness. However, some informants suggested that behavior change could be facilitated through habit formation and stacking, gamification, and positive reinforcement, making sustainability more accessible and integrated into daily routines.*

Study 2 – Insights on energy usage. *When dealing with the topic of energy usage, informants exhibited varying levels of commitment, often expressing contradictions between intentions and subsequent behaviors. While some of them said that they actively transitioned to renewable energy sources, many acknowledged the existence of knowledge gaps impeding an informed decision-making process. For instance, informants often recalled the recurring barrier related to the misalignment between their willingness to shift to sustainable energy sources and the perceived feasibility of this option. While they mostly reported minor sustainable actions (such as turning off unnecessary lights at home, thus minimizing their energy consumption), they simultaneously maintained behaviors that are counterproductive to conservation efforts. A recurring theme was the prioritization of comfort over efficiency, especially reported by informants who prefer excessive indoor heating in winter, despite the waste of energy. This contradiction highlights the attitude-behavior gap, as well as the role of structural constraints (even on a perception level) in shaping consumer choices. On the other hand, experts emphasized the need for structural improvements on infrastructures to ensure a smooth transition to sustainable consumption patterns. For instance, experts stressed the importance of decentralized*

energy solutions, pointing out the potential of innovations like solar panels and microgrids to reduce reliance on fossil fuels. However, they also emphasized how individual behavior change alone is insufficient, as systemic interventions, regulatory incentives, and public awareness campaigns are fundamental for large-scale adoption. According to experts, policies should frame energy conservation as practical, convenient and desirable rather than restrictive and sacrificing, ensuring that sustainable behaviors are positioned as default instead of exceptional choices.

Study 2 – Insights on food consumption. *When dealing with food consumption, informants often view sustainability as an aspiration, deprioritized in favor of more tangible aspects of consumption, such as concern for one's personal health, convenience, and affordability. Many informants, for instance, expressed their preference for local and minimally processed foods, yet their choices were primarily motivated by health concerns rather than environmental considerations. A significant knowledge gap emerged regarding the most effective CO_2 mitigation strategies. While informants frequently recalled episodes related to the adoption of lower-impact actions (e.g., reducing plastic packaging when grocery shopping), higher-impact changes such as adopting a vegan or plant-based diet were rarely mentioned. When mentioned, higher-impact behaviors were perceived as too effortful. This misalignment between perceived impact and actual impact mirrors findings in energy conservation, as informants prioritized actions that feel actionable and easy rather than those that offer the greatest environmental benefit.*

Food choices are also impacted by economic constraints, which emerged as a major barrier to the shift to sustainable consumption patterns. Informants acknowledged the higher cost of sustainable products, limiting their ability to prioritize eco-friendly options. The dietary needs further complicated decision-making, as informants who considered themselves as environmentally conscious still felt constrained by health requirements, reinforcing the multimodal nature of sustainability barriers, consistently with the literature. On this end, experts emphasized how sustainability in food consumption extends beyond individual choices, requiring systemic changes in food production, distribution, and waste management. They also highlighted the importance of strategies such as meal planning to reduce food waste and prioritizing seasonal ingredients, considered effective approaches. However, experts also emphasized the importance of institutional interventions, considered necessary to make sustainable food practices economically viable for the majority of consumers.

Research limitations. *The two studies present some limitations that pave the way for future research. More particularly, Study 1 is limited to self-reported, correlational data. Therefore, future research could delve deeper into the role of perceived impact and effort by implementing experimental designs. Second, while our goal was to shed light on Italian consumers' attitudes and behaviors, future research could investigate samples from other populations to increase our results' generalizability. Study 2 adopted a qualitative approach that allowed us to bring intriguing constructs (e.g., laziness) to light. Future research could build on our insights to design experimental studies and then solid evidence-based interventions.*

Managerial implications. *Given the persistence of attitude-behavior gap and the misalignment between individuals perceived and actual mitigation potential through their behavior, organizations could design interventions that are able to bridge that gap, thus enhancing consumer engagement in sustainable behavior. From a company perspective, reframing sustainability as effortless and desirable is a key lever. As proved by our two investigations, consumers default to convenient choices, therefore sustainable options should be framed as significantly more accessible and rewarding. Moreover, and in a related vein, businesses need to bridge the gap between perceived sacrifice and impact by educating consumers on the actual environmental benefits of their choices, while simultaneously lowering the perceived barriers through effective communication. Given the role played by laziness in creating ingrained behaviors based on inertia, companies could leverage behavioral nudges, habit formation and staking, and gamification to encourage incremental changes and help consumers visualize environmental progress. Also, tackling consumer skepticism is necessary to contrast greenwashing concerns and improve trust. Brands, in particular, should ensure transparency through accessible, clear, science-backed sustainability metrics, also partnering with authoritative third parties (e.g., associations supporting environmental actions, experts, and figures like popularizers) who can authentically communicate environmental commitments and facilitate consumers' understanding of their actions' impact.*

Based on our findings, addressing economic and structural changes is also crucial, as affordability and feasibility still remain major constraints. Policymakers need to align sustainability incentives with consumer priorities, thus making sure that financial and infrastructural interventions facilitate behavioral transitions. For instance, regulatory bodies could support consumers with short-term interventions like subsidies or tax incentives, to allow them to smoothly transition to sustainable options while ingraining sustainable behaviors in their routine. Moreover, large-scale communication campaigns, supported by media and opinion leaders, could drive a broader change in societal norms by framing sustainable consumption patterns as aspirational and desirable, rather than as obligations to which we must conform. Investment in infrastructures (such as expanding public transportation network, increasing in number vehicle charging stations, and supporting local food supply chains) is essential to remove practical barriers and to enhance the (perceived) accessibility and affordability of sustainable options.

Lastly, a holistic approach is more than necessary. Companies should aim at simplifying and normalizing sustainable consumption, while policymakers should create the systemic conditions that make sustainability the default choice, thus bridging the gap between sustainability ideals and real behaviors and making sustainable consumption an effortless practice.

Originality of the paper. *This study extends existing literature by focusing on high-impact sustainable behaviors and exploring the cognitive and structural barriers that prevent their adoption. By integrating different research methods, this study provides a comprehensive understanding of consumer sustainable decision-making.*

Keywords: *sustainability; sustainable consumption behavior; CO2; mitigation; energy usage; food consumption.*

Does seniors' co-creation enhance acceptance of digital public services? A conceptual model

ANGELA CARIDÀ[1] NICOLA VARRONE[2] BEATRICE BELLASSI[3]

Abstract

The rapid digitalization of public services, accelerated by the COVID-19 pandemic and driven by the EU's Digital Decade targets, has intensified the risk of digital exclusion for older adults, who frequently face cognitive, physical, and digital literacy barriers. This study proposes a conceptual model that integrates value co-creation theory with technology acceptance frameworks to explore how participatory service design can support senior citizens' adoption of digital public services. We argue that co-creation may reduce technology anxiety, enhance perceived social support and digital self-efficacy, and positively influence perceived usefulness (PU) and ease of use (PEOU)-key determinants of technology acceptance. By reframing older adults as active participants in service development, the model addresses a critical gap in public service design literature. It offers a theoretical foundation for investigating how participatory approaches can promote more accessible and responsive digital services.

Framing of the research. *The digitalization of public services has undergone rapid and transformative acceleration, particularly in response to the COVID-19 crisis. Far from being a purely technological shift, this evolution reconfigures the relationship between governments and citizens, positioning digital public service delivery as a core mechanism of welfare provision.*

Within this broader evolutionary trajectory, the EU's Digital Decade Initiative has set a clear objective: to ensure full online accessibility of all essential public services by 2030 (Virnandes et al., 2024). Yet, the success of this agenda depends not only on infrastructure and technological capacity but also on the extent to which digital systems promote equitable access and avoid deepening social divides (Virnandes et al., 2024; Vilpponen et al., 2020).

Older adults are especially at risk of exclusion in this context. They often face intersecting challenges, including physical limitations, cognitive decline, and low levels of digital literacy (Chan and Chen, 2014; Wu et al., 2025). These are further exacerbated by psychological barriers such as anxiety around technology use, diminished confidence, and limited access to support networks (Chan and Chen, 2014). Poor interface design, low usability, and inadequate accessibility standards contribute to these difficulties (Charmarkeh, 2017), particularly in domains where digital interaction is not optional but required-such as healthcare, welfare, or taxation. In such cases, the digital shift risks marginalizing those least equipped to navigate it (Lee and Coughlin, 2015).

The urgency of addressing this risk is heightened by Europe's demographic outlook. According to Eurostat (2024), individuals aged 65 and over are projected to represent nearly 30 percent of the EU population by mid-century, with the 80-plus segment growing even more rapidly. While recent policy frameworks have recognized the need for inclusive, user-centred service design (OECD, 2022), implementation across Member States remains uneven. For example, Italy continues to underperform on key digitalization metrics, with service availability and citizen uptake significantly below the EU average (European Commission, 2023).

In response to these systemic gaps, a growing body of scholarship identifies value co-creation as a promising lever for public service inclusion (Acar et al., 2023; Rodríguez Müller et al., 2021; Voorberg et al., 2015). By involving users directly in the design, implementation, and evaluation of public services, co-creation may enable more responsive and equitable systems-especially for marginalized or digitally excluded groups. Among older adults, participatory approaches are associated with increased perceptions of usefulness, enhanced digital confidence, and stronger alignment between services and everyday needs (Mergel et al., 2025; Morte-Nadal and Esteban-Navarro, 2025). Recognized in major policy frameworks (OECD, 2022), co-creation is increasingly framed as an operational principle of inclusive digital transformation.

Despite its conceptual appeal and growing policy recognition, the actual impact of co-creation in digital public service delivery remains insufficiently substantiated. As highlighted by Voorberg et al. (2015), empirical evidence on the effectiveness of co-creation is mixed, and many of its assumed benefits remain theoretically compelling but empirically

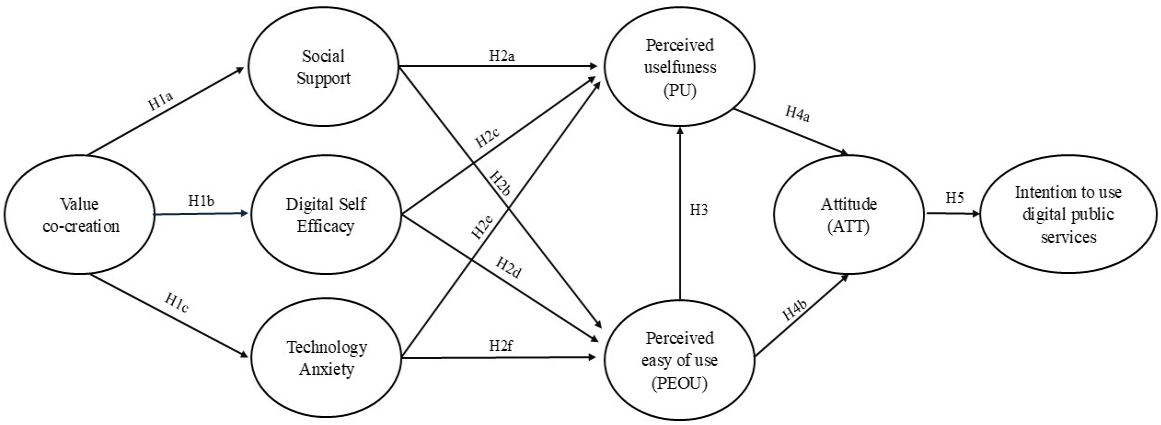
DOI 10.7433/SRECP.SP.2025.01

underexplored. This underscores the need for deeper conceptual inquiry into the conditions under which co-creation can meaningfully contribute to more accessible and age-inclusive digital services.

At the same time, research on e-government and public service adoption has largely relied on established technology acceptance models, including the Theory of Reasoned Action (Ajzen, 1991), the Technology Acceptance Model (TAM) (Davis, 1989), and its extensions-TAM2, TAM3 (Venkatesh and Davis, 2000; Venkatesh and Bala, 2008), and UTAUT (Venkatesh et al., 2003).

To address these limitations, the Senior Technology Acceptance Model (STAM) (Chan and Chen, 2014) expands the traditional framework by incorporating psychosocial variables-including technology anxiety, self-efficacy, and social support-offering a more realistic account of older adults' digital engagement. Building on STAM, this study explores how these psychological dimensions can be influenced by participatory design processes. Specifically, it conceptualizes co-creation as a potential mechanism for mitigating psychological barriers and enhancing older adults' acceptance of digital public services (Rodríguez Müller et al., 2021; Voorberg et al., 2015).

Purpose of the paper. *This study engages with a timely research priority in public service innovation by proposing a conceptual model that explores how co-creation may influence older adults' adoption of digital public services. The model brings together insights from value co-creation theory (Vargo and Lusch, 2008; Vargo et al., 2020) and technology acceptance frameworks-most notably the TAM (Davis, 1989) and the STAM (Chan and Chen, 2014).*



The core objective is to examine whether, and to what extent, involving older adults in co-creation processes can reduce technology-related anxiety, enhance digital self-efficacy, and improve perceived usefulness (PU) and perceived ease of use (PEOU)-key antecedents of technology acceptance. In this way, the model repositions older users not merely as recipients of digital services but as active contributors to their design and delivery, shifting the focus from provider-led digitalization to participatory inclusion.

Methodology. *This explanatory study develops an integrative conceptual model that links value co-creation processes (Vargo and Lusch, 2008; Vargo et al., 2020) with established technology acceptance frameworks (Davis, 1989; Venkatesh et al., 2003; Chan and Chen, 2014), focusing on older users of digital public services. The model emerges from a critical synthesis of interdisciplinary literature in public administration, service management, and information systems. It positions co-creation as a potential mechanism for reducing psychological barriers-such as technology anxiety, low digital self-efficacy, and limited social support-and explores their role in shaping perceptions of usefulness, ease of use, and adoption intention among elderly people. This form of theory-building is consistent with prior conceptual contributions that seek to integrate fragmented insights and identify pathways for empirical validation (Tarhini et al., 2016).*

The conceptual model developed in this study serves as a foundation for future research and hypotheses testing. In particular, future methodological developments include the direct involvement of older adults through the administration of surveys and interviews. The information and data collected will be used to test the research hypotheses using structural equation modelling. In this regard, Appendix A presents a preliminary version of the survey that we intend to administer to measure the main constructs of the conceptual model, which will be used to test the research hypotheses. Each construct is measured using items adopted from prior studies and revised to align with the objectives of the current research.

Research model and hypotheses development. *Building on the conceptual foundations outlined above, figure 1 presents the proposed model, which is followed by the formulation of research hypotheses.*

Fig. 1: The conceptual model

Co-creation and psychological barriers

The effect of co-creation on social support

Co-creation takes place in socially embedded environments where users interact, exchange knowledge, and collaborate in solving problems (Vargo et al., 2008). Such collaborative settings in public service contexts strengthen social skills through sustained interactions with professionals and peers (Acar et al., 2023; Edelmann, 2022; Mergel et

al., 2025), and contribute to a stronger perception of being supported and guided-particularly among users who may experience isolation or uncertainty in digital environments (Farr, 2019). These interactions foster belonging, reciprocity, and emotional connection, which are widely recognized as core components of perceived social support (Liu et al., 2020). Park et al. (2019) conceptualize social support as an operant resource that becomes activated (Zimmerman, 1951) through co-creative engagement in online service environments. Referring to the typology developed by Cutrona and Russell (1990), the authors identify emotional, informational, esteem-based, and network-related support as distinct forms of social value that are not inherent to the service itself but emerge progressively through user participation. These resources represent a key experiential outcome of value co-creation. Based on this evidence, we hypothesize that co-creation positively influences perceived social support.

H1a. Co-creation reinforces perceived social support.

The effect of co-creation on digital self-efficacy and technology anxiety

Co-creation is further expected to empower citizens by providing a platform to voice their needs, contribute to service improvements, and actively participate in decision-making processes (Jo and Nabatchi, 2018). This approach is particularly valuable for vulnerable groups, as it supports capacity-building and facilitates technology adoption when accompanied by appropriate professional support (Verschuere et al., 2018): when resourceful and vulnerable citizens collaborate in co-creation, it promotes inclusivity and helps reduce digital exclusion (Robert, et al., 2020; Verschuere et al., 2018).

Acar et al. (2023) show that co-creation fosters self-development by engaging citizens in learning processes related to service design and implementation. Park et al. (2019), instead, emphasize its role in enhancing self-efficacy and stimulating the generation of new ideas. These experiences enhance users' sense of competence and control in digital environments.

Moreover, public service co-creation typically unfolds in socially supportive learning contexts where users can ask questions, receive feedback, and gain reassurance (Verschuere et al., 2018; Robert et al., 2020). The presence of professional guidance and peer interaction contributes to lowering emotional barriers and increasing users' confidence in using digital tools.

Therefore, we expect that co-creation, by enhancing capacity and psychological readiness, will increase digital self-efficacy and reduce technology anxiety.

H1b. Co-creation reinforces digital self-efficacy.

H1c. Co-creation reduces technology anxiety.

Psychological barriers and PU and PEOU

The effect of social support on PU and PEOU

Social support-whether provided by family members, peers, or institutional programs-has been widely recognized as a key facilitator of technology adoption among older adults (Chen and Chan, 2014; Czaja et al., 2018; Vaportzis et al., 2017). Support systems assist seniors in navigating digital environments, resolving technical challenges, and building digital literacy, thereby alleviating technology-related anxiety and enhancing digital self-efficacy (Kim and Yang, 2024).

Empirical research indicates that social support has a positive influence on both PU and PEOU by offering practical assistance and emotional reassurance (Czaja et al., 2018). Song et al. (2022) found that seniors who received help from family members or caregivers were more likely to perceive digital health services as useful and user-friendly, underlining the value of intergenerational digital support. Similarly, Meijer (2012) showed that community-based digital training initiatives reduce resistance to e-government platforms by building trust and increasing digital confidence.

Based on this evidence, higher levels of social support are expected to enhance older adults' confidence in using digital platforms, reduce anxiety, and facilitate more positive evaluations of public e-services, thereby increasing both PU and PEOU (Chen and Chan, 2014).

H2a. Social support positively influences PU.

H2b. Social support positively influences PEOU.

The effect of self-efficacy on PU and PEOU

Digital self-efficacy refers to an individual's confidence in their ability to effectively use technology (Davis et al., 1989). It is a key determinant of PEOU, as individuals with greater confidence in their technological abilities tend to perceive digital systems as more intuitive and less cognitively demanding (Venkatesh and Davis, 2000). Davis et al. (1989) argue that PEOU is partially derived from self-efficacy, given that confident users require less effort to learn and operate digital technologies.

Empirical evidence supports this relationship in the context of digital public services. Wu et al. (2024) found that seniors with higher digital self-efficacy were significantly more likely to perceive e-government platforms as both useful and easy to use. Similarly, Song et al. (2022) identified self-efficacy as a mediating factor in enhancing PEOU in digital healthcare services, highlighting the effectiveness of structured training programs. Public service research further confirms that self-efficacy-enhancing interventions-such as digital literacy initiatives, interactive tutorials, and peer mentoring-can strengthen confidence and motivation among older users (Meijer, 2012; Rodríguez Müller et al., 2021).

Based on this evidence, higher digital self-efficacy is expected to positively influence PU and PEOU.
H2c. Digital self-efficacy positively influences PU.
H2d. Digital self-efficacy positively influences PEOU.

The effect of technology anxiety on PU and PEOU

Technology anxiety refers to the discomfort or apprehension individuals experience when interacting with digital systems (Meuter et al., 2003; Curran et al., 2003). Among older adults, this anxiety is often intensified by unfamiliarity, fear of making irreversible mistakes (Renaud and Ramsay, 2007; Wu et al., 2024), and concerns about privacy breaches or identity theft (Vaportzis et al., 2017).

As highlighted by Guner and Acarturk, C. (2020), increased anxiety elevates the perceived effort required to use a system, thereby reducing PEOU. Empirical studies confirm this relationship: technology anxiety discourages interest in digital tools (Wu et al., 2024), amplifies perceived complexity (Al-Hujran et al., 2015), and creates cognitive overload during digital interactions (Song et al., 2022). For example, Phang et al. (2006) found that older adults with high technology anxiety perceived online public services as more difficult to navigate, leading to lower engagement.

Importantly, beyond its detrimental effect on PEOU, technology anxiety also exerts a negative influence on PU. When individuals experience high levels of anxiety in digital contexts, they are less inclined to perceive such technologies as beneficial or capable of enhancing task performance. This effect is not limited to operational discomfort but extends to a broader skepticism regarding the actual value of digital solutions. Prior research has shown that users affected by anxiety often question the relevance and efficacy of technology in meeting their needs (Venkatesh and Bala, 2008), thereby weakening both acceptance and integration.

Given this evidence, technology anxiety is expected to negatively influence PU and PEOU.
H2e: Technology anxiety negatively influences PU.
H2f: Technology anxiety negatively influences PEOU.

PU, PEOU and attitude

The effect of PU on PEOU

Studies applying the TAM and its extensions consistently emphasize the strong relationship between PEOU and PU, both of which influence attitude toward technology adoption in e-government and digital public service contexts (Al-Hujran et al., 2015). Furthermore, PEOU is expected to have a direct impact on PU, as services perceived as easy to use are more likely to be considered useful (Venkatesh and Bala, 2008).

H3: PEOU positively influences PU.

The effect of PU and PEOU on attitude

While early versions of the TAM proposed attitude as a central mediator between PU, PEOU, and behavioral intention (Davis et al., 1989), subsequent revisions questioned its necessity. In contexts where technology use is instrumental-such as workplace settings-individuals may adopt systems for pragmatic reasons, regardless of their personal preference (Davis and Venkatesh, 1996). Accordingly, Venkatesh and Davis (2000) and Venkatesh et al. (2003) refined TAM by removing attitude, positing a direct relationship between PU and intention, particularly when performance gains are prioritized.

However, in more discretionary contexts, attitude remains a relevant predictor of intention. Yang and Yoo (2004) conceptualize attitude as comprising both affective (emotional response) and cognitive (rational evaluation) dimensions. When the cognitive component is dominant-as in the evaluation of e-government services-attitude plays a significant role in shaping behavioral intentions. Empirical evidence supports this claim: Yang and Yoo (2004) and Al-Hujran et al. (2015) found that both PU and PEOU positively influence user attitudes toward public digital services, which in turn shape their intention to use them.

H4a. PU positively influences attitude toward digital public services.
H4b. PEOU positively influences attitude toward digital public services.
H5. Attitude positively influences intention to use digital public services.

Research limitations. *This research advances a conceptual model that, while theoretically sound, has not been empirically tested, marking its main limitation. The proposed relationships-such as co-creation's impact on digital self-efficacy and technology anxiety-are anchored in prior research (Acar et al., 2023; Verschuere et al., 2018), but demand empirical scrutiny to substantiate their validity, a challenge resonant with earlier critiques of co-creation's measurable effects (Voorberg et al., 2015). The model also presumes a general ability among older adults to engage in co-creation, potentially overlooking disparities in physical, cognitive, or socioeconomic circumstances that might hinder participation (Lee and Coughlin, 2015). While it nods to regional variations, such as Italy's lagging digital service uptake (European Commission, 2023), it does not fully unpack these differences, limiting its broad applicability.*

Moreover, it sidesteps potential reluctance from service providers to embrace participatory methods, a dynamic that could obstruct practical deployment (Mergel et al., 2025). As a preliminary framework, it establishes a basis for further exploration rather than a conclusive resolution.

Managerial implications. *While this study does not provide empirical validation, the proposed conceptual model offers an initial framework for reflecting on the potential of co-creation to address psychological barriers and foster technology acceptance among older adults. If future research confirms its effectiveness, co-creation could become a critical lever for improving the accessibility and perceived relevance of digital public services for seniors-particularly in a policy landscape shaped by demographic aging and increasing digitalization.*

For policymakers and service designers, this model serves as a prompt to critically assess current assumptions about the universality of user needs and the effectiveness of participatory approaches. Although OECD frameworks emphasize co-creation as a core principle for inclusive digital service delivery (OECD, 2022), its actual value for older populations remains an open empirical question. Should future studies demonstrate limited or no impact, it would suggest the need to reconsider the role of co-creation in this context and potentially redirect efforts toward other strategies-such as tailored digital literacy programs, assistive technologies, or enhanced support infrastructures.

At the same time, if validated, this model could guide the development of more inclusive service design practices that move beyond consultation to embed older adults as active participants in the conception of digital services. In this scenario, interventions such as participatory design workshops, peer support networks, or co-learning communities could play a pivotal role in translating the promise of co-creation into measurable outcomes in terms of engagement, trust, and adoption.

In sum, the model encourages a more critical and evidence-based application of co-creation in the digital public sector. Rather than assuming its universal efficacy, it calls for an adaptive approach that aligns design strategies with the specific barriers and needs of older users.

Originality of the paper. *This study makes an original contribution by integrating value co-creation theory with technology acceptance models to examine digital public service adoption among older adults. While existing frameworks emphasize individual cognitive and usability factors, this model introduces co-creation as a contextual enabler that reduces technology anxiety, enhances digital self-efficacy, and reinforces perceived social support. By reframing seniors as co-creators of value rather than passive users, the study expands the STAM and addresses a key gap in public service literature concerning inclusive service design. The study contributes to service design theory by offering a multidimensional perspective that connects participatory approaches to key drivers of technology acceptance, thereby advancing the understanding of how co-creation can support equitable and age-responsive digital transformation.*

PB6 While using digital public services, I can be patient with the system. CB1 I informed the staff when I had useful ideas on how to improve digital public services. CB2 I evaluated their services when digital public services provided me with good service. CB3 I informed the staff when I encountered problems in using digital public services. CB4 I shared with others about the pleasant experience of using digital public services. CB5 I helped other users when they encountered problems in using digital public services. CB6 I gave suggestions to other users when they used digital public services.
Digital self efficacy	Kumar et al. (2023)	DSE1 I think that I do not have enough capability to use digital public services. DSE2 I do not have the confidence to use digital public services. DSE3 I do not feel comfortable using digital public services.
Technological anxiety	Jon Chao et al. (2012)	TA1 When using new digital public services, I worry that I might break them. TA2 When using new digital public services, I worry that pressing the wrong buttons might cause the system to freeze or accidentally delete important data. TA3 Operating new digital public services makes me anxious or uncomfortable.
Perceived social support	Zimet et al. (1988)	PSS1 There is a special person who is around when I am in need. PSS2 There is a special person with whom I can share my joys and sorrows. PSS3 My family really tries to help me. PSS4 I get the emotional help and support I need from my family. PSS5 I have a special person who is a real source of comfort to me. PSS6 My friends really try to help me. PSS7 I can count on my friends when things go wrong. PSS8 I can talk about my problems with my family. PSS9 I have friends with whom I can share my joys and sorrows. PSS10 There is a special person in my life who cares about my feelings. PSS11 My family is willing to help me make decisions. PSS12 I can talk about my problems with my friends.
PU	Davis (1989a)	PU1 Using digital public services would enhance my productivity. PU2 Using digital public services will make me more effective. PU3 Digital public services will facilitate my daily tasks. PU4 The use of digital public services is valuable for citizens.
PEOU	Davis (1989a)	PEOU1 Using digital public services requires little mental effort. PEOU2 I can easily set up and personalize digital public services. PEOU3 My interaction with digital public services is clear and understandable. PEOU4 Digital public services are easy to use.
ATT	Venkatesh (2003)	ATT1 Using digital public services is a good idea. ATT2 Digital public services make my tasks more efficient. ATT3 Digital public services are user-friendly. ATT4 I like using digital public services.
Behavioral intention of use	Wong (2015)	BI1 I intend to use digital public services in the future. BI2 I predict I will use digital public services regularly. BI3 I plan to use digital public services for my needs.

How Artificial Intelligence in Advertising Impacts Consumer Perceptions of Brand Authenticity

ALBACHIARA MATTEUCCI[1] ANGELO BACCELLONI[2]

Abstract

Artificial Intelligence (AI) is transforming the advertising industry, raising important questions about its impact on brand authenticity. This study examines how AI-driven advertising affects consumer perceptions of authenticity, using focus groups to explore consumer attitudes. The findings reveal that transparency in AI use plays a crucial role in maintaining brand authenticity-brands that openly disclose AI involvement reinforce credibility and strengthen consumer trust. When used ethically and responsibly, AI has the potential to enhance rather than undermine authenticity. However, this effect is shaped by factors such as clear communication, consumer awareness, and alignment with brand values..By bridging AI-driven advertising with existing literature on brand authenticity, this research advances the discussion on responsible AI integration in marketing. It highlights the need for clear regulations to prevent deceptive practices and positions AI as a tool for ethical innovation rather than a threat to authenticity.

Framing of the research. *Artificial Intelligence has become an integral part of business strategies across industries, with advertising being one of the most profoundly impacted sectors. The integration of AI into advertising is accelerating at an unprecedented pace, driven by the ability of machine learning algorithms to process vast amounts of consumer data, predict behavioral patterns, and generate hyper-personalized marketing content (Kietzmann, Paschen, and Treen 2018). AI's growing role in advertising enables real-time optimization of campaigns, automated content creation, and enhanced targeting precision, significantly increasing efficiency and cost-effectiveness for brands (Malthouse et al. 2019).*

As AI-generated content becomes more sophisticated, the boundaries between human-created and machine-generated communication are becoming increasingly blurred (Kaplan and Haenlein 2019). The rise of AI-driven copywriting, visual content production, and synthetic influencers challenges traditional notions of creativity, authorship, and authenticity in advertising. Consumers are now frequently exposed to advertisements, social media posts, and brand interactions that may have been entirely designed by AI, often without their knowledge. This has led to growing concerns regarding transparency, consumer trust, and the perceived authenticity of AI-generated brand messaging (Davenport et al. 2020).

The ability of AI to simulate human creativity and emotional resonance raises critical questions about its impact on consumer perception. Authenticity has long been recognized as a key driver of consumer trust, brand loyalty, and emotional engagement (Morhart et al. 2015; Napoli et al. 2014). Consumers tend to favor brands that are perceived as genuine, transparent, and aligned with their values (Beverland 2009). However, the increasing reliance on AI in advertising presents a paradox: while AI allows brands to deliver hyper-personalized content at scale, it also removes the human element that traditionally underpins authenticity (Fritz, Schoenmueller, and Bruhn 2017). This has led to skepticism among consumers, who question whether machine-generated brand narratives can evoke the same emotional depth and credibility as human-created content (Wu and Wen 2021).

The implications of this shift are both theoretical and managerial. From a consumer behavior perspective, research suggests that trust in advertising is contingent on perceived transparency, credibility, and emotional relatability (Chaudhuri and Holbrook 2001). If AI-generated advertising is perceived as overly artificial, inauthentic, or manipulative, consumers may disengage, leading to decreased brand trust and loyalty (Campbell et al. 2022). Conversely, when AI is used transparently and ethically, it has the potential to enhance brand engagement by providing consumers with highly relevant and personalized experiences (Wu and Wen 2021).

From a managerial standpoint, the challenge for brands is twofold: how to leverage AI to enhance advertising efficiency without eroding authenticity and consumer trust, and how to integrate AI-driven strategies while maintaining transparency in brand communication (Davenport et al. 2020). Failing to address these challenges could lead to consumer skepticism, reputational risks, and diminished long-term brand equity (Beverland 2009). Research on AI ethics in advertising suggests that consumers react negatively when they feel misled or manipulated by AI-driven content, particularly when AI use is concealed or its impact is exaggerated (Fritz, Schoenmueller, and Bruhn 2017). This

DOI 10.7433/SRECP.SP.2025.01

highlights the necessity for brands to establish clear AI disclosure strategies, ensuring that consumers understand the extent of AI's involvement in advertising content creation (Kaplan and Haenlein 2019).

This research aims to address this critical gap by investigating how AI-generated advertising influences consumer perceptions of authenticity. Despite AI's rapid adoption in marketing, academic research remains limited in examining its impact on brand authenticity. Most existing studies have focused on AI's role in programmatic advertising, targeting, and campaign automation (Qin and Jiang 2019), as well as consumer reactions to AI-generated content in isolated contexts (Wu and Wen 2021). However, a crucial gap in the literature persists regarding the long-term implications of AI on brand authenticity and consumer trust (Fritz, Schoenmueller, and Bruhn 2017). While it is well-documented that authenticity plays a vital role in brand-consumer relationships, little is known about whether AI-generated advertising can sustain authenticity or if it inherently dilutes it (Morhart et al. 2015). Using a qualitative approach, the study examines whether AI enhances or hinders authenticity and explores the role of transparency and ethical AI use in mitigating potential consumer skepticism. The findings contribute to both academic research and managerial practice by offering new insights into the intersection of AI, brand authenticity, and consumer trust. The study provides theoretical contributions by bridging AI research with brand authenticity literature and offers practical guidance for marketers navigating the complexities of AI-driven brand communication.

The article is structured as follows: first, it reviews the literature on AI in advertising and brand authenticity; next, it outlines the research methodology and presents key findings; finally, it discusses managerial implications, limitations and proposes future research directions.

Purpose of the paper. *While prior research has extensively examined AI's technical capabilities in advertising-such as automation, targeting precision, and engagement optimization (Kietzmann, Paschen, and Treen 2018; Malthouse et al. 2019)-its impact on perceived authenticity remains largely unexplored. Authenticity is a crucial factor in shaping consumer responses to advertising, influencing brand perception and long-term engagement. However, as AI-generated advertisements become more prevalent, concerns arise about whether they can maintain the sense of originality, emotional depth, and consistency traditionally associated with authentic brand communication.*

Existing research on advertising effectiveness has emphasized the importance of informativeness, credibility, and emotional engagement in shaping perceived authenticity (Richards and Curran 2002; Pollay and Mittal 1993; Lutz, MacKenzie, and Belch 1986). Yet, these findings have not been fully applied to AI-created content. While early studies suggest that AI-driven advertising is valued for its efficiency (Wu and Wen 2021), others highlight its potential to feel impersonal or inauthentic (Sundar 2008). This tension raises critical questions: Can AI-generated advertising replicate the authenticity consumers expect from brands? If so, under what conditions does AI enhance or undermine authenticity?

Brand authenticity has traditionally been linked to human creativity, emotional storytelling, and alignment with core brand values (Fritz, Schoenmueller, and Bruhn 2017; Rose and Wood 2005). However, as AI increasingly mediates brand communication, it remains unclear whether it can uphold these qualities. While studies on brand engagement and consumer perceptions suggest that authenticity plays a vital role in fostering strong brand relationships (Beverland 2009; Morhart et al. 2015), the implications of AI-driven advertising for authenticity perceptions have yet to be fully understood.

To address this gap, this study examines how AI-generated advertising influences consumer perceptions of brand authenticity. Specifically, it investigates whether AI can enhance or compromise authenticity and identifies the conditions under which brands can integrate AI without eroding consumer confidence in their authenticity. By focusing on this emerging challenge, the study contributes to the growing discourse on AI in advertising, offering new insights into the evolving relationship between AI, branding, and authenticity.

RQ: How does AI-generated advertising shape consumer perceptions of brand authenticity, and under what conditions is AI perceived as enhancing or diminishing authenticity?

Methodology. *This study adopted a qualitative approach to explore consumer perceptions of AI in advertising, particularly given the limited existing research on this topic. Focus Groups were chosen as the most suitable method for capturing in-depth consumer insights. This method enables interaction between participants, leading to the spontaneous emergence of themes that may not surface in individual interviews (Bell, Bryman, and Harley 2022).*

Four Focus Groups, each consisting of six participants, were conducted, with participants selected based on two key criteria: age (18 to 60 years) and background in Marketing or Management. This selection was guided by two assumptions: younger individuals are generally quicker in adopting technology, while those with a Marketing or Management background possess greater expertise in advertising. The Focus Groups were structured to ensure a balanced representation of perspectives, distinguishing between participants with and without marketing expertise.

The discussions followed a semi-structured format, covering key themes such as Advertising, AI in Advertising, Transparency in Brand Communication, and Brand Authenticity. Participants were encouraged to engage with open-ended, probing, and funnel questions, designed to elicit deeper responses and guide the conversation naturally. Leading questions were minimized to avoid bias, while follow-up probing techniques were used to encourage participants to elaborate on their thoughts. Before the Focus Groups, participants were contacted via message and telephone to confirm eligibility based on the selection criteria. Once confirmed, they received an official invitation via email with a Microsoft Teams link for the session. Prior to participation, they were sent an informed consent form detailing the study's purpose, voluntary participation, confidentiality measures, and the right to withdraw at any time (Bell, Bryman, and Harley 2022).

Participants were also informed that the discussions would be recorded (both audio and video) to ensure accurate transcription and analysis. The moderator ensured that all participants felt comfortable and understood the study's objectives before the discussion began.

Each Focus Group followed a structured yet flexible discussion guide to ensure consistency while allowing for organic interactions. The session began with an introduction to the research topic, after which participants introduced themselves and shared their general opinions on AI and advertising. The discussion unfolded in different phases, beginning with an exploration of general perceptions of AI, where participants were asked about their understanding of AI, its role in society, and their attitudes toward AI-generated content. The conversation then shifted to AI's role in advertising, including its advantages, concerns, and ethical implications. Participants then watched a commercial advertising without being informed that it was AI-generated and shared their impressions, discussing elements such as emotional engagement, credibility, and perceived effectiveness. Once the AI involvement was revealed, participants re-evaluated their initial impressions, reflecting on how this information influenced their perception of the ad, brand authenticity, and trust. The final part of the discussion focused on transparency in brand communication, AI's impact on authenticity, and the extent to which AI can coexist with genuine brand messaging. Throughout the discussion, the moderator employed probing techniques to explore underlying attitudes and beliefs, ensuring that participants elaborated on their responses. Funnel questions were used to guide participants from broad generalizations to more specific reflections on AI's impact on branding. Open-ended questions encouraged unrestricted responses, allowing participants to voice concerns, personal experiences, and expectations.

At the end of each Focus Group, participants were thanked for their contributions and informed about the next steps in the research. They were given the opportunity to provide additional comments or clarifications. As a small incentive, participants were offered a follow-up summary of the research findings upon request. To ensure anonymity, all personal data were anonymized, and participants were reminded that their recorded responses would be used solely for research purposes. Data storage and confidentiality procedures followed ethical guidelines (Bell, Bryman, and Harley 2022).

The recorded discussions were transcribed and analyzed using NVIVO, a leading qualitative data analysis software. NVIVO enables the organization, categorization, and visualization of data to identify emerging patterns (NVivo 2024). Coding was performed through a three-stage process (Strauss and Corbin 1990). In open coding, key themes from participants' responses were initially identified. Axial coding was used to establish relationships between these themes, examining how perceptions of AI advertising influence brand trust and authenticity. Selective coding synthesized the findings into overarching themes that contribute to understanding consumer attitudes toward AI-driven advertising. The analysis followed an iterative process, ensuring that interpretations remained closely tied to participants' verbatim responses (Cooney 2010).

The study adhered to strict ethical guidelines to protect participants' rights and data. Informed consent was obtained prior to participation, ensuring voluntary involvement and the right to withdraw at any time (Bell, Bryman, and Harley 2022). Participants were assured of confidentiality, with personal information anonymized and deleted after six months. The study complied with data protection regulations and ethical research standards, with findings intended solely for academic and scientific dissemination.

Results. *The study involved four Focus Groups, each groups were structured as follows: Group A included younger individuals (18-35 years) with no Marketing or Management background, Group B consisted of younger individuals (18-35 years) with experience in these fields, Group C included older participants (35-60 years) without a specialized background in Marketing or Management, and Group D comprised older participants (35-60 years) with such expertise. This classification provided a diverse range of perspectives, allowing for a nuanced exploration of how AI in advertising is perceived across different demographic and professional segments.*

Table 1: Sample Characteristics

Participant	Gender	Age	Background	Occupation
A1	Female	20	No Marketing/ Management	Student
A2	Female	27	No Marketing/ Management	Employee
A3	Male	20	No Marketing/ Management	Student
A4	Female	20	No Marketing/ Management	Student
A5	Male	21	No Marketing/ Management	Student
A6	Female	20	No Marketing/ Management	Student
B1	Female	23	Marketing/ Mangement	Student/Employee
B2	Male	23	Marketing/ Mangement	Student/Employee
B3	Male	22	Marketing/ Mangement	Student/Employee
B4	Male	24	Marketing/ Mangement	Student/Employee
B5	Female	23	Marketing/ Mangement	Student
B6	Female	22	Marketing/ Mangement	Student
C1	Female	60	No Marketing/ Management	Employee
C2	Male	60	No Marketing/ Management	Employee
C3	Female	44	No Marketing/ Management	Employee
C4	Male	53	No Marketing/ Management	Employee
C5	Female	40	No Marketing/ Management	Employee
C6	Female	56	No Marketing/ Management	Employee
D1	Male	52	Marketing/ Mangement	Employee
D2	Female	53	Marketing/ Mangement	Employee
D3	Male	58	Marketing/ Mangement	Employee
D4	Female	54	Marketing/ Mangement	Employee
D5	Male	53	Marketing/ Mangement	Employee
D6	Male	52	Marketing/ Mangement	Employee

The findings revealed a mix of pre-existing attitudes from the literature and new insights emerging from Focus Groups. In particular, the Third-Order codes (central categories, more abstract concepts), Second-Order codes (codes created according to similarities and differences or other forms of relationships between the first-order codes) and First-Order codes (topics expressed directly from Focus Groups) were aligned with the focus group script and represented the forming topic of the research. The findings represent a mix of already identified structures in the literature and new aspects resulting from the focus groups. Table 2 shows all constructs used for the analysis divided by their respective levels. The Third-Order constructs can be classified as follows: Advertising and Consumer Attitudes towards Advertising, AI, AI in Advertising, Attitude toward AI Advertising, Transparency in Brand Communication, ADV Authenticity and AI, Brand Authenticity and AI and Outcomes of Brand Authenticity. Second-Order constructs, meanwhile, are divided into: Emotions, Relevant Elements in Advertising, Consumers Attitude towards the Brand, Online Advertising and TV Advertising. These Second-Order constructs are associated with the Third-Order construct "Advertising and Consumer Attitudes towards Advertising". The Second-Order constructs AI Opportunities and AI Ethical Challenges are associated with the Third-Order construct "AI". The Second-Order constructs of Main Consumers Perceptions associated to AI ADV and Ethical Considerations of Use of AI in ADV are related with the Third-Order construct "AI in Advertising". Moreover, Impact of the use AI in ADV on Brand and Product and Challenges related to the use of AI in ADV are associated with the Third-Order construct "Attitude toward AI Advertising". The Second-Order constructs of Communications about the use of AI In ADV and Impact on the Brand are related with the Third-Order construct "Transparency in Brand Communication". ADV Authenticity Elements, and Impact of AI on ADV Authenticity are associated with the Third-Order construct "ADV Authenticity and AI". The Second-Order constructs of Brand Authenticity Characteristics, and Impact of AI on Brand Authenticity are related with the Third-Order construct "Brand Authenticity and AI". Finally, Behavioral and Attitudinal are related with the Third-Order construct "Outcomes of Brand Authenticity". For completeness, the table also shows the First-Order codes that were used in the analysis.

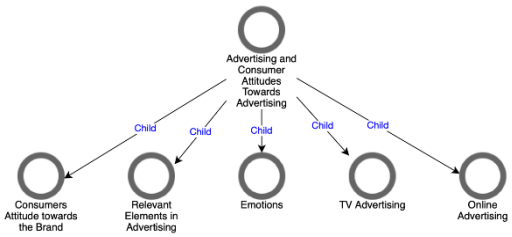
Table 2: Codes

Source: author elaboration based on NVivo output

Analyzing the Third-Order codes in detail, including the number of references (times the topic was raised) and sources (number of Focus Groups), all participants engaged with each main interview topic, and no one refused to answer any questions (Table 2). The most discussed construct, with 235 references, is "Advertising and Consumer Attitudes Towards

Advertising," the main topic of the study on which all other topics are based. Conversely, "Outcomes of Brand Authenticity" has the fewest references at 19, likely because it wasn't directly questioned but inferred from discussions on other topics.

Table 3: References and Sources of the Third-Order codes



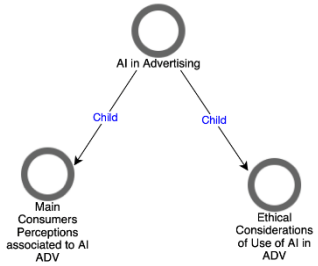
Third - Order Construct	References	Sources
Advertising and Consumer Attitudes Towards Advertising	235	4
AI	93	4
AI in Advertising	119	4
Attitude toward AI Advertising	117	4
Trasparency in Brand Communication	78	4
ADV Authenticity and AI	83	4
Brand Authenticity and AI	59	4
Outcomes of Brand Authenticity	19	4

Source: author elaboration based on NVivo output

The Focus Group analysis highlights the interplay between AI in advertising and brand authenticity, emphasizing key factors such as visual appeal, emotional connection, transparency, and trust.

Visual aesthetics and clear messaging were the most valued aspects of advertising, with 21 out of 24 participants emphasizing the importance of a well-crafted ad. As A3 noted: "What strikes me the most is whether the advertisement is well done, both visually/cinematically and in terms of effect."

Figure 1: Third- Order Constructs "Advertising and Consumer attitudes towards Advertising" and associated Second-Order Constructs.

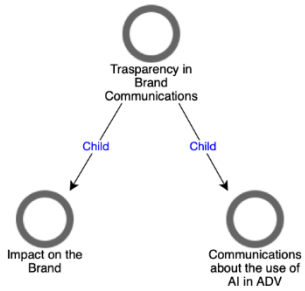


Source: author elaboration based on NVivo output

Brand perception also played a crucial role, with 22 participants confirming its influence on purchase intention. Emotional engagement was another defining factor, as B3 stated: "The elements I value most are the emotions that an ad has to convey." Online advertising was preferred for its accessibility and personalization, with A2 remarking: "Online, the customer can see a product, explore the site to find similar or more suitable products, and order them directly at home."

Regarding AI in advertising, process efficiency was cited as the greatest advantage, improving productivity and reducing costs. However, AI-generated ads were often perceived as easily recognizable and lacking realism, as A3 observed: "I didn't like it because you could tell it was fake."

Figure 2: Third-Order Constructs "AI in Advertising" and associated Second-Order Constructs.



Source: author elaboration based on NVivo output

While awareness of AI use did not significantly alter perceptions, transparency remained a critical factor. Seventeen participants supported clear AI disclosure in ads, with B6 emphasizing: "It would convey a message of transparency."

In contrast, a few respondents saw disclosure as unnecessary, believing AI is already an industry standard, as A3 stated: "There is no need to communicate artificial intelligence in an advertisement because most ads today already use AI."

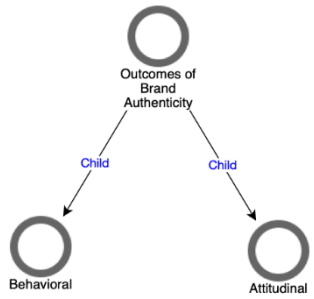


Figure 3: Third-Order Constructs "Transparency in Brand Communication" and associated Second-Order Constructs.

Source: author elaboration based on NVivo output

Trust and authenticity emerged as additional central themes. Fifteen participants linked brand authenticity to trust and loyalty, as D3 noted: "If I perceive a brand as authentic, it increases my trust and loyalty." AI and authenticity were largely seen as compatible if AI is used ethically and transparently, as D2 explained: "A brand using AI can still be authentic if it does so responsibly."

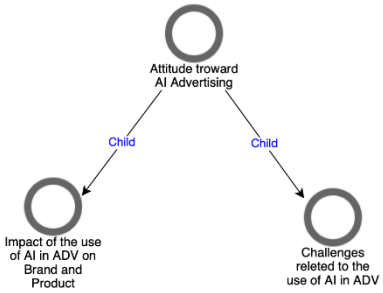

Figure 4: Third-Order Constructs "Outcomes of Brand Authenticity and AI" and associated Second-Order Constructs.

Source: author elaboration based on NVivo output

However, concerns over emotional detachment remained, with C5 stating: "While efficiency and personalization increase, there is a feeling of detachment that fails to establish an emotional connection".

Figure 1: Third-Order Constructs "Attitude toward AI in Advertising" and associated Second-Order Constructs.

Source: author elaboration based on NVivo output

Differences in perception emerged across demographics. Younger marketing professionals embraced AI for innovation, while older participants were more cautious, emphasizing trust and consistency. Marketing professionals viewed AI as a tool to enhance authenticity rather than replace human creativity, provided it maintains ethical and transparent practices.

This study reveals that AI-generated advertising has a complex relationship with brand authenticity, capable of both enhancing and diminishing it depending on its implementation and communication. Transparency is a key determinant of consumer perception, with many participants emphasizing the importance of clear AI disclosure in fostering honesty

and credibility. However, a minority view AI as an industry norm, questioning the necessity of explicit disclosure. Ethical AI use is another crucial factor-when brands integrate AI responsibly, ensuring that it aligns with core values and avoids deceptive practices, consumers perceive AI as a tool that can support rather than compromise authenticity.

At the same time, AI-generated content often lacks the emotional depth and human creativity traditionally associated with authentic advertising. Many participants noted that AI-driven ads, while visually polished, sometimes feel impersonal or overly synthetic, making it difficult to establish a meaningful emotional connection with consumers. This sense of detachment can weaken perceptions of authenticity, particularly among older consumers who value consistency and trust in brand communication. Younger marketing professionals, however, were more open to AI's role in innovation, seeing it as an opportunity to enhance rather than replace authenticity.

Ultimately, AI itself does not inherently diminish brand authenticity-its impact depends on how brands balance technological advancement with human-centric storytelling and ethical communication. Brands that use AI transparently, maintain a strong emotional connection, and align AI-generated content with their established identity can leverage AI as a tool for innovation without compromising authenticity.

Research limitations. *Convenience and snowball sampling may have introduced bias, while online Focus Groups limited control over participants' environments and emotional cues. Language was another constraint, as interviews in Italian required English translation, possibly altering responses. Additionally, viewing an AI-generated commercial may have influenced participants' perceptions. Future research could explore AI transparency in advertising, best practices for balancing innovation and authenticity, and quantitative studies to generalize findings. Comparing consumer perceptions of AI-driven vs. traditional ads and refining sample criteria to include AI and advertising experts could provide deeper insights. Further studies may also examine global AI adoption and regulatory impacts on consumer trust.*

Managerial implications. *The study underscores the balance between technological innovation and core values like authenticity and trust. Managers must ensure AI-generated content accurately reflects reality to avoid distorting consumer perceptions. Clear AI usage guidelines, including manuals, training, and oversight by internal experts, can aid its effective integration.*

Transparent communication of AI's benefits and limitations is crucial, as its long-term impact remains uncertain. Implementing monitoring systems, such as surveys, social media analysis, and KPIs tracking (e.g., conversion rates, user satisfaction), can help assess AI's effect on brand perception and refine strategies.

Emotional engagement, via storytelling or tone of voice, can ease AI acceptance. Companies could train AI to create emotionally compelling ads and test pilot campaigns to gauge consumer reactions.

Finally, transparency is key-publishing reports on AI usage and outcomes fosters trust and keeps customers informed.

Originality of the paper. *This study provides a novel contribution to the existing literature by exploring the intersection of AI in advertising and brand authenticity, a topic that remains underexplored despite the growing presence of AI in marketing. While previous research has primarily examined AI's efficiency and personalization capabilities, this study addresses a critical gap by analyzing how AI-generated advertising shapes consumer perceptions of authenticity. Rather than focusing solely on trust or brand perception, this research highlights the conditions under which AI is perceived as enhancing or diminishing authenticity.*

Through qualitative analysis via focus groups, the study uncovers both established themes from the literature and emerging consumer concerns. It reveals that AI's role in advertising creates a paradox: while AI can enhance authenticity by improving consistency and efficiency, it also risks diminishing it when ads lack emotional depth or appear overly synthetic. A key finding is that transparency in AI communication plays a decisive role-clear disclosure fosters authenticity by reinforcing brand honesty, whereas ambiguous AI use may lead to skepticism.

Furthermore, this research deepens the conversation on responsible AI integration by emphasizing the ethical and strategic considerations necessary to maintain authenticity. It bridges the gap between AI-driven advertising innovation and the fundamental consumer expectation of brand genuineness, offering insights that are valuable for both academic discourse and industry practices. By highlighting the balance between technological advancement and human-centric storytelling, this study provides actionable recommendations for brands seeking to leverage AI while preserving their authentic identity.

Key words: *Artificial Intelligence, Brand Authenticity, Advertising, Brand Communication, Consumer Perception.*

The SITE Model: A Conceptual Framework for Understanding AI and Emerging Technologies in Tourism and Hospitality

NICOLAIA IAFFALDANO[1] ALESSANDRO GIANNATTASIO[2] LORENZO SAPONARO[3]
CESARE AMATULLI[4] MARCO PICHIERRI[5]

Abstract

This study analyzes the role of Artificial Intelligence (AI) and emerging technologies in tourism and hospitality through a literature review. To provide a structured understanding of their adoption, we introduce the SITE Model, a framework that synthesizes the literature into four key areas: Sustainability, Impact, Technology, and Experience. Using the PRISMA approach, a literature review was conducted on 52 articles from 2018 to 2024. Our findings indicate that AI and emerging technologies enhance sustainable mobility, operational efficiency, and customer experience, while also raising ethical and social challenges. Their strategic integration is essential for maximizing engagement and innovation in the sector. By offering a comprehensive perspective, this study contributes to guiding future research and strategy development.

Research framework and purpose. *Research on artificial intelligence (AI) and emerging technologies in hospitality and tourism industry has increasingly grown over recent years due to the pervasiveness of AI-enabled technologies, which are relevant for both scholars and managers. Artificial intelligence (AI) could be defined as a subfield of computer science that explains how machines can mimic human intelligence (Tussyadiah, 2020). Similarly, AI may also refer to "the use of computational machinery to emulate capabilities inherent in humans, such as doing physical or mechanical tasks, thinking, and feeling" (Huang & Rust, 2021, p.31). AI is also considered as a set of technologies capable of imitating human intelligence in learning, problem-solving and decision-making processes. It includes systems that analyze large volumes of data (big data), leverage advanced algorithms, and improve their performance over time through learning processes such as machine learning and deep learning. It is pointed out that AI technology includes both effective technologies and emerging technologies (Doborjeh et al., 2022). Effective technologies concern machine learning, artificial neural networks, and deep learning for analyzing complex data; emerging technologies concern virtual/augmented reality, robotics, and chatbots that are also transforming the tourism industry by offering personalized experiences and improving operational efficiency (Bulchand-Gidumal, 2020).*

Literature has analyzed AI and emerging technologies in tourism and hospitality in a quite fragmented way as separated research fields that consider different perspectives. Moreover, the literature fragmentation calls for a more focused research effort to better understand a comprehensive view that organizes the topics in an organic way. This study aims at providing a more comprehensive understanding of the artificial intelligence phenomenon in hospitality and tourism industry by collecting evidence from the associated literature. We propose the SITE model, a theoretical framework which provides a clear structure for classifying academic research on the role of Artificial Intelligence (AI) and emerging technologies in tourism and in the hospitality into four thematic areas: *1. Sustainability; 2. Impacts; 3. Technology, 4. Experience.*

The first thematic area includes studies on the environmental and social impacts of AI and emerging technologies in terms of reducing the environmental impact of tourism and improving the sustainability of destinations. The articles within this category highlight how the adoption of AI, intelligent automation technology and smart technologies can contribute to greener tourism. The second area focuses on how the implementation of artificial intelligence in the hospitality and tourism sector is taking place and what its impacts could be at the organizational and economic level. The third area includes studies on the use of innovative technologies in tourism, such as augmented reality, robotics and machine learning, and analyzes how they are revolutionizing tourism. Lastly, the fourth category includes studies

DOI 10.7433/SRECP.SP.2025.01

investigating how AI and intelligent automation may improve customer experience (for instance, the use of chatbots and intelligent systems to customize tourism offers).

In general, the paper offers a descriptive framework that allows for an organized classification of the literature, serving as a solid starting point for future theoretical developments that could, for example, analyze the causal relationships between the topics included in the proposed model.

Methodology. *A literature review was conducted. In order to provide a reliable and bias-free analysis of the empirical evidence, we based our methodology on the PRISMA approach across four stages (Moher et al., 2015; identification, screening, eligibility and inclusion).*

Identification. We identified academic articles published in international peer-reviewed scientific journals. The search engine used for this purpose was Scopus and Scholar widely recognized as a major source of academic research (Paschou et al., 2020). We selected two sets of keywords to explore the role of Artificial Intelligence and emerging technologies in tourism and hospitality. The first set of keywords included: 'Artificial Intelligence', 'Machine Learning', 'Smart Tourism Technologies', 'Chatbot', 'Robotics', 'Augmented Reality', 'Virtual Reality', 'Internet of Things' and 'Intelligent Automation'. The second set of keywords included terms such as 'Tourism Innovation', 'Smart Destinations', 'Digitization in Tourism' and 'Hospitality Management'. After defining the final set of keywords, we launched a series of search queries based on data mining criteria to extract the most relevant articles to describe the state of the art. A query was for example: "Title-Abs (("AI" and "Chatbot") and ("Tourism Innovation" or "Hospitality Management")) and pubyear > "2018" and <"2024" and (limit-to (doctype, "ar") or limit-to (doctype, "cp")) and (limit-to (language, "English"))).

Screening. We considered only papers published in the most relevant journals (e.g., Journal of Hospitality and Tourism Insights). We focused exclusively on articles written in English in the field of marketing and management applied to the tourism sector. From an initial list of 54 manuscripts, two were excluded and a final sample of 52 articles published between 2018 and 2024 was considered.

Eligibility and Inclusion. Abstracts were screened to include only results consistent with AI and emerging technologies in tourism and hospitality. Through this process, 31 articles were removed because they did not meet the eligibility and inclusion criteria (e.g., because they were not in line with the specific topic of the review). Therefore, for the literature analysis, 21 final articles were considered. For each article, we created summary sheets reporting purpose, methodology and main findings, as well as identifying the key constructs defined by the authors. This process allowed us to structure and categorize the literature facilitating comparative analysis.

Results. *Based on the final sample of 21 papers we divided them into four thematic macro areas.*

1) <u>Sustainability</u> - In this first category we analyzed the environmental and social impacts of AI and emerging technologies on the environment of the destinations. Kim et al. (2023) studied how artificial intelligence contributed to sustainable tourism mobility. According to their research, they stated that AI optimized the efficiency of public transport, for example by facilitating travel planning. More exactly, AI is integrated into the EVAB model as a moderator, showing how it can strengthen the links between personal values, positive attitudes towards sustainability, personal and social norms, and subjective well-being of tourists. This makes it more likely that tourists will adopt green behavior. Also, according to Kim et al. (2024a), AI and smart apps influence public transport usage and reduce CO2 emissions. The authors' proposed research framework explains how AI benefits and awareness, as well as the usefulness and knowledge of smart apps, influence the intention for participation in public transport, considering older and younger population segments and gender. While Kim et al. (2024b) considered that artificial intelligence contributed to the sustainability of space tourism, Majid et al. (2023) studied intelligent automation for sustainable tourism development to facilitate an understanding of how the power of technology can be harnessed in achieving a sustainable tourism agenda. Lastly, Balsalobre-Lorente et al. (2023) highlighted the Information and Communication Technology role in reducing the environmental impact of urbanization, tourism, and natural resources exploitation. Artificial intelligence is not explicitly analyzed as a standalone construct, the article integrates the concept within ICT, implying its role in enhancing technological efficiency and supporting smart decision-making processes in urbanization, tourism, and natural resource management to achieve environmental sustainability.

2) <u>Impacts</u> - The articles within this category focused on how the implementation of artificial intelligence in the hospitality and tourism sector is taking place and what its impacts could be at the organizational and economic level. Sharma et al. (2022) examined the impact of artificial intelligence (AI) on the competitiveness of tourism firms. The study has identified 10 key factors impacting AI-driven competitiveness in tourism. The competitiveness of tourism firms is assessed primarily through their financial performance. Tourist satisfaction directly influences financial performance. AI-skilled workforce and infrastructure are foundational for AI adoption. AI-enabled technologies and digital platforms enhance productivity and innovation. Government policies and regulations shape AI implementation. The hierarchical model adopted in the study shows interdependencies between these factors. Therefore, strategic AI adoption boosts competitiveness in the tourism sector according to this research. Similarly, another study identifies human knowledge, including employee education and training, as the most significant factor influencing the adoption of automation and AI in the hospitality and tourism sectors (Jabeen et al., 2022). AI adoption in hospitality and tourism varies by application type according to another study (Huang et al., 2021). It is highlighted that highly adoptable technologies are search/booking engines and virtual agents/chatbots due to personalized and efficient user experiences. Appreciated technologies are AR/VR applications because of their immersive capabilities. Less adoptable technologies are robots, autonomous vehicles, and kiosks/self-service screens due to perceived risks, operational complexity, and low trialability.

Another author presented a research agenda on intelligent automation in tourism (Tussyadiah, 2020). Four research priorities were indicated, namely: designing beneficial artificial intelligence, facilitating adoption, assessing the impacts of intelligent automation on tourism, and creating a sustainable future with intelligent systems. Assessing the impacts of intelligent automation on tourism, Tussyadiah (2020) identified negative and positive impacts of AI. The economic, psychological and social impacts of artificial intelligence are negative.

Economic impacts relates to changes in productivity of intelligent automation: for instance, when tourist and hospitality service jobs are replaced by intelligent machines. Psychological impacts of AI and human-robot interaction, as well as emotional responses to the closeness of robot appearance to that of humans, technostress, loneliness, and isolation are all due to reduced interpersonal interaction and increased solitary activities. By assessing social impacts of intelligent automation, the author highlights the reduction of the need for personal, face-to-face interactions between tourists and residents.

As for the positive impacts of AI, the complementarity between humans and intelligent systems in collaborative decision making and task assignment is considered the first significant impact. As people increasingly use and rely on virtual assistants and robots to manage their daily and travel needs, it is necessary to fundamentally change perception of the role of intelligent agents in society, from simple tools to large and complex social actors. This is the second positive impact of AI.

Mariani and Wirtz (2023) highlighted in their study that the adoption of AI has influenced data analysis in the hospitality and tourism sector. The study is a critical reflection on the extent to which hospitality and tourism management scholars have accurately used the term "analytics". "Analytics is the scientific process of transforming data into insight for making better decisions" (Boyd, 2012, p. 1). Findings show that there is an exponential growth of articles published in hospitality and tourism academic journals on the topic of "analytics" from 2011 to 2022. A systematic literature review was conducted by Mariani and Wirtz to understand to what extent analytics has been accurately and consistently defined in the hospitality and tourism management literature. It is found that articles rarely defined their interpretation of analytics and the specific type of analytics used.

The last article within this category focuses on how the implementation of artificial intelligence in the hospitality and tourism sector is taking place according to a systematic literature review (Kong et al., 2023). The study emphasized that AI research relating to the hospitality and tourism industry has shown a growing trend since 1991, and that the number of publications and citations has increased significantly since 2018, thus indicating that AI has become a focus for researchers. It suggests that the topic of AI has obtained considerable research attention, which corresponds to the widespread application of service robot (SR) during the outbreak of COVID-19 worldwide.

3) <u>Technology</u> - The third category includes studies on the use of innovative technologies in tourism, such as augmented reality, robotics and machine learning and analyses how they are revolutionizing the tourism sector. Pratisto et al. (2022) provided a comprehensive view of immersive technology in tourism by critically analyzing prior scholarly work. The article explores the use of immersive technology in the tourism sector. Immersive technology concepts can be considered on a reality-virtuality continuum: at the former end is reality environment, and at the latter end is a computer-generated virtual environment. Within that spectrum there are two concepts - augmented reality (AR) and augmented virtuality (AV), which fall under the umbrella terminology of mixed reality (MR). In addition, there is virtual reality (VR), which is a fully virtual environment (Milgram et al., 1995). Therefore, immersive technology includes AR and VR. Whereas AR can overlay the view of the user's current environment with digital objects, VR can create a virtual environment that the user can seamlessly interact with in real time. Thus, AR combines a virtual object with the real environment in real time. AR provides additional interpretation resources to enhance user engagement with the observed object during visitation, significantly impacting the experience. AR device information also needs to be delivered in real time to pique the user's interest and allow an uninterrupted leisure experience (Han et al., 2019). VR as a marketing tool in tourism research was more common than AR, specifically pre-visit tourism destination promotion.

Both AR and VR can increase the quality of visitors' experience of a destination. From this perspective, immersive technology enables tourism stakeholders to enhance tourists' satisfaction since consumers can choose and modify such an experience to a degree that was once considered impossible (Williams & Hobson 1995). Findings show the increasing number of articles published from 2012 to 2020 on the use of immersive technology in the tourism sector. This review provides a comprehensive view of the use of immersive technology in tourism research and the potential challenges it poses. The article examines how AR applications and VR applications usage, - such as AR applications for tour guidance (via smart glasses or mobile device), navigation, education, marketing, heritage preservation, entertainment, accessibility and VR applications for marketing, heritage preservation-, are revolutionising the tourism sector. Therefore AR/VR applications usage to improve the user's experience while exploring location or object. Sustacha et al. (2023) studied smart destinations linked to smart cities, thus considering the urban approach based on the employment of ICTs in economy, environment, mobility, and governance to transform city infrastructures and services (Bakıcı et al., 2013). Moreover, the study investigates the relationship between smart tourism technology (STT) and smart destinations, evaluating how STT may influence experience in smart destinations in terms of accessibility, informativeness, interactivity, personalization, and security. According to Sustacha et al. (2023, p.2) "STTs are the basic infrastructure that integrates hardware, software and networks, travel services, and ICTs to provide real-time data to facilitate smarter decision-making by destination stakeholders. They include a variety of solutions, such as the internet of things (IoT), cloud computing, artificial intelligence, mobile devices and applications, big data, Wi-Fi, virtual reality, augmented

reality, chatbots, wearable devices, QR codes, near field communication (NFC), radio frequency identification (RFID), social networks and beacons". Overall, STTs encompass a broad range of applications that can enrich tourists' experiences and generate additional value at the same time. Findings confirm that STT positively impacts the tourism experience, with interactivity and informativeness being the key attributes that enhance visitor satisfaction. However, security and privacy during the applications usage negatively affect the experience.

The last article within the third category conducts a computer-assisted qualitative data analysis (CAQDA) to analyze hospitality and tourism technology literature, for the purpose of understanding the last 10 years' research trends (Lee, 2022). Moreover, this study divided and compared two groups of analysis: the former from 2010 to 2014 was composed by 78 articles while the latter, from 2015 to 2019, by 140. In the first group the most used and common words were "use", "hotel", "tourism", "technology", "service", "information", "industry", "sites", "analysis" and "systems". In the second group new nouns emerged: "twitter", "smart", "TripAdvisor". Therefore, initially the studies focused on hotel management, performance and websites, while later the attention shifted to social media, smart tourism and digital platforms such as TripAdvisor and Twitter. All that suggests that the topic on the use of innovative technologies in tourism has obtained considerable research attention.

4) Experience - The fourth category includes studies that analyze how AI and intelligent automation enhancing personalization, improving the customer experience, and increasing operational efficiency. Doborjeh et al. (2022) explored the impact of artificial intelligence in the tourism and hospitality sectors. The main findings of the study highlight that artificial intelligence (AI) has a significant impact on the tourism and hospitality sector, enhancing demand forecasting, tourist behavior analysis, and customer experience. The most effective AI technologies include machine learning algorithms, artificial neural networks, and deep learning, particularly for analyzing complex and multimodal data. Additionally, emerging applications such as virtual reality, augmented reality, robotics, and chatbots are transforming the industry by offering personalized experiences and improving operational efficiency. Finally, the study proposes new research approaches, such as personalized AI models and the concept of neuro-tourism, to deepen the understanding of tourist behavior. Similarly, another study explores how AI and big data can enhance individuals' behaviors and attitudes, explorations of visitor attitudes, customer satisfaction and preferences (Lv et al., 2021).

Bulchand-Gidumal (2020) explored the impact of Artificial Intelligence (AI) in the travel, tourism, and hospitality sectors. The article examines how AI applications, such as personalization systems, chatbots, robots, forecasting tools, and language translation applications, are transforming the travel and hospitality industry. Findings of the study highlight that AI is revolutionizing the travel and hospitality industry by enhancing personalization, improving customer experiences, and increasing operational efficiency. Applications such as smart travel assistants, chatbots, and recommender systems help tailor services to individual preferences, while robots and automation optimize resource allocation. However, the study highlights challenges related to AI adoption, including tourists' concerns about privacy, ethical biases in AI, and the risk of human workforce substitution. The future of AI in tourism is seen as a balance between human-AI collaboration and technological advancements, with significant potential to improve sustainability and innovation. Tussyadiah (2020) said the same about it.

Ghesh et al. (2024) explored the AI-enabled customer experience (AICX) in tourism, focusing on customer-facing AI technologies (such as chatbots, service robots, virtual/augmented reality, and intelligent voice assistants) and their impact on customer satisfaction and engagement. The main findings of the study highlight that AI enhances personalization and customer interaction across the journey but requires integration with human touch to address concerns like trust and emotional engagement. Bulchand-Gidumal (2020) underlined the same about service encounter experiences.

Solakis et al. (2024) explored the factors that affect value co-creation (VCC) through artificial intelligence (AI) and automation in tourism and hospitality. The study identifies customer-based factors such as trust, attitude, and hedonic motivations, as well as technologies like service robots, mixed-reality tools, and chatbots, that drive co-creation. This research adopts a general literature review approach, analyzing existing studies on psychological and technological elements influencing VCC in tourism. The main findings of the study highlight that customer perceptions, trust, social influence, and prior experiences significantly influence participation in VCC processes enabled by AI. Key technologies, such as service robots, AI-powered kiosks, chatbots, and mixed-reality tools, facilitate more personalized and efficient co-creation experiences. These findings suggest that tourism firms should integrate AI strategically to optimize customer engagement and satisfaction while improving service innovation.

Another study examines how artificial intelligence (AI) innovations can enhance tourist satisfaction and encourage continued service usage in the tourism industry. Findings of the study indicate that AI innovation and new product advantages significantly enhance perceived functional benefits, which in turn strengthen tourist satisfaction and their intention to continue using AI-powered services following Ku and Chen's research model validated through both quantitative and qualitative analysis. Therefore, functional benefits play a crucial role in shaping user satisfaction and loyalty. Functional benefits "are regarded as the external advantages of products or services and are usually related to the product attributes tourists select" (Ku & Chen, 2024, p. 3). Continued service usage intention "by tourists reflects a motivational influence that drives their behavior" (Ku & Chen, 2024, p. 4). The results highlight the importance of aligning AI innovation with strategic business goals to maximize its impact on customer experience and service adoption.

Research limitations. *One potential limitation of our research is that it only considered articles published between 2018 and* 2024: *on the one hand this guarantees the topicality of the results, that is reflecting the current state of art, and on the other hand, it excludes that some older contributions can provide useful insights on the historical development of*

artificial intelligence and emerging technologies in tourism and in the hospitality, thus representing the latter a limitation of the research. Another limitation is that we do not consider industrial sources and company reports. These documents could offer alternative perspectives and provide additional insights that we may have overlooked, as our evaluation was limited to peer-reviewed academic articles.

Managerial implications. *From a theoretical perspective, this paper contributes to the literature on AI in tourism/hospitality field by providing the SITE framework, which provides a model for future research, permitting scholars to examine the development of AI in tourism industry. Moreover, it enables future research to have a less fragmented view of this topic. From a practical perspective, the study offers to tourism marketers some insights on 4 different aspects of the tourism industry. Specifically, results show that AI may be used as a marketing tool during the entire process of purchasing, which is capable of enhancement of the customer experience during the pre-purchase, passing from the experience itself to the post-purchase. Moreover, AI could be implemented as a strategic tool to enhance sustainable tourism, so that managers could customizing the tourism experience to attract tourists and to differentiate the service/product. In addition, AI may make tourism less environmentally impactful, and contribute to possible reduction of CO2 emissions (Kim et al. 2024a). Finally, AI offers the opportunity to automate processes and personalize the service using VR, AR as chatbots, robots, instant language translation applications, automatic check-in and check-out, virtual agents which make travel planning less difficult, giving users support during the whole process and along the entire chain (Bulchand-Gidumal, 2020). The SITE framework may also work as a theoretical support for private organizations, managers and scholars, and might serve as a guide for DMOs and policy makers.*

Originality of the paper. *Unlike existing literature, which analyzes these issues independently - focusing separately on technological, economic or experiential impacts - our study proposes a more structured and mixed approach through the development of the SITE Model. This innovative framework organizes and classifies academic research into four key areas, offering a systematic and integrated view. The SITE Model not only provides a new tool for understanding the adoption and impact of AI and emerging technologies in tourism and hospitality but also underlines the research gaps that need to be filled in, thus supporting academics and practitioners in building more effective strategies for innovative, sustainable and customer experience-driven tourism.*

The four proposed dimensions (Sustainability, Impact, Technology, Experience) were identified inductively through a thematic analysis of the existing literature and reflect the most frequently recurring topics in studies focused on the role of digital technologies within the tourism and hospitality sector. This classification is descriptive in nature and provides an initial framework that helps to organize and understand the main areas of interest and research on the subject.

The Power of Transparency: Can Disclosing AI-Generated Advertising Enhance Consumer Perceptions, Attitude, and Dispositions?

VERONICA MAROZZO[1] FABRIZIO CESARONI[2] TINDARA ABBATE[3] AUGUSTO D'AMICO[4]

Abstract

The growing diffusion of Artificial Intelligence (AI) in the advertising sector has led to new opportunities and challenges for companies that use social media to promote their products and services. In particular, the use of Generative AI (gen-AI) is increasingly transforming advertising content creation. However, despite the evident potential for creative automation, the effect of declaring AI use on consumer perceptions, attitudes, and behaviors toward ads remains underexplored. This study examines the impact of declaring the use of Artificial Intelligence (AI) in social media advertising on consumer perceptions, attitudes, and behaviors. Two experimental studies with 554 Italian participants reveal that AI declaration significantly enhances advertising credibility and language comprehension. Users are more willing to like and share ads when AI use is disclosed regardless of the product category. These findings suggest that transparency in AI-generated content can improve consumer engagement and brand perception, offering valuable insights for marketers, while highlighting the need for further research exploration of ethical and regulatory concerns.

Framing of the research. *Digital transformation (DT) is a ubiquitous phenomenon that involves different aspects of our daily lives, radically shaping economic, social, and cultural scenarios (Padua, 2021). At the center of this revolution are several new digital technologies - such as the Internet of Things (IoT), Wearable Devices, Blockchain, Augmented Reality (AR), Virtual Reality (VR), Biometric Authentication, and Artificial Intelligence (AI) -, and their application in disparate domains. In this respect, recent research is increasingly focused on the implementation of these new technologies in healthcare (e.g., Agbo et al., 2019; Van Hauwaert et al., 2024), financial management (e.g., Budiasih, 2024), energy and sustainability (e.g., Neves et al., 2024), and marketing (e.g., Diaz et al., 2022; Srivastava and Bag, 2024). Concerning the latter domain, Calderon-Monge and Ribeiro-Soriano (2024), recognizing that the acceptance and management of social media are valid marketing strategies, have highlighted the relevant role of social media campaigns through new digital technologies in enhancing consumer engagement and managerial relations. As stated by Diaz et al. (2022), as a consequence of the explosion in social media marketing, recent studies have explored company-generated or brand-generated content - such as advertising campaigns - in social networks (e.g. Facebook page or X feed) through the analysis of customer behavior (Lee et al., 2018; Meißner et al., 2019).*

From the consumer perspective, social media has turned into a resource of inspiration, entertainment, and news. From the firm perspective, social media has become one of the most effective digital marketing channels (Peter and Dalla Vecchia, 2021), with most companies embracing the power of social networks as never before. As the number of social network users persists to increase and consumer shopping behavior is more and more impacted by the activities on, among others, Instagram and TikTok, marketers strongly leverage these networks' drawing power for promotion and advertising. As reported by Statista (2024), in 2023, social media advertising spending stood at approximately 270 billion U.S. dollars, with the expenditure predicted to exceed the 300-billion-dollar mark by 2024[5]. Advertising spending is expected to show an annual growth rate (CAGR 2024-2029) of 8.11%, resulting in a projected market volume of 345 billion U.S. dollars by 2029. Moreover, in the social media advertising market, the number of users is expected to amount to 6,265.00m users by 2029 (Statista, 2024). Finally, Statista (2024) also reports that global spending on social media advertising has more than doubled since the COVID-19 outbreak, reaching 226 billion U.S. dollars in 2022. This scenario and these growing trends underline the concrete opportunities that social media offers to businesses in terms of promoting and advertising their products and services.

DOI 10.7433/SRECP.SP.2025.01

In the lens of advertising, among the new digital technologies, Artificial Intelligence (AI) sees wide applications (e.g., Vakratsas and Wang, 2020; Başev, 2024; Park et al., 2024; Bhusan, 2024), and its integration represents a paradigmatic change in contemporary marketing strategies. In its basilar definition, AI refers to "computer software that imitates human thoughts and actions and is open to development" (Başev, 2024, p.168). Then, in advertising, AI implies the replication of human intelligence within machines, enabling them to think and respond in ways akin to humans based on input data. As reported by Başev (2024), several brands (e.g., Burger King, Netflix, Spotify, National Geographic, and Harley Davidson) utilize AI in roles such as copywriting, editing, and other functions to enhance their collaboration with AI in the advertising sector. One aspect of AI that became prominent in the advertising industry is represented by Generative Models. An example is Generative Artificial Intelligence, commonly known as "Generative AI" or "Gen AI" (Euchner, 2023). According to Zhou and Lee (2024), such generative models allow humans to be directly involved in the creative process through, for example, text-to-image systems (e.g. DALL-E, Midjourney, or Deep AI) or by involving in an open dialog with transformer-based language models (e.g., Claude, Bard, or ChatGPT). Generative AI is expected to become more potent to automate even more creative tasks typically reserved for humans and generate significant economic value in the future years (Huang and Grady, 2022).

However, while on the business side adopting these generative AI tools could be a positive strategy able to support content creation, and campaign optimization within the advertising landscape, on the consumer side, the widespread use of generative AI is raising questions about the transparency and authenticity of digital content. The threat of deepfake images and videos used in contexts such as advertising campaigns has prompted politicians and regulators to come up with proposals to prevent their use. To address these challenges, a series of tech companies (i.e., Adobe, Microsoft, Nikon, Leica, Camera Bits, Truepic e Publicis Groupe) have proposed the Coalition for Content Provenance and Authenticity (C2PA) protocol[6], which uses cryptography to track the origin of digital content. Specifically, the pioneering "transparency icon" of the C2PA will use the symbol with the initials "CR" which stands for "Content CRedentials". Operatively, the Content CRedentials symbol can be incorporated into image, video, and PDF metadata via photo and video editing platforms. On the user's side, when they encounter online content marked with the acronym "CR", with a click on the symbol they can identify the rightful owner, find information about the AI tools used in the creation of the content, as well as insights into the production process[7].

Purpose of the paper. *Proposals by politicians and regulators to prevent the use of deepfake images and videos in contexts such as advertising campaigns highlight the need to regulate these aspects to protect users. In the same perspective, it becomes relevant to understand the users' perspective. Therefore, since the effects of AI-generated advertising on user perceptions, attitudes, and dispositions remain largely unexplored, this research aims to bridge this gap in the literature. Accordingly, this research aims to investigate whether declaring the use of AI (vs. not declaring it) in social media advertising creation can affect consumers' perceptions, attitudes, and dispositions. Prior research has highlighted key variables in online advertising that shape consumer responses. For instance, advertising credibility has been identified as a crucial factor affecting consumer perceptions (MacKenzie & Lutz, 1989; Eisend, 2006). Regarding attitudes, language comprehension plays a pivotal role in how advertisements are processed and understood (Puntoni et al., 2009). Additionally, consumers' willingness to engage with advertisements-such as liking and sharing-has been recognized as a key indicator of online behavioral dispositions (Berger & Milkman, 2012). Accordingly, this research examines whether the explicit disclosure of AI involvement in advertising creation impacts consumer perceptions (e.g., the credibility of the advertising), attitudes (e.g., language comprehension), and dispositions (e.g., willingness to like and share the advertising). The theoretical underpinning of this study is based on the Persuasion Knowledge Model (PKM) in the advertising context (e.g., Moore & Rodgers, 2005; De Pelsmacker & Neijens, 2012; Evans & Park, 2015). According to this theory, consumers develop knowledge about persuasion tactics and use this knowledge to interpret and respond to advertising messages (Friestad & Wright, 1994). This theory explains that consumers are aware of persuasive strategies and tend to resist persuasion when they perceive manipulation (Fransen et al., 2015; Ringold, 2002). In line with this model, transparency regarding the source and process of advertising can influence consumer reactions in terms of perceptions, attitudes, and disposition. In terms of perceptions, previous studies (e.g., Schweitzer et al., 2019; van der Heide & Lim, 2016) suggest that disclosing relevant information - as it could be AI involvement - can increase trust in advertising content. According to the Source Credibility Theory, which refers to the understanding of the believability and persuasiveness of an agent in communication (Fogg et al., 2001), the use of AI in communication could be considered such a source able to influence consumer opinions and behavior (Khan & Mishra, 2024). Therefore, we maintain that disclosing AI usage in advertising creation can enhance the perceived credibility of the advertisement, as consumers may view the brand as more transparent. In terms of attitudes, recent literature (e.g., Gao et al. 2023; Al Tawalbeh et al., 2024) demonstrated that AI can improve personalization and linguistic adaptation in advertising, making it more understandable and relevant to the target audience. Therefore, we maintain that disclosing AI usage in advertising creation may improve the consumers' advertising language comprehension as they perceive enhanced quality and adaptability in advertising communication. In terms of dispositions, recent research (e.g., Suraña-Sánchez & Aramendia-Muneta, 2024) provided evidence that AI positively affects the consumer's engagement towards advertising. Additionally, as stated by Berger and Milkman (2012), according to the PKM, when consumers perceive an advertisement as more honest and transparent, they are more likely to engage with it. Therefore, we maintain that disclosing AI usage in*

[7] https://www.ilsoftware.it/adobe-lancia-un-nuovo-logo-per-taggare-le-immagini-generate-con-lia/

advertising creation may improve the consumers' engagement and sharing toward the advertising. Overall, building upon the Persuasion Knowledge Model - i.e., consumers are conscious of persuasive strategies also in the advertising context and tend to resist persuasion when they perceive manipulation - we assert that if the use of AI is not reported, consumers may perceive it as an attempt to deceive. On the contrary, declaring it can reduce resistance, increasing credibility, comprehension, and engagement.

Formally, we proposed the following hypotheses:

H_1: The declared use of AI (vs. not declared) positively affects the consumers' perceived advertising credibility.

H_2: The declared use of AI (vs. not declared) positively affects advertising language comprehension.

H_3: The declared use of AI (vs. not declared) positively affects the consumers' a) willingness to like and b) willingness to share the advertising.

Methodology. *We conducted 2 experimental studies. Study 1 aimed to test whether the AI's use declaration affects the credibility and the language comprehension of the advertising. The use of AI (not declared vs. declared) was manipulated in a between-subjects design, holding constant all other elements in social media advertising.*[8] *Study 2 aimed to obtain additional support for the previous results, by providing evidence of the generalizability of the proposed effect against a different product category*[9]*, and to test the effects of AI's use declared (vs. not declared) on consumers' dispositions, such as willingness to like and willingness to share the advertising. Advertising credibility was captured by three 7-point items (Kim et al., 2017; Study 1 α=.88; Study 2 α=.86); while advertising language comprehension was captured by three 7-point items (Lin & Wang, 2016; Study 1 α=.80; Study 2 α=.80). In Study 2, user's willingness to like and to share the advertising were captured, respectively, by a 7-point item ("To what extent are you willing to put "like" at this advertising?", and "To what extent are you willing to put share this advertising?"), both ranking from 1 "At all" to 7 "Very much".*

Results. *Two hundred and thirty Italian users (50.4% females; M_{age}=26.50; SD_{age}=6.80) took part in Study 1 and were randomly assigned to one of the two conditions. Results of a first one-way ANOVA showed that the advertising credibility was significantly higher in the case of AI'use declared compared to not declared ($M_{AIdeclared}$=4.225, SD=1.49; $M_{AInotdeclared}$=3.554, SD=1.323; F(1, 228)=12.94, p < .000). Results of a second one-way ANOVA showed that the advertising language comprehension was significantly higher in the case of AI'use declared compared to not declared ($M_{AIdeclared}$=4.296, SD=1.208; $M_{AInotdeclared}$=3.747, SD=1.186; F(1, 228)=12.05, p < .000). Overall, these findings provide support for the effect of AI's use declared (vs. not declared) on consumers' perception of advertising credibility and consumers' attitude toward the advertising language comprehension.*

Three hundred and twenty-four Italian users (58.3% females; M_{age}=25.94; SD_{age}=7.12) took part in Study 2 and were randomly assigned to one of the four conditions in a 2 (AI's use: not declared vs. declared) by 2 (product category: wine vs. body wash) between-subjects design. Results of a first two-way ANOVA on advertising credibility with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as between-subject factors confirmed a significant main effect of AI's use ($M_{AIdeclared}$=4227, SD=.106; $M_{AInotdeclared}$=3.699, SD=.107; F(1, 320)=12.36, p <,000). The results also showed a significant main effect of the product category (M_{Wine}=4.14, SD=.107; $M_{BodyWash}$=3.787, SD=.106; F(1, 320)=5.51, p =.019). Finally, no significant interaction effect between AI's use and product category was found (F(1, 320)=.028, p =.866). Results of a second two-way ANOVA on advertising language comprehension with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as between-subject factors confirmed a significant main effect of AI's use ($M_{AIdeclared}$=4.379, SD=.090; $M_{AInotdeclared}$=3.869, SD=.091; F(1, 320)=15.867, p < .000). They also showed a significant effect of the product category (M_{Wine}=4.298, SD=.091; $M_{BodyWash}$=3.95, SD=.090; F(1, 320)=7.391, p =.007). No significant interaction effect between AI's use and product category was found (F(1, 320)=.884, p =.348). Overall, these findings suggest that the effect of AI's use declared (vs. not declared) on consumer perception of advertising credibility and consumer attitude toward the advertising language comprehension holds regardless of the product category, then provide preliminary evidence of the generalizability of the proposed effects.

Finally, we tested the user's dispositions (i.e., willingness to like and willingness to share the advertising). Results of a first two-way ANOVA on willingness to like the avd, with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as between-subject factors showed a significant main effect of AI's use ($M_{AIdeclared}$=3.658, SD=,146; $M_{AInotdeclared}$=3.122, SD=.146; F(1, 320)=6.741, p=.01). The results also showed a significant main effect of the product category (M_{Wine}=3.733, SD=.146; $M_{BodyWash}$=3.007, SD=.146; F(1, 320)=13.752, p=.000). Finally, no significant interaction effect between AI's use and product category was found (F(1, 320)=.011, p=.915).

Results of a second two-way ANOVA on willingness to share the advertising, with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as between-subject factors confirmed a significant main effect of AI's use ($M_{AIdeclared}$=2.67, SD=.129; $M_{AInotdeclared}$=2.288, SD=.130; F(1, 320)=4.365, p=.037). The results also showed a significant main effect of the product category (M_{Wine}=2.774, SD=.130; $M_{BodyWash}$=2.183, SD=.129; F(1, 320)=10.437,

[8] The stimulus was an advertisement on the Instagram platform that used wine as a product category. It was entirely created by an AI-generative tool. In particular, ChatGPT is used for the creation of the text part, while DeepAI is used for the creation of the visual part. The manipulation of the Artificial Intelligence use (not declared *vs.* declared) was made by inserting a logo with the words "created with AI" placed at the bottom right of the visual part of the advertising, and a logo with the words "Content created with Artificial Intelligence" placed at the end of the textual part of the advertising (see Appendix).

[9] Body wash. The use of AI (not declared *vs.* declared) was manipulated as in Study 1.

p=.001). Finally, no significant interaction effect between AI's use and product category was found (F(1, 320)=.003, p=.956). Overall, these findings indicate that users are more willing to like and share the advertising when the use of AI is declared.

Research limitations. *While this study establishes a main effect of AI disclosure (vs. not disclosure) on consumers' perceptions, attitudes, and dispositions, it does not explore potential moderators (e.g., consumer familiarity with AI, brand reputation, or product involvement). Future research could investigate how these variables influence the effect of AI disclosure on perceived advertising credibility, advertising language comprehension, and consumers' willingness to like and share the advertising. Moreover, the study focuses on outcome variables (credibility, comprehension, and engagement) without fully unpacking the cognitive and affective mechanisms driving these effects. Future research could explore whether AI disclosure influences perceived authenticity, skepticism, brand confidence, perception of honesty, or trust- key psychological constructs in AI-related marketing research. Additionally, although the study investigates two product categories (wine and body wash), it does not account for other potentially influential product categories or industries. It is possible that the impact of AI declaration in advertising may differ across product types (e.g., technology products vs. consumer goods or experience goods), and further studies could explore this potential moderation. In addition, further research could include a variety of advertising platforms to see if similar effects are observed across different digital environments. Finally, the study is based on Italian consumers, which may limit generalizability across cultural contexts. Given that attitudes toward AI transparency may vary by country, industry, or regulatory environment, cross-cultural comparisons could provide further insights.*

Managerial implications. *The study highlights the importance of declaring the use of AI in the creation of digital advertisements by suggesting some managerial directions. Marketers could emphasise transparency by openly disclosing the use of AI tools in their advertising campaigns. This transparency could enhance the perceived credibility of the advertisement, which is crucial in building trust with consumers. Users might appreciate the transparency of the firm and develop positive attitudes and dispositions towards the advertising. This novel finding has important implications for how businesses integrate AI into their advertising strategies and how transparency can build consumer trust. In this direction, these results suggest that the declared use of AI as an advertising creator can be considered an extension of the source credibility theory (Khan & Mishra, 2024). Thus, even advanced technologies, like gen-AI, can become a credible source when explicitly declared and, in turn, enhance user engagement in social media advertising. Improving advertising credibility and user engagement could have effects on the brand, opening up opportunities to study how the perception of the advertising indirectly affects the perception of the brand that promotes it. Additionally, considering that the results suggest that users are more likely to engage with advertisements that disclose the use of AI, as shown by their increased willingness to like and share the advertising, businesses should strategically use AI-generated content to improve user engagement and social media interactions. By fostering this engagement, companies can increase the reach and effectiveness of their advertising campaigns. Moreover, these results demonstrate that AI can be an effective tool in creating advertisements that resonate with consumers. Marketers should not shy away from using AI in creative tasks such as copywriting and content optimization, as long as the use is declared. AI's ability to enhance the overall quality of advertisements-by improving credibility and comprehension-could be a competitive advantage for companies looking to stand out in crowded social media spaces.*

Originality of the paper. *This paper introduces a novel angle in advertising research by exploring the effects of declaring AI's involvement in the creation of social media advertisements. While AI's role in digital marketing is widely discussed, few studies have specifically focused on how transparency regarding AI use can influence consumer perceptions, attitudes, and behavioral intentions. Moreover, by examining the impact of AI declaration on consumer perceptions (advertising credibility), attitudes (advertising language comprehension), and dispositions (willingness to like and share the advertising), the paper provides a comprehensive framework to understand the multifaceted effects of AI transparency on consumer behavior in advertising. This holistic approach contributes to a more nuanced understanding of consumer engagement with AI-generated content.*

Key words: *Artificial Intelligence; Social media advertising; Advertising credibility; Advertising language comprehension; Willingness to like; Willingness to share.*

Enhancing the Identity of Made in Italy: The Role of Augmented Reality in the Food Sector

Analysis of U.S. Consumers' Purchase Behavior

VALERIA VIGNOLI[1]

Abstract

In a context of significant growth in Italian food exports, the "Made in Italy" label plays a central role, projecting an image of Italy as a rich country in cultural values such as innovation, lifestyle, tradition, history, prestige, and quality. However, the phenomenon of "Italian Sounding" risks confusing consumers, making it essential for marketing professionals to provide greater transparency regarding authenticity of food products. Recent studies have demonstrated that the use of Augmented Reality (AR) can influence consumer behavior, driven by the desire to understand product origins. However, the literature has yet to explore how this technology, applied to transparent communication, can raise awareness of the true provenance of food products.

This research examines the use of Augmented Reality (AR) as a tool to enhance awareness of the authenticity of Italian products through transparent and immersive disclosure. The results of this research, based on a sample of U.S. consumers, show that immersive disclosure significantly and positively increases both authenticity awareness and purchase intentions compared to traditional disclosure methods.

The study suggests that technological innovation represents a key strategy for protecting the value of "Made in Italy" and mitigating the effects of "Italian Sounding", providing relevant insights for both Italian food producers and importers motivated by more conscious purchasing decisions. Moreover, the results indirectly address government authorities, chambers of commerce, and export funding agencies, emphasizing the importance of safeguarding the "Made in Italy" label through tools that foster technological innovation within businesses.

Framing of the research. *According to the Economic Observatory of the Ministry of Foreign Affairs and International Cooperation (M.A.E.C.I.), in 2023, Italy exported goods worth a total of 626.2 billion euros, generating an increase of 5.3% compared to the previous year. Specifically, the food sector achieved a historical record for exports, reaching a value of 64 billion euros, representing more than 10% of total Italian exports (Fortune Italia, 2024; Ismea, 2024; M.A.E.C.I., 2024). The most significant foreign markets for food exports are the United States, France, and Germany, which serves as the main destination market.*

In the context of exports, "Made in Italy" plays a significant role, representing a brand of guarantee for international consumers and offering a positive perception worldwide. The term "Made in Italy," in its literal interpretation, refers to goods and services produced within Italian borders. However, this expression requires a broader interpretation: it evokes in the consumer's mind an image of Italy as a country with its cultural values such as innovation, lifestyle, attitude, history, social life, prestige, and quality (Pellegrini, 2016; Temperini et al., 2016). While consumers show a positive attitude toward Italian values, this phenomenon can lead to the improper use of the term, creating a sort of "trap" for the consumer. Many products, although conceived in Italy, are manufactured in other countries and then enriched and distinguished by elements that still evoke the concept of "Italianity." Indeed, the Italian market, known for its high quality standards, faces a worrying phenomenon known as "Italian Sounding," which is primarily widespread in the food sector (Montanari et al., 2016).

The term "Italian Sounding" refers to a commercial practice in which non-Italian products are promoted using names, images, colors, symbols, or designs that evoke Italy, misleading the consumer into believing that they are authentic products (Agrifood.tech, 2020). Therefore, it can be considered an ethically improper marketing strategy, as the intent is to exploit the appeal of Italian identity and the reputation of the "good table," distorting the consumer's perception. A study conducted by Ismea (Institute of Services for the Agricultural Food Market), in collaboration with The European

House - Ambrosetti, shows that the phenomenon of "Italian Sounding" represents a value of 11.7 billion euros (Ismea, 2024). Although this phenomenon is widespread abroad, its consequences are particularly important for the Italian economy, as it affects food exports. Besides the economic damage, this phenomenon leads to the deterioration of the image and reputation of "Made in Italy." The goal of Italian businesses and government bodies is to enhance and protect the identity of the "Made in Italy" brand, preventing the image of excellence from being compromised, generating consumer distrust, and a wrong perception of product authenticity.

According to research conducted by Mazzù et al. (2022) on Chinese consumer behavior toward "Made in Italy" products, it has emerged that these consumers have become increasingly attentive and demanding over the years. They

[1] e-mail: vale27.vignoli@gmail.com

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

not only seek quality and authenticity in products, but they also desire active and immersive involvement with them through the use of specific digital platforms (Mazzù et al., 2022). Therefore, it is crucial for companies to adopt innovative, immersive, and engaging strategies that can strengthen consumer trust while protecting and enhancing the "Made in Italy" brand.

According to Rauschnabel et al. (2019), AR integrates informational content directly into the user's perception of the real world through an interactive, immersive, informative, and satisfying experience, overlaying or adding digital content such as text, geolocated information, graphics, audio, and video in real-time to the view of physical objects and environments (Du et al., 2022).

This technology, through the use of digital devices, has been integrated into marketing and sales strategies, allowing marketers to create authentic storytelling and enhance customer experience. Indeed, the final consumer has the opportunity to better understand product information and develop a simplified and interactive purchasing decision-making process (M. Claudia Tom Dieck & Dai-in Danny Han, 2022).

Recent studies have shown how the use of Augmented Reality (AR) can influence consumer behavior, driven by the desire to know the product's origin, where authenticity and origin are crucial aspects (Mazzù et al., 2023). However, the literature has not yet explored how this technology, applied to transparent disclosure, can generate awareness about the true origin of food products.

This research aims to explore how the use of Augmented Reality, through immersive disclosure, can influence consumer awareness regarding the authenticity of "Made in Italy" products and, consequently, their purchase intention. The hypothesis is that transparent and immersive communication can enhance the perception of authenticity of these products. Furthermore, it investigates how awareness of authenticity can mediate the relationship between the use of Augmented Reality and purchase intention.

The term "disclosure" in food marketing is widely studied and discussed in literature; it refers to marketers' actions aimed at informing consumers about certain facts regarding a product or service (Wilkie, 1986). Specifically, it involves the transparent disclosure of food product information, expressed in various forms, such as the origin of ingredients, production methods, nutritional information, and potential health risks (Freeman, 2015; Stewart & Martin, 2004). Transparent communication offers value to the consumer and promotes a more informed consumption attitude, influencing food behaviors (Oprea, 2023).

There are various forms of disclosure, both traditional and innovative, that use digital technologies to allow consumers to access detailed product information in real-time. Although existing literature has analyzed the impact of traditional tools on information comprehension and consumer behaviors, there is a significant research gap regarding the use of immersive digital tools, such as Augmented Reality. The use of Augmented Reality (AR) in marketing presents a wide range of opportunities: AR allows consumers to test products repeatedly before purchase, facilitating the customer decision journey (Matarazzo et al., 2020). Indeed, consumers are more likely to engage with products through interactive experiences where AR offers immediate access to product information, promoting transparency and stimulating consumer trust, especially in markets where the phenomenon of "Italian Sounding" is widespread (Mazzù et al., 2023; Scholz & Smith, 2016; S.M.C. Loureiro et al., 2019). A study conducted by eMarketer on the trend of users engaging with Augmented Reality applications shows a steady increase in the number of individuals accessing AR content at least once a month on any device. The data show that users increased from 59.4 million in 2019 to 95.5 million in 2023, with a projections indicating a further rise to 106.9 million by 2027 (eMarketer, 2023). This trend highlights the increasingly widespread adoption of Augmented Reality, driven by the growing integration of immersive technologies into everyday life.

For these reasons, U.S. companies are increasingly investing in AR solutions to enhance customer engagement and experience. A notable example is Starbucks, which launched an application allowing customers to scan products in-store using their smartphones, enabling them to see the items come to life on screen while also providing additional product information in an engaging and innovative way.

This technology could offer new perspectives on how information regarding food products may be perceived and processed by consumers. So, this research examines how immersive disclosure through Augmented Reality influences consumer perception and behavior toward food product information.

Framing Purpose of the paper. *The literature offers various definitions, characteristics, and opportunities related to Immersive Realities, such as Augmented Reality. However, few applications of this technology are focused on the concept of disclosure for "Made in Italy" products, with the goal of enhancing brand identity and preventing improper uses.*

In particular, the study proposes a Conceptual Framework as a mediation model that examines the effect of immersive disclosure (vs. traditional) on food products, evaluating its impact on consumer awareness of the authenticity of "Made in Italy" products and the subsequent purchase intention. In other words, the analysis will focus on the potential offered by Augmented Reality (AR), applied to the transparent disclosure of food products, can provide information capable of increasing consumer awareness of the true origin of Italian products. The term "awareness of authenticity" refers to the level at which consumers recognize and understand the true origin of "Made in Italy" products. On one hand, according to Munoz et al. (2006), "authenticity" refers to something original, genuine, unique, traditional, and real. On the other hand, it refers to the connection with the territory, the production method, and the quality of the product (Beverland, 2006). Awareness plays a crucial role, as it enhances positive consumer perception by appealing to their desire to understand a product's origins, with authenticity and provenance being key factors. (Mazzù et al., 2023).

Based on the above, the following hypotheses are proposed:

- *H1. An immersive disclosure vs. traditional disclosure positively influences consumer awareness of the authenticity of "Made in Italy" products.*
- *H2. Consumer awareness of the authenticity of "Made in Italy" products positively influences purchase intention.*
- *H3. There is a positive relationship between immersive disclosure and purchase intention, mediated by the awareness of authenticity of "Made in Italy" products.*

The proposed hypotheses were analyzed using a quantitative methodology with an experimental mediation model through the SPSS platform.

Methodology. *A sample of one hundred and twenty-five respondents from the United States participated in the study, including eighty-nine women (71.2%), thirty-two men (25.6%), three individuals who preferred not to respond (2.4%), and one participant who did not disclose their gender (missing). They completed an online questionnaire via the Qualtrics platform.*

Particular attention was given to the involvement of U.S. consumers with no familial ties to Italy, ensuring that the responses provided by the participants were as unbiased and authentic as possible, thereby avoiding potential biases related to emotional attachment to the country of origin of the product shown.

Demographically, most participants were in the age group between 30 and 49 years old, representing 38.7% of the total sample (48 individuals), followed by those in the 50 to 70-year-old group (29.8%; 37 respondents), while the 18 to 29- year-old group accounted for 28.8% of participants (36 individuals). Only one individual was excluded from the demographic analysis for not disclosing their age (missing), and the remaining 2.4% of participants were over 70 years old (3 individuals).

Most participants reside in the Western U.S. (43.5%), followed by the South (27.4%), the Midwest (15.3%), and the Northeast (12.9%), with only 0.8% from Hawaii or Alaska. Participants were briefed on the research objectives and assured anonymity before being randomly assigned to one of two questionnaire versions, dividing them into two groups:

- *The control group (N = 64; 51.2%), which was shown an image of the "extra virgin olive oil" product in traditional format, with no indication of the product's origin.*
- *The experimental group (N = 61; 48.8%), which was shown the same image but with Augmented Reality (AR) stimulus.*

An attention check was placed below the image to verify the actual viewing and attention to the presented scenario.

The stimuli differed in how product characteristics were displayed, with the control group shown an image without Augmented Reality elements. In this case, product characteristics like origin and nutritional values were displayed on a standard label (traditional disclosure). The experimental group viewed the same olive oil bottle with AR elements, where scanning an AR code provided interactive information about the product's origin, quality, and traceability.

The reason to consider extra virgin olive oil as a representative "Made in Italy" product is supported both by literature and by the latest market data: several studies have considered extra virgin olive oil a particularly relevant product for ensuring proper monitoring and transparency of its characteristics (Zhang et al., 2012). After viewing the image, each participant was required to answer a series of questions to express their judgment concerning the variables in the mediation model.

To examine the variable "awareness of the authenticity of "Made in Italy" products," the 7-item scale by Marozzo et al. (2022) was used, following an analysis of the Cronbach's Alpha statistic for the elimination of item #5. With a result of 0.891 for the 7 items ($\alpha = 0.891$), the reliability of the scale was confirmed.

For the variable "purchase intention," the 7-item scale by Dodds, Monroe, and Grewal (1991) was considered, with items #2 and #3 removed. The results show that Cronbach's Alpha was 0.960 ($\alpha = 0.960$), suggesting that the scale is reliable despite the removal of the items. Furthermore, for a description of the sample, the study focused on the demographic and behavioral analysis of U.S. consumers regarding "Made in Italy" products and the use of Augmented Reality. The participants were thanked for their participation.

Results. *The analysis reveals that a significant part of the sample values transparency in food product information.*

The results show that 33.6% of participants find transparency "extremely important," 47.2% rate it "very important," and 19.2% consider it "moderately" or "not very important" in the pre-purchase phase. Familiarity with the "Made in Italy" brand is varied: 39.2% know it "very well" or "extremely well," 32% are "moderately familiar," 18.4% have limited knowledge, and 10.4% are unfamiliar with it. It is noted that 66.4% of participants report that the label significantly influences their perception. Not surprisingly, 45.6% consider it "very" or "extremely important" for a food product to be labeled as "Made in Italy," compared to 29.6% who find it "moderately important" and 24.8% who consider it "not very" or "not important at all." Moreover, 82.4% of participants consider "Made in Italy" products to be of good quality.

Regarding consumer behavior toward the use of AR, 69.6% of the sample has never used Augmented Reality applications, while the remaining 30.4% reported using them. Of the 69.6%, the results show that 33.6% are "very willing," followed by 25.6% who are "moderately willing." Only 10.4% say they are not at all inclined to use such applications. This suggests there is potential interest in using Augmented Reality if it offers detailed and interactive information about food products.

From the analysis of the data collected after exposure to the stimuli, it can be stated that, in general, regardless of the type of stimulus shown, all respondents, on average, are "rather agree" with the following statements ($M_{Authenticity} = 5.01$; $SD = 1.206$); the extra virgin olive oil shown:

- *is a genuine product;*
- *is an original product;*
- *is a true product (not altered);*
- *is a typical product;*
- *is unique in its kind;*
- *reflects its place of origin;*
- *is a typically Italian product.*

Upon further examination using the t-test, the results revealed that participants perceive a different level of authenticity depending on the type of stimulus presented: the experimental group (exposed to the image with an immersive AR disclosure) perceives, on average, greater authenticity compared to the control group exposed to an image with a traditional disclosure ($M_{Authenticity\ Immersive\ Disclosure} = 5.56$; SD = 1.250 vs. $M_{Authenticity\ Traditional\ Disclosure} = 4.49$; SD = 0.898; $t(108.494) = 5.476$; $p<0.001$). An immersive disclosure using Augmented Reality leads to higher perceived authenticity than traditional disclosure.

Regarding the dependent variable "purchase intention," the results show that, on average, the experimental group have a higher agreement level compared to the group that viewed the image with traditional disclosure. These results are confirmed by the t-test. Specifically, participants in the experimental group have, on average, a greater purchase intention than the control group ($M_{Purchase\ Intention\ Immersive\ Disclosure} = 5.43$; SD = 1.188 vs. $M_{Purchase\ Intention\ Traditional\ Disclosure} = 4.22$; SD = 1.268; $t(123) = 5.504$; $p<0.001$).

As expected, the results show that participants have a distinct purchase intention based on the stimulus presented. Again, it can be concluded that people who saw the product with immersive disclosure, on average, had a significantly higher purchase intention score than those exposed to a traditional disclosure.

The research continued by evaluating the effect of the type of disclosure (immersive vs. traditional) on purchase intention, mediated by the awareness of the authenticity of "Made in Italy" products using the SPSS PROCESS Macro, Model 4 (Hayes, 2013). Specifically, the model considered the following variables:

- *Independent variable (X) is the type of disclosure (innovative vs. traditional);*
- *Dependent variable (Y) is purchase intention;*
- *Mediator variable (M) is awareness of the authenticity of "Made in Italy" products.*

The goal was to test hypotheses H1, H2, and H3, present in the Conceptual Framework. Initially, the effect of the type of disclosure on authenticity (mediator) was analyzed. The effect was positive and statistically significant (b = 1.071, SE = 0.194, $t(1,123) = 5.519$; $p<0.001$). Specifically, when the disclosure is immersive, compared to traditional disclosure, the authenticity is higher by 1.071.

The impact of disclosure type (independent variable) and authenticity (mediator) on purchase intention was analyzed. Specifically, the effect was positive and statistically significant by 0.348 (b = 0.348; SE = 0.174; $t(2,122) = 2.004$; $p = 0.047$). Moreover, observing the impact of authenticity awareness on purchase intention, another positive and statistically significant effect of 0.806 was observed (b = 0.806; SE = 0.72; $t(2,122) = 11.164$; $p < 0.001$).

To verify hypothesis 3, it was necessary to synthesize the total, direct, and indirect effects observed. Analyzing the total effect, it can be noted that the scenario is statistically significant, with a positive effect of 1.211 and a 95% confidence interval for the coefficient ranging from 0.776 to 1.647 (b = 1.211; SE = 0.22; $t(1,123) = 5.504$; $p < 0.001$; CI 95% = 0.776, 1.647). Specifically, a statistically significant total effect ($p < 0.001$) of 1.211 is observed, of which 0.348 is due to the direct effect ($p = 0.047$) and the remaining 0.863 is due to the indirect effect.

Moreover, for the indirect effect, a 95% confidence interval was observed, ranging from 0.524 to 1.243, not including zero; therefore, it can be stated that this effect is statistically significantly different from zero. The statistically significant and positive total effect (b = 1.211, $p < 0.001$) consists of a weaker direct effect (b = 0.348, $p = 0.047$) and a stronger indirect effect (b = 0.863), suggesting that a significant portion of the influence of the type of disclosure on purchase intention is mediated through authenticity. Hypothesis 3 is confirmed.

Research limitations. *The research examines how an immersive disclosure, compared to a traditional disclosure, affects the awareness of authenticity and the purchase intention of "Made in Italy" products. However, it presents some limitations that offer opportunities for further investigations in the future.*

Firstly, the main limitation of the study lies in its geographical aspect: the responses from U.S. consumers were examined without focusing on a particular state. Considering the significant sociocultural differences between various states, it would be interesting to analyze consumer behavior by including variables like traditions and cultural influences. Secondly, it is considered crucial to expand the current research towards the use of neuromarketing tools. Specifically, it could be suggested that the sample's responses were influenced by stereotypes related to "Made in Italy." Therefore, future research could assess how psychological and emotional factors have influenced consumers' decisions regarding Italian food products. These could be used by marketers to optimize augmented reality experiences, making them more engaging and tailored to consumers' emotional desires. Furthermore, future research could analyze technological accessibility across demographics and willingness to adopt new technologies, factors that may influence perceptions of authenticity and purchase intentions. Lastly, future research could explore whether sharing personal data through AR applications affects purchase intention, providing insights into personalized marketing strategies.

Managerial implications. *The research offers valuable insights for Italian food companies seeking to differentiate themselves in the international market, emphasizing the importance of adopting innovative technologies like Augmented*

Reality (AR) to create a more authentic, transparent, and engaging shopping experience. For this reason, Italian food companies can leverage AR to enhance the authenticity of their products, make the consumer purchasing process more informed and transparent, while simultaneously strengthening their competitive position in international markets and contributing to the protection and enhancement of the "Made in Italy" brand from the phenomenon of "Italian Sounding."

Thus, while the research allows producers to guarantee the authenticity of their products, particularly against "Italian Sounding," it also provides greater security for importers in their purchasing decisions. Marketers are therefore encouraged to adopt innovative strategies that take advantage of the opportunities offered by Augmented Reality. For example, product packaging could be enhanced with an AR Code (smart labels), allowing access to additional information that enriches the consumer decision-making and purchasing process, and supports the creation of an engaging storytelling experience. Additionally, companies could implement AR experiences on their online stores, allowing customers to visualize products without the need to physically inspect them. This strategy could also be applied in digital marketing campaigns, enabling consumers to virtually explore products and interact with them.

In conclusion, the study indirectly addresses Government Authorities, Chambers of Commerce, and export-financing companies, helping them to protect the "Made in Italy" brand by promoting incentives that encourage the technological innovation of companies.

Originality of the paper. *In the context of the rapid growth of Italian food exports, the "Made in Italy" brand plays a crucial role, representing Italy as a symbol of innovation, lifestyle, tradition, prestige, and quality. However, the phenomenon of "Italian Sounding" poses a challenge to foreign trade, as it misleads consumers about the true origin of products, making greater transparency regarding the authenticity of products essential. The novelty of this study lies in the use of Augmented Reality (AR), which is of great interest in modern food marketing, and the adoption of a U.S. sample, which expands the investigation to an international context.*

Augmented Reality (AR) is considered by the literature as a technology capable of increasing consumer engagement through interactive and authentic experiences. In fact, this immersive technology not only fosters greater consumer interaction with products but also contributes to a deeper awareness and motivation to purchase. According to Poushneh and Vasquez-Parraga (2017), AR enhances three key aspects: immersion, fun, and stimulation, elements that play a fundamental role in creating an emotional connection between the consumer and the product. Furthermore, recent studies state that the use of Augmented Reality (AR) can influence consumer behavior, driven by the desire to know the origin of the product, where authenticity and provenance are crucial aspects (Mazzù et al., 2023). However, the existing literature has not yet explored how this technology, applied to the concept of disclosure within the "Made in Italy" food sector, can increase awareness of the real origin of food products. For this reason, this study investigates how an immersive AR-based disclosure can influence awareness of authenticity and, consequently, the purchase intention of Italian food products, such as extra virgin olive oil.

In other words, this research aims to explore how the use of new immersive technologies, particularly Augmented Reality, can influence U.S. consumers' awareness of the authenticity of "Made in Italy" products and their subsequent purchasing behavior. The study contributes to understanding how transparency of information can be enhanced through the use of innovative technologies, as well as enhancing and protecting the "Made in Italy" brand from the phenomenon of "Italian Sounding."

The study, based on a quantitative analysis, enriches the literature by using a sample of U.S. consumers with no emotional or family ties to Italy, ensuring unbiased and authentic responses. The analysis of the sample revealed that participants' familiarity with the "Made in Italy" brand was evenly distributed: 32% of participants were "moderately familiar" with the brand, while 39.2% knew it "very well" or "extremely well," compared to 10.4% who did not know it at all and 18.4% who had only limited knowledge of it. The data show that a significant portion of the sample places great importance on the transparency of food product information, particularly regarding the origin of ingredients, production methods, nutritional information, and potential health risks. A study conducted by Mazzù et al. (2022) on Chinese consumers' behaviors regarding "Made in Italy" products highlighted how these consumers have become increasingly attentive and demanding over the years, not only seeking quality and authenticity in products but also a strong active and immersive engagement with the product, through the use of specific digital platforms (Mazzù et al., 2022). The results of the present research show that U.S. consumers also attach great importance to quality as a purchase criterion: 97.6% of respondents agree or strongly agree on the importance of quality, while only 2.4% remain neutral. Moreover, a product labeled as "Made in Italy" is perceived as high quality by 82.4% of the sample, with quality being considered a key factor for 95.2% of respondents.

This analysis clearly shows how consumer purchasing habits are strongly influenced by perceived quality and the transparency of product information. Both Chinese and U.S. consumers share an increasing focus not only on the authenticity of products but also on more engaging and interactive purchasing experiences, made possible by the use of advanced digital technologies. This trend highlights a shift in consumer preferences, where they no longer evaluate products solely based on their intrinsic characteristics but also seek the authenticity of these products. The results confirm theories present in the literature: individuals exposed to an immersive AR-based disclosure show greater awareness of the authenticity of the product compared to those exposed to traditional disclosure. This effect is directly reflected in the purchase intention, suggesting that respondents generally expressed a higher purchase intention for products shown with an immersive disclosure.

This illustrates the opportunities and capabilities that AR offers in food marketing. Augmented Reality not only facilitates greater transparency about product features but also creates an interactive and engaging experience that enhances the perception of authenticity. This level of interactivity and immersion can strengthen the emotional bond between the consumer and the product, encouraging a more conscious and motivated purchasing behavior. This confirms Hypothesis 1 of the mediation model: "an immersive vs. traditional disclosure positively influences consumer awareness of the authenticity of 'Made in Italy' products," where the effect was found to be positive and statistically significant. Specifically, the results showed that immersive disclosure can significantly increase awareness of the authenticity of Italian food products compared to traditional disclosure. Additionally, the results from the mediation model analysis confirm Hypothesis 2, too.

This result aligns with recent literature on the use of AR, suggesting that immersive experiences can create a sense of trust and authenticity in consumers, enhancing their purchase intention (Du et al., 2022). However, awareness of authenticity not only positively affects purchase intention but also acts as a key mediating variable between immersive disclosure and purchasing behavior. Furthermore, this analysis shows that authenticity significantly mediates the relationship between disclosure type (immersive vs. traditional) and purchase intention; thus, Hypothesis 3 is also confirmed. In conclusion, in light of the literature and the results of this research, Augmented Reality can be considered an effective tool capable of increasing interactivity and transparency in "Made in Italy" food products. This translates into greater awareness among American consumers regarding the authenticity of such products, positively influencing their purchase intentions.

Keywords: *Made in Italy; Disclosure; Augmented Reality; Food Marketing; Purchase Intention.*

Investigating Effective Health Communication Strategies to Enhance Customer Engagement in Preventive Health Behaviors

VALENTINA SBROLLI[1] LAURA GRAZZINI[2] GAETANO AIELLO[3]

Abstract

This work-in-progress study investigates the role of prevention in the health customer journey, focusing on effective engagement strategies for promoting preventive health behaviors. It examines how health communication strategies, combined with individual factors such as health literacy, motivation, and risk perception, effectively influence individuals' willingness and ability to adopt preventive behaviors. Adopting a multi-method approach, including focus groups and experimental designs, the study aims to provide actionable insights for healthcare professionals, policymakers, and communication strategists. The goal is to offer evidence-based recommendations for improving patient engagement in prevention and designing personalized, effective health communication.

Framing of the research.

Customer journey in healthcare

In the digital age, the customer journey has become a complex, multi-touchpoint experience, as customers interact with businesses across various channels, making the management of these interactions increasingly vital (Grewal & Roggeveen, 2020). Customer experience is best conceptualized as a dynamic process unfolding over time, involving multiple stages of the purchasing cycle, characterized by loops, detours, and repeated interactions (Lemon & Verhoef, 2016; Grewal & Roggeveen, 2020). Studying the customer journey extends beyond transactional interactions to include experience, behavioral responses, co-creation, and the impact of technology (Tueanrat, Papagiannidis & Alamanos, 2020). From a service design perspective, the customer journey encompasses both processual and experiential dimensions, providing a lens through which businesses can analyze service encounters (Følstad & Kvale, 2017).

In healthcare, the concept of the customer journey is framed as the patient journey, which can be understood through the service delivery system (Ponsignon, Smart & Phillips, 2018). This journey tracks a patient's experiences, particularly during transitions of care (Beleffi et al., 2021), considering emotional, physical, and task-oriented aspects across multiple touchpoints (McCarthy et al., 2016). This dynamic approach offers a more comprehensive view of the patient experience (Saragosa et al., 2023).

Patient experience plays a crucial role in disease prevention and treatment, aiming to improve overall health (Ryan et al., 2014). Patient involvement in decision-making enhances care and boosts satisfaction (Birkeland et al., 2022), a key aspect of patient-centered care that empowers patients (Castro et al., 2016). Empowerment is defined as a process where patients understand their role, gain necessary knowledge, and engage in care within a culturally sensitive environment (WHO, 2009).

Given the connection between patient involvement, satisfaction, and empowerment (Tambuyzer & Van Audenhove, 2013), it is essential to engage patients throughout care stages. Engagement requires empowerment, motivation, and the ability to participate (Hickmann et al., 2022). This aligns with Higgins et al. (2017), who emphasize personalization, access, commitment, and therapeutic alliance, and Carman et al. (2013), who highlight the importance of collaboration among patients, families, advocates, and professionals. In prevention, patient characteristics, health conditions, healthcare professional knowledge, tasks, and settings significantly influence engagement (WHO, 2016). Effective communication, especially with patients of varying health literacy, is essential for all clinicians (Krist et al., 2017; Mazor et al., 2016). Enhancing health literacy through supportive environments and patient education promotes autonomy and patient-centered care (Barello et al., 2020). It is crucial to foster environments that prioritize patient-centered care, encourage proactive communication, and promote autonomy (Barello et al., 2020), and to develop strategies that cultivate a culture of two-way communication about health promotion and prevention (Luecking et al., 2020).

Health communication

Health communication is critical in public health, as the rapid dissemination of information is essential for conveying important messages to a broad audience (Ceretti et al., 2022). Traditional communication strategies often targeted undifferentiated audiences, limiting their effectiveness. Recently, there has been a shift toward tailoring both the audience and message to improve intervention outcomes. For instance, younger patients' preference for digital tools such as patient portals, mobile health apps, and email communication suggests that online interventions for education and prevention could be particularly effective (Clarke et al., 2020; Lana et al., 2014).

To optimize these strategies, it is crucial to incorporate behavioral theories that explain why some approaches are more effective in engaging patients in preventive efforts. Self-Determination Theory (SDT) (Ryan & Deci, 2000) emphasizes the role of autonomy, competence, and relatedness in motivating individuals. Similarly, Social Cognitive Theory (SCT) (Bandura, 1986) highlights observational learning and self-efficacy as key factors shaping behavior. These theories offer valuable insights into how personalized communication strategies can enhance patient engagement in prevention (Bandura, 2004; Ng et al., 2012). Studies such as Ntoumanis et al. (2021) show that SDT-based interventions improve autonomy and motivation, while SCT emphasizes the mediating role of self-efficacy in behavior change, as demonstrated by Dishman et al. (2014).

Many studies also examine factors like message framing, risk perception, and social norms. For example, research shows that gain-framed messages are more effective in promoting preventive behaviors (Gallagher & Updegraff, 2012; Rothman et al., 2006). Effective communication often addresses perceived risks, as individuals who perceive higher risks are more likely to engage in protective behaviors (de Bruin & Bennett, 2020). Additionally, personalized risk assessments in patient-provider discussions tend to be more effective than generic communications (Edwards et al., 2000).

Social norms significantly influence health behavior. Perceived social expectations drive adherence to preventive behaviors, such as social distancing, and reinforcing positive norms encourages safer behaviors (Martínez et al., 2021; Holschneider & Alexander, 2003). For example, targeting prevention-oriented social norms has been effective in promoting safer behaviors among adolescents (Dixon et al., 2015). Similarly, social norms messaging in mental health can reduce stigma and foster help-seeking behaviors (Silk et al., 2017). Research on melanoma prevention shows that emphasizing injunctive norms-what people should do-along with descriptive norms-what others are doing-can enhance the effectiveness of interventions (Malher et al., 2008).

Effective campaigns require understanding the factors shaping individual decision-making. This includes analyzing existing communication dynamics, identifying barriers to change, and tailoring messages to address these challenges (Snyder, 2007). Health literacy-the ability to obtain, process, and understand health-related information-is particularly important in primary prevention (Berkman et al., 2010). Family communication also plays a key role in engaging individuals in prevention, particularly in the context of hereditary diseases like melanoma (Wu et al., 2023). Open parent-child communication can guide children toward desired behaviors (Gaber et al., 2013).

Furthermore, empowering individuals as active contributors to the creation of preventive messages fosters greater engagement. Schillinger et al. (2017) highlight how involving young people in preventive behaviors by stimulating creativity and influencing peer behavior can be effective. Trust is fundamental in this context, as health prevention relies not only on the accurate dissemination of information but also on the credibility and authenticity of the messengers. When individuals, particularly young people, are involved in creating and sharing prevention messages, it enhances relatability and the impact of the communication, fostering a culture of collective responsibility in health prevention (Zhu et al., 2018).

Purpose of the paper. *This paper aims to explore the role of prevention within the patient journey, focusing on the effectiveness of different engagement strategies in promoting preventive behaviors. Given the multidimensional nature of patient engagement, this study seeks to understand how and why certain strategies succeed or fail in fostering active participation in prevention efforts. Specifically, it examines which health communication strategies are most effective in engaging patients in prevention initiatives and how individual factors - such as health literacy, motivation, and risk perception - influence patients' willingness and ability to adopt preventive behaviors.*

To achieve these goals, this work-in-progress study will employ a multi-method approach, using both focus groups to explore differences in perceptions, motivations, and obstacles to engagement and experimental designs. In doing so, the study seeks to generate actionable insights for healthcare professionals, policymakers, and communication strategists, offering evidence-based recommendations on how to leverage communication strategies to maximize patient engagement in prevention. Ultimately, this research aspires to support the design of more effective, personalized, and culturally sensitive health interventions that empower individuals and foster proactive health management.

The discussion thus far can be summarized in three primary research questions:

RQ1. Which health communication strategies are most effective in promoting patient engagement in prevention?

RQ2. How do individual factors and social factors affect patient participation in preventive activities?

RQ3. What are the main barriers to patient engagement in prevention, and how can communication strategies overcome them?

Methodology. *This study employs a mixed-method design (Davis et al., 2011), incorporating a focus group (Study 1) to inform two subsequent experimental studies (Studies 2 and 3). The primary objective of Study 1 is to explore the most effective health communication strategies for fostering patient engagement in preventive behaviors. Given the contradictory and limited findings in the existing literature regarding the communicative elements that best promote*

preventive engagement, we adopt an inductive qualitative approach, utilizing the focus group method as an effective tool for exploratory data collection (Calder, 1977; Fern & Fern, 2001). The focus group setting allows for the observation of group interactions, a fundamental advantage of this method, as it facilitates the emergence of diverse perspectives compared to individual interviews (Krueger, 2014).

Following the methodological recommendations of Fern and Fern (2001), a structured discussion will be guided by a trained moderator using a standardized protocol developed in collaboration with the research team. A purposive sampling strategy based on referrals will be employed to recruit 10 to 15 participants. The session will last approximately two hours, beginning with an exploration of participants' willingness to engage in preventive health behaviors, followed by an in-depth discussion of the key communicative factors that either facilitate or hinder such engagement. Prior to the discussion, the moderator will provide participants with a detailed explanation of the session's objectives and procedures.

An interpretive methodological approach will be used to analyze the qualitative data, following Yin's (2013) three-stage analytic framework: (1) transcription analysis, (2) identification of recurring themes, and (3) synthesis of shared themes. To ensure the reliability of the coding process, two independent researchers will analyze the transcripts, with their findings subsequently compared to establish interrater reliability (Weber, 1990). Cohen's kappa coefficient (0.83) will be calculated to quantify the level of agreement between coders (Cohen, 1960). A thematic analysis will be conducted, with emergent themes systematically categorized to provide meaningful insights into the role of health communication in promoting preventive behaviors.

Results of Study 1 will then guide two subsequent experimental studies which will be designed to test what health communication strategies are most effective by also investigating possible boundary conditions (e.g., health literacy, motivation, and risk perception) and underlying mechanisms (e.g., perceived inefficacy of preventive measures).

Research limitations. *This work-in-progress research is not without limitations. The exploratory nature of this study does not allow for the generalizability of the expected results. For instance, the validity and reliability of the data collected could be influenced by the number and characteristics of individuals participating in the focus group. To mitigate this limitation, careful selection of participants and the facilitation of the focus group by expert researchers will be employed to enhance methodological rigor.*

Managerial implications. *From a managerial standpoint, this study aims to provide healthcare professionals, policymakers, and communication strategists with recommendations for optimizing communication strategies to enhance patient engagement in preventive care. By generating actionable insights, the research seeks to inform the development of more effective, personalized, and culturally responsive health interventions. Ultimately, this study aspires to contribute to the design of strategies that empower individuals, foster proactive health management, and improve public health outcomes*

Originality of the paper. *The originality of this study lies in reconciling previous conflicting findings on the effectiveness of health communication strategies in promoting preventive health behaviors. By investigating the communication factors that influence the success or failure of various approaches in promoting active participation in prevention efforts and addressing how individual factors-such as health literacy, motivation, and risk perception shape individuals' willingness and ability to adopt preventive behaviors, this research sheds light on how to maximize patient engagement in prevention.*

Key words: *health marketing; customer journey in healthcare; health communication strategies; preventive health behaviors.*

AI and sustainability: Preliminary insights from a bibliometric analysis*

MIHAELA GIANNELLI[1] ALESSANDRO M. PELUSO[2]

Abstract

Artificial Intelligence (AI) is causing terrific effects on business ecosystems and human activities in general. This paper investigates the use of AI in two linked areas: production processes and consumer behavior. The paper reports the main results of a bibliometric analysis on the state of the art on the role of AI in these two fields. Regarding production processes, the goal was to analyze the current state of research on how AI can contribute to improving efficiency and reducing environmental impact. As for consumption, the analysis examined the relationship between AI-powered tools and their influence on consumer behavior. The bibliometric analysis let us identify relevant gaps in how these AI-based tools can guide consumers toward more eco-friendly choices and behaviors.

Framing of the research. *AI is emerging as a driver that improves global sustainability by supporting policy makers and companies in reducing environmental issues (Chan & Huang, 2003). Indeed, researchers and companies worldwide are recognizing the potential role of AI in improving production processes, reducing environmental impact, and guiding consumers toward more environmentally friendly choices (Haenlein et al., 2022). Moreover, this paper discusses the employment of AI in fighting against environmental challenges, referring to two strategic areas: production processes and consumer behavior. Sustainable production is defined as the production of goods or services using a set of methods that simultaneously address economic, environmental, and social issues, with the goal of reducing negative impacts through responsible and conscious activities (Garretson et al, 2016). On the other hand, sustainable consumption is defined as "actions that result in decreases in adverse environ mental impacts as well as decreased utilization of natural resources across the lifecycle of the product, behavior, or service" (White et al., 2019, p.23). AI is commonly defined as the use of computational machines capable of emulating human functions, such as prediction, learning, or generating content (Huang and Rust, 2021).*

The introduction of AI in production processes has received growing attention about its ability to optimize production processes, reduce environmental impact, reduce costs, and improve quality by analyzing large data sets and automating complex processes. According to this, Industry 4.0 represents an approach that shifts production processes from a traditional model, where machines dominate the production process, to a digital system process in which machines are automated (Oztemel and Gursev, 2020). The advent of Industry 4.0 has transformed modern manufacturing (Oztemel and Gursev, 2020), transforming companies into "digital ecosystems" in which technology promotes connection and collaboration between different parts of the production system (Kang et al., 2016). This revolution is led by digitalization and automation and, in such a scenario, AI is only one of the central elements of Industry 4.0, which includes a lot of complementary technologies such as Internet of Things (IoT) (Nižetić et al., 2020), robotics (Szilágyi et al., 2023) and big data analytics (Kumar et al., 2021), all working together to optimize efficiency in production processes.

On the other hand, AI plays a central role in shaping consumer behavior. It could enhance consumers' experience and influence their behavior, through tools such as wearable devices (Nahavandi et al., 2022), virtual assistants (Hoy, 2018; Pérez-Soler et al., 2021), or personalized recommendation systems (Yeomans et al., 2019). However, while promoting sustainable consumption is fundamental, academic literature on the use of AI to encourage consumers toward environmentally friendly choices is still limited. To date, academic studies have focused on individual responsibility by investigating barriers and drivers from a psychological point of view (see White et al., 2019 for a review), thus neglecting investigating how AI could promote more environmentally sustainable behaviors, both at an individual level and in relation to systems and infrastructures (Chater & Loewenstein, 2023).

* **Acknowledgment**: The authors acknowledge financial support under the National Recovery and Resilience Plan (NRRP), provided through Ministerial Decree 118/2023 by the Italian Ministry of University and Research (MUR) and financed by the European Union - NextGenerationEU. This support was allocated to the project titled "New technologies and sustainable consumption behaviors" - CUP F83C23000980002.

Purpose of the paper. *The academic literature highlights a relevant interest in Industry 4.0 with a focus on the integration of AI technologies and the digitization of the value chain. The integration of Industry 4.0 allows the creation of connected ecosystems able to optimize business operations and to improve sustainability in production processes (Kang et al., 2016). Industry 4.0 is based on the use of data and advanced devices to automate processes, improve efficiency, and reduce environmental impact throughout the entire value chain (De Man and Strandhagen, 2017; Stock and Seliger, 2016). At the same time, the power of AI is not only linked to production processes. It is becoming an important tool that influences consumer behavior. While academic literature has given considerable attention to industrial optimization and business strategies, the use of AI to guide consumers toward environmentally friendly consumption choices remains underexplored. This is particularly significant when considering the opportunities offered by easily accessible AI tools, such as vocal assistants (Hoy, 2018), personalized recommendation systems (Yeomans et al., 2019), and virtual influencers (Lee and Yuan, 2023), which could help guide consumers toward more informed and sustainable decisions (Puntoni et al., 2021).*

Given the aim of analyzing these two contexts, production processes and consumer behavior, the main objective of this research is to map the existing literature in both fields to highlight central trends, areas of application, and future research opportunities. Additionally, while an expanding interest in research has begun to examine the use of AI in different contexts, such as production processes (Belhadi et al., 2024; Neri et al., 2023) and consumer behavior (Hollebeek et al., 2024; Jain at al., 2024), there is a lack of research on the link between AI, consumer behavior, and sustainability, particularly regarding the direct relationship between AI-powered tools and consumers' engagement in pro-environmental behaviors. To achieve this aim, we conducted a bibliometric analysis on the use of AI for sustainability in production processes and consumers' behaviors to identify the main trends and areas of application of AI and the current state of research in the aforementioned areas.

Methodology. *To analyze the literature on the use of AI in production processes and consumer behavior, we conducted a bibliometric analysis (De Man and Strandhagen, 2017; Maio et al., 2023; Stock and Seliger, 2016). This analysis allows for overcoming the biases related to the sample selection process that often characterize traditional systematic reviews (Cosma and Rimo, 2024) and provides both quantitative and qualitative results. It enables the identification of knowledge clusters in a specific research area and offers a comprehensive overview of an entire field of study (Mukherjee et al., 2022).*

The bibliographic data used for this analysis were extracted from the Scopus database (Öztürk et al., 2024). For the production processes perspective, the search focused on scientific studies containing the following keywords: "circular economy," "artificial intelligence," "industry 4.0," "sustainability," "smart manufacturing," "sustainable production," "industry 5.0," "green product," "green," "smart manufacturing." These terms were searched within the title, abstract, and keywords of the studies. For the consumer behavior perspective, the following keywords were used: "artificial intelligence," "sustainable consumption," "green consumption," "green purchase," "sustainable purchase," "green choice," and "sustainable choice."

The initial phase of the search produced a preliminary sample of 4,222 and 2,189 studies for the two perspectives, respectively. Afterward, a filtering process was carried out to include only studies published in English and exclude irrelevant articles based on their abstracts. To further refine the search criteria and obtain relevant documents, we referred to journals included in the Academic Journal Guide (AJG) published by CABS (Cheng et al., 2023). This phase resulted in a final sample of 207 documents for production processes and 401 for consumer behavior, published between 2018 and 2025. We used VosViewer software (Van Eck and Waltman, 2010) and the Bibliometrix package in R (Aria and Cuccurullo, 2017) to analyze the data. These tools allow conducting author performance analysis and content analysis for both perspectives. Our bibliometric analysis on production processes identified clusters related to advanced technologies, digitalization, and operational sustainability. Regarding consumer behavior, the analysis highlighted thematic clusters linked to emerging technologies, personalized marketing strategies, and ethical issues, but revealed a significantly lower number of studies.

Network Analysis *VOSviewer 1.6.18 was used to conduct the network analysis presented in this study as mapping techniques. The software visually represents the keywords from the analyzed articles, based on co-occurrence data (Van Eck et al., 2010). These maps identify knowledge clusters within a broad research field, providing a structured overview of emerging topics in both domains: AI in production processes and AI in consumer behavior.*

AI in Production processes. *To analyze the literature on the integration of AI and advanced technologies in production processes, a co-occurrence analysis of keywords used by authors was conducted. This approach assumes that the joint appearance of two keywords in documents indicates a connection between the concepts they represent (Donthu et al., 2021). VOSviewer allowed the identification of key concepts through a text-mining algorithm: each keyword is represented by a circle, the size of which is proportional to the frequency of the word in the analyzed documents. The distance between the keywords indicates their correlation, while colors define distinct clusters (Laudano et al., 2018). The co-occurrence analysis identified three main clusters, each represented by a different color in the map that shows the strongest connections through multiple lines (Figure 1). These clusters highlight key areas of focus within AI in production processes domain.*

Fig. 1: Network diagram of the co-occurrence of keywords - AI in production processes

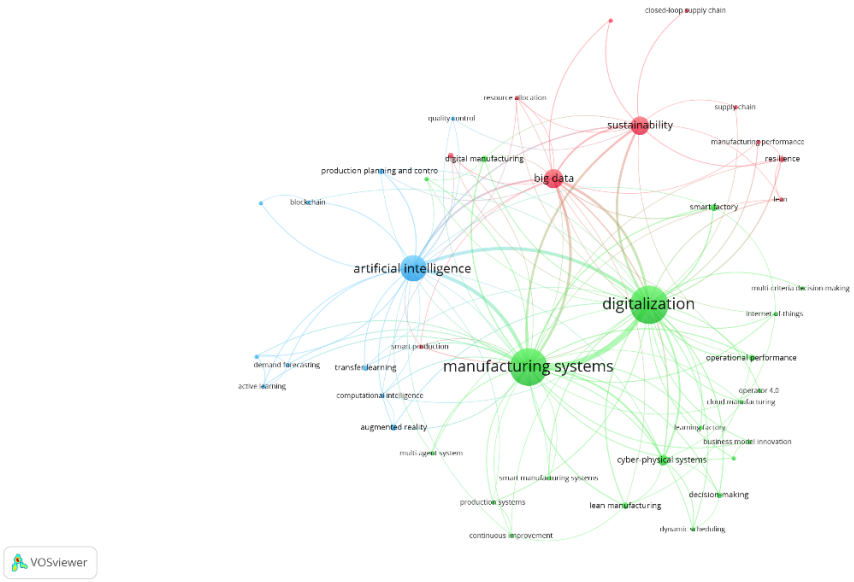

Figure 2 (below) shows the keywords with their respective occurrence number (OC) and Link Strength (LS) for each cluster. The identified clusters are as follows:

- *Cluster 1 (Green): Includes keywords such as digitalization (125 OC, 209 LS), manufacturing systems (123 OC, 214 LS), and cyber-physical systems (10 OC, 27 LS). This cluster highlights the crucial role of digital integration in advanced manufacturing processes.*
- *Cluster 2 (Blue): Contains keywords related to transformative technologies like artificial intelligence (59 OC, 110 LS), augmented reality (10 OC, 17 LS), and blockchain (4 OC, 10 LS). This cluster reflects the focus on technological innovations aimed at revolutionizing the manufacturing sector.*
- *Cluster 3 (Red): Gathers keywords related to sustainability and business performance, including sustainability (30 OC, 51 LS), big data (31 OC, 72 LS), and resilience (6 OC, 10 LS). It indicates a strong connection between innovation and environmental goals.*

OC= Occurrences LS= Link Strength

Fig. 2: Analysis of keywords - AI in production processes

Cluster 1 (Green): Digital Integration in Manufacturing			Cluster 2 (Blue): Artificial Intelligence and Transformative Technologies			Cluster 3 (Red): Sustainability and Resilience		
Keywords	OC	LS	Keywords	OC	LS	Keywords	OC	LS
digitalization	125	209	artificial intelligence	59	110	big data	31	72
manufacturing systems	123	214	augmented reality	4	7	closed-loop supply chain	2	2
cyber-physical systems	10	27	production planning and control	3	6	lean	2	5

AI and consumer behavior

The co-occurrence of keywords related to the use of AI to influence consumer behavior was also analyzed. The analysis revealed the presence of distinct clusters that outline the main research areas. The co-occurrence analysis

identified three main clusters, each represented by a different color on the map, showing the strongest connections through multiple lines (Figure 3).

Fig. 3: Network diagram of the co-occurrence of keywords - AI and consumer behavior

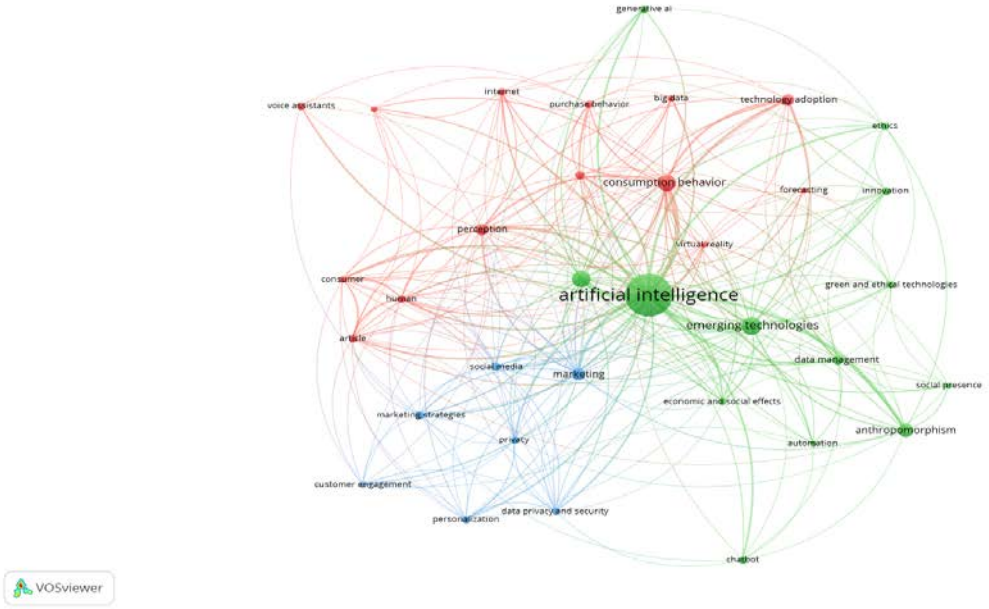

Figure 4 (below) shows the keywords along with their number of occurrences (OC) and Link Strength (LS) for each cluster. The identified clusters are as follows:

- *Cluster 1 (Green): Includes keywords such as artificial intelligence (305 OC, 439 LS), automation (70 OC, 108 LS), and generative AI (54 OC, 113 LS). This cluster focuses on technological applications and the evolution of AI, with an emphasis on emerging technologies, ethics, and sustainability. A strong connection is observed between innovation, green technologies, data management, and automation. Anthropomorphism indicates interest in personalizing human-machine interactions, such as chatbots mimicking human-like features.*
- *Cluster 2 (Red): Contains keywords related to consumer behavior and decision-making, including consumer behavior (46 OC, 131 LS), purchase behavior (9 OC, 21 LS), and technology adoption (21 OC, 63 LS). It indicates a strong link between artificial intelligence and consumer decision-making processes, highlighting AI's role in influencing purchase behavior and value perception.*
- *Cluster 3 (Blue): Includes keywords related to marketing strategies, such as marketing strategies (46 OC, 146 LS), personalization (16 OC, 72 LS), and social media (12 OC, 41 LS). This cluster reflects the focus on using AI to enhance consumer engagement and personalize user experiences. Privacy emerges as a critical theme, indicating consumer concerns regarding data management.*

OC= Occurrences LS= Link Strength

AI in production processes: Results.

Digitalization and Manufacturing Systems (Green Cluster). *In recent years, digitalization has been a fundamental transformative force in production systems, leading to a revolution in business practices. Digitalization manifests through advanced technologies such as cyber-physical systems and smart factories, which are redefining production processes by integrating digital tools into the management and control of operations (Xu and Zweifel, 2020). The strong connection to the concept of advanced manufacturing systems is demonstrated by the frequent co-occurrence with terms such as "lean manufacturing" and "decision-making" (Najaf et al., 2020). Innovation in business models, supported by technologies like the Internet of Things (IoT) and cloud manufacturing, has facilitated the spread of collaborative processes, improved operational efficiency and stimulated continuous improvement (Rawat et al., 2021). This cluster highlights how digitalization is becoming the cornerstone of Industry 4.0, creating a highly integrated and dynamic ecosystem.*

AI and Advanced Technologies (Blue Cluster). *Advanced technological innovations represent another crucial area of research, with a particular focus on AI and augmented reality (AR) (Gimpel et al., 2018). These transformative technologies are influencing key aspects of production, including operations planning and control, knowledge transfer, and quality inspection (Gupta et al., 2022). For example, AI is finding applications in domains such as demand forecasting and computational intelligence, improving prediction and adaptation to market dynamics. Emerging technologies, such as blockchain and active learning, are helping to create more resilient and adaptive production systems, promoting the transition to digitalized operational models (Zarifis et al., 2021). The convergence of these technologies highlights significant potential for addressing critical challenges in production systems, such as reducing cycle times and optimizing resource use.*

Sustainability and Corporate Performance (Red Cluster). *Sustainability has emerged as a central element in corporate strategies, linking environmental goals with improvements in organizational performance. Keywords associated with this cluster, such as "resilience," which refers to the ability of supply chains to recover from disruptions while maintaining operations (Ribeiro and Barbosa, 2018), and "lean manufacturing," a method for minimizing waste without sacrificing productivity (Ruiz-Benitez et al., 2019), highlight the importance of strategies for resource efficiency and adaptability. Additionally, the concept of "closed-loop supply chain," which combines forward and reverse logistics to recover value from returned products (Mehrjerdi and Shafiee, 2019), emphasizes commitment to the circular economy by reducing waste and optimizing material usage. Sustainability is also closely linked to digital and advanced technologies, as suggested by the growing role of big data and its application in monitoring and optimizing business operations (Aitken, 2022). This cluster emphasizes the importance of integrating sustainable practices into production systems to balance economic and environmental objectives.*

AI and consumer behavior: Results.

Artificial Intelligence and Emerging Technologies (Green Cluster). *In recent years, AI has become central to technological innovation, leading to significant developments in automation and emerging technologies. The focus on ethics and sustainability points to the necessity of developing AI solutions that are not only practical but also capable of persuading users to take socially and environmentally conscious actions. This perspective ties into the broader debate on corporate social responsibility, where the adoption of sustainable AI technologies can contribute to more ethical and inclusive business models (Riva et al., 2022). Generative AI, which Feuerriegel (2024) defines as computational techniques that can generate seemingly original, meaningful content—like writing, images, or audio—from training data, is a key component of this cluster. It is revolutionizing how businesses engage with customers and streamline production processes. Furthermore, the concept of social presence related to AI technologies suggests that the perception of human-machine interaction is a central factor for their acceptance and widespread adoption (Pérez-Soler et al., 2021).*

Consumer Behavior and Decision-Making (Red Cluster). *AI is transforming consumer behavior and their decision-making process, particularly focusing on the influence of voice assistants and digital technologies on purchasing habits. The adoption of tools such as Alexa and Google Assistant is redefining how consumers search for information, make purchases, and interact with brands (Sharma et al., 2024). Additionally, the increasing use of chatbots and conversational interfaces in e-commerce highlights AI's potential to enhance customer experience by offering more personalized and immediate interactions (Sidlauskiene et al., 2023). However, questions remain about the relationship between AI and decision-making processes, particularly regarding how increasing automation may reduce consumer autonomy and influence choices in ways that are not always transparent (Hollebeek et al., 2024). An emerging aspect in this cluster is the role of the internet and advanced connectivity technologies in amplifying AI's influence on consumption decisions, creating new opportunities for marketing and digital engagement.*

Marketing Strategies (Blue Cluster). *Companies are increasingly investing in AI to improve marketing strategies, with a particular focus on personalization and customer engagement. The use of advanced AI systems allows companies to analyze vast amounts of data to create tailored experiences, boosting the effectiveness of advertising campaigns and consumer loyalty (Lee et al., 2022). However, the growing attention to personalization raises concerns related to privacy and the protection of personal data, especially in an increasingly stringent regulatory environment (Sands et al., 2022). The main challenge for companies is finding a balance between optimizing AI-based marketing strategies and adhering to data security regulations, ensuring that consumers have transparency and control over their information (Arsenyan et*

al., 2021). The adoption of ethical and regulated AI practices will be crucial in maintaining consumer trust and promoting responsible use of digital marketing technologies.

Research limitations. *The present research offers preliminary insights from bibliometric analysis and, as such, presents some limitations that pave the way for future research. First, other statistical analysis typical of the bibliometric methodology could expand our understanding of the state of knowledge in the two examined areas. Second, this research indicates potential avenues for future studies but say little on how AI could effectively contribute environmentally sustainable product processes and consumption behaviors.*

Managerial implications. *AI can serve as a strategic tool to promote sustainability in both domains. In the industrial context, AI-based systems can be used to monitor the environmental impact of production and encourage more sustainable practices, enabling real-time adjustments to reduce resource consumption. In this way, policymakers can foster new models based on continuous improvement in sustainable practices. In consumption context, AI can support targeted public policies, such as using predictive algorithms to raise awareness about more environmentally friendly consumption behaviors or deploying intelligent systems to regulate transparency in the use of data. Moreover, AI can provide important information to policymakers, by analyzing a large amount of insight into consumer habits. For companies, the opportunities vary depending on the sector of application. In the manufacturing sector, the adoption of AI-driven technologies can improve operational efficiency and reduce waste, contributing to a more sustainable supply chain. In the context of consumer behavior, AI allows the design of innovative tools that not only personalize the shopping experience but also guide consumers toward more sustainable choices.*

Originality of the paper. *This study makes several contributions. First, it deepens the understanding about the role of AI in production processes, particularly in the context of Industry 4.0, by demonstrating the way in which AI can improve not only data management, operational efficiency and reduce waste, contributing to a more sustainable supply chain, but also challenging the existing theories about companies' capabilities and management of resources. According to this perspective, this study provides new visions on how companies can develop and sustain competitive advantage in this digitalized environment. Second, this study deepens the understanding of the role of AI and consumer behavior. Specifically, this study contributes to academic literature by investigating the capability of AI in shaping consumer decision-making process. While current models highlight the role of rationality and other psychological drivers like social influence, habits formation, individual self, feelings and cognition, tangibility (White et al., 2019) in shaping sustainable consumption behaviors, this study contributes to the literature on the current state of research by highlighting the missing link between three areas of current academic literature: AI, consumer behavior and sustainability.*
Although the growing body of work has begun to examine the role of AI in specific sectors like Industry 4.0, human-machine interaction in smart manufacturing (Kang et al., 2016; Kusiak, 2018), or how avatars, chatbots, and other AI-powered tools shape consumer behavior (Bonezzi et al., 2022; Cadario et al., 2021; Longoni et al. 2019; Longoni and Cian 2022; Puntoni et al. 2021), this bibliometric analysis contributes to literature by confirming that Industry 4.0 continues to successfully integrate AI to create more efficient and sustainable production systems, enabling companies to optimize resource use, reduce costs, and lower environmental impact. However, a clear gap in research has emerged regarding the direct interaction between AI and consumers in the context of sustainability.

Key words: *artificial intelligence; sustainability; bibliometric analysis; consumer behavior; network analysis*

All That Glitters Is Not Gold, but Words: Transparency and Uniqueness in Luxury Brand Building Through Storytelling

VIRGINIA GRETTER[1] MARCO FRANCESCO MAZZÙ[2] ANGELO BACCELLONI[3]

Abstract

The luxury sector is undergoing a profound transformation driven by a combination of unsatisfactory performance results and shifting consumer attitudes. Among other factors, a prominent role is played by the growing interest among stakeholders in how luxury companies address various facets of sustainability - a core element in shaping branding strategies to remain competitive within the sector. However, limited attention has been devoted to the practical implications of sustainability in the luxury domain, underestimating the strategic opportunities it offers. Accordingly, our research aims to examine how transparency regarding sustainable operations influences the perceived uniqueness of products, fostering positive consumer attitudes and improving brand reputation, purchase intention, and word-of-mouth. Furthermore, the study explores whether different communication styles (Narrative storytelling vs. Informative) enhance these effects. The findings suggest that providing transparency about a company's sustainable practices significantly increases the perceived value of its products and positively impacts brand outcomes. This effect is further amplified by narrative communication, which more effectively fosters favorable brand-related outcomes compared to purely informational approaches.

Key words: *Sustainability; Luxury; Transparency; Storytelling; Uniqueness; Brand Attitude*

Introduction. *The luxury goods industry is currently under extreme pressure, resulting in several brands experiencing declining economic and reputational performance. While anecdotal evidence suggests the presence of a shift in consumers' attitudes - with young shoppers attributing less value to traditional luxury code (Klasa & Indvik, 2025), and older ones affected by fatigue and trivialisation (Carbone, 2024) - multiple other factors are also gaining relevance in shaping consumer decisions. One of such factors is sustainability, which has become a key expectation among increasingly conscientious consumers (Kapferer & Michaut, 2015). In this context, transparency emerges as a potentially strategic signal (Spence, 1973) to communicate trustworthiness and sustainability commitment to consumers, expecially when traditional makers of luxury are under question.*

Traditionally associated in the literature with exclusivity (Dubois & Paternault, 1995), quality, and prestige (Colucci, Tuan & Visentin, 2020), luxury now faces the challenge of reconciling its hedonistic nature with ethical and environmental principles (Achabou & Dekhili, 2013; Janssen et al., 2017).

Previous research indicates that consumer reactions to sustainability-oriented luxury goods - whether sustainability is an intrinsic product attribute (Janssen et al., 2017; Kapferer & Michaut-Denizeau, 2019) or the result of communication strategies (Amatulli, De Angelis & Donato, 2021) - are mixed. Some studies suggest that sustainability may negatively affect luxury brand perception, to the extent of hindering commercial performance (Davies, Ahonkhai & Lee, 2012; Kapferer & Michaut, 2013), as luxury and sustainability are often perceived as contradictory. Conversely, other findings view luxury and sustainability as compatible, with the integration of sustainable practices enhancing brand performance (Janssen et al., 2017). While earlier research emphasized consumer skepticism, more recent studies suggest a progressive convergence between luxury and sustainability. Nevertheless, despite luxury firms expressing interest in integrating sustainability into their business strategies (Broccardo et al., 2022), reluctance persists - not only in implementing concrete actions but also in disclosing information about corporate sustainability efforts (Fashion Revolution, 2023).

In this context, transparency in sustainable practices plays a central role, as it reflects the ability of companies to communicate information clearly and accessibly about their production practices and the values they endorse (Yoo &

Jeong, 2014). Despite being under-investigated in luxury, transparency fosters authentic consumer-brand relationships, strengthens trust, and enhances brand reputation (Orij, 2010; Lin et al., 2017; Kang & Hustvedt, 2014).

On one hand, transparency in luxury branding can serve as a differentiating factor, reinforcing perceptions of uniqueness and authenticity (Kapferer & Michaut, 2015). On the other, it must be carefully balanced to preserve the aura of exclusivity and desirability that defines luxury goods. Recent literature highlights that narrative communication strategies, such as storytelling, can play a pivotal role in enhancing the effectiveness of transparency by transforming technical information into emotionally engaging and accessible messages (Kang et al., 2020; Giorgino & Mazzù, 2024). Through authentic and credible narratives, brands can articulate their values, foster emotional connections with consumers, and promote positive brand attitudes (Lundqvist et al., 2013; Dwivedi et al., 2018).

Despite the growing academic interest in the intersection of luxury and sustainability, little is known about how transparency regarding sustainable practices influences the perception of uniqueness in a luxury product and, in turn, how this perception influences key brand-related outcomes, such as reputation, purchase intention, and word-of-mouth. Furthermore, the moderating role of communication style - particularly the contrast between narrative versus purely informational messaging - remains underexplored, despite its practical implications.

This study aims to address these gaps through an experimental investigation into the impact of transparency within sustainable luxury branding.

Framing of the research and purpose of the paper

Sustainability and Luxury

Despite numerous attempts to establish a unified definition of the concept of luxury (Fionda & Moore, 2009), research as not yet reached a consensus on its precise meaning (Janssen et al., 2017). Luxury is often associated with the cultivation of appearance, pronounced hedonism, and the fulfillment of primarily symbolic needs (Atkinson & Kang, 2021; Kapferer, 1998) and, in recent years, with the increasing demand for ethical and sustainable standards (Kapferer & Bastien, 2009). While luxury brands have responded by systematically incorporating sustainable practices into their priorities (Sipilä et al., 2020), ambiguity persists regarding the precise meaning of sustainability in this context (Athwal et al., 2019). This contradiction, known as the luxury paradox (Wong & Dhanesh, 2017), underscores a key challenge: the impact of transparency on consumer perceptions (Mohr, Webb & Harris, 2001).

Lin et al. (2017) clarified the role of transparency in shaping consumers' green perceived value and self-brand connection, ultimately reinforcing consumer trust. Transparency, when leveraged to disclose relevant corporate information (Yang & Battocchio, 2020), can enhance brand reputation (Albu & Flyverbom, 2016) by fostering trust and authenticity (Yoo & Jeong, 2014; Orij, 2010). This is in line with the findings of Shuv-Ami (2020), who developed a scale to measure emotional brand attachment, showing how trust, honesty, and transparency contribute to the formation of "brand lovemarks" in consumers' minds. However, it also poses a potential risk to the aura of exclusivity that defines luxury goods (Kapferer & Michaut-Denizeau, 2019). Literature suggests that when applied strategically, transparency can enhance product differentiation, leading to more favorable consumer attitudes toward the brand (Mohan et al., 2020).

Recent studies interpret transparency through the lens of Signaling Theory (Spence, 1973; 2002), which posits that companies reduce information asymmetry by sending credible signals to the market. In the luxury context, transparency acts as a costly signal of authenticity and ethical commitment, enhancing trust and differentiation (Friske, Hoelscher & Nikolov, 2023). Moreover, Sansome, Wilkie & Conduit (2024) define brand transparency as comprising three core components: clarity, objectivity, and proactivity, which together shape consumers' perceptions and responses to sustainability communication.

Prior research has primarily focused on the mass fashion industry, categorizing transparency into the two dimensions of price transparency and production transparency (Yang & Battocchio, 2020; Mohan, Buell & John, 2020). Price transparency refers to the disclosure of unit costs incurred throughout the production process (Mittal & Agrawal, 2016), while production transparency pertains to the disclosure of manufacturing and supply chain details (Egels-Zandén, Hulthén & Wulff, 2015). Within the Italian context, Gatti, Gabrielli & Bonetti (2022) show how specific product features in luxury - such as craftsmanship and origin - can reinforce perceived authenticity and symbolic value. These features may interact with transparency in shaping brand perception.

Based on the above, this study hypothesizes that providing consumers with transparent information on corporate operations can positively influence brand reputation, purchase intention, and word-of-mouth. Formally:

H1a: *The presence of transparency regarding the production process of a luxury good exerts a more favorable influence on the brand's reputation in the eyes of consumers compared to its absence.*

H1b: *The presence of transparency regarding the production process of a luxury good exerts a more favorable influence on consumers' purchase intention toward the brand's products compared to its absence.*

H1c: *The presence of transparency regarding the production process of a luxury good exerts a more favorable influence on word of mouth about the brand compared to its absence.*

Luxury Consumers' Desire for Uniqueness

Previous research has highlighted a strong correlation between luxury consumers and their pursuit of uniqueness, as these individuals seek to maintain their distinctiveness (Kauppinen-Räisänen et al., 2018). Prior studies confirm that the need for uniqueness is driven by the desire to affirm social status through consumption, directly influencing purchasing

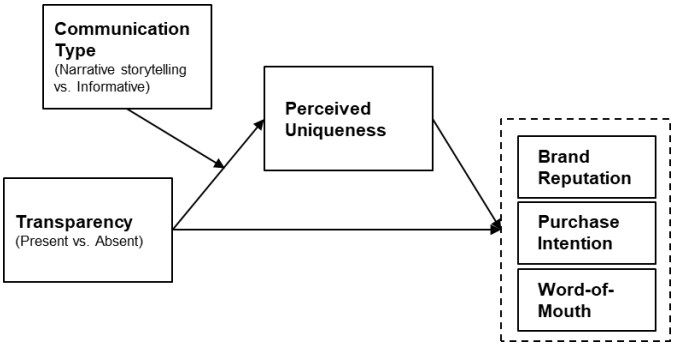
decisions (Chan, Berger & Van Boven, 2012). According to Kim et al. (2012), sustainable development represents an opportunity to enhance brand differentiation and strengthen corporate image. Given consumers' growing interest in sustainability (Mena et al., 2019), transparent communication has the potential to elevate the image of a luxury brand (Kapferer & Michaut, 2015). In the current context of luxury massification (Atkinson & Kang, 2021), transparency may serve as a strategic tool to rebuild trust and stimulate consumer curiosity. This aligns with the findings of Villani and Mattiacci (2021), who emphasized that sustainability-related product features significantly contribute to value perception and uniqueness in the new luxury landscape.

Amatulli et al. (2021) found that the atypicality, or deviation from what is considered common (Schnurr, 2017), of a message communicated by a luxury brand influences the willingness to buy, with a more pronounced impact on consumers who aspire strongly toward uniqueness. Moreover, the increase in perceived uniqueness through this communication strategy enhances purchase intention. Since atypicality - a strong differentiating element (Kim et al., 2012) - can increase purchase intention and the perception of transparency in production, we hypothesized that:

H2: *The presence of transparency in a luxury brand's production process positively impacts the perceived uniqueness of the brand compared to its absence.*

The need for uniqueness is also associated with self-expression, suggesting that consumers who highly value uniqueness tend to choose distinctive brands and adopt innovative products (Snyder, 1992). Luxury brands - often perceived as rare and exclusive - are used to satisfy this psychological drive (Tian, Bearden & Hunter, 2001). Furthermore, the literature suggests that when perceived uniqueness increases, it can influence not only purchase intention, but also how consumers evaluate brand reputation and their willingness to engage in word of mouth (Kapferer & Michaut, 2015; Phau & Prendergast, 2000). We therefore propose that perceived uniqueness mediates the relationship between production transparency and brand-related outcomes, as follows:

H3a: *The perception of uniqueness ~~positively~~ mediates the relationship between production transparency and brand reputation.*
H3b: *The perception of uniqueness ~~positively~~ mediates the relationship between production transparency and purchase intention.*
H3c: *The perception of uniqueness ~~positively~~ mediates the relationship between production transparency and word of mouth.*



The Power of Storytelling

A high level of information dissemination is not always effective, as the message received by consumers requires *interpretation by the recipient. Numerous studies on storytelling have highlighted that this practice is now central to strategies for engaging consumers by evoking emotions (Kang et al., 2020). However, it is not enough to tell a story; it is essential that the story is truthful: companies must tell honest and credible stories to maintain their relevance (Dessart & Standaert, 2023). In this context, transparency applied to brand narratives appears to be a relevant element. Herskovitz and Crystal (2010) argue that a credible narrative can create a lasting emotional bond based on trust, strengthening a brand's power. The association with transparent practices, which in turn provide differentiation (Kim et al., 2012), could strengthen the distinction which, as hypothesized in this paper, would contribute to the brand's uniqueness (Dwivedi, Nayeem & Murshed, 2018). Considering these premises, it is hypothesized that communication style moderates the effect of transparency on perceived uniqueness. In particular, narrative communication is expected to enhance the positive effect of transparency compared to informative communication.*

H4: *Narrative communication (narrative storytelling), compared to a purely descriptive communication (informative), strengthens the positive effect of production transparency on perceived uniqueness.*

Figure 1 shows the integrated hypothesized model.

Figure 1: Hypothesized model

Methodology

Data collection and Sample

Data collection was conducted through an online questionnaire administered via the Qualtrics XM platform, in Italy, in August 2024. A total of 245 participants (Mage = 30.88; 48.6% Female) completed the survey in a consistent and valid manner, following a data cleaning process that led to the exclusion of 10 non-compliant responses. Participants were randomly assigned to one of four experimental conditions: transparency (present vs. absent) and communication type (narrative storytelling vs. informative).

Procedure and Pretest

A pre-test with 55 participants confirmed the successful perception of the manipulations with significant differences between the experimental conditions ($p < 0.001$). After verifying the reliability of the stimuli, the main study proceeded with a final causal between-subjects 2x2 research design. Participants were randomly exposed to one of the four experimental conditions, each presenting a visual scenario featuring a webpage related to a fictitious luxury brand product. The decision to avoid referencing real brands and to create a fictitious one specifically for the experiment was made to minimize potential cognitive biases.

After viewing the stimulus, participants completed a questionnaire divided into four sections, containing multiple-choice questions. Appendix 1 illustrates the stimuli viewed by the survey respondents.

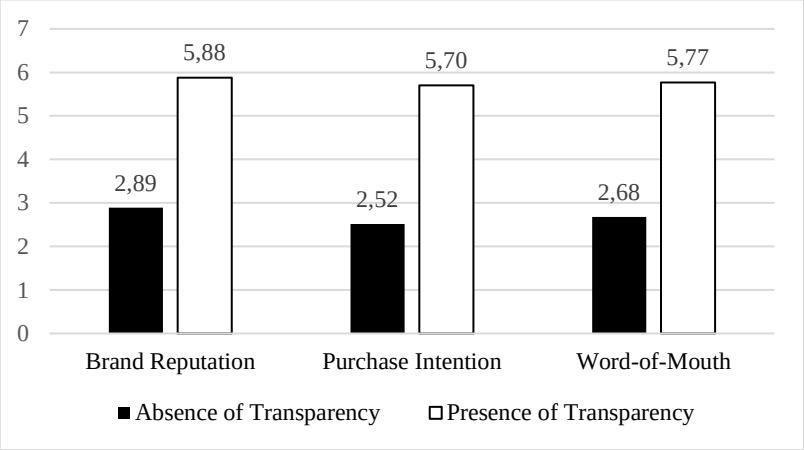
Stimuli and Measurement Scales

The stimuli were designed to represent a sustainable luxury product, accompanied by textual and visual descriptions that manipulated transparency and communication style. Each question was evaluated using previously validated 7-point Likert scales (1 = strongly disagree, 7 = strongly agree). The mediation of perceived uniqueness was based on Homer's (2006) scale (e.g., "Dull / Exciting", "Unoriginal / Original", "Not Unique / Unique"). Brand reputation was measured using Hart and Phau's (2022) scale (e.g., "The brand is transparent", "The brand is honest", "The brand is reliable"). Purchase intention was based on the study by Dodds, Monroe, and Grewal (1991) (e.g., "Would buy the product", "Would consider buying the product", "Would like to buy the product"). Finally, word-of-mouth was based on Maxham and Netemeyer's (2002) study (e.g., "Spread a positive Word of Mouth", "Would recommend the product", "Would mention the product").

Results. *All measurement scales demonstrated satisfactory reliability, as the Cronbach's alpha values for each construct exceeded the recommended threshold for internal consistency. Specifically, the reliability values were as follows: perceived uniqueness ($\alpha = 0.947$, SE = 0.16), brand reputation ($\alpha = 0.979$, SE = 0.05), purchase intention ($\alpha = 0.972$, SE = 0.16), and word-of-mouth ($\alpha = 0.973$, SE = 0.04), thereby confirming the robustness of the measurements.*

To assess construct validity, an exploratory factor analysis was conducted using the principal component analysis method with Varimax rotation. The number of extracted factors was determined according to Kaiser's criterion (eigenvalue > 1) and a cumulative variance exceeding 60%. All items exhibited extraction values above 0.50 and factor loadings greater than 0.30, supporting the adequacy of the factorial structure.

Sampling adequacy was verified through the Kaiser-Meyer-Olkin (KMO) test, which indicated satisfactory levels for all scales (mediator: 0.768; first dependent variable: 0.781; second dependent variable: 0.785; third dependent variable: 0.776). Finally, Bartlett's test of sphericity yielded statistically significant results ($p < 0.001$) for all constructs, confirming the suitability of the factor analysis.



Direct Effects

To test hypothesis H1a, which posits that the presence of transparency (vs. absence) has a positive effect on luxury brand reputation, a one-way Analysis of Variance (ANOVA) was conducted. Assuming the conditions of 0 = absence of transparency and 1 = presence of transparency, the analysis revealed a significant difference between the two groups. Specifically, participants in the absence of transparency condition (n = 122) reported a mean score of M = 2.89, SD = 1.51, whereas those in the presence of transparency condition (n = 123) obtained a significantly higher mean score (M = 5.88, SD = 1.12). The one-way ANOVA results confirm a significant effect of transparency on brand reputation ($F(1,243) = 307.197$, $p < 0.001$), highlighting that the presence of transparency leads to a significant increase in the perception of brand reputation compared to the absence of transparency condition.

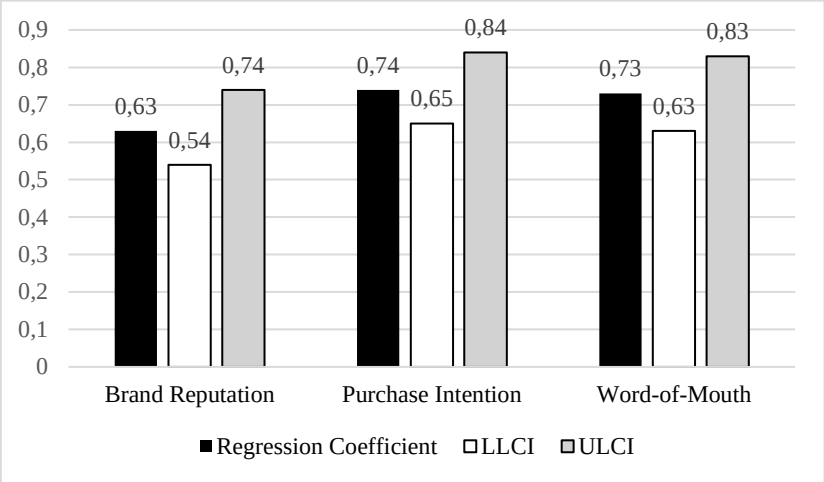
Hypothesis H1b posits that the presence of transparency (vs. absence) positively influences consumers' purchase intention. A one-way ANOVA indicated a significant difference ($F(1,243) = 332.080$, $p < 0.001$) between the groups in the absence of transparency condition (n = 122, M = 2.52, SD = 1.35) and those in the presence of transparency condition (n = 123, M = 5.70, SD = 1.37) on purchase intention.

Hypothesis H1c suggests that the presence of transparency (vs. absence) is associated with a greater propensity for word-of-mouth regarding a luxury brand. In this case as well, the one-way ANOVA revealed a significant difference ($F(1,243) = 308.737$, $p < 0.001$) between the two groups. Participants in the absence of transparency condition (n = 122) reported a mean score of M = 2.68, SD = 1.44, whereas those in the presence of transparency condition (n = 123) obtained a significantly higher mean score (M = 5.77, SD = 1.30).

Figure 2. Mean Scores of Direct Effects of Transparency

Mediation

To assess the statistical significance of the mediation hypotheses, three distinct regression analyses were conducted using Model 4 of the SPSS Process Macro (version 4.2), developed by Andrew F. Hayes. The objective was to test the mediating effect of perceived uniqueness in the relationship between the independent variable (transparency: present vs. absent) and the three dependent variables (brand reputation, purchase intention, and word-of-mouth).



To determine statistical significance, a 95% confidence interval (α = 0.05) was adopted. For the effect to be considered significant, the confidence interval limits (LLCI, ULCI) had to be consistent in sign (either both positive or both negative), ensuring that zero was not included in the range.

The effect of transparency on perceived uniqueness was found to be statistically significant (β = 3.60; SE = 0.16; p < 0.001), with a favorable confidence interval (LLCI = 3.28; ULCI = 3.94), suggesting that the presence of transparency positively contributes to the increase in perceived uniqueness, thus confirming H2. Moreover, the relationship between perceived uniqueness and brand reputation revealed a positive and significant effect (β = 0.63, SE = 0.05, p < 0.001). The confidence interval (LLCI = 0.54, ULCI = 0.74) further confirms the statistical significance of this effect. Therefore, the results support H3a, suggesting that a higher perception of brand uniqueness enhances brand reputation.

The analysis revealed that perceived uniqueness is a significant predictor of purchase intention (β = 0.74, SE = 0.16, p < 0.001). Similarly, the confidence interval (LLCI = 0.65, ULCI = 0.84) supporting H3b and indicating that an increase in perceived uniqueness translates into a higher purchase intention. Similarly, the relationship between perceived uniqueness and word-of-mouth yielded statistically significant results (β = 0.73, SE = 0.04, p < 0.001). The confidence interval (LLCI = 0.63, ULCI = 0.83) confirms the effect and H3c, indicating that a higher perception of brand uniqueness stimulates positive word-of-mouth among consumers.

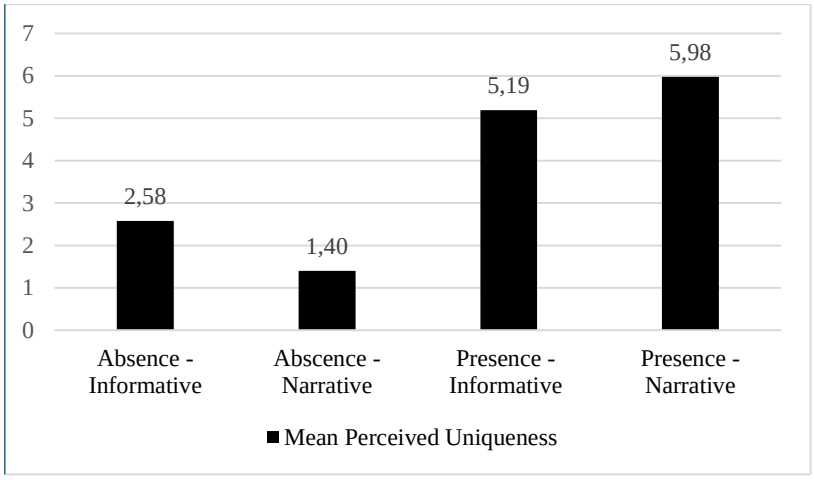
Overall, the results indicate a partial mediation effect of perceived uniqueness in the relationship between transparency and the three brand-related outcomes, confirming its key role in shaping consumer responses to sustainable luxury branding.

Figure 3. Regression Coefficients of Mediation Effects

Moderation

To test the moderation hypothesis H4, a two-way analysis of variance (ANOVA) was conducted to evaluate the joint effect of transparency (X: presence vs. absence) and communication Type (W: narrative storytelling vs. informative) on the mediating variable, perceived uniqueness (M). Assuming absence of transparency / informative communication as 0, and presence of transparency / narrative storytelling as 1, the results of the Two-Way ANOVA indicate that:

- *The absence of transparency / informative communication group (n = 61) reported M = 2.58, SD = 1.33.*
- *The absence of transparency / narrative storytelling group (n = 61) obtained M = 1.40, SD = 0.32.*
- *The presence of transparency / informative communication group (n = 59) recorded M = 5.19, SD = 1.39.*
- *The presence of transparency / narrative storytelling group (n = 64) obtained M = 5.98, SD = 1.37.*



The overall model was found to be statistically significant ($F(3,245) = 201.005$, $p < 0.001$), confirming the adequacy of the model and allowing for the rejection of the null hypothesis (H0).

The analysis of main effects and interaction effects revealed:

- *Main effect of X on M: $p < 0.001$.*
- *Main effect of W on M: $p = 0.199$*
- *Interaction effect of X*W on M: $p < 0.001$*

These findings confirm that the interaction between transparency and communication type has a significant effect on perceived uniqueness, thereby supporting H4.

Figure 4. Mean Scores of Perceived Uniqueness by Transparency and Communication Type

General Discussion and Managerial implications. *In a context where luxury is experiencing a period of crisis due to the interplay of various consumer, market, and political factors, transparency regarding sustainable practices, combined with narrative storytelling, emerges as a potential lever for managers aiming to reshape their marketing strategies. These elements can positively influence brand reputation, purchase intention, and word-of-mouth recommendations, ultimately impacting consumers' decision-making. Perceived uniqueness mediates the effect of transparency on the dependent variables, underscoring the strategic role of communication in shaping consumer perceptions and brand evaluations. This is consistent with Villani and Mattiacci (2021), who found that product features - particularly those related to sustainability - can increase perceived value in the context of new luxury.*

This study contributes to extant literature by introducing an innovative theoretical framework that integrates transparency in sustainable practices as a strategic lever in luxury brand positioning and clarifies the amplifying role of narrative storytelling in generating impact. While exclusivity and secrecy have traditionally characterized luxury, the findings suggest that uniqueness can also emerge from informational openness, challenging conventional industry norms. The emotional dimension of branding is also relevant in this context. As highlighted by Shuv-Ami (2020), brands that foster emotional connection - so-called "lovemarks" - benefit from increased loyalty and advocacy. Storytelling and transparent communication can thus reinforce consumer-brand bonds and enhance positive behavioral outcomes.

From a managerial perspective, these insights provide concrete guidance for luxury marketing professionals, indicating that adopting transparency-driven communication, supported by storytelling, can strengthen consumer-brand relationships, enhance trust, and drive engagement. The findings encourage luxury brands to reconsider their approach to uniqueness, positioning transparency on sustainable practices as a strategic asset that differentiates the brand while preserving prestige and perceived value.

Limitations and Future Research. *Although this study makes a significant contribution to the literature on transparency in sustainable luxury, it presents limitations that open new avenues for future research. First, the analysis*

focused on the social and environmental dimensions of sustainability, while excluding economic aspects, which could differently influence consumer perceptions and managerial decisions.

Moreover, this study examined a single product within the apparel sector without distinguishing between product categories. Investigating whether the effects of transparency extend across various types of luxury goods could offer valuable insights, enabling comparisons that highlight potential variations in consumer responses. Future studies might also assess the impact of environmental certifications in shaping perceptions of transparency within luxury contexts.

Another limitation concerns the use of a fictitious luxury brand, selected to avoid brand-related biases. Future research could explore whether the impact of transparency differs based on a brand's pre-existing reputation, including brands involved in reputational controversies. Comparing brands recognized for their sustainability efforts and those with a history of reputational crises could provide a more nuanced understanding of trust and perceived credibility dynamics.

Furthermore, exploring how consumers react to sustainability strategies in different luxury contexts would be beneficial. A comparison between luxury fashion and fast fashion could clarify whether transparency is perceived as a differentiating value in the former or merely a baseline requirement in the latter.

From a methodological perspective, this study employed a quantitative approach, which allows for large-scale data collection but is limited in capturing deeper consumer motivations. Future research could complement this approach with qualitative methods to explore underlying perceptions and behaviors related to transparency.

Finally, the sample for this study was collected in Italy, which limits the generalizability of the findings. Future research could replicate the experiment in different cultural contexts to test the validity of the model across international markets and assess whether perceptions of transparency vary based on cultural and regulatory differences.

Consumers' Expectations Elicited by Frozen Food Packaging Colors in Digital Environments

RAFFAELE CAMPO[1] DANIELE PORCHEDDU[2] PIERFELICE ROSATO[3] SAVINO SANTOVITO

Abstract

Research has widely shown the influence of colors on consumers' choices, in particular the colors of packages. Actually, research is more focused more on physical stores than in the online ones, despite the growing impact of e-commerce. To this end, we have organized a lab experiment with 220 participants, divided into 4 groups, involved to rate some packages of frozen foods, presented online in different hues (yellow, green, blue, and red). Specifically, they had to evaluate the perceived trust, the freshness of the product, the degree of perceived integrity of the product packaging, the shelf-life length, and the perceived degree of continuity of the cold chain. Through the application of Kruskal-Wallis tests, we found that with reference to the dimension of trust, green and yellow seem to be the best colors; with regards to sensation of freshness only yellow emerges as a successful color; finally, once again, yellow is the color which better stimulate a good perception of integrity of the package. Some managerial implications and limitations of our study are finally discussed.

Framing of the research. *Research has largely shown the role of the external appearance of products which denotes a relevant role of packaging (Creusen and Schoormans, 2005; Vieira, 2010; Silayoi and Speece, 2007) as it is also considered a 5th P of Marketing (Nickels and Jolson, 1976). It is widely recognized its impact on consumers (Sara, 1990; Pires and Agante, 2011; Rundh, 2013; Wang, 2013; Simmonds and Spence, 2017; Vergura and Luceri, 2018; Togawa et al., 2019) also in digital environments (Modi and Singh, 2021, Reinoso-Carvalho et al., 2021) even though it is essential to consider cultural differences for international marketing strategies (Ren and Chen, 2018). Spence (2016) underlines the relevance of visual attributes of packaging in terms of sensory, defined as the most important sensory cues, in particular with reference to colors, which are defined as the most important attributes, as they identify brands uniqueness, differentiate products (Yi-Chou et al., 2020) and affect competitive advantage, loyalty and also have impact on the perception of the shopping experience (Sliburyte and Skeryte, 2014). For example, Seo and Scammon (2017) and Wenting et al. (2022) highlight the ability of green to inspire environmental sensitivity. Interestingly, Gopikrishna e Kumar (2015) found that people can develop in 90 seconds an opinion on a person or a product just observing the colors, while Aghdaie and Honari (2014) affirm that colors can create an emotional connection for consumers, contributing to the increasing of sales and loyalty. Moreover, expectations and evaluations are mainly based on color (Veflen et al., 2023; Singh, 2006).*

Colors are definitely connected to emotions, for example Hemphill (1996) verified the connection between green/yellow/blue and positive emotions, because of they remind nature, sun, and sky. Gordon et al. (1994), on the other hand, studied the relationships between colors and brands, finding that they communicate the quality of a brand and peculiar characteristics of products (e.g. flavor). Recently, Berthold et al. (2024) carried on a study on package color; specifically, in their online study the participants had to observe 12 pictures representing food products with a package (different in color and material), revealing that green is the color which better inspires healthiness, whose connection with color was further studied by Marques da Rosa et al. (2018). The latter scholars, in fact, through 2 experiments investigated how visual attributes of food packaging affected perception of healthiness and taste, highlighting that packaging color affects product preference (in particular red to yellow and blue to green over grey shades) and taste associations; healthiness, on the other hand, was mainly inspired by red to yellow backgrounds (for buttery products). Moreover, Rebollar et al. (2012) explored the expectations elicited by packaging colors (and shape) in the case of chewing gums, showing a stronger relationship between colors and willingness-to-buy rather than between shape and willingness-to-buy. Influence of colors on taste is also shown by Ares and Deliza (2010) and Tijssen et al. (2017). In the first one, 105 consumers had to evaluate six images of milk packages (different in color and shape), in particular color emerged to strongly affect the expectation of flavor, specifically yellow with sweetness and vanilla, white with fruity, sourness and tasteless, black with bitterness but also with premium chocolate desserts. Tijssen et al. (2017), on the other hand, focused on sugar and fat-reduced food, through the Implicit Associations Test, explored the relationship between colors cues

(hue, brightness, and saturation) and perceived attractiveness and healthiness of the products: they revealed that warm, saturated and less bright packages result to improve sensory expectations and perception and are considered to be more attractive and connected to less healthy products. Further findings come from Baptista et al. (2021), whose research was focused on chocolate packaging (in France and Brazil). 420 consumers were involved, with the aim to evaluate some samples of chocolate (milk and dark ones) whose package was different in colors (7 alternatives: black, blue, yellow, red, pink, brown, and green): results pointed out that bitterness was better expected by a black package, while sweetness by a pink or yellow one. Surprisingly, the expected liking varied depending on the type of chocolate: in fact, when milk chocolate was wrapped in a black packaged, the participants perceived the best expected liking while, in case of dark chocolate, black made them rate the expected liking as the worst one.

Additionally, Lunardo et al. (2021) focused on red, stressing that red food packages may have consequences such as negative cognitions and affecting a feeling of guilt (the other colors analyzed were green and blue), in particular for unhealthy products. On the other hand, Huang and Lu (2015) indicated that red affected the sweet flavor, which was perceived as higher, compared to green and blue packages, for ice cream, iced tea, cereal, and yogurt. Furthermore, Hallez et al. (2022) studied the association between colors and tastiness/healthiness/sustainability: in their study they found a connection between cool colors and expectations of lower taste (compared to warm colors) and a lower likelihood to select products whose packaging had cool colors. Hues in digital environments are object of analysis of Kunz et al. (2019). Their sample had to view some pictures of snacks in an online supermarket and rate them in terms of expected healthiness and tastiness: a group could observe grayscale images, another one images in their real colors while, in a further experiment, they had to evaluate images in increased and decreased color saturation: their results showed that there were no differences between full colors and grayscale to evoke healthiness while full color strengthened the positive relationship between healthiness and tastiness; finally, increased saturation was better predictor of healthiness and tastiness.

Purpose of the paper. *In terms of gaps, we noted the need to increase research on the impact of packaging colors in digital environments, because essentially, we did not find any studies specifically focused on this topic, which is relevant because of the dramatically growth of e-commerce. The main objective of this paper is to verify whether (and how) frozen food packages of different colors, shown in an online context, can give rise to different expectations regarding the attributes of the product and its supply chain. The choice of frozen foods was justified by the fact they represent one of the most sold food products online (Mark-Up, 2020) and, considering that they are not fresh products, they always need a package.*

Methodology. *In order to test the impact of packaging colors in digital environments, we organized an experiment, which consisted to the exposure to realistic visual stimuli represented by images depicting packaging of a widely consumed frozen product, which is frozen Brussels sprouts. We considered the real images of a product commercialized by an Italian company and modified them for our purposes.*

1) Experimental sample

The subjects involved underwent a short preliminary protocol to evaluate their suitability to participate in the experiment. As a matter of fact, considering that the experiment was based on the sense of sight, we have ascertained that:

• each participant had normal (or corrected-to-normal) visual acuity;

• each participant did not suffer from forms of dyschromatopsia (i.e. altered color perception); for this reason participants underwent an Ishihara test (Ishihara, 1917) through a specific smartphone app.

Overall, we involved 220 Italian people (100 females and 120 males).

2) Stimuli

We started chosing a real product, which was Brussels sprouts sold by a leading Italian company. We considered the original package of this product, represented in Figure 1.

Fig.1: The real package

Source: picture sourced from publicly available online source.

Then, by using a computer graphics program (Photoshop CS6) we proceeded to modify the image and to replace the original brand with a fictitious one and, finally, the verbal elements present in the package were colored black. Afterwards, we created four different versions from the real image. Each obtained image was characterized by the prevalence of a different color: yellow (RGB: 222, 223, 0), red (RGB: 223, 0, 0), green (RGB: 0, 225, 0), and blue (RGB: 0, 0, 222). The four "new" packages are therefore identical to each other, except for the prevalent color (see Figure 2).

Fig. 2: The four lab versions of the actual package

Source: Authors' own work.

3) Experimental design

To simulate an e-commerce environment, the stimuli were presented on a 21'' color CRT monitor (Sony GDM-F520, 1600×1200 pixels, 100 Hz refresh rate) controlled by a MacBook computer. The testing environment was illuminated with an Osram Daylight fluorescent light (250 lx, 5600 K). All stimuli were displayed on a frontoparallel plane positioned 50 cm from the observer.

The 220 participants were randomly assigned to one of the following 4 Groups:

1. *Group n. 1: people exposed to the predominantly blue colored packaging;*
2. *Group n. 2: people exposed to the predominantly red colored packaging;*
3. *Group n. 3: people exposed to the predominantly yellow colored packaging;*
4. *Group n. 4: people exposed to the predominantly green colored packaging.*

The experiment supervisor, after collecting data on gender, age, and level of education, asked each participant to carry out this task: "On the screen you can see a frozen product sold online. After having carefully observed the image, we ask you to formulate some evaluations regarding a series of aspects in the sheet that we will now submit to you". Then, every participant was asked to answer a series of questions (through a Likert scale from 1 to 7):

- *Q_1: the trust (in general) placed in the product observed on the screen;*
- *Q_2: the perceived degree of freshness of the product;*
- *Q_3: the degree of perceived integrity of the product packaging;*
- *Q_4: the shelf-life length of the observed product;*
- *Q_5: the perceived degree of continuity of the cold chain.*

In this experiment, the manipulated independent variable is represented by the prevailing color of the packaging to which the participants in the experiment were exposed, through the images represented on a monitor. This variable was presented in four ways (the colors) so, as written before: 1) blue 2) red 3) yellow and, finally, 4) green. The dependent variables are represented by the ratings on a Likert scale from 1 to 7, expressed by the participants with reference to the questions from 1 to 5 reported in the survey sheet. It is relevant to remind that the evaluations formulated by the participants in the experiment regarding questions from Q_1 to Q_5 were elicited in a context of ceteris paribus, except for the packaging color of the frozen product, which was different depending on the experimental group.

4) Statistical methodology

The evaluations expressed by the participants were, consequently, collected in a database and subjected, question by question, to Kruskal-Wallis tests (which is the non-parametric equivalent of the one-way between subjects ANOVA), considering the prevailing color of the package observed as between-subjects factor. A Kruskal-Wallis test is significant when at least one of the medians referring to the experimental groups is significantly different from the others and it will be necessary to proceed with specific post-hoc tests (Conover, 1999; Sheskin, 2011). Specifically, in order to identify which treatment (i.e. color) the significantly different medians refer to, one can proceed by comparing them two by two

with the Wilcoxon test for the sum of the ranks, taking care however to correct the level of significance based on the Bonferroni inequality (Conover, 1999).

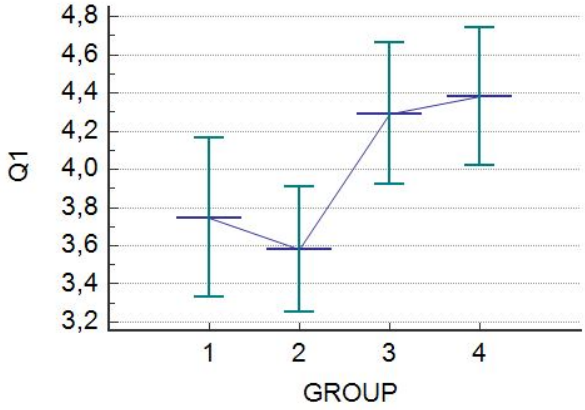
Results. *Overall, 220 participants (100 females and 120 males), total average age 25.48 years (SD=5.75) were admitted to our studio. The sample size of our study (55 subjects per group) is that necessary to guarantee the statistical tests of the Kruskal-Wallis ANOVA type that we conducted, with α=0.05, a statistical power of at least 80% and to detect at least a medium effect size (Clark-Carter, 2004, pp. 239-240). We report, for each experimental condition, the mean values (SD in brackets) of the evaluations expressed by the participants in a 7-point Likert scale regarding the issues referred to in questions from Q_1 to Q_5.*

Tab. 1: Average ratings (and related SD), by package color, expressed with reference to questions from Q_1 to Q_5

Question\Color	Blue	Red	Yellow	Green
Q1	3.7 (1.5)	3.6 (1.2)	4.3 (1.4)	4.4 (1.3)
Q2	4.0 (1.6)	3.4 (1.5)	4.6 (1.6)	4.2 (1.7)
Q3	5.0 (1.6)	4.9 (1.4)	5.6 (1.3)	5.1 (1.5)
Q4	5.0 (1,6)	4.8 (1.5)	5.1 (1.4)	5.2 (1.2)
Q5	4.8 (1.4)	4.5 (1.6)	5.0 (1.6)	5.0 (1.2)

Source: Authors' own work.

For each of the questions from Q_1 to Q_5, we describe below the results of the inferential analysis conducted with the non-parametric Kruskal-Wallis test (Conover, 1999):



• Q_1: value of the H_t statistic (with 3 degrees of freedom and with correction for ties) = 13.64; p=0.0034 (see table 2); this test was highly significant and the post-hoc tests revealed, in pairwise comparisons, statistically significant differences between some levels of the treatment (color) in the ability to arouse trust (in general); in particular, participants showed significantly higher degrees of trust, ceteris paribus, towards products with Green and Yellow packaging compared to those with the prevalent Blue and Red colors (see Figure 3).

• Q_2: value of the H_t statistic (with 3 d.f. and with correction for ties) = 14.42; p=0.0019. The test was highly significant and post hoc tests showed, in pairwise comparisons, statistically significant differences between some levels of treatment in the ability to elicit the sensation of freshness(see Table 3); in particular, the Yellow has proven to be able to better convey the sensation of freshness of the product compared to Blue and Red; while Green only compared to Red (see Figure 4).

Research limitations. *The results just described were obtained during a laboratory study, in a ceteris paribus context in which, in particular, several potential confounding variables were controlled (on these methodological aspects see, for example, Lambin, 2025). These variables are so called because they are able to (potentially) interfere with the cause-effect relationships between the independent variable (prevalent color of packaging) and the dependent variables included in our experimental design (variables of interest referred to in questions from Q_1 to Q_5). Among the potential confounding variables controlled during our work we can mention:*

• *the product brand, which, in addition to being the same in the four experimental groups, was also fictitious and, therefore, unknown to all participants in the experiment;*

• the further verbal and non-verbal components of the package (except for the prevailing color) were exactly identical in the images to which the four experimental groups were exposed.

Considering the laboratory nature of our study (and the consequently problems of external validity, see for example Lambin, 2025; Luceri, 2013), the results we obtained lead, overall, to believe that the color of the package of a frozen product significantly influences the perception of potential buyers in an e-commerce experience, with reference to aspects we consider important, such as the overall trust placed in the product, or the freshness or, again, the integrity of the product.

Future research could replicate the results we found in more realistic decisional contexts and consider further types of frozen products (e.g. sweets and French fries). We also hope that future research can adopt a multicultural approach to evaluate possible cultural biases on the results we obtained. Finally, from a further point of view it could also be interesting to conduct future neuromarketing research in order to study the uncontrolled reactions of the brain when observing the different packaging colors.

Managerial implications. *The main results of this study, related to digital environments, are:*

1. with reference to the dimension of trust, green and yellow were the best performing colors;

2. with regards to sensation of freshness aroused by the product, only yellow shows performances significantly different from those highlighted by the other possible colors of the package;

3. finally, with reference to the expected integrity of the package, we detected a significantly superior performance of yellow compared to the other colors.

We therefore have several reasons to believe that the color of the package of a frozen product can influence people's expectations of a series of aspects that we consider to be of interest and which can decisively influence the choice of the product during the purchase phase in an e-commerce context.

This study highlights how colors can impact on consumer's responses in a digital environment. Definitely, colors are not the only variable to influence consumers, for example we did not consider the role of the packaging size and shape, but how the choice of particular hues can play a relevant cognitive and affective influence. Certainly, the role of e-commerce today requires attention to consumers' expectations and perceptions online and this could be relevant especially for those brands which are less known and have to compete with brand leaders (let's think for example about local firms which produce frozen foods). From a managerial point of view, with reference to the variables we considered, the choice of a yellow background for the packaging appears to be the optimal one for those firms which sell frozen foods online.

Originality of the paper. *Originality of this research lies first of all in the choice of frozen food, which is rarely studied in sensory studies. Then, the focus on digital environments - in a context in which e-commerce assume more and more relevance - represents a further element of originality in particular considering that large-scale distribution (but not only) is solidly present online.*

Key words: *Packaging; Colors; E-commerce; Food Marketing; Frozen food*

Persuasion knowledge activation versus health knowledge intervention: enhancing the effectiveness of Front-of-pack nutritional labels against misleading information

JUN HE[1] MARCO FRANCESCO MAZZÙ[2] CINZIA CALLUSO[3]
PIERPAOLO IODICE[4] REGIS THOUVARECQ[5]

Abstract

The rise in overweight and obesity is driving an increasing prevalence of noncommunicable and chronic diseases all around the globe, resulting in a heavier burden on individuals and higher costs for families and health systems. The presence of misleading information on food packaging exacerbates the situation by causing consumers to unknowingly choose less healthy options. Front-of-pack nutritional labels (FOPLs) have been reported as solutions to provide consumers with reliable information and be able to partially mitigate misleading information with negative consequences on consumers' health. However, FOPLs exposure presents some limitations as misleading information may divert consumer attention from FOPLs and lead them to misinterpret the product as healthier than it actually is. Therefore, further interventions are needed to empower consumers to be better informed and educated. Our exploratory experiment, including 79 participants, found that persuasion knowledge activation, compared to health knowledge intervention, are more effective in assisting Front-of-pack nutritional labels against misleading information. Hence, building of persuasion knowledge model, we examined the underlying mechanisms that motivate consumers to engage more effectively with health information (i.e., spread the negative word of mouth of products that contain misleading information), using a psychological reactance perspective.

Framing of the research.

Misleading or informative? The role of Front-of-pack nutritional labels in consumer recognition of misleading information.

Overweight and obesity have been linked to an increased risk of chronic and non-communicable diseases, such as cardiovascular diseases, cancer, and chronic respiratory diseases (WHO, 2024). Despite the increased awareness of the risks, the prevalence of overweight and obesity has risen significantly worldwide, with 43% of adults classified as overweight, and 16% living with obesity (WHO, 2024). Moreover, the prevalent use of deceptive and misleading information on food packaging, such as false nutrient content and misleading health claims, may exacerbate the issue (André et al, 2019; Pérez-Ferrer et al, 2019; Perry et al, 2018; Pulker et al, 2018). Particularly, this misleading information on unhealthy food undermines the well-established informative elements that healthy food widely use-authentic nutrient content and accurate health claims-that are intended to assist consumers in making healthier choices. Specifically, the misleading information appears with partially correct claims, which may legally and factually highlight the rich vitamin and mineral content of a product through nutrition claims, while the product as a whole is unhealthy due to high sugar content (Pérez-Ferrer et al, 2019). Similarly, to meet the criteria for a "low fat" claim, the fat content may be significantly reduced while other caloric ingredients are added to compensate for taste, ultimately resulting in a product that is less healthy overall (Schermel et al, 2016). Furthermore, there are more packaging cues that may lead consumers to misinterpret the food healthiness (de Sousa et al, 2022), such as "free from pam oil" or "free from genetically modified organism" (Hartmann et al, 2018), natural claims (Hooker et al, 2018), health trade labels (Berry and Romero, 2021), health related images (e.g., a brain image) (Delivett et al, 2022), packaging color and ecological claims (Hallez et al, 2023). Recent research gathered 3813 products from supermarket packaged food and reported that 67% of the products include health-related cues while the cues on the packages do not relate to higher nutritional value and cannot be a health indicator (Alcaire et al, 2023). While different legislations have been implemented worldwide to prevent misleading information (European Commission, 2024; FDA, 2024; Ministerio de Salud, 2016), these laws have

several limitations, including low levels of compliance, challenges in monitoring the real adoption, and notably, the persistence of misleading practices that fall into a grey zone (Clement et al, 2017; Pulker et al, 2018). For instance, Pulker et al (2018) analyzed the packaging information of ultra-processed foods, such as breakfast cereals, snacks, and confectionery items, collected from supermarket. The study found that 56% of food packages contained nutrition claims but only 18% of these claims were compliant, while the remaining 82% being misleading. Additionally, 25% of the products featured health claims, with a compliance rate of 79% (Pulker et al, 2018). They reported that these products, which are typically high in added sugar and generally considered as unhealthy, often misuse claims to attract consumers. Moreover, marketers often comply with legislation in wording while still being misleading (Clement et al, 2017; Schermel et al, 2016).

This misleading information can be particularly harmful among consumers that are interested in pursuing a healthier diet, as they are more sensitive to the health information on packaged food. Ironically, these consumers might ultimately purchase less healthy foods for themselves due to misleading information (Miklavec et al, 2015). Notably, parents often (mis)interpret foods with misleading health information as healthier and show a higher intention to buy these less healthy options for their children, which is contrary to their intentions (Harris et al, 2011). For example, these parents interpret the 'antioxidants and vitamins' claim on the packaging as proof that the product can help prevent their children from getting sick, even if the nutrient content of product is below the average quality for the category.

The use of front-of-pack nutritional labels that are easy to understand, as a prioritized policy encouraged by WHO (2024), have been demonstrated to be an effective solution to mitigate misleading information. FOPLs are generally considered as more trustful and useful than other sources on food packages (He et al, 2023; Mazzù, et al, 2022; Mazzù et al, 2023). When existed together with misleading information (i.e., nutrient claims), FOPL has been shown to influence consumers' perceptions of a product's healthiness while misleading health information like nutrient claims do not have the same effect (Mazzù et al, 2021; Schnettler et al, 2019). Overall, FOPL has demonstrated greater relative importance than misleading information in influencing consumers' healthful perception of the product (Nobrega et al, 2020) and the existence of FOPL can sometimes eliminate the influences from misleading health information (Stoltze et al, 2021).

On the other hand, FOPL has also shown some limitations in resolving misleading health information (Mazzù et al, 2024). While front-of-pack nutritional labels can correct the bias generated by misleading information, it could happen only when consumers pay attention to the FOPL (Talati et al, 2017). Nevertheless, misleading information from graphics on food packaging are usually more appealing to attention and therefore influences consumer healthiness perception even when individuals are encouraged in advance to pay attention to FOPL information (Bone and France, 2001). Medina-Molina and Perez-Gonzalez (2021) reported that health claims that may be misleading exceed the influence of front-of-pack nutritional labels in informing consumers of the product healthiness. Similarly, recent studies reported that misleading nutrition claims cancel out the unhealthy indication suggested by Nutri-Score E (Janssen and Bogaert, 2023). Moreover, FOPLs may be perceived as a healthy symbol and therefore induce individuals to consider the product as healthier both for healthy and unhealthy food (Ikonen et al, 2020).

In response, policymakers and leading public health communicators actively employ knowledge-based interventions, such as educating consumers on effectively interpreting food labels (European Commission, 2024a) and informing consumers about the presence of misleading elements on the food package (European Commission, 2024b). One challenge to the effectiveness of such information is that it is often cognitively demanding (Gokani, 2024).

Persuasion knowledge model and psychological reactance as the empowering mechanism

The persuasion knowledge information (also referred to as disclosure of persuasion attempt of the company) may inform consumers about the food label elements more effectively.

The persuasion knowledge model (Friestad and Wright, 1994) explains how consumers develop their capabilities of recognizing and interpreting the persuasion attempts from marketers and in turn execute their own coping strategies, such as ignoring or discounting these persuasion tactics. Misleading elements on food packages, often used as a persuasive tactic to make the products appear healthy and influence consumers to purchase them, therefore, fall into the category of persuasion attempts. A recent meta-analysis has shown that persuasion knowledge can counteract marketers' persuasion effect (e.g., advertising) by 50%, which represents a substantial impact (Eisend and Tarrahi, 2022). When persuasion knowledge is activated, individuals show primarily emotional and behavioral responses, indicating that responses are automatic and fast reacting (Eisend and Tarrahi, 2022).

Although the persuasion knowledge model explains the heightened consumer responses to persuasion attempts, the underlying motivation driving these responses remains unclear (Eisend and Tarrahi, 2022; Eisend et al, 2020). In our research, we aim to use psychological reactance as the theoretical framework to explain how interventions leveraging persuasion knowledge can empower consumers to counter misleading information.

Psychological reactance theory (Brehm, 1966) posits that consumers have the need to be autonomous, such that when they feel their freedom of choice is threatened, a motivational state aimed at restoring their sense of freedom is activated. The motivation state drives individuals to respond emotionally with anger toward the subject, restricting their freedom and cognitively by arguing against the persuasive content. This motivational state has been widely studied in health communication literature, where persuasive messages promoting healthy eating are often perceived as threats to freedom. In turn, consumers not only reject the health-related messages but also feel anger toward the communicator (Lombardini and Lankoski, 2013; Lu and Cai, 2023). However, the threats that can be posed by unhealthy food promotion have been overlooked in psychological reactance literature, as people don't appear to be persuaded to exclusively choose unhealthy

options. On the other hand, the lying intention behind misleading information serves as a barrier to healthier choices. Therefore, consumer coping strategies within the persuasion knowledge model may align with the psychological reactance responses.

Purpose of the paper: *This research aims to explore whether persuasion knowledge, compared to health knowledge, contributes to increased consumer negative word of mouth about the product and to examine the underlying mechanism for this effect. Specifically, we integrate two theories-the persuasion knowledge model and psychological reactance theory-to investigate whether reactance responses serve as the empowering mechanism linking the activation of persuasion knowledge to consumer coping strategies in response to misleading persuasive attempts.*

Hypotheses:

H1: Informing consumers about the persuasion knowledge (i.e., lying intention of the food company), compared to healthiness knowledge (i.e., the unhealthiness of the food products), results in higher likelihood of spreading negative word-of-mouth about the food.

H2: The differential impact of these two types of information exposure on consumers' negative responses toward the food product and the company is mediated by reactance responses, including anger and counterargue intention.

Methodology.

Study Population: *We conducted a class experiment in an Italian university. We collected data from 79 participants (Mage = 21.89, SD=0.95; 48.1% female, 51.9% male).*

Research design: *Respondents were informed that the study is about packaged food and engaged in an evaluation task after been randomly assigned to one of two conditions categorized by knowledge intervention type ((i) persuasion knowledge; (ii) health knowledge) (see Appendix A). We measured participants' negative word of mouth of the product (Voorhees et al, 2006; 3-item), anger (Dillard and Shen 2005; 4-item), and counterarguing (Nabi et al. 2007; 4-item).*

Manipulation check

At the end of the main study, the manipulation check was added with the same 79 participants from the Italian University. Participants were asked to indicate the extent to which they thought the company had lying intention (Argo et al, 2006, 4-item). The results showed that the manipulation was successful, with $M_{(persuasion\ knowledge)} = 4.30\ (SD = 1.21)$ *scoring significantly higher than* $M_{(health\ knowledge)} = 3.71\ (SD = 1.23)\ (t = -2.17, df = 77, p = 0.01)$.

Results. *The independent t-test results confirm H1 and show the consumer negative word of mouth of the product when informed with persuasion knowledge,* $M_{(NWOM_persuasion\ knowledge)} = 4.14\ (SD = 1.27)$ *scoring significantly higher than health knowledge,* $M_{(NWOM_health\ knowledge)} = 3.09\ (SD = 1.27)\ (t = -3.67, df = 77, p < 0.01)$. *Moreover, consumer anger response when informed with persuasion knowledge shows* $M_{(anger_persuasion\ knowledge)} = 3.52\ (SD = 1.75)$ *scoring significantly higher than informed by health knowledge,* $M_{(anger_health\ knowledge)} = 2.08\ (SD = 1.24)\ (t = -4.26, df = 77, p < 0.01)$. *Consumer counterarguing response shows that* $M_{(counterargue_persuasion\ knowledge)} = 3.87\ (SD = 0.94)$ *scoring significantly higher than* $M_{(counterargue_health\ knowledge)} = 3.18\ (SD = 1.10)\ (t = -3.00, df = 77, p = 0.004)$.

Simple mediation: we employed simple mediation test with knowledge type as independent variable, consumer anger response and counterargue as mediators, and consumer negative word-of-mouth as dependent variable.

A mediation analysis (process model 6, Hayes, 2022) confirms H2 and suggests that when consumers are exposed to persuasion knowledge, compared to health knowledge, consumers exhibit an increased level of anger towards the food company (b = 0.73, t = 4.26; p < 0.01), which in turn increases counterargue intentions toward the food company (b = 0.35, t = 5.31, p < 0.01). Furthermore, the increased anger is positively associated with a higher negative word-of-mouth of the food (b = 0.29, t = 3.29, p < 0.01) and the increased counterargue intention is positively associated with a higher negative word-of-mouth of the food (b = 0.49, t = 3.86, p < 0.01). Specifically, the direct positive effect of persuasion knowledge exposure on negative word of mouth is not statistically significant (b = 0.15, [SE] = 0.12; [CI] = -0.10, 0.39). Importantly, the indirect positive effect of persuasion knowledge exposure on negative word of mouth-through anger-is statistically significant (b = 0.21, [SE] = 0.08; [CI] = 0.08, 0.40); the indirect positive effect of persuasion knowledge exposure on negative word of mouth-through anger and counterargue intentions-is statistically significant (b = 0.13, [SE] = 0.05; [CI] = 0.05, 0.24). The study results indicate that, when exposed to persuasion knowledge, compared to health knowledge, which informs consumers misleading information on food, consumers show higher willingness to spread negative word of mouth, mediated by an increased anger and counterargue intention.

Research limitations. *The sample size is limited to 79 participants due to the class size. However, all the students were highly motivated to complete the experiment, as participation offered extra credit for the final exam, ensuring a high quality of responses. This research is based on a sample of Italian student, which may limit the generalizability of the findings. Future research should aim to test this effect across diverse cultural and demographic contexts to enhance the universality of the results.*

Managerial implications. *The prevalence of misleading health information on food packaging can prevent consumers from capturing accurate food information and may lead them to unknowingly purchase less healthy options. While FOPLs have been acknowledged by policymakers and the scientific community as an effective tool for providing consumers with reliable indicators of a food's healthiness, their sole presence has proven to be partly ineffective in limiting unhealthy choices.*

This research proposes a potential solution, highlighting that the intentional disclosure -by policymakers and public health advocates, for example- of the manipulative intent behind misleading health information could be included as part

of their communication. Specifically, our results show that informing consumers about the persuasion knowledge (i.e., persuasive intent of misleading information), as compared to healthiness knowledge (i.e., sheer healthiness knowledge about food packages displaying misleading information), leads consumers to spread more negative word-of-mouth about the company, and that the process is mediated by consumer anger and counterargue intention toward the company.

Originality of the paper. *In the food communication context, psychological reactance theory has explained how consumers respond with reactance towards the persuasive messages about healthier food because people feel compelled by the healthy food and want to restore their freedom of unhealthy food choices. However, the potential consumer reactance towards unhealthy food is overlooked in the literature. Anchored in persuasion knowledge model, we confirm, for the first time in the literature, that persuasion intent, specifically lying intention from unhealthy food companies, can activate consumer reactance, including anger and counterargue intention, to restore their freedom of choice and spread more negative word of mouth about the company that has the lying intention.*

Key words: *misleading information; front-of-pack nutritional labels; persuasion knowledge model; psychological reactance; health communication.*

Research advances in Front-of-Pack Nutritional Labeling and stages of policy life cycles: A Systematic Review

VALERIA GAMMELLA QUINTERO[1] MARCO FRANCESCO MAZZÙ[2] ANGELO BACCELLONI[3]

Abstract

Over the past years, policymakers and institutions have begun adopting Front-of-Pack Nutritional Labels (FOPLs) as an effective measure to counteract the rise in overweight and obesity, a major concern with negative consequences for individuals and health systems. The current landscape presents a wide variety of FOPL proposals, ranging from more directive to more informative solutions, within a context of varying stages of market implementation.

Through a systematic review of the most recent research on FOPLs (2020-2024), this paper aims to provide a perspective on the latest advances in the research, also showing how research productivity and areas of investigation varies across countries in different stages of the policy lifecycle. Evidence suggests that the effectiveness of FOPLs depends not only on their design and clarity but also on the regulatory framework, consumer familiarity, and broader public health strategies. This underscores the need for continuous research advancements to address varying policymaking priorities at different stages of policy development.

Framing of the research. *Obesity and overweight are major public health concerns that have been rising globally in recent decades, leading to several negative consequences for populations-such as an increase in non-communicable diseases-and placing a growing financial burden on health systems (WHO, 2024). In response, institutions and policymakers have begun implementing various countermeasures to reverse this trend, including the introduction of Front-of-Pack Nutritional Labels (FOPLs), which have been recognized as an effective strategy (Mazzù et al. 2021) to nudge consumers toward healthier and more informed food choices (Mazzù et al., 2023). While the strategic direction of introducing FOPLs is widely acknowledged as effective and necessary, significant differences exist in both "policy maturity" and execution. In more recent years, the European Commission has recognized the need for a harmonized mandatory Front-of-Pack nutrition labeling system. This initiative is part of the Farm to Fork strategy, aiming to standardize FOP labeling across the EU (van der Bende & Lissner, 2019, EU Commission 2020).*

However, as for the current state of things, we are in a fragmented regulatory landscape and market implementation, often influenced by local dietary habits, economic interests, and political priorities. In this fragmented perspective, Scholars have identified and tried to rationalize different approaches and categories of FOPLs, ranging from more directive Summary labels, such as the Nutri-Score-already implemented in several markets, including France, Germany, and the Netherlands-or warning labels, as introduced in Chile, to Nutrient-Specific labels, such as the Multiple Traffic Lights (MTL) system introduced in the UK (Mazzù et al., 2022). Moreover, as different countries are at varying stages of the policymaking lifecycle and extant research has not been conclusive on which FOPL best serves its purpose, multiple research streams seem to coexist-either focusing on validating existing solutions or exploring new ones for market implementation. Research fragmentation and intensity also appear to be linked to different stages of the policy lifecycle. During periods of intense debate and high uncertainty-such as the early stages of FOPL selection or the later stages of assessing FOPL effectiveness after market entry-research activity might increase. Conversely, policymakers rely on research to reach conclusive solutions or to determine whether further exploration of alternatives is needed: an appropriate example of this is the European Commission's decision to slow down the adoption of the NutriScore in 2022, after the collection of additional evidence on consumers decision-making processes in presence of different forms of FOPLs (Italian Food News, 2023).

Consequently, a fundamental question arises regarding researchers' investigative priorities and whether the intensity of research production is linked to different stages of policy development. In other words, the extent to which scientific research can influence policy development and, conversely, how the evolution of policy frameworks shapes researchers' interest in pursuing further investigations within this domain.

Purpose of the paper. *To have some preliminary insights to start exploring this question, we examined the evolution and advancements of FOPL research over the past five years in terms of intensity and quality, and, in parallel, observing*

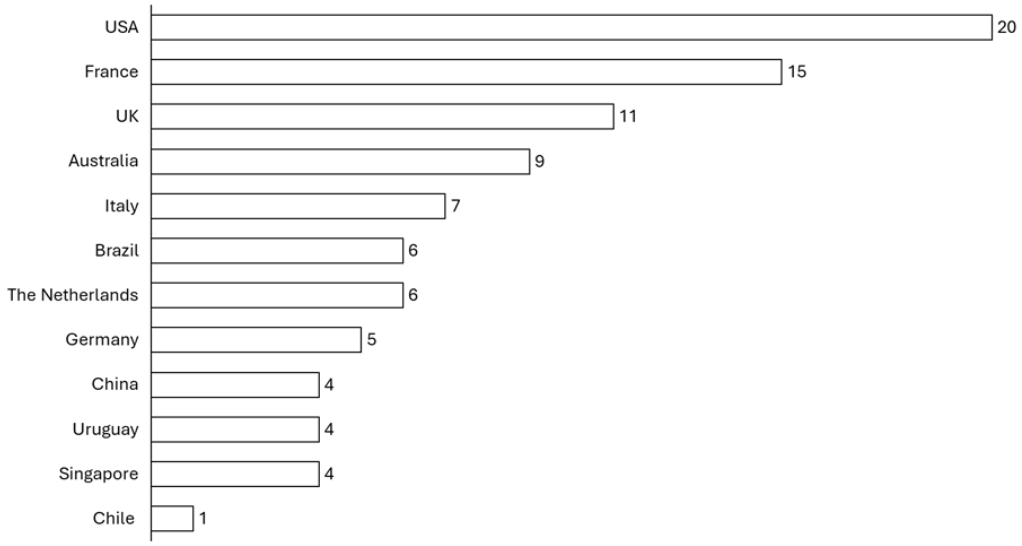
the different stages of the policy lifecycle in multiple countries. By combining (i) a systematic literature review on FOPLs and (ii) a preliminary analysis of the status of FOPL policymaking development across different regions, this study aims to provide very first insights if scientific research and policy development are synchronized in shaping future investigations.

Methodology.

Systematic Literature Review.

We conducted our investigation following the PRISMA guidelines. In the first stage, we used the search query ("= Front AND Pack AND Nutr") on the Scopus and Web of Science databases, limiting the search to peer-reviewed articles published between 2020 and 2024. This resulted in a total of 1,316 papers.*

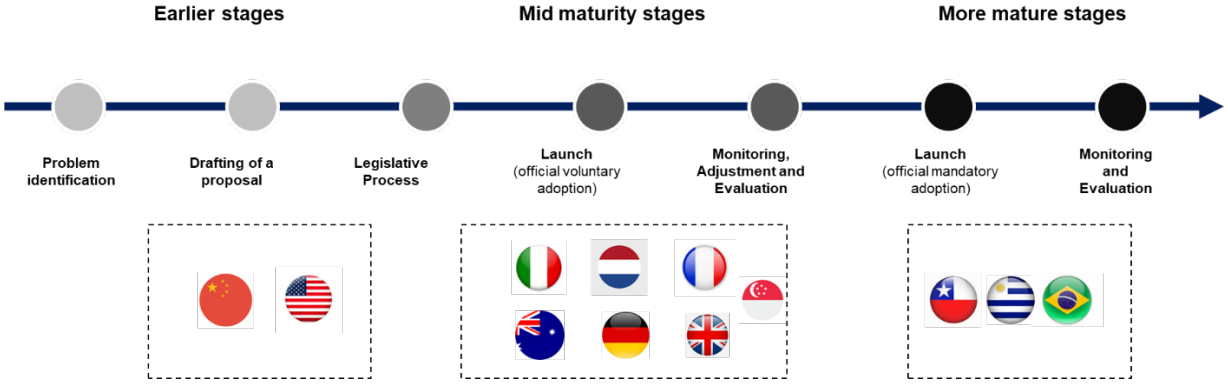
After removing duplicates and cleaning the data, we proceeded to the second stage by assessing the relevance of the publications using the Scimago ranking (SJR). Only papers published in the top quartile (Q1) based on the SJR were retained, resulting in a subset of 1,161 articles. This subset was further narrowed down to 238 articles by selecting only those with an SJR above the calculated median for the main thematic areas.



In the third stage, to ensure the inclusion of relevant and high-quality studies, we conducted a comprehensive abstract review. Studies that did not mention FOPLs or had a primary focus that significantly diverged from this topic were automatically excluded. This step ensured that the subsequent analysis was conducted on a coherent and thematically focused body of work. After this stage, the dataset was reduced to 150 articles.

In the last stage we moved to the analysis of the full text; to make the process more straightforward and to have a clearer overview of the data that would emerge from the articles, we relied on a specific classification, based on the inclusion in a dedicated file of some precise information extracted during the reading. After this process, some articles were excluded due to some inconsistencies with the objectives of this research, which did not emerge during the first screening reserved for abstracts. That led to a final pool of 106 articles, 92 of which related to specific countries.

Policy-making lifecycle



The policy making lifecycle can be articulated in some major phases: (i) Problem identification: recognizing a public health issue such as unhealthy diets and assessing the need for policy interventions, (ii) Drafting of a proposal: development of a policy framework based on research, stakeholder inputs and existing models; (iii) Legislative Process: debate, approval and formalization of the policy through legal and regulatory mechanisms; (iv) FOPL market launch (official voluntary adoption), and subsequent (v) Monitoring, Adjustments, and Evaluation, (vi) FOPL market launch with official mandatory adoption, and (vii) ongoing monitoring of the implementation of the policy, assessment of its impact and creation of the necessary adjustments. The presence of this phases in policy-development is also confirmed by previous research (Robinson, 2010) (Waylen et al. 2019).

Results. *Authors from 12 different countries were active in top journals, advancing FOPL research (Figure 1).*

These include countries at different stages of the policy lifecycle. The USA and China, accounting for a total of 24 papers (26,0%), are connected to countries in the earlier stages of policy development. A second cluster includes countries such as France, Italy, Germany, and the Netherlands, and Singapore, with the UK and Australia who are among the oldest in terms of FOPL voluntary adoption, where the national legislative process has been completed, often with voluntary adoption of an official label, while the supra-regional legislative process - at the EU level in this case - is still underway. This group accounts for a total of 57 papers (62% of the total). A final cluster includes countries where FOPLs have already been launched, and institutions are assessing their real-market effectiveness post-introduction. This last group includes mainly Chile, Uruguay, and Brazil and with a total of 11 papers (12,0% of the total).

Observing the evolution of FOPL policymaking in different countries where scientific production exists, according to the above systematic literature review, we can observe different stages in its development (Figure 2)

More details on the content in the following paragraph, ordered by frequency of occurrence.

USA

The USA is still in the development phase of FOPL. In recent years, institutions and regulatory bodies, such as the FDA, have initiated public research efforts to identify a suitable solution for the market. As of January 14, 2025, the U.S. Food and Drug Administration (FDA) proposed a mandatory FOPL, consisting in a "Nutrition Info Box", which could be able to provide accessible information that helps consumers quickly identify how foods can be part of a healthy diet. Despite that, research appears to be still in an exploratory phase and not polarized toward a specific label, with a primary focus on public health and policy implications and, to a lesser extent, consumer behavior. In addition to comprehensive reviews on the policy evolution of Front-of-Pack labeling in the Americas (Crosbie & Gomes, 2023), authors have investigated existing summary labels, using Chile as their reference country in three instances (Paraje et al. 2021). Other studies have examined responses to advertising regulations on high-calorie or high-sugar products and their effects on children's viewership (Alé-Chilet & Moshary, 2022). Other researchers have focused more on the relevance of extrinsic cues, such as label color (Oswald et al., 2022), as well as the differential effects across various socio-demographic groups (Meng & Chan, 2022). These aspects are particularly relevant as the FDA evaluates different proposals in a country characterized by a diverse range of consumer cluster. More generally, studies within this geographical cluster focus on understanding whether FOP labels have the potential to influence consumers' perceptions and the nutritional quality of their choices (Cimino et al., 2020). A specific subset of research in this cluster examines the potential acceptance of FOPLs already introduced in other markets, such as Nutri-Score (Tachie et al., 2023) or Traffic Lights (Andrews et al., 2021). Although the research is in a mature phase, rather than concentrating on a single label, these studies tend to explore various possibilities across different applications.

France

France introduced its label - the Nutri-Score - in 2017, following a long pre-qualification process. Recent studies continue to focus on the Nutri-Score and its comparative performance against other FOPL proposals, including the Brazilian NOVA classification for ultra-processed foods (Chazelas et al. 2020) the Siga classification (Davidou et al., 2020), and the FSA nutrient profiling score (Egnell et al., 2021; Dubois et al. 2021). Other researches investigate the real-market effectiveness of the Nutri-Score after several years of implementation, including its impact on decision-making influenced by advertising (Courbet et al., 2024) food reformulation (Sarda et al., 2024), and cognitive processing among specific groups, such as mothers with children (Hémar-Nicolas et al., 2024). Another major research stream focuses on supporting the Nutri-Score in EU policy development, particularly in connection with the Farm to Fork initiative. Related studies also explore the potential benefits of the Nutri-Score in other EU countries, such as Portugal (Fialon et al., 2024), among others.

UK

The UK introduced the Multiple Traffic Light (MTL) system in 2013. After an initial period of intense research, focus and interest declined following the UK's departure from the EU, reducing the need to demonstrate its superiority over EU alternatives, such as the Nutri-Score. More recent research streams have examined the use of the Multiple Traffic Lights label as a reference in policy initiatives like food reformulation (Downs & Demmler, 2020) and its interaction with other front-of-pack cues, such as eco-labels (Macdiarmid et al., 2021), green labels (Duckworth et al., 2022), and health symbols in general (Maesen et al., 2022).

Italy

Research has focused on assessing the Italian FOPL proposal - the NutrInform Battery - in comparison to other alternatives, particularly in relation to consumer decision-making. Studies have examined aspects such as understanding, preference, and willingness to adopt the label in purchase processes (Mazzù et al., 2023). While most studies compare

the NutrInform Battery to the two most relevant alternatives within the EU, some research, as recommended by EU institutions, also considers the Australian Health Star Rating (Hasni et al., 2024) and the UK Multiple Traffic Light system (Mauri et al., 2021)

Brazil

Brazil is in an exploratory phase, primarily focused on selecting a summary label that would be effective for the country. One research stream examines Corporate Political Activity (CPA), analyzing the strategies corporations use to influence policy decisions on label adoption in other South American countries, such as Chile and Colombia (Mialon et al., 2020). Other studies have specifically analyzed the "black magnifier" label, which has been in use in Brazil since 2020, investigating how its positive health effects are mitigated by the presence of on-pack claims that enhance health perceptions (França et al., 2025).

The Netherlands

The Netherlands introduced officially the Nutri-Score in 2024. Recently, most studies have focused on the policy impact of FOPLs, highlighting differences between public health and agricultural policies in France (Nutri-Score), the UK (Multiple Traffic Light), and the Netherlands (where no specific label has been officially designated) (Candel et al., 2021). Other studies compare the effectiveness of the Nutri-Score against alternatives, such as the Traffic Light system (Van Doorn et al., 2023) and the Chilean warning label (Pachali et al. 2023).

Germany

Germany adopted NutriScore for voluntary use in 2020. However, as of January 2025, some German food manufacturers have decided not to implement NutriScore, citing concerns that the system may favor products with additives over those with high-quality. Recent research focused on three main areas: (i) an experimental perspective, with works texting the effectiveness of the label through quantitative studies (Hau & Lange, 2024), (ii) policy implications (Ewert, 2024), and (iii) the extension of knowledge to eco-labeling, including the use of traffic lights applied to eco-labels (Bengart & Vogt, 2023).

China

China is also in an exploratory phase of FOPL development. The focus for this research stream is on sustainability/ environmental labeling, partly because of internal scandals concerning the origin of food products (Yang et al., 2021) (Xu et al., 2024). Papers that touch on nutritional labeling also do so by relating it to sustainability labeling (Sun et al., 2024), with a focus on color coded schemes (Liu et al., 2020).

Uruguay

One research strand, led by Gaston Ares, focuses on designing communication campaigns to promote the acceptance and positive effects of warning labels (Ares et al., 2021). Other research explores the effects of FOPLs on different product categories, such as bread (Antúnez et al., 2020) and sugar (Velázquez et al., 2023)

Singapore

Singapore implemented the voluntary Healthier Food Choice initiative in 2015, associating it to the always voluntary NutriGrade for beverages in 2022 (mandatory for C, D level). Recent research has focused on benchmarking the effectiveness of different FOPLs, comparing the country's proposed system with various alternatives, such as Nu-Val, inspired by the Nutri-Score (Li et al., 2022); the Nutritional Traffic Lights (Shin et al., 2022); NutriGrade (Shin et al., 2023); and the Nutri-Score (Shin et al., 2024).

Chile

The study considered is a good resume of the current state of research in this country. It aims at showing the effects of a large-scale mandatory FOPL regulation on consumer behavior, overall showing that the warning label effect is consistent with information disclosure influencing consumers' choices when the advertised information is unexpected (Sebastián et al, 2022)

Discussion. *This study is a preliminary attempt to observe the dynamic evolution of scientific research and policymaking in Front-of-Pack Nutritional Labeling (FOPL), with the aim of activating a reflection and stimulate a further debate on whether research influences policy decisions at different stages and, conversely how evolving regulations shape academic priorities. Findings suggest that there is no real strong link between between research present in high-end journals and policy development stages, and that the intensity of research productivity varies not necessarily based on a country's regulatory maturity. In terms of content, fragmentation appears in the selection of research topics not always aligned to policy priorities. Nevertheless, as countries differ in their FOPL adoption, research varies its focus, either assessing existing models, or exploring new solutions tailored to specific markets. Vast part of the research in all phases of the lifecycle is connected to comparative studies highlight and confronting the effectiveness of different FOPL systems (e.g., Nutri-Score, Multiple Traffic Lights, Warning Labels) in shaping consumer behavior, improving public health, and influencing industry practices. However, a disconnect remains between research timelines and policy needs.*

While institutions require timely insights, academic studies might have different research priorities. Better coordination between researchers and policymakers might be advisable to ensure findings effectively inform regulations.

Research limitations. *The study primarily focuses on articles published in top-tier journals, as classified by Scimago. Future research could expand the analysis to include additional studies, providing a broader perspective on research interests and identifying major research streams across different countries and stages of the policy lifecycle.Furthremore, real-world impact of food manufacturers' and retailers' strategic responses to labeling policies might be assessed, as well as examining how different FoP schemes influence reformulation decisions, innovation processes and practices over time, Longitudinal studies or case analyses across different market contexts could help capture how stakeholders adapt their strategies in response to changing regulatory environments, and changing consumer expectations. Moreover, the current timeriod of the analysis (2020-2024) might be extended, thus helping highlight shifts in research priorities or identify enduring research trends. Furthermore, the analysis could be enhanced by identifying patterns of relevance and the occurrence of specific topics in different phases of policy life cycles. Additionally, it could examine the extent to which research priorities are driven by institutional research calls, such as those within the From Farm to Fork strategy.*

Managerial implications. *The research identifies a shift from policy-driven studies to more applied streams of research in regions where labeling policies are well established, like France. Furthermore, by analyzing studies from marketing, public and health policy, nutrition and behavioral sciences, this work reinforces the importance of cross-disciplinary approaches. This study suggests that more is required to be understood to assess if research in top journal is connected to the policy development lifecycle, and if researchers' commitment to advancing independent, high-quality research, in specific timeframes within which research is conducted may impact policy decision-making and, ultimately, the best interests of end consumers. The findings underscore the need to create mechanisms able to foster timely collaboration between policymakers and academic researchers. Institutions could increase their demand for more diverse and independent research to provide stronger policy support, playing a proactive role and incentivizing responses to evolving societal needs. Additionally, they could formalize processes that include timely requests for research contributions. This also calls to expedite research focus that addresses phenomena that significantly impact consumers' lives and influence corporate investments - such as reformulation efforts - as well as major R&D, production, and communication strategies. The results highlight an opportunity for food manufacturers to strategically align reformulation and product innovation efforts with the consumers' expectations. Deeply understanding how labeling affects perception and choice helps companies offer healtier products without losing appeal, and collaborating with researchers on evidence-based communication can build trust and boost competitiveness. This could also be helped by building labeling standards into the early stages of product development, not just packaging decisions. Also, in the case of retailers, the present insights can inform shelf layout decisions, in-store messaging and promotional strategies aligned with the health-focus given by FoP label-usage; this is even more important if we consider that retailers can also serve as intermediaries between consumers and producers, and promote enabled and informed decision making towards more consistent labeling standards.*

Originality of the paper. *This paper presents initial observations on how research aligns with different stages of the policy lifecycle and, conversely, how various phases of policy development attract the attention of high-quality researchers.*

Although these insights should be considered very preliminary, this research establishes a discussion priority on how research can better serve to impact high-relevance topics. It also highlights the intrinsic call for top researchers to provide insights that contribute to advancing individual well-being. Exploring the reciprocal influence between policymaking and scientific research adds a novel dimension, highlighting how academic advancements can drive regulatory decisions and vice versa. This integrative approach offers fresh insights into the evolving landscape of FOPL and its broader implications.

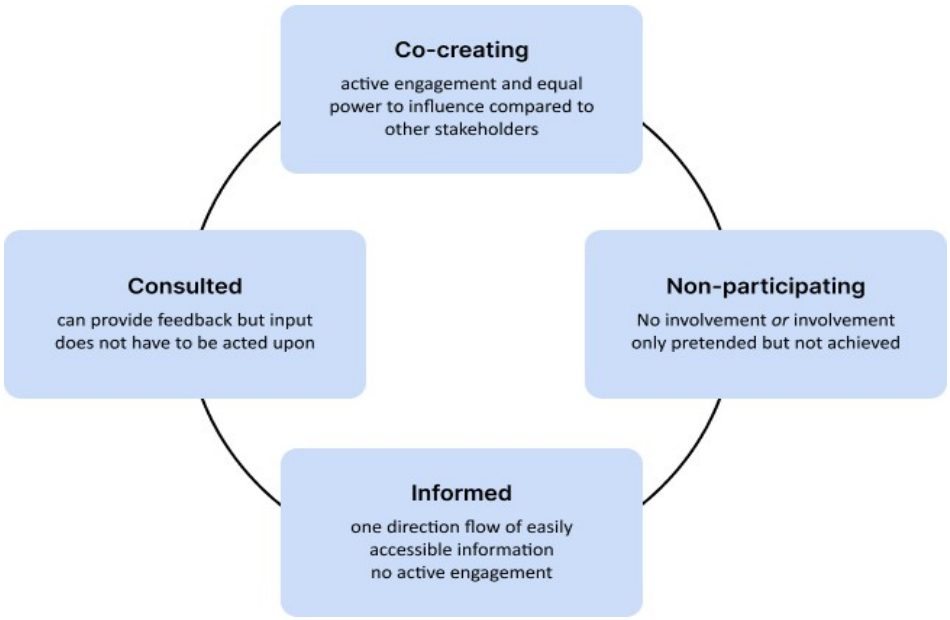
Understanding the Motivation of Co-Creation in Urban Living Labs: A Preliminary Study on Citizen Engagement

GIUSEPPE CECI[1] MAURO GATTI[2] MICHELA IANNOTTA[3]

Abstract

Urban Living Labs (ULLs) provide real-world environments where citizens, businesses, researchers, and governments work together to address urban challenges. Although the literature on these organisms has undergone a profound process of theoretical discussion, there is still a lack of research on how they actually work in practice, especially when it comes to involving citizens. To provide a broader and more contextualized understanding of participation in ULLs, this study adopted a mixed-methods approach, integrating survey data with semi-structured interviews. The initial survey phase aimed to identify patterns and key factors influencing willingness to engage in ULLs, while the subsequent interviews provided deeper insights into the motivations and experiences of participants. From a theoretical perspective, our preliminary results highlight a "citizen-attraction" model, showing that engagement is largely shaped by self-selecting, educated, and innovation-oriented individuals, which challenges traditional consultation frameworks and suggests that citizens' access to information does not necessarily lead to full participation in the co-creation process. Practically, the research reveals that while ULLs benefit stakeholders like businesses and local authorities by providing a platform to refine innovations and collect feedback, the selective nature of participation raises concerns about inclusivity. The motivations of citizens to participate are primarily driven by a desire to co-create products or services based on their own needs, yet the inability to innovate solutions that address the broader needs of all local communities may limit engagement, particularly among less-educated or lower socio-economic groups, ultimately restricting the impact and inclusivity of ULLs.

Framing of the research. *Urban living labs (ULLs) are gaining attention as spaces where cities experiment new solutions for urban challenges, particularly in sustainability and smart city initiatives (Bulkeley et al., 2018). These labs bring together different stakeholders-governments, businesses, researchers, and communities-to test and refine ideas in real-life settings. While much of the existing research focuses on how institutions and organizations manage and drive this co-creation process within ULLs (Puerari et al., 2018; Rahmawan-Huizenga & Ivanova, 2022), there is still limited understanding of how citizens experience and contribute to these spaces. Although both scholarly and managerial studies on ULLs suggest many benefits for different stakeholders, their nature and real contribution remain little known (Hossain et al., 2019). Moreover, despite the growing popularity of ULLs, there is still a lack of empirical research into their practical implementation and outcomes (Veeckman et al., 2013). In this vein, exploring citizen participation within ULLs may offer new insights into how they can be more inclusive and better aligned with public interests, since citizens should be considered as the primary stakeholders within smart city contexts.*



Indeed, in the literature there is still a lack of research that sheds light on citizens' motivations and behaviors in ULLs. In today's debate, the majority of the studies take a top-down perspective, looking at how these labs are structured and managed by organizations, mostly emphasizing the role played by universities, entrepreneurial activities and governments (Criado et al., 2021; Evans, 2015; Le Dinh et al., 2018). To date, there is little research on what drives individuals to engage with ULLs, what obstacles they face, and how their involvement influences their future participation. As it was noted by Kasri et al. (2017) the importance of understanding the structure, culture, and process within a community's living and their motivations is crucial to assess the citizen engagement. Since the ULL approach is believed to close the gap between production and actual market uptake by directly involving all end users and other urban stakeholders in the development of new products or services (Steen & Van Bueren, 2017), it is crucial both for researchers and practitioners, to have a clear understanding of how the process of directly involving citizens can be triggered by starting from their needs and inner motivations. Our investigation lies in the current gap, by framing the attention on how ULLs can be efficiently designed by posing its focus on citizens life.

Purpose of the paper. *To address this gap, this study draws on concepts from citizen engagement and political participation research to explore how everyday behaviors and personal motivations influence citizens' willingness to participate in ULLs. While participation is often limited to formal feedback mechanisms, such as surveys or committee involvement, or informal actions like protests or petitions, this study takes a broader view. It acknowledges that engagement can also occur through everyday activities, which, although often overlooked, have a significant impact on both the individual and collective level. These everyday practices, such as recycling, energy conservation, or participating in local community initiatives, allow citizens to engage with ULLs on complex issues, including those that affect them personally, like climate change or urban mobility. By focusing on these subtle yet impactful forms of participation, this research emphasizes that public engagement is not merely about formalized channels of input but also about how citizens interact with and respond to issues in their daily lives. In fact, public participation, when fully understood, includes these everyday practices, which Marres (2012) refers to as "everyday practices of engagement," that are integral to a more comprehensive understanding of citizen involvement. These forms of engagement often provide insights into how citizens are willing to actively shape the urban environments they inhabit, even when they are not part of formal decision-making processes. Building on Menny et al.'s (2018) framework of four levels of participation within ULLs, ranging from no participation to the highest degree of co-creation and decision-making, this study aims to provide a tailored comprehension of the degree to which citizens are engaged in ULLs (Fig.1).*

Fig. 1: Levels of participation, adapted from Menny et al. (2018)

Source: Authors' own elaboration of Menny et al. (2018)

By examining these varying levels of involvement, we seek to uncover the underlying factors that drive citizens to participate (or not participate) in these processes, offering a clearer picture of how ULLs can be designed to foster deeper engagement across diverse community groups. For these reasons, our research question is structured as follows: "What factors influence citizens' decisions to engage or not engage in Urban Living Labs?" To answer this question, the study will employ a mixed-methods approach. The research context of our work focuses on sustainability-themed ULLs, as these are among the most common and impactful (Bulkeley et al., 2018). These labs often tackle issues such as climate change, renewable energy, waste reduction, and sustainable mobility, all of which require active community participation to succeed. Our methodology is structured as follows. First, a survey was conducted to measure how citizen engagement and pro-environmental behavior impact willingness to participate in ULLs. This helped us to identify broader trends and patterns to build our interview protocol. Then, semi-structured interviews with ULL participants provided deeper insights into how their experiences influence their perceptions of ULL effectiveness and their willingness to participate and engage in the co-creation process.

By combining insights from urban innovation studies and citizen engagement research, this study aims to offer a clearer picture of citizen participation in ULLs. From a theoretical perspective, it highlights a new and more realistic citizen engagement model, showing what factors activate (or not) the willingness to co-create in ULLs. Practically, our preliminary findings will support policymakers, urban planners, and ULL organizers design more inclusive and effective co-creation processes that genuinely engage the people they aim to serve.

Methodology. *Research on living labs has predominantly relied on qualitative methods such as case studies and interviews (Bulkeley et al., 2018; Puerari et al., 2018; Rahmawan-Huizenga & Ivanova, 2022). To provide a broader and more contextualized understanding of participation in ULLs, this study adopted a mixed-methods approach, integrating survey data with semi-structured interviews. The initial survey phase aimed to identify patterns and key factors influencing*

willingness to engage in ULLs, while the subsequent interviews provided deeper insights into the motivations and experiences of participants. This combination allowed for a more comprehensive analysis, where broad trends identified through surveys were complemented by qualitative descriptions that clarified concepts such as "sense of ownership" (Puerari et al., 2018).

The study was conducted across three Amsterdam-based urban living labs focused on plastic waste reduction that are hosted by a research body, the AMS Institute for Advanced Metropolitan Solutions. The three ULLs are located in the neighborhoods of Centrum, Zuid, and Nieuw-West. These labs aimed to engage local residents in co-creating solutions to urban plastic waste issues. Participants were recruited through an open call and AMS's network. The survey, distributed via mail with a QR code linking to an online Qualtrics form, was available in Dutch, English, Arabic, and Turkish to ensure accessibility, especially in a multicultural setting like the Netherlands. The questionnaire measured willingness to participate in ULLs, adapting a protest potential scale from Kwak (2021), civic engagement using the Civic Engagement Scale (CES) (Remr, 2023), and topic awareness following Irani et al. (2023), with an additional question from Marres (2009) regarding environmentally conscious behaviors. Socio-demographic data were collected using measures from the European Social Survey (2022), including age, gender, household size, length of residence, employment status, education level, household income, and ethnic background. Given prior findings that household size may influence participation (Park & Fujii, 2023), while gender and civic engagement showed no clear correlation (Remr, 2023), these variables were considered as potential factors in participation willingness.

After analyzing survey responses, semi-structured interviews were conducted with selected participants at the lab locations. The interviews, lasting approximately 40 minutes each, aimed to contextualize survey findings and explore motivations in greater depth. When possible, interviewees were drawn from the survey sample to facilitate within-subject comparisons. If a participant had not previously completed the survey, they were asked to do so before the interview. This ensured alignment between quantitative and qualitative data. Five interviews were conducted per lab, totaling fifteen interviews. Thematic analysis (Braun & Clarke, 2006) was applied to the interview transcripts, which were manually processed in Google Docs and coded in Google Sheets.

Despite the challenges of a mixed-methods design, such as managing workload and reconciling conflicting data, this approach provided a more detailed understanding of participation in ULLs. While the survey captured general trends, interviews clarified underlying motivations and variations in participant perceptions and subsequent degree of engagement within ULLs. By integrating both quantitative and qualitative data, the study aimed to strengthen its validity and offered a detailed perspective on the factors influencing participation in ULLs.

Results. *Although our data analysis is still in a stage of work in progress, we are capable of showing our expected results. Preliminary findings from this research offer insights into citizen engagement within ULLs contributing both theoretically and practically to the field. The first analysis conducted within the textual matrix suggests that participation in ULLs frequently follows a "citizen-attraction" model, where engagement is largely shaped by self-selecting groups-typically individuals with higher education levels, professional backgrounds, and specific interests related to innovation and urban development. This pattern aligns with much of the existing literature, which suggests that ULLs tend to attract participants who are already predisposed to innovation, co-creation, and active civic engagement (Gascó, 2017). These individuals are often (already) motivated by an inner desire to contribute to societal change and to collaborate in shaping solutions for urban challenges.*

However, from the perspective of key stakeholders-such as companies, startups, and local authorities-this selective engagement is often viewed favorably and almost desired. These actors benefit not only from the opportunity to showcase their products and services within ULLs but also from gathering valuable feedback, testing ideas in real-world settings, and collecting data during co-creation sessions. ULLs therefore serve as collaborative spaces where private sector actors can refine their innovations with input from an engaged, yet specific, subset of the population that get to give their contribute to the co-creation process on specific themes. This process of co-creation provides a dual benefit that aligns with the ongoing debate: it helps the private sector in adapting their solutions while also empowering citizens who feel invested in the development process (Følstad, 2008; Rahmawan-Huizenga & Ivanova, 2022). In this vein, the motivation of citizens to participate in ULLs seems to be related to a need to co-design product or services based on their specific needs from a utilitarian point of view rather than a full engagement. From a theoretical perspective, this study positions itself within an informed approach to consultation, drawing on Menny's framework. In this context, citizens have access to information, yet this does not necessarily translate into an active, consultative role within the co-creation process. The new role of attraction acts as a filter between these two stages, complicating the transition for all citizens into the third phase. This creates a barrier that potentially hinders full participation and engagement, ultimately undermining the effectiveness of the co-creation process. By introducing this filter, the study suggests that while citizens may be informed, their actual involvement in shaping outcomes is limited, which could reduce the inclusivity and success of ULL initiatives.

This model of selective participation raises critical questions about inclusivity. The apparent tendency for ULLs to attract a homogeneous group of participants-often from higher socio-economic backgrounds, with higher levels of formal education, and with an existing interest in innovation-poses challenges for ensuring equitable, inclusive and "spontaneous" and more committed citizen engagement. Specifically, starting from our survey, our preliminary findings highlighted the difficulty of engaging a broader and more diverse cross-section of the community, particularly those from lower socio-economic groups or with less formal education. Although we tried to expand our dataset by incorporating different languages and including different participants, citizens that happened to be truly involved in the process had

similar characteristics (the afore mentioned "higher socio-economic backgrounds, with higher levels of formal education, and with an existing interest in innovation"). Therefore, the motivations of citizens lie in contributing, together with other actors in the ULLs, to the creation of products. However, the lack of motivation for participation in ULLs among certain segments of the population may stem from the inability to innovate products and services that can truly benefit all local communities.

Research limitations. *This research has several limitations that need to be acknowledged. First, our findings are not easily generalizable to all ULLs as these initiatives operate in diverse contexts and are shaped by varying levels of governmental support. The influence of local authorities is particularly strong, and different political climates, policy frameworks, and financial backing across municipalities can significantly affect how ULLs function and succeed. As a result, our conclusions may not apply universally to ULLs in different countries or regions with contrasting socio-political conditions. This limits the external validity of our study, particularly when considering how ULLs in other parts of the world might operate under different circumstances.*

Second, since our study employs qualitative methods, there is always a potential for researcher bias in the data collection and analysis process. For example, the way interview questions were framed, how citizens were selected within ULLs, and how we interpreted their responses could have influenced the results. Although we made efforts to minimize subjectivity by incorporating an initial survey, qualitative research inherently involves a degree of interpretation. Future studies could improve upon this by integrating different data sources or employing mixed-methods approaches to increase reliability and provide a fuller, more balanced understanding of the issues at hand.

Third, while we have gained some insight into the motivations behind citizens' engagement in ULLs, these findings are still partial. The personal, cultural, and socio-economic factors that drive or prevent people from participating in co-creation processes are complex and multifaceted. Our research has highlighted some key motivators and barriers, but there is a need for further exploration to better understand the full range of influences at play. This deeper investigation could provide a clearer picture of how to design more inclusive ULLs that engage a wider variety of citizens.

Managerial implications. *From a managerial perspective, these findings have direct implications for the design and organization of ULLs. Organizers must consider strategies to make participation more accessible and appealing to a wider audience, particularly by addressing the barriers that prevent certain groups from engaging. This may involve simplifying communication to ensure that information about the labs is clear and widely disseminated, fostering trust within communities through partnerships with local organizations, and co-developing innovation challenges that align with the concrete needs of different social groups. Moreover, understanding the motivations and obstacles to participation is crucial for refining ULL frameworks in ways that maximize their effectiveness and societal impact. Ensuring that diverse voices are included not only improves the legitimacy of the co-creation process but also increases the likelihood of developing solutions that truly respond to the complexities of urban life, especially in multicultural setting like the Netherlands or similar. Finally, this study provides an initial step toward assessing the performance and practical organization of ULLs, offering empirical data that can guide future research and managerial improvements. Finally, our work has implications for private stakeholders. Indeed, citizen engagement and attraction within ULLs are perceived positively by companies and start-ups, which benefit from the opportunity to present their ideas, receive valuable feedback, and collect data from co-creation events. These dynamics highlight the key drivers that lead different stakeholders to participate in ULLs and provide insight into how these interactions unfold. However, an important challenge remains: how to ensure that ULLs engage a broader and more diverse segment of the population, particularly vulnerable or less-educated citizens who might not see these initiatives as relevant or accessible.*

Originality of the paper. *The originality of this paper lies in its comparative approach, which seeks to address gaps in the literature by providing a deeper understanding of how to effectively attract citizens to ULLs (Hossain et al., 2019; Veeckman et al., 2013). While previous studies have explored participation dynamics, this research goes further by offering a more tailored analysis of the factors that influence citizen engagement. Moreover, the use of a mixed-methods approach represents an advancement over traditional methodologies, allowing for a more comprehensive exploration of both quantitative trends and qualitative insights (Bulkeley et al., 2018; Puerari et al., 2018; Rahmawan-Huizenga & Ivanova, 2022). In addition, compared to existing frameworks on Living Labs, this study is among the first to provide concrete empirical evidence on their ability-or, more specifically, their limitations-in creating value. While much of the literature focuses on theoretical models and best practices (Følstad, 2008) our findings, although in a preliminary form, offer a data-driven perspective on the real challenges these initiatives face in fostering meaningful citizen engagement. This empirical contribution not only contribute the academic discussion on Living Labs but also provides valuable insights for practitioners looking to design more effective and inclusive co-creation processes.*

Bridging the Trust Gap and Digital Divide: A Dual-Path Model of Public Service Satisfaction

GIOELE ZAMPARO[1] MICHELA C.MASON[2] SANDRO BRUNO[3] ANDREA MORETTI[4]

Abstract

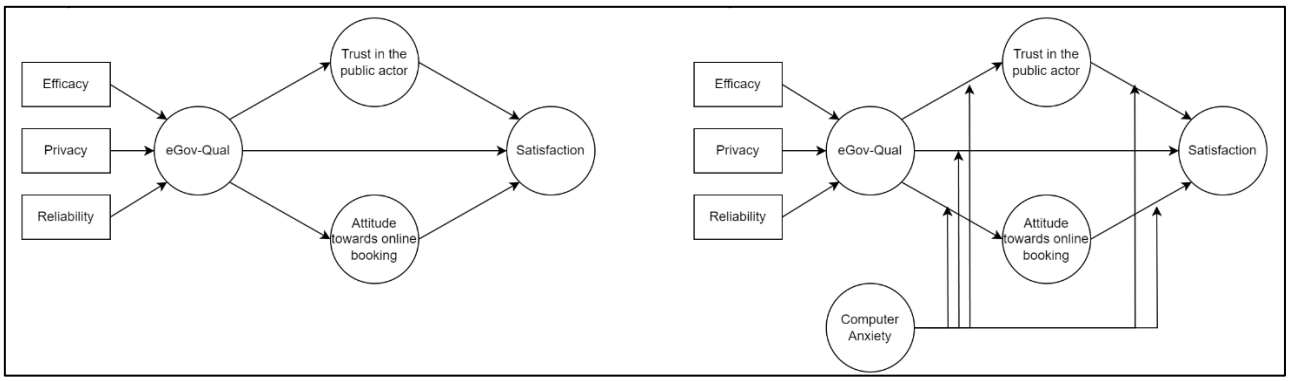
This study investigates the determinants of satisfaction with digital public services, focusing on Italy's healthcare booking system. Grounded in the e-GovQual framework, we model service quality as a second-order construct encompassing efficiency, reliability, and privacy while introducing trust in public actors and digital anxiety as critical elements in the relationship between service quality and users' satisfaction. Using survey data from Veneto and Emilia Romagna (n = 839), we conducted two complementary analyses: a mediation model (model 1) and a multi-group analysis stratified by digital anxiety (model 2). Results reveal that service quality drives satisfaction directly, with trust in public actors mediating this relationship. However, digital anxiety reshapes these dynamics: high-anxiety users rely on trust and positive attitudes to compensate for technological discomfort, while low-anxiety users prioritise functional performance alone. By integrating institutional trust and digital anxiety into the e-GovQual framework, this study advances a dual-path model of public service satisfaction, offering some insights for fostering inclusive digital governance.

Keywords: *Public service satisfaction; Trust in government; Digital anxiety; e-GovQual framework*

Framing of the research. *The Italian public health system is rooted in the national constitution, which defines the division of legislative responsibilities between the state and regions for health protection. Despite ongoing debates about this division (Gorlani, 2023), healthcare remains a matter of public interest, ensuring universal and equitable access to services through the National Health Service (SSN). Established in 1978, the SSN is built on the principles of universality, equality, and equity, offering healthcare services either free of charge or at minimal cost. The system's organisation relies on local health authorities (ASL) and hospitals, with the Ministry of Health and regional agencies overseeing service quality and evaluating citizen satisfaction.*

In recent years, digitalisation has become a key focus in public health service management, with expectations that it would drive innovation and improve efficiency. The European Union's NextGenerationEU programme, implemented in Italy through the National Plan for Resistance and Resilience (PNRR), has reinforced this push toward digital health solutions. However, despite its strategic importance, the digitalisation of public healthcare services has encountered significant challenges, including regional disparities and limited adoption of digital alternatives such as online appointment booking and telemedicine (Vaagan *et al.*, 2021). *A crucial issue remains the lack of a user-centred approach in the design and implementation of these services, which contributes to persistent inefficiencies.*

Citizen perceptions and attitudes toward these services are pivotal as they shape long-term engagement with these new tools, with digitalised healthcare being no exception: satisfaction with the e-services influences adoption and continuity of use. Grounded in the e-GovQual framework (Papadomichelaki and Mentzas, 2012), this study examines how service quality dimensions-efficacy, privacy, and reliability -shape satisfaction of a specific service offered by the healthcare system (i.e., online booking system) through two distinct lenses: (1) trust in the public actor and user attitudes, and (2) citizens' digital capacity, operationalised as computer anxiety (i.e., stress or discomfort when interacting with digital tools).



Purpose of the paper. *This paper aims to advance the understanding of public service satisfaction by investigating how institutional trust and user attitudes mediate the translation of service quality (e.g., efficacy, privacy, reliability) into satisfaction, offering insights into the mechanisms that underpin citizen-state interactions. Moreover, it examines how digital anxiety - a barrier rooted in users' technological discomfort - moderates these relationships, revealing whether and why service quality and trust matter differently across subgroups with varying digital readiness.*

To achieve this, we propose two complementary models. The first one is a baseline mediation model, positing that trust in public institutions and user attitudes act as dual channels through which service quality influences satisfaction. Trust here embodies citizens' confidence in the public actor and its actions, while attitudes reflect their openness to digital service adoption. The second model extends the first by introducing digital anxiety as a moderating variable. Using multi-group analysis, we clustered users into high- and low-anxiety cohorts to test whether the strength of relationships between service quality, trust, and satisfaction diminishes or intensifies among digitally anxious individuals. The models are depicted in Figure 1.

Figure 1: The proposed theoretical models

Methodology. *The study draws on data collected through an online survey conducted in February 2024 across two northern Italian regions, Veneto and Emilia Romagna. Participants were invited to complete a structured questionnaire designed to assess their experiences with digitalised public healthcare services. The survey comprised two primary sections. The first section captured socio-demographic characteristics, including age, gender, and occupational status, while the second focused on the study's core constructs, measured using validated scales adapted to the Italian healthcare context. All items were modelled on a 7-point Likert scale (1 = absolutely disagree, 7 = absolutely agree). Participants were allotted 10 minutes to complete the survey, resulting in 839 valid responses after removing incomplete or inconsistent entries. The final sample was predominantly female (71.75%), aged 30 or older (53.15%), and the majority of respondents were employed full-time (42.19%).*

The measures of service quality-efficiency, privacy, and reliability-were adapted from the e-GovQual framework (Papadomichelaki and Mentzas, 2012), while trust in public actors was measured using items derived from Teo et al. (2008) trust in government scale. Satisfaction with e-services was assessed through a modified version of Li and Shang's (2020) satisfaction scale. Computer anxiety was measured using the scale developed by Lester et al. (2005). For the attitude scale, we followed the guidelines provided by Ajzen (2001).

The validity and reliability of the measurement model were evaluated using confirmatory factor analysis (CFA) with MLR estimator. The model showed strong fit indices: $\chi^2 = 499.47$ (df = 180), RMSEA = 0.06, CFI = 0.94, TLI = 0.93, and SRMR = 0.05 (Hu and Bentler, 1999). Convergent validity was confirmed through composite reliability and average variance extracted values exceeding the thresholds of 0.70 and 0.50, respectively, alongside standardised factor loadings surpassing 0.50 (Hair et al., 2018). Further evidence of reliability emerged from ordinal alpha coefficients, which exceeded 0.70 for all latent constructs (Zumbo et al., 2007), reinforcing the internal consistency of the scales. Notably, service quality was modelled as a second-order construct formed by efficiency, privacy, and reliability. It demonstrated good reliability with an ω value of 0.81 (Flora, 2020). For discriminant validity, all square roots of AVE estimates were greater than the corresponding inter-construct correlation, and the HTMT values did not exceed the value of 0.85 (Fornell and Larcker, 1981; Henseler et al., 2015).

To estimate the two models, we randomly partitioned the data into two groups. By testing on independent subsets, the risk of overfitting is reduced, and the generalizability of findings is enhanced. This approach also validates that observed relationships are consistent across different samples (Hair et al., 2018).

Model 1 Results.

Model 1 revealed significant direct effects of service quality (eGovQual) on user attitudes ($\beta = 0.57$, 95% CI [0.44, 0.68]) and trust in public actors ($\beta = 0.64$, 95% CI [0.54, 0.73]), as well as a strong, direct association with satisfaction ($\beta = 0.71$, 95% CI [0.56, 0.89]). Trust exhibited a modest yet significant positive relationship with satisfaction ($\beta = 0.19$, 95% CI [0.02, 0.32]), while attitudes showed no meaningful link to satisfaction ($\beta = -0.02$, 95% CI [-0.17, 0.07]). Indirect effects further clarified these dynamics: the mediation pathway through trust was significant ($\beta = 0.12$, 95% CI [0.02, 0.20]), whereas the pathway via attitudes was negligible ($\beta = -0.02$, 95% CI [-0.11, 0.05]). The total effect of service quality on satisfaction remained robust ($\beta = 0.82$, 95% CI [0.75, 0.89]), emphasising its central role in shaping user experiences.

Table 1: Estimates of the proposed models

		β	Boot.se	Boot.CI.	
Direct effect				**Lower**	**Upper**
e-GovQual → Attidute					
	Model 1	0.57	0.05	0.44	0.68
	Model 2: low computer anxiety	0.53	0.09	0.33	0.68
	Model 2: high computer anxiety	0.60	0.06	0.46	0.70

	Model 1	0.64	0.04	0.54	0.73
	Model 2: low computer anxiety	0.48	0.08	0.30	0.64
	Model 2: high computer anxiety	0.47	0.6	0.32	0.59
e-GovQual → Satisfaction					
Model 1		0.71	0.08	0.56	0.89
	Model 2: low computer anxiety	0.79	0.09	0.64	0.91
	Model 2: high computer anxiety	0.53	0.09	0.35	0.72
Trust in public actors → Satisfaction					
	Model 1	0.19	0.07	0.02	0.32
	Model 2: low computer anxiety	0.15	0.08	-0.02	0.28
	Model 2: high computer anxiety	0.19	0.06	0.07	0.32
Attitude → Satisfaction					
	Model 1	-0.02	0.07	-0.17	0.07
	Model 2: low computer anxiety	-0.09	0.09	-0.30	0.05
	Model 2: high computer anxiety	0.23	0.09	0.03	0.40
Indirect Effects					
e-GovQual → Trust in public actors → Satisfaction					
	Model 1	0.12	0.04	0.02	0.20
	Model 2: low computer anxiety	0.07	0.03	-0.01	0.13
	Model 2: high computer anxiety	0.09	0.03	0.03	0.15
e-GovQual → Attidute → Satisfaction					
	Model 1	-0.02	0.04	-0.11	0.05
	Model 2: low computer anxiety	-0.05	0.05	-0.19	0.02
	Model 2: high computer anxiety	0.14	0.05	0.02	0.24
Total effect					
e-GovQual → Satisfaction					
	Model 1	0.82	0.03	0.75	0.89
	Model 2: low computer anxiety	0.81	0.04	0.73	0.89
	Model 2: high computer anxiety	0.76	0.04	0.66	0.85

Note: The results are controlled for the covariates of gender, age, frequency of use of the service, and region of provenience. Before conducting the multi-group analysis (i.e., model group), we established invariance on factor loading and intercepts (Chen, 2007). To estimate indirect effects, we employed bootstrapping (5000 samples) with bias-corrected confidence intervals (Preacher and Hayes, 2008). This non-parametric resampling method accounts for non-normality in mediation pathways and provides robust estimates of indirect effects.

Model 2 Results.

The multi-group analysis comparing low- and high-computer anxiety subgroups revealed distinct patterns in the relationships between service quality, trust, attitudes, and satisfaction. For low-anxiety users, service quality (eGovQual) exhibited a strong direct effect on satisfaction (β = 0.79, 95% CI [0.64, 0.91]), with weaker associations for trust (β = 0.15, 95% CI [-0.02, 0.28]) and a non-significant link between attitudes and satisfaction (β = -0.09, 95% CI [-0.30, 0.05]). Indirect effects via trust (β = 0.07, 95% CI [-0.01, 0.13]) or attitudes (β = -0.05, 95% CI [-0.19, 0.02]) were negligible, resulting in a total effect of eGovQual on satisfaction of β = 0.81 (95% CI [0.73, 0.89]).

In contrast, high-anxiety users showed a reduced direct effect of service quality on satisfaction (β = 0.53, 95% CI [0.35, 0.72]), alongside a significant positive relationship between attitudes and satisfaction (β = 0.23, 95% CI [0.03, 0.40]) and a stable trust-satisfaction link (β = 0.19, 95% CI [0.07, 0.32]). Indirect effects for this subgroup were notable: trust mediated the relationship (β = 0.09, 95% CI [0.03, 0.15]), and attitudes emerged as a significant mediator (β = 0.14, 95% CI [0.02, 0.24]), yielding a total eGovQual effect of β = 0.76 (95% CI [0.66, 0.85]). These results underscore digital anxiety as a critical moderator, attenuating direct service quality effects for high-anxiety users while amplifying the roles of trust and attitudes in shaping satisfaction.

Short Discussion.

This study elucidates the interplay between service quality, trust in public actors, and digital anxiety in shaping satisfaction with Italy's digitised healthcare services. By modelling eGovQual as a second-order construct encompassing efficiency, reliability, and privacy, we demonstrate that holistic service quality constitutes the cornerstone of user satisfaction. However, the pathways through which this quality translates into satisfaction diverge markedly based on users' digital readiness, underscoring the necessity of adaptive policy frameworks that address both technical performance and psychosocial barriers.

The robust total effect of eGovQual on satisfaction (β = 0.82 in Model 1; β = 0.76–0.81 in Model 2) reaffirms the centrality of functional excellence in public e-services. Efficiency and reliability-capturing ease of use, accuracy, and

timeliness-emerged as the primary drivers of satisfaction, consistent with prior work emphasising the non-negotiable nature of technical performance in digital governance (Li & Shang, 2020; Papadomichelaki & Mentzas, 2012).

Trust in public actors emerged as a relational mediator. In Model 1, trust partially bridged the gap between service quality and satisfaction (β = 0.12), highlighting that institutional legitimacy amplifies the benefits of technical performance. This aligns with (Tolbert and Mossberger, 2006) assertion that e-government can foster process-based trust, though our findings reveal its role as contingent rather than universal. For high-anxiety users in Model 2, trust in public actors remained a stable mediator (β = 0.09), serving as a psychological anchor to mitigate digital discomfort. In contrast, low-anxiety users derived satisfaction almost exclusively from direct service experiences (β = 0.79), with trust playing a negligible role. This bifurcation underscores how institutional trust functions to offset the negative effects of digital anxiety on satisfaction.

Digital anxiety, operationalised through the lens of computer anxiety (Lester et al., 2005), emerged as a structural moderator reconfiguring user priorities. High-anxiety users relied on both service quality and psychosocial factors-trust in public actors (β = 0.19) and positive attitudes toward digital services (β = 0.23)-to achieve satisfaction. For these users, satisfaction is not merely a product of functional performance but the result of the interplay between technical efficacy and relational and attitudinal aspects. Low-anxiety users, conversely, exhibited a technically oriented relationship with e-services, prioritising efficiency and reliability while remaining indifferent to institutional trust or attitudes. In summary, these results highlight a bifurcation: digitally confident users prioritise functionality, whereas anxious users require both technical and relational assurances to derive satisfaction.

Research limitations. *This study's findings must be interpreted within several constraints. First, the data were collected from two northern Italian regions (Veneto and Emilia Romagna), limiting generalizability to southern Italy, where digital infrastructure and citizen-state dynamics may differ. Second, the focus on healthcare services-a high-stakes, low-frequency context-may amplify the salience of reliability and trust compared to routine services (e.g., tax filings). Third, the cross-sectional design precludes causal inferences about how satisfaction evolves with prolonged service use. Fourth, self-reported measures of digital anxiety may conflate trait-level anxiety with situational discomfort, warranting behavioural or experimental validation.*

Managerial implications. *To enhance satisfaction in digital public services, managers must prioritise technical performance-ensuring interfaces are intuitive, transactions error-free, and services delivered promptly-as these elements universally drive user satisfaction. For digitally anxious populations, pair these technical improvements with trust-building measures such as transparent communication about data use and step-by-step guidance to reduce barriers. In general, the strategies implemented may depend on user readiness: simplify interfaces for high-anxiety groups while offering advanced features for confident users.*

Originality of the paper. *This study contributes to the e-government literature by integrating trust in public actors and digital anxiety into the analysis of service satisfaction-a novel approach that highlights the interplay between relational and technical dimensions of public service delivery. Unlike prior frameworks focusing solely on functional quality, we demonstrate that institutional trust mediates satisfaction and that users' digital anxiety moderates its role. For high-anxiety individuals, trust acts as a compensatory mechanism, mitigating technological discomfort; for low-anxiety users, satisfaction hinges predominantly on service performance. By methodologically distinguishing trust in public institutions (a relational construct) from service quality (a technical construct), we offer a dual-path perspective where satisfaction arises from both operational excellence and citizen-state rapport. This approach advances a more nuanced understanding of digital governance, providing policymakers insights to address equity gaps in digitisation efforts.*

Empowering Consumers in Participatory Pricing: a Comparative Analysis of Pay-What-You-Want and "Choose a Price" Models and Their Impact on Consumers' Willingness to Co-Create Value

FRANCESCA SAMMARTINO[1] ALFONSO SIANO[2] AGOSTINO VOLLERO[3]
ALESSANDRA FERRARA[4]

Abstract

Participatory pricing challenges traditional firm-controlled pricing by involving consumers in the price-setting process. Among these models, Pay-What-You-Want (PWYW) gives consumers full autonomy to set the price, while variations like The Ordinary's "Choose a Price" campaign introduce some brand control, offering a novel take on PWYW. While much research has focused on the financial and behavioral aspects of participatory pricing, its impact on non-financial outcomes like value co-creation and differences in financial results between model variations has been less explored. Therefore, this study aims to investigate how different co-pricing models influence financial outcomes and the relationship between willingness to pay and value co-creation. For this purpose, a quantitative online survey involving 791 subjects is being conducted to compare the effects of Pay-What-You-Want and "Choose a Price" pricing models on both price decision and value co-creation using The Ordinary as case study. Preliminary results show similar willingness to engage in value co-creation across both models. However, in terms of financial outcomes, most participants in the PWYW model paid more than the original price, while those in the "Choose a Price" model mostly opted for the highest discount. Thus, while the willingness to co-create value is similar in both models, traditional PWYW leads to better financial results. This suggests that given similar results in consumer willingness to co-create value, managers may favor the PWYW model in the short term to maximize revenue.

Framing of the research. *Pricing has traditionally been considered one of the most critical elements of marketing strategy, playing a central role in consumer decision-making, brand positioning, and perceived value creation (Monroe, 1973; Zeithaml, 1988).*

Conventional pricing approaches are rooted in the Goods-Dominant Logic (G-D Logic), which assumes that firms are the sole creators of value, embedding it within products and services before exchange (Vargo and Lusch, 2004). However, the shift toward a Service-Dominant Logic (S-D Logic) has challenged this perspective, positioning value as something co-created through interactions between firms and consumers with both sharing knowledge and experiences rather than being unilaterally determined by the company (Vargo and Lusch, 2008). This conceptual evolution has further reinforced the recognition of consumers as increasingly empowered and actively involved in decision-making processes, leading to the emergence of participatory pricing models in which they play a direct role in price determination. One of the most widely studied participatory pricing model is the "Pay-What-You-Want" (PWYW), also referred to as "Name-Your-Own-Price" (NYOP) (Fay, 2004), "Pay-What-You-Like" (PWYL) (Fernandez and Nahata, 2009) or "Pay What You Can" (Saccardo et al., 2015). This model grants customers the freedom to pay any price they consider appropriate-including nothing- without the seller being able to oppose it (Kim et al., 2009).

The PWYW model has long existed in various cultural and religious contexts. For example, in Indian villages, priests and rural doctors receive compensation based on what patrons can afford (Fernandez & Nahata, 2009). Similarly, nonprofit organizations have traditionally relied on discretionary payments, such as voluntary contributions in religious institutions, which exemplify a long-standing tradition of this approach (Christopher & Machado, 2019; Fernandez & Nahata, 2009). Beyond the nonprofit sector, early forms of PWYW have emerged in for-profit contexts, particularly in cause-related marketing, where consumers can voluntarily decide the additional amount to pay-on top of the set product price-to support philanthropic causes (Gneezy et al., 2010).

However, the model has also gained traction in purely commercial settings. Thus, although the Pay-What-You-Want pricing mechanism is classified as a variant of the "voluntary market payment mechanism" (Natter and Kaufmann, 2015), in this case it differs from other "honor system" models, such as donations or tipping (Gerpott, 2016), in that customers are not contributing for the benefit of others but rather determining the price of their own consumption (Jung et al., 2014).

The commercial relevance of the PWYW model emerged when businesses began experimenting it in sectors such as entertainment, media, and dining receiving positive outcomes. A notable example is the band Radiohead, which, in 2007, offered their album In Rainbows under a 'Pay What You Want' scheme, achieving satisfactory results compared to the performance of previous releases with fixed prices (Schmidt et al., 2015).

Subsequently, academic research also began to examine the PWYW model, providing empirical evidence of its advantages, such as market penetration, its role as a short-term promotional tool (Christopher & Machado, 2019),

Conference Proceedings

DOI 10.7433/SRECP.SP.2025.01

additional opportunities for seller differentiation, and its positive impact on credibility and perceived fairness (Kim et al., 2009).

However, due to its inherent characteristics, the model has raised several questions regarding its economic viability and the behavioral drivers that enable PWYW to yield positive outcomes (Fernandez & Nahata, 2009).

First, various studies highlight the influence of behavioral factors on the willingness to pay more than zero in a PWYW context and, at times, even more than the price the product would have had under a fixed pricing scheme, challenging the dominant perspective in economic theory that purchasing decisions are primarily rational and driven by utility maximization through a trade-off between costs and benefits (Roy, 2015; Gneezy et al., 2010; Kim et al., 2009).

Indeed, Kim et al. (2009) tested the PWYW pricing model across three different contexts and found that more fair-minded and satisfied consumers tend to pay more, while those with higher price consciousness or lower incomes tend to pay less. Narwal and Nayak (2020) observed that consumers primarily rely on external reference prices-such as similar products or competitor pricing-as benchmarks rather than past purchase experiences (internal reference prices). Similarly, Roy et al. (2021) found that in the absence of an external reference price, consumers anchor their payments on their internal reference price. Their study also highlighted the role of social desirability, showing that the presence of others encourages consumers to pay at least as much as their internal reference price. On the same line, Rabbanee et al. (2022) also found that social desirability can overcome the effect of price consciousness on price decisions in PWYW contexts, as even consumers who are price-conscious and seek the best deals may choose to pay more in order to appear more generous and socially responsible in front of others and so also preserving their social image (Gneezy et al., 2012).

However, behavioral aspects that can contribute to positive outcomes in the PWYW context do not seem to be universally applicable to all market contexts. The sustainability of PWYW model depends on several factors, including market conditions, product type, and consumer demographics (Gerpott, 2016). Empirical evidence suggests that PWYW is more successful for low-cost, experience-based goods and services, such as digital products, dining, and entertainment (Kim et al., 2014; León et al., 2012). Schmidt et al. (2015) noted that the PWYW pricing model is more effective for small businesses or non-profit organizations than for large corporations. They also suggested that this model may be ineffective in highly competitive markets, particularly when fixed-price sellers are present, as their study found that consumers tend to prefer fixed prices over the PWYW model. In contrast, while Chen et al. (2017) agree with Schmidt et al. (2015) that PWYW is most suitable for products with low marginal costs, such as cultural events or digital goods, they argue that it can also be advantageous in highly competitive markets. Their findings suggest that in perfectly competitive markets, firms tend to set prices close to marginal costs, leading to zero economic profits. In contrast, companies adopting the PWYW model may avoid this pricing pressure, shifting competition toward factors other than price

Thus, apart from the analysis of behavioral aspects and economic viability, limited research has focused on the non-monetary consequences of PWYW for both firm and customers (Gerpott, 2016) such as value co-creation. Participatory pricing aligns with the principles of value co-creation, emphasizing that consumers do not passively accept value propositions but actively contribute to shaping their experiences with brands (Prahalad and Ramaswamy, 2004). By involving consumers in price-setting, participatory pricing fosters engagement, enhances trust, and strengthens the relationship between brands and consumers (Machado and Sinha, 2013). Therefore, since both PWYW and value co-creation emphasize capturing value for customers, we assume that they are inherently compatible (Read et al., 2019).

To date, only Lin and Souma (2024) conducted an online experiment to explore whether the PWYW experience for acquiring New Age music enhances customers' sense of empowerment and subsequently increases their willingness to pay (WTP) - understood as the maximum amount of money an individual is willing to spend to obtain a given product or service (Krishna, 1991) - and their inclination toward value co-creation. The results indicated that customers who made higher payments in the PWYW condition experienced an increase in self-efficacy, which in turn made them more likely to engage in value co-creation activities with the service provider.

However, despite these insights, a gap remains in the literature regarding the relationship between participatory pricing and consumers' willingness to engage in the co-creation process, particularly in relation to the emerging variations of the PWYW model. This lack of research leaves uncertainty about the actual potential of PWYW and its variants as a catalyst for value co-creation.

Purpose of the paper. *This study aims to fill a gap in the existing literature by first examining whether there are differences in consumers' WTP between the PWYW model and the case-based variation "Choose a Price", introduced by the brand The Ordinary. In the PWYW model, where consumers are free to set their own price, WTP emerges through a self-regulated adjustment process in which individuals settle on a price they perceive as satisfactory in relation to the perceived value of the offering (Narwal and Nayak, 2020). By contrast, in the "Choose a Price" model, WTP is expressed within a predefined pricing framework, typically consisting of three fixed discount options applied to the full price of one of the brand's products. Consumers are invited to select one of these options, reflecting their perceived value of the offering. The use of percentage-based price discounts is a well-established strategy employed by sellers to enhance both purchase likelihood and product attractiveness (Wang et al., 2025). However, prior research has shown that small discounts, compared to fixed prices, may increase consumers' price sensitivity, emphasizing economic sacrifice and reducing overall perceived value, whereas higher discounts can lower the sense of sacrifice and enhance value perception (Suri et al., 2000). Therefore, in the "Choose a Price" scenario, the presence of increasingly higher discount percentages may encourage consumers to opt for the highest available discount, in contrast to the classic PWYW model, where empirical evidence has demonstrated that, in several cases, consumers voluntarily choose to pay a price higher than what*

they would have paid under a fixed-price condition. Nevertheless, the attractiveness of a higher discount percentage could suggest that the brand's primary objective extends beyond direct financial outcomes.
Therefore, after identifying potential differences in the WTP under the two conditions (PWYW and Choose a Price), this study further examines how these differences impact consumers' willingness to co-create value. Specifically, it explores whether granting complete freedom in price determination or implementing a partially constrained pricing mechanism leads to different outcomes in terms of value co-creation.

Methodology.

The Ordinary's "Choose a Price" campaign

The skincare brand The Ordinary–now fully owned by Estée Lauder (ilSole24ore, 2024) –has disrupted the beauty industry by prioritizing transparency and consumer education over traditional branding and aspirational marketing (Theordinary.com). Since its launch in 2016, the brand has empowered consumers with clear, accessible product information, fostering an engaged community that actively contributes to its evolution.

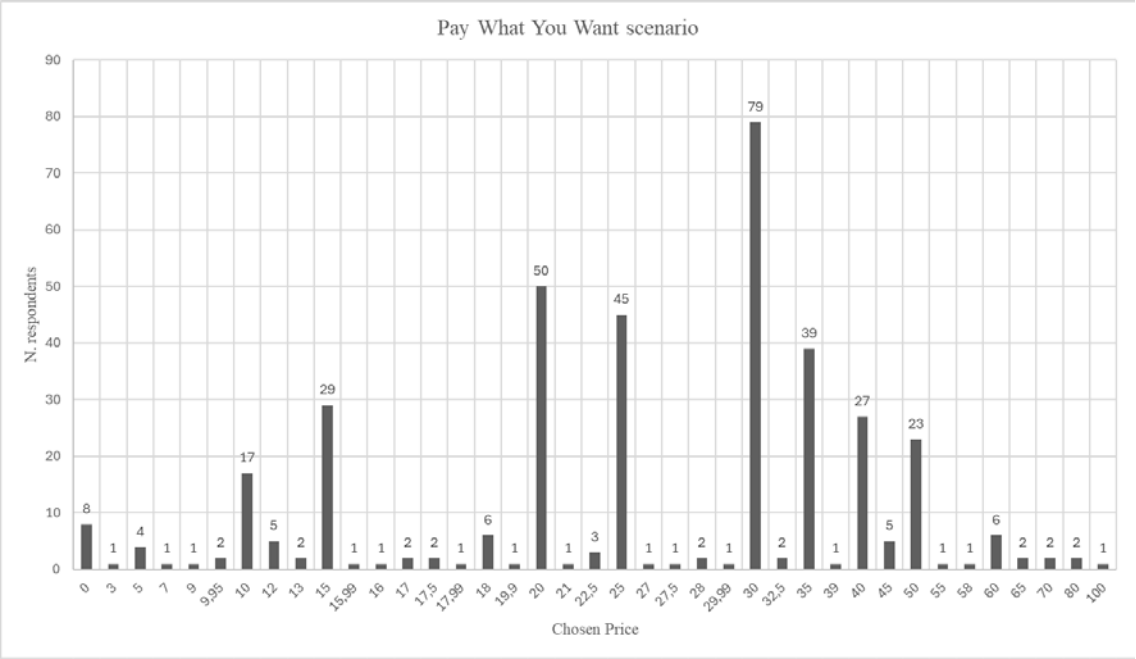
This commitment to co-creation extends to pricing strategies, as demonstrated by the 2024 Choose a Price campaign. The brand proposed a specific variation of the PWYW model, where the price selection is not entirely free, but consumers could freely choose from three different discount levels (0%, 23%, and 40% off) for the The Daily Set. This approach represents an innovation in the participative pricing model framing, where the brand's control is not exercised through price suggestions or the definition of a minimum price, but rather by predetermining the available discount levels. By allowing customers to select from these predefined options, the initiative reinforced The Ordinary's reliance on its community, framing pricing as a participatory decision. This strategy exemplifies how the brand integrates consumer engagement into multiple aspects of its business, positioning its audience as active contributors rather than passive buyers.

Questionnaire design

This study employed a quantitative analysis through an online questionnaire administered via Qualtrics. Participants were selected using a discriminant criterion to include only those familiar with the brand The Ordinary. This was achieved using the skip logic feature of Qualtrics, which excluded respondents indicating unfamiliarity with the brand from further participation. This allowed us, in this first phase of analysis, to focus exclusively on participants who, being familiar with the brand and its products, can make a more informed judgment regarding the price they are willing to pay. In contrast, those unfamiliar with the brand may base their pricing judgment on factors such as the packaging or other cues, which are less reliable compared to personal experience with the brand and its products. This distinction ensures that the price evaluation is more grounded for those with direct knowledge of the brand.

The sample we have analyzed so far consists of 791 individuals, with an average age of 28 years, of whom 96.84% were women.

To familiarize participants with the subject of the study, they were presented with The Daily Set, the product featured in the "Choose a Price" campaign. The product was displayed as it appears on the official e-commerce site of The Ordinary, with all its information except the price.



The questionnaire was structured into two main sections:

1. ***Willingness-to-Pay Assessment:*** *Participants were randomly assigned to one of two experimental conditions using the automatic randomization feature in Qualtrics. Each group was presented with a distinct pricing scenario:*
   - ***Pay What You Want (PWYW) Model:*** *Participants in this group (n = 378) received the following open-ended prompt:*
     "Imagine you have to purchase this set of products in euros. The Ordinary has created a system that allows you to freely choose the price to pay, even €0. How much do you decide to pay for the set of products?"
   - ***Predetermined Price Options Model (Choose a Price):*** *Participants in this group (n = 413) were presented with the following multiple-choice scenario:*
     "Imagine you have to purchase this set of products in euros. The Ordinary has created a system with three different price bands, leaving you with the choice of how much to pay for the set among the proposed prices. The options are:
     - *Full price: €22.60*
     - *23% discount: €17.40*
     - *40% discount: €13.56*
     - *Which one do you choose to pay?"*
2. ***Perceived Value Co-creation Assessment:*** *in the second section, participants were asked to evaluate their propensity to engage in value co-creation. The questions in this section were linked to the pricing scenario previously assigned to each respondent, ensuring consistency between their pricing decision and their co-creation attitudes. To evaluate the level of perceived value co-creation, nine questions were posed using the scale from the experiment by Lin and Souma (2024), appropriately adapted for this study. The sole exception in the scale used in the following experiment is question no. 3, whose reference was adapted from Sarmah et al. (2017). The questions aim to capture key*

dimensions of customer engagement in co-creation: collaboration for brand improvement, intrinsic and extrinsic motivations for engagement and positive word-of-mouth and advocacy.
The response options were presented on a 5-point Likert scale (Strongly Agree, Agree, Neutral, Disagree, Strongly Disagree).

Results. *The data collected from the web survey provided an initial overview of purchasing behavior across the two pricing scenarios. In the PWYW scenario, certain price points emerged as more frequently selected. Specifically, as shown in Figure 1, €30 was the most chosen price, selected by 79 participants, followed by €20 and €25. The mean amount that respondents were willing to pay in this condition was €28.14, exceeding the original price of the product by €5.54. In summary, 64% of participants opted for a price higher than the original product's fixed price (€22,60), while 36% selected a lower price.*

Fig. 1: Frequency of price choices in the Pay What You Want scenario.

Source: authors' elaboration

In contrast, as represented in Figure 2, the "Choose a Price" scenario shows a distinct rational consumer behavior pattern, where 54% of participants opted for the maximum discount option (40% off), 35% chose the intermediate price with the lowest discount (23% off), and only 11% selected the full-price option without any discounts. This distribution resulted in an average payment of €15,89, highlighting a significant divergence between the two scenarios.

Fig. 2: Frequency of price option choices in the Choose a Price scenario.

Source: authors' elaboration

Following the consumers' WTP analysis in the two conditions, we examined the willingness to co-create value with the brand The Ordinary. In the PWYW scenario, the segment of respondents who were willing to pay more than €22,60

exhibited an average co-creation level of 3,98, while those who were willing to pay less had an average of 4,01. In the Choose a Price scenario, the average co-creation scores were 4.03 for the €13.56 option, 3.93 for €17.40, and 3.98 for €22.60.

Overall, these preliminary findings suggest that willingness to co-create does not significantly differ between the two co-pricing mechanisms. Although minor variations are observed, no consistent pattern emerges that would suggest a strong relationship between pricing strategy and consumer engagement in co-creation. Future developments of this paper should include more robust statistical analyses to more reliably assess the presence or absence of statistically significant differences.

Research limitations. *While this study provides valuable insights into participatory pricing and its role in value co-creation, several limitations must be acknowledged.*

First, the sample consists primarily of Italians participants, which may limit the generalizability of the findings to other populations with different cultural contexts or economic environments. Therefore, future research developments could benefit from including more diverse samples encompassing different countries, regions, or cultural backgrounds to assess whether the findings are consistent across various consumer segments. Moreover, the findings from this initial exploratory phase are based solely on descriptive analysis; therefore, future developments of the study should incorporate more in-depth statistical testing to validate and deepen the insights obtained.

Second, the study is focused on a specific brand, which further limits the external validity of the results. The relationship between consumers and the brand studied in this research may not fully reflect the dynamics observed in other industries or product categories.

Managerial implications. *Our preliminary findings suggest a fundamental difference in consumer behavior between the two types of participatory pricing analyzed. In the Choose a Price condition, the presence of greater brand control and discounts that constrained price-setting freedom led most participants to adopt a rational decision-making approach, prioritizing the most cost-effective option. This outcome could align with traditional economic theories, which suggest that when faced with predefined price tiers, consumers tend to maximize their financial benefit by selecting the lowest available price (Roy et al., 2016). Additionally, these results could confirm the position of Suri et al. (2000), who argue that discounts increase consumers' price sensitivity and highlight economic sacrifice, potentially leading to a lower perceived value of the offer.*

Conversely, in the PWYW scenario, slightly more than half of the participants was willing to pay a price higher than the predetermined fixed price for the analyzed product. Therefore, pricing decisions in this context appear to be influenced by factors beyond purely rational economic considerations, confirming previous research findings (e.g., Roy, 2015; Kim et al., 2009). Furthermore, our initial results align with those obtained by Kim, Natter, and Spann (2014), who found that PWYW yielded better financial performances compared to discount-based promotions. Our findings extend this insight by demonstrating that even allowing consumers to freely choose their discount level leads to inferior results compared to the classic PWYW model.

An additional key insight from our comparison comes from the propensity of consumers to engage in value co-creation activities, which was found to be consistently high across both analyzed co-pricing strategies. In the PWYW model, observing that consumers who are willing to pay more also exhibit a high willingness to co-create value is not surprising, as it aligns with previous empirical evidence (e.g., Lin and Souma, 2024), which suggests that increased consumer confidence and empowerment foster value co-creation behaviors. However, what is particularly interesting is that in both the PWYW model and Choose a Price, those who were willing to pay less still demonstrated a likelihood to co-create value comparable to those who paid more.

According to PWYW literature, one of the primary reasons why consumers choose to pay more than zero is related to perceived fairness and reciprocity in social exchanges (Roy, 2015; Kim et al., 2009). Consumers recognize the value of price-setting freedom and feel a moral obligation to reciprocate the benefit received by paying what they consider a fair price (Narwal and Rai, 2022). Kim et al. (2009) further support this idea, stating that in PWYW settings, buyers are expected to financially reward the seller for the product/service received. Therefore, one possible explanation for our preliminary findings is that, for some customers, The Ordinary's offer may have had a lower perceived monetary value than their usual reference price for the analyzed product. Alternatively, consumers who were willing to pay less than the base price may have still reciprocated the brand in non-monetary ways, in line with the principles of reciprocity and Equity Theory. These compensatory actions could manifest as value co-creation behaviors, as suggested by our preliminary results.

Moreover, based on our preliminary findings, we recommend that managers prioritize the classic PWYW model over the Choose a Price case-based variation, as it yields better economic performances while achieving the same effect in enhancing consumers' willingness to co-create value.

Additionally, with regard to the value-informed pricing which relies on capturing the monetary equivalent of the co-created value, Ingenbleek et al. (2014) argues that one of the key challenges remains understanding how consumers perceive value and translating it into an appropriate monetary expression. In line with this, Kim et al. (2009) suggest that PWYW can serve as an indicator of perceived quality, as consumers tend to align their payments with their evaluation of the product or service. Therefore, building on our preliminary findings we could propose that managers leverage the PWYW model as a promotional tool which, by capitalizing on its entertainment factor (Kim, Natter, and Spann, 2014) and its ability to enhance consumers' self-efficacy (Lin and Souma, 2024), could effectively reveal the perceived value of

a brand's offering while simultaneously fostering greater consumer engagement in co-creation activities. However, given that the long-term sustainability of the PWYW model depends on several factors-such as high levels of consumer loyalty, satisfaction, and fairness (Kim et al., 2009) -as well as the significant risks associated with its failure, including the inability to cover costs, unintended brand positioning, and erosion of corporate image (Balan, 2014), we suggest that this potential function of PWYW, should be strategically applied periodically through time-limited initiatives. This would help establish a virtuous cycle in which managers gain actionable insights into consumers' value perceptions-emerging from their co-creation process-allowing for the refinement of pricing strategies and ultimately supporting more effective compensation across the company's value network.

Originality of the paper. *First, this study contributes to the existing literature on participatory pricing models in several ways. First, it introduces a new variation of the PWYW model that has emerged from a context-specific marketing practice-"Choose a Price"- by the brand The Ordinary, in which consumers' freedom of choice is constrained through predefined discount levels. Second, it directly compares the financial performance of the classic PWYW model with its Choose a Price variation under identical conditions.*

Additionally, preliminary findings of this research expand the literature by offering a new perspective on how participatory pricing models could enhance consumers' willingness to engage in value co-creation activities. The findings demonstrate that there are no significant differences between the two models in terms of their impact on co-creation willingness. In both cases, consumers exhibit a high willingness to participate in value co-creation processes, thereby reinforcing the conclusions of Lin and Souma (2024), who found that participatory pricing mechanisms increase consumers' propensity for value co-creation. Moreover, this paper introduces the possibility of considering co-pricing models as a tool for implementing value-informed pricing (Ingenbleek et al., 2014), suggesting a new avenue for future research to explore and validate.

The use of PLS-SEM by the Italian management scholars' community: An updated review and some guidelines

FABIO CASSIA[1] FRANCESCA MAGNO[2]

Abstract

Partial least squares structural equation modeling (PLS-SEM) is a component-based structural equation modeling (SEM) technique that has gained prominence internationally in management studies. However, a comprehensive review of PLS-SEM's use by Italian management scholars is not yet available. This research aims to fill this gap by reviewing the articles published by Italian scholars until the end of 2024 to identify current practices and areas for improvement. We analyze 140 PLS-SEM studies published by Italian management scholars covering four aspects: (1) reasons for using PLS-SEM, (2) sample and model characteristics, (3) structural model evaluation, and (4) advanced analysis techniques. The findings show that 106 of the 140 studies have been published in the 2022-2024 period, suggesting that PLS-SEM is gaining popularity among Italian management scholars. At the same time, the results show that researchers can benefit from the use of advanced PLS-SEM techniques in their studies. We make various suggestions based on our analyses.

Key words: *Research methods; Management studies; Structural equation modeling; PLS-SEM; Partial least squares structural equation modeling*

Framing of the research. *Partial least squares structural equation modeling (PLS-SEM) is a component-based structural equation modeling (SEM) technique that has recently experienced wide popularity. The bibliometric literature review published by Angelelli et al. (2025) identified 9,150 documents indexed in the Web of Science Core Collection database in the 1985-2022 period. Interestingly, more than 50% of these documents (n=3,931) have been published in the two most recent reviewed years (2021-2022), revealing an exponential adoption of this technique. Moreover, the "Business & Economics" research area accounted for the highest share (i.e., 40%) of the retrieved documents. In particular, several analyses indicate the growing importance of PLS-SEM in the management field and its sub-fields, including, among others, marketing (Guenther et al., 2023; Sarstedt et al., 2022), quality management (Magno et al., 2024), family business (Hair et al., 2021), and international business (Richter et al., 2022). Methodological studies are rapidly advancing and refining PLS-SEM, resulting in new opportunities and guidelines (Becker et al., 2023; Sarstedt et al., 2023). Hence, researchers interested in applying this method need to align their studies with the most recent advancements to enhance the rigor, relevance, and transparency of their research findings (Adler et al., 2023).*

Purpose of the paper. *In 2020, the first Italian version (Hair et al., 2020b) of the highly cited textbook on PLS-SEM (Hair et al., 2014; Hair et al., 2017; Hair et al., 2022) was published, which represented an additional opportunity for the Italian management scholars' community to approach PLS-SEM. However, a comprehensive review of PLS-SEM's use by Italian management scholars is not yet available. This research aims to fill this gap by reviewing the PLS-SEM articles published by Italian scholars until the end of 2024 to identify current practices and areas for improvement. The findings of this analysis can thus offer an opportunity for collective updating of PLS-SEM applications to the most recent methodological advancements.*

Methodology. *We followed the procedure outlined in Figure 1 to perform our review. First, we ran a search of Elsevier's Scopus database[3] (last update: 15th March 2024), resulting in 272 articles that met all the following criteria:*

- *search keywords: "PLS-SEM" or "partial least squares";*
- *year: until 2024 (included);*
- *subject area: "Business, Management and Accounting";*
- *country/territory of affiliation of at least one co-author: Italy;*
- *document type: "Article";*
- *language: "English";*

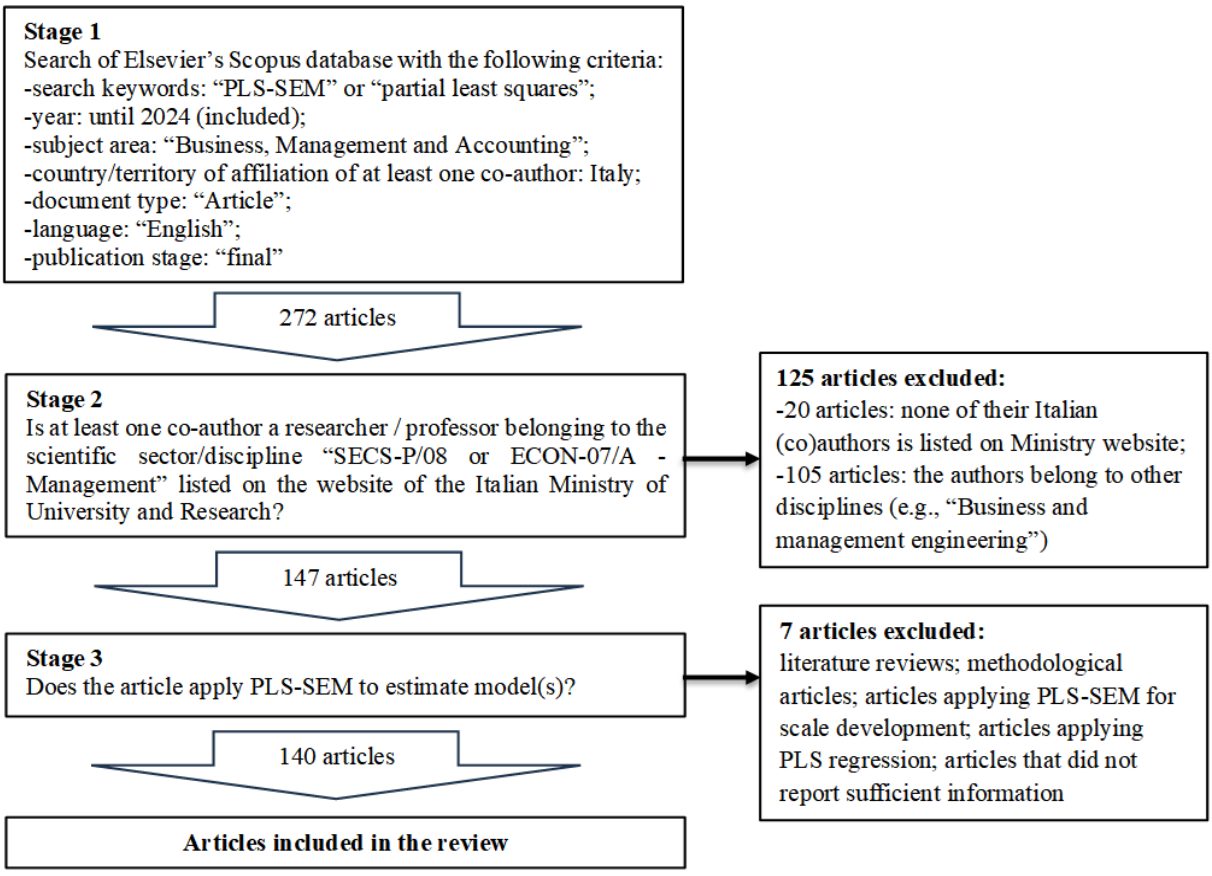
e-mail: francesca.magno@unibg.it

[3] Query: (TITLE-ABS-KEY ("pls-sem") OR TITLE-ABS-KEY ("partial least squares")) AND PUBYEAR > 1992 AND PUBYEAR < 2025 AND (LIMIT-TO (SRCTYPE , "j")) AND (LIMIT-TO (AFFILCOUNTRY , "Italy")) AND (LIMIT TO (SUBJAREA , "BUSI")) AND (LIMIT-TO (DOCTYPE , "ar")) AND (LIMIT-TO (LANGUAGE , "English")) AND (LIMIT-TO (PUBSTAGE , "final"))

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

- *publication stage: "final" (i.e., articles "in press" were not included in the review).*

Second, we checked the subject area of each Italian (co)author to ensure that she/he belonged to the scientific sector/discipline "SECS-P/08 or ECON-07/A - Management". For this purpose, we checked the official list of researchers and professors on the website of the Italian Ministry of University and Research.[4] Through this procedure, 125 articles were excluded from the analysis for the following reasons:



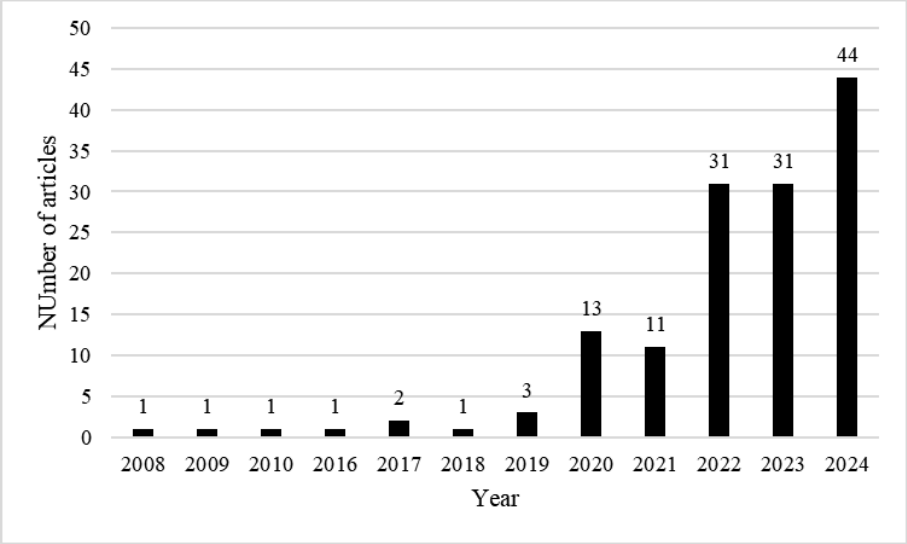
- *20 articles because none of their Italian (co)authors were listed on the Ministry website, neither at the time when the article was published nor in the most recent update of the list (31st December 2024);*
- *105 articles because the authors belonged to other disciplines, including "Business and management engineering", "Agricultural economics", "Accounting", "Economics", "Statistics", and others.*

Third, we considered only articles that applied PLS-SEM for estimating models, and therefore we excluded 7 articles for the following reasons: one article contained a literature review (Magno et al., 2024); one was a methodological article

(Kurtaliqi et al., 2024); two articles applied PLS-SEM for scale development (Corsaro and Maggioni, 2022; Merz et al., 2018). Finally, one article contained a PLS regression and two articles did not report sufficient information for our analysis. Overall, 140 articles and 145 models (some articles included more than one model) were considered in the review.

Consistent with previous reviews of PLS-SEM studies (Sarstedt et al., 2022), this study covered four aspects: (1) reasons for using PLS-SEM, (2) sample and model characteristics, (3) structural model evaluation, and (4) advanced analysis techniques.

Fig. 1: Article search and selection



Source: our elaboration.

Results. *The analysis revealed that 106 of the 140 articles have been published in the 2022-2024 period (Figure 2), thus suggesting that, even if later compared to the international context (Angelelli et al., 2025), PLS-SEM is now being rapidly adopted by the Italian management scholars' community.*

The journals hosting the highest number of reviewed studies were: Journal of Knowledge Management (n=11); Technological Forecasting and Social Change (n=9); Journal of Cleaner Production (n=8); Business Strategy and the Environment (n=6); Journal of Business Research (n=6); Sinergie Italian Journal of Management (n=6).

(1) Reasons for using PLS-SEM

The analysis (Table 1) shows that nonnormal data is the most frequently mentioned reason (n=36) to motivate the use of PLS-SEM, followed by theory development and exploratory research (n=30). Interestingly, the predictive and causal-predictive study focus, which should be a core aspect of PLS-SEM studies (Sarstedt et al., 2023), is mentioned in 29 studies. A remarkable number of studies (n=32) do not indicate a specific reason for using PLS-SEM.

Tab. 1: Reasons for using PLS-SEM

Reasons	Number of studies (*n*=140)
Nonnormal data	36
Theory development and exploratory research	30
Predictive (and causal-predictive) study focus	29
Small sample size	24
High model complexity	24
Explain variance in the endogenous constructs	13
Formative measures	10
PLS-SEM's popularity and standard use in the field	7
Higher-order constructs	7
Mediation effects	5
Latent score availability	5
Other reasons (e.g., theory testing, moderation effects, higher statistical power than CB-SEM; multi-group analysis)	30
No explicit reason	32

Source: our elaboration.

(2) Sample and model characteristics

Our analysis of the 145 models reveals an average of 5.94 latent variables and an average of 8.06 path relationships (Table 2), indicating quite simple structural models (Sarstedt et al., 2022). At the same time, more than 50% of the models (n=79) include mediation effects, and 31 models include interaction effects. A remarkable number of models (n=42) encompass higher-order constructs, with a higher presence of reflective-reflective (n=13) and reflective-formative (n=13) models. However, the approach for specifying and estimating higher-order constructs is not reported for half of the cases (n=21). Moreover, only 10 of the 42 higher-order constructs are evaluated using criteria documented in the extant literature. Hence, it would be important to adhere to the established guidelines for higher-order constructs' specification, estimation, and validation (Sarstedt et al., 2019).

Tab. 2: Model characteristics

Criterion	Results (*n*=145)
Sample size	
Mean	368.34
Median	300
Range	(38;3574)
Number of latent variables	
Mean	5.94
Median	6.00
Range	(3; 11)
Number of inner model path relations	
Mean	8.06
Median	7.00
Range	(2; 27)
Measurement model (first-order)	
Only reflective	131
Only formative	2
Reflective and formative	10
Not specified	1
Total number of indicators in models	
Mean	30.97
Median	30.00
Range	(6; 80)
Number of models with single-item constructs	18
Number of models with control variables	36
Number of models with mediation effects	79
Number of models with interaction effects	31
Number of models with nonlinear relationships	1
Number of models with higher-order constructs	42
Type of second-order constructs	
Type I (reflective-reflective)	13
Type II (reflective-formative)	13
Type III (formative-reflective)	0
Type IV (formative-formative)	1
Both types I and II	1
Not specified	14
Specification and estimation of higher-order constructs	
Repeated indicators approach	6
Two-stage approach	15
Not specified	21
Evaluation of higher-order constructs	
Use of criteria documented in the extant literature	10
Missing evaluation of higher-order constructs	23
Incomplete application of relevant criteria	9
Misapplication of evaluation criteria	0

Source: our elaboration.

(3) Structural model evaluation

Table 3 shows the findings for the evaluation of the structural model, which includes the model's explanatory and predictive accuracy. The values of their path coefficients and the level of significance are reported for almost all models. Similarly, the coefficient of determination is shown for the vast majority of models (n=124), thus providing information about the explanatory power of the models. Regarding predictive relevance, almost half of the models (n=69) apply Q^2 based on the blindfolding routine. Nonetheless, the current PLS-SEM guidelines recommend the use of the PLSpredict algorithm and the CVPAT (Sarstedt et al., 2023; Sharma et al., 2023; Shmueli et al., 2019). The analysis indicates that only 15 studies have implemented such procedures.

Tab. 3: Structural model evaluation

Criterion	Empirical test criterion in PLS-SEM	Number of models (*n*=145)
Path coefficients	Values	144
Significance of path coefficients	Standard errors, significance levels, t values / p values	143
Effect size	f^2	42
Explanatory power	R^2	124
Model fit	GoF, SRMR, etc.	53
Predictive relevance (blindfolding)	Q^2	69
	q^2	4
Predictive power	$PLS_{predict}$	11
	CVPAT	4
Predictive model comparison	BIC, GM, CVPAT	1

(4) Advanced analysis techniques.

Gudergan et al. (2025) provide an overview of the wide variety of established advanced PLS-SEM methods in their Table 1, which makes the method particularly useful for research projects and studies. The application of advanced techniques in the articles we reviewed is still quite limited. The analysis showed that multi-group analysis was applied for 25 models, but in 13 models, the needed measurement invariance tests had not been executed (Chin and Dibbern, 2010; Hair et al., 2024). A smaller number of studies applied the following advanced techniques: importance-performance map analysis (n=8) (Ringle and Sarstedt, 2016); Necessary condition analysis (n=5) (Richter et al., 2023); Endogeneity assessment (n=2) (Cheah et al., 2024; Liengaard et al., 2025); Confirmatory composite analysis (n=1) (Hair et al., 2020a). Advanced techniques such as the combined importance-performance map analysis (cIPMA; Sarstedt et al., 2024) have not been applied yet.

Research limitations. *The criteria applied to retrieve articles may have excluded articles that used PLS-SEM but did not reflect their use in the title, abstract or keywords. Moreover, we did not analyze the "in press" articles, which were 28 at the time we executed our search. In addition, given the space constraints, in this study, we reported only a part of the detailed information we collected on the reviewed articles.*

Managerial implications. *The findings indicate several avenues for researchers interested in applying PLS-SEM in their management studies such as: it is important to provide not only an evaluation of the explanatory power of the model but also of its predictive accuracy using the PLSpredict algorithm and the CVPAT; the guidelines provided by Hair et al. (2024, chapter 2) should be applied in modeling higher-order constructs; multi-group analysis is a valuable technique but requires measurement invariance assessment to provide solid outcomes; there are many opportunities to apply PLS-SEM more sophisticated techniques in management research. Moreover, PLS-SEM can also be valuable in deriving strong practical implications from management studies (for example, by using the IPMA).*

Originality of the paper. *This is the first study to provide a comprehensive review of PLS-SEM's use by Italian management scholars. Its findings can represent an opportunity for collective learning toward enhanced use of PLS-SEM and its extensions.*

Sostenibilità e Creazione di Valore Condiviso: il Contributo degli Incubatori nella Generazione dell'Impatto

GABRIELE LECIS[1] LEONARDO CORBO[2]

Abstract

Gli incubatori sociali possono offrire un importante contributo nel supportare le imprese a impatto sociale e ambientale. Ciononostante, la letteratura attuale dedica ancora poca attenzione a questo tema. Il presente studio si pone come obiettivo quello di analizzare l'operatività degli incubatori attenti alla generazione dell'impatto, identificando le attività chiave che consentono alle imprese incubate dedite all'impatto di superare gli ostacoli alla crescita. Nel fare questo, lo studio utilizza un approccio qualitativo al fine di esaminare le dinamiche che sussistono tra gli incubatori e le imprese dedite all'impatto sociale. Pertanto, sono state condotte interviste in profondità con gli incubatori e gli acceleratori distribuiti lungo il territorio italiano, identificando, per ciascuna barriera alla crescita, una rispettiva soluzione. Queste soluzioni rappresentano il contributo che gli incubatori e gli acceleratori possono offrire per favorire la crescita delle imprese dedite all'impatto sociale, garantendo di conseguenza un più ampio impatto. I risultati finora ottenuti mostrano che gli incubatori attenti all'impatto offrono soluzioni reali alle barriere alla crescita, a partire dalle attività di coaching e mentoring, passando per il networking e le attività di finanziamento. I risultati forniscono indicazioni pratiche ai manager degli incubatori e ai policymaker su come strutturare modelli di business efficaci, in modo tale da stimolare il dialogo tra attori dell'ecosistema e società incubate. Questo studio contribuisce alla letteratura esistente offrendo un'analisi dell'operatività degli incubatori in chiave di impatto sociale, ambito ancora poco esplorato.

Inquadramento della ricerca. ***Impatto sociale****. Nel corso degli ultimi decenni, è stata rivolta una particolare attenzione al tema dell'impatto sociale. Generalmente, con questo termine si intende l'insieme delle ricadute, di medio e lungo periodo, che si verificano sulla società a seguito di azioni e politiche (Bertani e Fassina, 2019). In ambito aziendale, quando si parla di impatto sociale si fa riferimento ai benefici che le imprese apportano su un territorio, indipendentemente dal fatto che ciò costituisca o meno il core business dell'azienda. L'economia di impatto, infatti, rappresenta il paradigma imprenditoriale e finanziario votato alla creazione simultanea di valore economico e valore sociale (Camera di commercio di Torino, 2022).*

Affinché ci sia impatto, devono essere rispettati i seguenti tre principi (Camera di Commercio di Torino, 2022):

- *Intenzionalità: ci deve essere la volontà di creare valore sociale;*
- *Addizionalità: fa riferimento alle opportunità di impatto sociale derivanti dall'operare in settori sottocapitalizzati, in quanto penalizzati dai tradizionali meccanismi di mercato;*
- *Misurabilità: relativa alla possibilità di applicare dei metodi di valutazione ex ante e misurazione ex post.*

Le imprese a impatto sociale possono contribuire in maniera diretta o indiretta al bene del territorio, affrontando i bisogni sociali che i servizi pubblici o i meccanismi di mercato non riescono ad affrontare. In ogni settore, è possibile operare con l'obiettivo di generare un impatto sociale positivo. Infatti, la dimensione sociale rappresenta un elemento rilevante per permettere alle aziende di stabilire connessioni con il contesto circostante e adottare una prospettiva orientata all'impatto sociale costituisce un importante requisito per essere accolta positivamente nella sua area operativa (Camera di Commercio di Torino, 2022.

Il concetto di impatto sociale è stato centrale nella letteratura della Corporate Social Responibility (CSR), la quale riconosce che le aziende abbiano delle responsabilità nel contribuire positivamente al contesto socioeconomico in cui esse operano (Motilewa et al., 2016). La CSR rappresenta, infatti, l'insieme dei doveri dei dirigenti aziendali di perseguire politiche, prendere decisioni e seguire una condotta che siano desiderabili rispetto agli obiettivi e ai valori della società (Nigro e Petracca, 2016).

Un'evoluzione della CSR è la Creating Shared Value (CSV), che integra direttamente l'impatto sociale nelle strategie aziendali, migliorando contemporaneamente la competitività dell'impresa e le condizioni economico-sociali delle comunità (Porter e Kramer, 2011). Nella fattispecie, con Creating Shared Value si suole intendere l'insieme di "politiche e pratiche operative che migliorano la competitività di un'azienda e contemporaneamente migliorano le condizioni economiche e sociali nella comunità in cui opera" (Porter e Kramer, 2011). A differenza della CSR, la CSV gestisce

attivamente le esternalità negative (ad esempio l'inquinamento), evitando che le problematiche sociali vengano relegate a questioni periferiche o, peggio ancora, a escluderle dalle strategie aziendali (Porter e Kramer, 2011).

***Barriere alla crescita**. Le imprese che perseguono obiettivi di impatto sociale, come imprese sociali, cooperative sociali, SIAVS, Società Benefit, B Corp (Camera di commercio di Torino, 2022), affrontano barriere alla crescita più complesse rispetto a quelle che potrebbero incontrare imprese a vocazione esclusivamente commerciale (Davies, Chambers e Chambers, 2019). Davies et al. (2019) riconducono le suddette barriere a tre grandi macrocategorie: 1) barriere basate sui valori che comprendono le differenze di valori etici e la filosofia di crescita e principi etici, 2) barriere basate sul modello di business che comprendono la difficoltà di accesso ai finanziamenti e di accesso alle risorse umane, 3) barriere istituzionali che influenzano e sono influenzate da comportamento dei consumatori e norme aziendali tradizionali.*

***Incubatori e acceleratori**. Secondo i principi della CSV, l'imprenditorialità e l'innovazione sono particolarmente stimolati in tutti quegli ambienti dove si concentrano attività innovative e attori chiave, poiché ivi si possono instaurare processi cooperativi, e concentrare saperi, conoscenze e pratiche (Coscarello, 2024). L'innovazione non è un processo isolato, ma è strettamente connesso alle reti di interazioni tra imprese, istituzioni e altri attori sociali. In questo senso, si parla di "ambienti dell'innovazione" o "luoghi dell'innovazione" per riferirsi all'insieme di spazi che stimolano la collaborazione tra gli attori locali e promuovono lo scambio di idee. Si tratta di spazi che abilitano il cambiamento socioeconomico, rendendo i territori più attrattivi e resilienti alle sfide globali (Coscarello, 2024).*

All'interno della tassonomia dei luoghi dell'innovazione, rientrano i cosiddetti incubatori di impresa e sociali (Montanari e Mizzau, 2016b). Con il termine incubatore si suole generalmente intendere un'entità istituzionale che fornisce una gamma di servizi e, talvolta, risorse finanziarie, con lo scopo di assistere le imprese durante le prime fasi del loro ciclo di vita. In questo senso, gli incubatori svolgono un ruolo primario nell'accelerare il processo di costituzione e formazione di un'impresa, aumentandone la probabilità di sopravvivenza nel mercato (Gervasoni e Sattin, 2020). L'attività di accelerazione comprende la progettazione e lo sviluppo di programmi dedicati, i quali possono essere realizzati sia dagli incubatori stessi, sia da entità distinte note come acceleratori in senso stretto.

Diversi rapporti e pubblicazioni scientifici adoperano i termini incubatore e acceleratore in modo intercambiabile, mentre altri li considerano come due concetti distinti. Generalmente, è possibile identificare i seguenti elementi differenziali (Social Innovation Monitor, 2022):

- *La fase di intervento. Gli incubatori offrono servizi più early-stage, mentre gli acceleratori operano su iniziative già sviluppate:*
- *Il tempo di supporto. gli acceleratori sembrano avere un tempo medio di accompagnamento minore degli incubatori;*
- *Livello di operatività. È emerso che nei programmi di accelerazione le imprese accompagnate inizino insieme il percorso, quasi come una classe di studenti, mentre negli incubatori questo sembra non accadere perché le imprese possono entrare con continuità nel programma.*

Poiché entrambe le realtà perseguono l'obiettivo di sostenere l'innovazione imprenditoriale, verranno trattate congiuntamente nel corso dell'analisi.

In termini generali, gli incubatori rientrano tra le istituzioni finalizzate a stimolare e promuovere l'imprenditorialità (Auricchio, Cantamessa, Colombelli, Cullino, Orame e Paolucci, 2014). La gamma di servizi offerta è diversificata, e funzionale agli obiettivi che si propongono. All'interno degli incubatori lavorano manager con competenze che si estendono su tutte le aree funzionali di un'impresa: marketing, finanza, strategia aziendale (Gervasoni e Sattin, 2020). Queste competenze sono necessarie per poter valutare la fattibilità tecnica, economica e finanziaria di un'idea di business e accelerarne il processo di crescita.

Le imprese che riescono a essere selezionate per un programma di incubazione ottengono diversi benefici tangibili, come la possibilità di ottenere informazioni e risorse rilevanti in minor tempo, le economie di scala e di scopo tipiche delle grandi imprese e una rete di contatti fondamentale. Sansone et al. (2020) identificano diverse tipologie di incubatori sulla base del loro interesse alla generazione dell'impatto sociale e ambientale. Secondo tale classificazione, possono essere individuate tre tipologie di incubatori: 1) Business Incubator: 0% di organizzazioni incubate a significativo impatto sociale rispetto al totale; 2) Mixed Incubator: fino al 50% di organizzazioni incubate che sono a significativo impatto sociale rispetto al totale; 3) Social Incubator: più del 50% di organizzazioni incubate che sono a significativo impatto sociale rispetto al totale.

I Mixed Incubator e, in misura ancora maggiore, i Social Incubator si distinguono dagli incubatori generalisti (Business) per l'attenzione prioritaria all'impatto. Questi incubatori supportano le organizzazioni che sviluppano soluzioni innovative e orientate al mercato per affrontare le problematiche sociali. Sansone et al. (2020) evidenziano che i Social Incubator danno particolare rilevanza alle metriche di impatto e alle attività di consulenza in materia di CSR. Inoltre, sia i Social Incubator che i Mixed Incubator mostrano una marcata attenzione all'educazione imprenditoriale e manageriale. Marconatto et al. (2019) osservano che il processo di incubazione è associato positivamente alla sostenibilità delle Solidarity Economy Organizations[3] (SEOs) in Brasile, e che le realtà incubate presentano una maggiore probabilità di stabilire delle relazioni cooperative, grazie ai network che queste sviluppano stando all'interno dell'incubatore.

[3] Le SEOs sono imprese che operano solitamente nel Terzo Settore e sono create dai membri delle comunità che queste servono, con il fine di contribuire a un mondo più sostenibile (Marconatto et al., 2019).

Obiettivi della ricerca. *La recente letteratura ha esplorato le differenze tra incubatori generalisti e incubatori con una maggiore attenzione all'impatto (Sansone et al., 2020), così come il potenziale delle attività di incubazione nel promuovere la sostenibilità delle imprese (Marconatto et al., 2019). Tuttavia, resta ancora poco esplorato il modo in cui gli incubatori possano supportare le imprese dedite all'impatto a superare le barriere che ostacolano la generazione dello stesso. Pertanto, l'obiettivo di questa ricerca è quello di contribuire al dibattito scientifico sull'impatto sociale, indagando il ruolo che gli incubatori possono avere nel supportare le imprese dedite alla generazione dell'impatto. Nella fattispecie, questo studio cerca di rispondere alla seguente domanda di ricerca: date le barriere alla crescita identificate in letteratura (Davies et al., 2019), gli incubatori e gli acceleratori possono contribuire al superamento delle suddette e alla scalabilità delle imprese dedite all'impatto sociale?*

Metodologia. *Lo studio segue un approccio di ricerca qualitativa, fondato sulla teoria e sull'interpretazione dei dati raccolti da diverse interviste effettuate direttamente agli incubatori italiani, elaborati secondo i principi della Grounded Theory (Glaser e Strauss, 1967). L'utilizzo di questo approccio si rivela vantaggioso in situazioni in cui il fenomeno oggetto di analisi non è completamente compreso prima dell'avvio dello studio. In tali circostanze, e quando l'obiettivo del processo di ricerca include la formulazione di una nuova teoria, l'adozione di un approccio qualitativo risulta essere preferibile (Rubin, Aas e Stead, 2015).*

Nella presente ricerca sono impiegate più fonti di dati, quali articoli scientifici, riviste, informazioni pubblicate in rete, a cui si aggiungono i dati primari ottenuti dalle interviste semi strutturate (Gioia, Corley ed Hamilton, 2013). Questa tipologia di interviste consente di rimanere flessibili e adattarsi al contesto e alle risposte del partecipante, garantendo l'integrità dell'obiettivo della ricerca grazie a un set di domande preimpostate.

Per la costruzione del campione, è stato deciso di circoscrivere l'analisi al solo contesto italiano. La ragione di questa scelta risiede nel fatto che si sono volute limitare le differenze normative, sociali e culturali che potrebbero sussistere se si considerasse un contesto territoriale di ordine superiore. In tal senso, sono selezionati incubatori esclusivamente italiani certificati dal Ministero delle Imprese e del Made in Italy (MIMIT), accedendo direttamente alla banca dati del Registro delle Imprese. Alla popolazione di incubatori così identificata (63 incubatori[4]), è applicato un ulteriore criterio di selezione, che si basa su quanto evidenziato in letteratura. Considerata la domanda di ricerca, si è ritenuto opportuno selezionare solamente gli incubatori che ponessero una particolare attenzione alla creazione di impatto sociale. Pertanto, all'interno della popolazione di 63 incubatori, è stato individuato un campione costituito dai soli social incubators e mixed incubators. La selezione dei suddetti incubatori è il risultato dall'osservazione dei portafogli da loro detenuti e delle dichiarazioni pubblicate sui loro siti ufficiali[5]. In particolare, sono stati selezionati gli incubatori con almeno un'impresa dedita all'impatto in portafoglio, rispettando la definizione di mixed e social incubator[6]. Questa mappatura ha portato a individuare un campione di 18 incubatori interessati alla creazione di impatto sociale, così distribuiti lungo il territorio italiano: 12 localizzati nell'area Nord del territorio italiano; 5 localizzati nell'area Centro; 1 localizzato nell'area Sud e Isole.

I partecipanti sono contattati virtualmente tramite indirizzo mail e/o profilo LinkedIn: a ciascuno di essi è presentato l'argomento e l'obiettivo di ricerca, ed è fornito il set di domande per l'intervista. Il tasso di risposta alla richiesta di partecipazione è finora del 50%, corrispondente a 9 incubatori su 18 totali. Le domande delle interviste sono state realizzate sulla base dei contributi della letteratura e, in particolare, delle tre barriere che ostacolano la crescita delle imprese dedite all'impatto sociale.

L'analisi dei dati ottenuti ha seguito i principi generali della Grounded Theory. In particolare, è stata attuata una procedura di codifica manuale, la quale offre "maggiore controllo e proprietà dell'opera" (Cozzolino, Corbo e Aversa, 2021). Attraverso questa procedura di codifica sono stati generati concetti di primo ordine (fase 1), temi di secondo ordine (fase 2) e dimensioni aggregate (fase 3). Come per ogni studio qualitativo, l'analisi è stata un processo dinamico e iterativo, caratterizzato da continui riferimenti a dati e teoria per convalidare le conclusioni.

***Fase 1: creazione delle categorie di primo ordine**. In questa fase, l'obiettivo è quello di conformarsi rigorosamente ai termini forniti dagli intervistati, il che può portare a ottenere una gamma di categorie di primo ordine molto ampia (Gioia, Corley ed Hamilton, 2013).*

Da un punto di vista procedurale, si è proceduto con l'analisi delle interviste effettuate e del materiale secondario, al fine di individuare i concetti chiave e formulare delle categorie rappresentative. I concetti similari sono stati accorpati per evitare ridondanze.

***Fase 2: creazione dei temi di secondo ordine**. Nella fase 2, il processo si distingue per la ricerca e l'analisi di temi di ordine superiore. Nella fattispecie, si richiede l'individuazione di similitudini e di differenze tra le categorie sopra specificate (Gioia, Corley ed Hamilton, 2013).*

Pertanto, si è proceduto a identificare dei temi di ordine superiore, combinando le categorie di primo ordine in base alle condizioni causali, il fenomeno sottinteso, il contesto e le interazioni.

***Fase 3: creazione delle dimensioni aggregate.** In questa fase dell'operazione di codifica, si richiede di determinare le dimensioni aggregate sottostanti ai temi di secondo ordine.*

---

4 Il dato è aggiornato al 02/02/2024.

5 I siti che sono stati visionati sono quelli che sono stati dichiarati nella sezione speciale del Registro delle Imprese.

6 L'analisi qualitativa dei portafogli e dei siti ufficiali è avvenuta ricercando elementi quali obiettivi espliciti di impatto e metriche di valutazione dell'impatto.

Il processo implica un esame approfondito su più livelli simultanei, che consideri sia i codici impiegati dagli intervistati, sia le teorie e i concetti più astratti che emergono dall'analisi (Gioia, Corley ed Hamilton, 2013). In particolare, si procede all'aggregazione dei temi simili, individuando delle dimensioni di ordine superiore che siano coerenti con le diverse tematiche emerse.

Risultati. *L'analisi dei dati qualitativi ha generato le seguenti dimensioni aggregate: 1) gestione strategica dell'impatto; 2) infrastruttura finanziaria per l'impatto sociale; 3) divulgazione proattiva per l'impatto sociale.*

Per quanto concerne la prima dimensione, la "gestione strategica dell'impatto" rappresenta la soluzione alle barriere basate sui valori, le quali fanno riferimento alle differenze nei valori etici e alla filosofia di crescita. Questa dimensione, infatti, spiega come sia possibile superare un disallineamento nei valori etici all'interno della catena del valore. In questa dimensione aggregata rientrano i seguenti temi di secondo ordine: a) valutazione e decisione; b) comunicazione di valore a monte; c) coinvolgimento attivo del network. Nel caso del tema "valutazione e decisione", il supporto proattivo dei mentori e il monitoraggio delle metriche sono gli elementi caratterizzanti. A tal proposito, il supporto dei mentori è emerso nelle interviste come segue: "Quando le startup cominciano a scalare facciamo un matching con mentori di esperienza". Al contempo, all'interno del "coinvolgimento attivo del network" sono presenti i seguenti temi di secondo ordine: a) networking con gli stakeholder; b) matching diretto. Questi due aspetti sono emersi durante le interviste, come si evince dal seguente codice: "Noi cerchiamo di promuovere quella che è una catena di valore, anche nel rapporto tra fornitori, nelle relazioni con gli stakeholders. Cerchiamo di favorire questo networking andando a individuare le aziende, i fornitori o gli stakeholders più pronti".

Per quanto riguarda la dimensione aggregata "infrastruttura finanziaria per l'impatto sociale", questa rappresenta la soluzione alle barriere basate sul modello di business, le quali fanno riferimento alle difficoltà di accesso ai finanziamenti. Attraverso la dimensione "infrastruttura finanziaria per l'impatto sociale" si spiega come sia possibile facilitare l'accesso alle forme di finanziamento nel caso delle imprese dedite all'impatto. All'interno della suddetta dimensione sono stati identificati i seguenti temi di secondo ordine: a) supporto diretto all'impatto sociale; b) ecosistema di sviluppo imprenditoriale simbiotico. All'interno del tema "supporto diretto all'impatto sociale", l'accompagnamento attraverso servizi di consulenza appositi e il supporto finanziario effettuato direttamente dagli incubatori risultano essere delle voci particolarmente rilevanti, come si evince dal seguente codice: "Cominciamo a confrontarci anche con tematiche di finanziamento. Quindi diamo evidenza dei primi bandi, e li accompagniamo anche nella ricerca di bandi finanziamenti.". Nel caso del tema "ecosistema di sviluppo imprenditoriale simbiotico", le partnership attuate con gli attori esterni sono di importante rilevanza. Dalle interviste emerge quanto segue: "L'incubatore è in contatto con una serie di attori sia privati, ma anche istituzionali (penso a Invitalia, o Cassa Depositi e Prestiti). Attraverso i suoi contatti con investitori istituzionali e non istituzionali (pensiamo anche a dei singoli imprenditori che possono investire in startup), l'incubatore può veicolare il messaggio della startup andando a toccare i punti per i quali gli investitori sono più sensibili".

Infine, la dimensione aggregata "divulgazione proattiva per l'impatto sociale" si identifica come soluzione alle barriere istituzionali, le quali riguardano il comportamento dei consumatori rispetto all'impatto sociale e le norme aziendali tradizionali. Nella fattispecie, attraverso la dimensione "divulgazione proattiva per l'impatto sociale" si spiega come sia possibile educare in maniera attiva al concetto di impatto. All'interno di questa dimensione rientrano i seguenti temi di secondo ordine: a) educazione all'impatto a valle; b) facilitazione dell'interazione istituzionale. Per quanto concerne il tema "educazione all'impatto a valle", sono collocate attività come la divulgazione sui propri canali social delle startup a impatto di successo e le iniziative di "give back" verso attori esterni agli incubatori. Ad esempio, l'attenzione alla divulgazione è riscontrabile dal seguente codice: " Quindi ogni volta che noi veniamo a conoscenza di, per esempio, startup sostenibili o casi di successo, li condividiamo sui nostri canali social con nostre iniziative di comunicazione". Allo stesso tempo, nel tema "facilitazione dell'interazione istituzionale" è di primaria rilevanza il dialogo con gli ambienti burocratici, come si evince dal seguente codice: "Noi siamo proprio un intermediario. Uno dei nostri lavori principali è tradurre il "burocratese" in linguaggio comune. Per cui noi interpretiamo i bandi in modo che siano accessibili a tutti quanti, fornendo anche network con la regione. Conosciamo gli enti regionali, conosciamo direttamente le persone che ci lavorano".

Queste tre soluzioni identificate (gestione strategica dell'impatto, infrastruttura finanziaria per l'impatto sociale e divulgazione proattiva per l'impatto) concorrono a identificare un approccio integrato alle sfide che le imprese dedite all'impatto sociale devono affrontare nel loro percorso di crescita. Attraverso questo studio emerge che gli incubatori e gli acceleratori svolgono un ruolo importante nel fornire supporto manageriale, finanziario e di networking, così come definito in letteratura. Il contributo particolare di questa ricerca risiede però nel fatto che ci si è concentrati maggiormente sui social e sui mixed incubators, i quali possono rendere il percorso di crescita delle imprese dedite all'impatto sociale più fiorente, grazie alla maggiore attenzione che questi istituti ripongono sulla tematica e all'offerta di strumenti specifici per l'impatto.

Limiti della ricerca. *Un primo limite di questo studio è legato alla dimensione campionaria ridotta. In particolare, si prevede che siano necessarie altre interviste per poter raggiungere la saturazione teorica. Queste interviste sono in corso, parallelamente alla stesura di questo paper. Pertanto, le soluzioni ottenute potrebbero subire modifiche future, ma rappresentano, ad oggi, un valido punto di partenza. Considerando le peculiarità degli incubatori all'interno del contesto italiano come legate a caratteristiche territoriali e normative, la generalizzazione dei risultati in altri contesti potrebbe essere limitata.*

Implicazioni manageriali. *I risultati dello studio forniscono indicazioni pratiche sia ai manager degli incubatori/acceleratori, sia ai policymaker, su come strutturare modelli di business efficaci e sostenibili. I dati evidenziano come la presenza di un ecosistema collaborativo possa favorire uno sviluppo economico sostenibile, e come gli incubatori orientati all'impatto possano svolgere un ruolo cruciale nel promuovere tale sviluppo, contribuendo al superamento delle barriere di natura valoriale, finanziaria e istituzionale. Lo studio sottolinea, inoltre, che gli incubatori sociali non possono operare in modo isolato, ma il loro successo dipende dalla capacità di creare connessioni efficaci con stakeholder chiave dell'ecosistema.*

Originalità della ricerca. *Questo studio intende arricchire il dibattito scientifico sull'impatto sociale, esplorando il ruolo degli incubatori e degli acceleratori dediti alla sua generazione. L'attenzione attorno a questi attori, specialmente per quanto concerne la loro capacità di promuovere sia dei modelli di business sostenibili (Marconatto et al. 2019), sia l'imprenditoria dedita all'impatto (Bonfanti et al., 2025; Pandey et al., 2017), è crescente. La precedente letteratura ha evidenziato risultati significativi sulla capacità di queste organizzazioni di promuovere la sostenibilità, la coopetizione e la maggiore partecipazione a network di attori chiave (Marconatto et al., 2020; Nascimento et al., 2021), tuttavia rimane ancor poco esplorato il modo in cui gli incubatori possano aiutare a superare le barriere che ostacolano la generazione dell'impatto. Questo lavoro si propone di colmare questa lacuna, approfondendo il ruolo degli incubatori nella promozione di un ecosistema imprenditoriale orientato all'impatto.*

Parole chiave: *impatto sociale; incubatori sociali; start-up; valore condiviso.*

Stili di leadership e tratti della personalità: strategie per eccellere nelle organizzazioni non-profit

ILENIA CEGLIA[1] NORA ANNESI[2] MASSIMO BATTAGLIA[3]

Abstract

Il manager riveste un ruolo cruciale e di grande responsabilità, influenzando direttamente i risultati aziendali. La sua capacità di prendere decisioni diventa ancora più complessa nel contesto delle organizzazioni non-profit, che devono affrontare sfide finanziarie legate a risorse limitate. In alcuni casi, ciò comporta anche il coinvolgimento volontario degli stessi manager.

L'obiettivo di questa ricerca è comprendere quali combinazioni di tratti della personalità e quali stili di leadership favoriscano un ambiente di lavoro positivo all'interno delle organizzazioni non-profit, contribuendo alla coesione del team e al miglioramento dei risultati finanziari nel tempo.

Lo studio è stato condotto attraverso una ricerca-azione all'interno di un'organizzazione non-profit purpose-driven del terzo settore. I risultati ottenuti hanno avuto un impatto significativo non solo sulla letteratura scientifica, ma anche sulla pratica gestionale. In particolare, sono state elaborate linee guida destinate ai manager delle organizzazioni non-profit, con l'obiettivo di aiutarli a valorizzare le proprie caratteristiche personali e a individuare gli stili di leadership più efficaci per affrontare le sfide del settore.

Framing of the research. *Il successo o il fallimento dell'azienda nel raggiungimento degli obiettivi dipendono soprattutto dal ruolo del manager (Fujianti, 2018; Sitthipongpanich & Polsiri, 2014) e dalle sue capacità. Precedenti ricerche sulle organizzazioni non-profit hanno documentato l'impatto delle decisioni dei manager (Hwang & Powell, 2009) che devono essere in linea con la missione dell'organizzazione (Drucker, 2004). Esistono due forme organizzative principali: organizzazioni non-profit con personale e organizzazioni non-profit basate su volontari (Hwang & Powell, 2009). Le organizzazioni non-profit basate sui volontari si trovano ad affrontare preoccupazioni maggiori relative alla progettazione organizzativa, alle questioni relative alle risorse umane e al mercato del lavoro, tra cui la retribuzione dei lavoratori (Baron, 2004). La sostenibilità finanziaria rappresenta una sfida costante per le organizzazioni non-profit, le quali si trovano spesso a operare in contesti instabili e in un ambiente finanziariamente turbolento (Golensky & Mulder, 2006). Tuttavia, la continuità delle loro attività è fondamentale per poter continuare a generare valore sociale attraverso il perseguimento della propria missione istituzionale (Weerawardena et al., 2010).*

In questo scenario, i tratti della personalità e lo stile di leadership adottato dai manager assumono un'importanza cruciale perché essi modellano la strategia e la cultura organizzativa e devono creare coesione all'interno dell'organizzazione. Poiché il personale delle organizzazioni non-profit è composto in larga parte da volontari, è fondamentale che i leader sappiano valorizzare la visione e i principi ispiratori dell'ente, contribuendo alla coesione interna, al benessere e alla motivazione dei collaboratori. Numerosi studi hanno evidenziato che questi tratti sono stabili nel tempo (McCrae & Costa, 1990), presentano una componente ereditaria significativa (Loehlin, 1992) e hanno importanti implicazioni comportamentali. La personalità di un manager è un fattore cruciale per ottenere successo e per guidare un alto livello di performance lavorativa in ogni organizzazione (Gupta & Gupta, 2020) e può essere vista come un insieme di tratti distintivi che influenzano il suo comportamento, atteggiamento, motivazione e cognizione in situazioni specifiche. Ozer e Benet (2006) sottolineano la personalità di un manager gioca un ruolo cruciale nel modo in cui affronta e risolve problemi complessi. In questo studio sono stati considerati i modelli della personalità quali la Dark Triad e la Light Triad come base teorica per comprendere le dinamiche interpersonali e per comprendere la relazione con i diversi stili di leadership (ad esempio, Kaletta & Reuther, 2021; Paunonen et al., 2006; Sacavém & de Bem Machado, 2023).

Il Dark Triad è un concetto che si riferisce a tre tratti di personalità considerati negativi (ad esempio, Brownell et al. 2021; Hirschfeld & Van Scotter 2018) che sono:

DOI 10.7433/SRECP.SP.2025.01

1) *Narcisismo (Narcissism): Si tratta di una tendenza a essere egocentrici, a cercare costantemente ammirazione e a ritenersi superiori agli altri. Le persone con tratti narcisistici hanno una visione distorta del proprio valore e spesso sono indifferenti alle esigenze altrui (Sacavém & de Bem Machado, 2023).*
2) *Machiavellismo (Machiavellianism): Il machiavellismo si manifesta in una visione cinica del mondo, freddezza emotiva, pragmatismo, manipolazione interpersonale e la ricerca di obiettivi egoistici e utilitaristici (Guillén et al., 2022). I machiavellisti esercitano un controllo coercitivo sugli altri per raggiungere i propri scopi (Hawley, 2003) e sono più propensi a comportamenti non etici (ad esempio, Greenbaum et al., 2017).*
3) *Psicopatia (Psychopathy): Questo tratto è caratterizzato dalla mancanza di empatia, impulsi aggressivi e comportamenti antisociali. Chi mostra tratti psicopatici può essere insensibile ai sentimenti degli altri, impulsivo e disposto a infrangere le regole per ottenere ciò che vuole (Paulhus & Williams, 2002) attraverso la manipolazione. Si mostrano molto sicuri di sé, credono di essere al centro dell'attenzione e disprezzano le opinioni altrui (Sacavém, & de Bem Machado, 2023).*

Infine, la Light Triad (Kaufman, et al., 2019) che ha recentemente ricevuto una considerevole attenzione (ad esempio, Song et al., 2020) è un concetto che descrive tre tratti di personalità positivi e altruisti, come antitesi alla Dark Triad. I tratti della Light Triad sono:

1) *Kantianesimo (Kantianism): Questo tratto di personalità si caratterizza per l'inclinazione a vedere le persone come fini a sé stesse e non come semplici mezzi per raggiungere obiettivi personali (Kaufman et al., 2019). Le persone che incarnano il Kantianesimo sentono il bisogno di rimanere autentiche e si sentono a disagio nel manipolare gli altri (Kaletta & Reuther, 2021).*
2) *Umanesimo (Humanism): Questo tratto implica empatia, rispetto e riconoscimento del valore intrinseco di ogni individuo (Kaufman et al., 2019). Le persone con questa inclinazione tendono a essere felici per i successi altrui e credono che tutti debbano essere trattati con dignità (Cooke, 2020).*
3) *Fede nell'umanità (Faith in Humanity): Chi possiede questa caratteristica crede nella bontà intrinseca delle persone (Kaufman et al., 2019) e ritiene che altri siano onesti e li trattino con giustizia, mostrando una visione ottimistica dell'umanità (Sacavém, & de Bem Machado, 2023).*

In sintesi, i tratti della Light Triad si concentrano sull'empatia, l'altruismo e la positività, promuovendo comportamenti che migliorano le relazioni e la qualità della vita. Invece, i tratti della Dark Triad, pur essendo associati a manipolazione, egocentrismo e scarsa empatia, possono risultare vantaggiosi in alcuni contesti, come nelle posizioni di potere (Brownell et al. 2021; Volmer et al. 2016) poiché è stato dimostrato che tali personalità possiedono competenze essenziali di leadership (Ames et al., 2006; Paunonen et al., 2006). La comprensione dei tratti di personalità dei leader è importante per capire come si rapportano con gli altri e se il loro comportamento può influenzare il comportamento altrui.

Diversi studi in letteratura hanno documentato che le caratteristiche personali del manager influenzano lo stile decisionale del manager (Campbell et al., 2011; Ben Fatma et al., 2013), che, secondo Hersey et al., (2001), può essere suddiviso in 4 categorie:

1- *Delegating, in cui i dirigenti affidano la responsabilità della decisione e dell'attuazione ai loro collaboratori senza un'attenta supervisione;*
2- *Participating, in cui i dirigenti condividono le idee e facilitano la partecipazione al processo decisionale;*
3- *Selling, in cui i dirigenti danno istruzioni specifiche e danno indicazioni chiare su come sono state prese le loro decisioni;*
4- *Telling, in cui i dirigenti danno istruzioni specifiche e monitorano attentamente le prestazioni.*

Lo stile di leadership rappresenta un insieme di comportamenti e caratteristiche attraverso cui il leader influenza e motiva i collaboratori al fine di raggiungere gli obiettivi organizzativi (Hackim et al., 2021). Questi stili non sono rigidi, ma devono essere adattati alle specifiche esigenze del gruppo e al contesto in continua evoluzione. Un leader efficace è in grado di modulare il proprio approccio, passando con agilità tra diversi stili (Almansour, 2012).

Purpose of the paper. *Nelle organizzazioni non-profit il ruolo del manager è ancora più impegnativo perché devono affrontare sfide maggiori legate alla sostenibilità economica in un ambiente instabile (Golensky & Mulder, 2006), oltre a gestire e motivare un personale che è spesso composto da volontari.*

Numerosi studi hanno esplorato il legame tra tratti della personalità e stili di leadership, cercando di individuare quali caratteristiche siano associate a una leadership efficace (Furnham, 2008). Sebbene in letteratura siano presenti alcuni contributi sul tema della leadership nelle organizzazioni non-profit (es. Agard, 2011), esiste ancora un gap significativo per quanto riguarda l'analisi dei tratti di personalità dei manager in relazione agli stili di leadership e ai risultati economici nel tempo, in particolare nel contesto del terzo settore (Cesinger, 2022).

L'obiettivo del presente studio è colmare questa lacuna, analizzando quali combinazioni di tratti della personalità e stili di leadership si siano dimostrate più efficaci anche in termini economici all'interno di una organizzazione non-profit. L'intento è comprendere quali caratteristiche personali e approcci gestionali abbiano contribuito a generare

performance economiche positive, pur operando in un contesto caratterizzato da risorse limitate e personale volontario. Pertanto, la nostra domanda di ricerca è:

RQ: Quali tratti della personalità e stili di leadership hanno contribuito a ottenere i migliori risultati economici nel tempo all'interno di una organizzazione non-profit?

Methodology. *Il metodo utilizzato è quello della ricerca azione che unisce teoria e pratica attraverso il cambiamento e la riflessione in una situazione problematica immediata (Avison et al., 1999). Questo metodo non si limita a promuovere il cambiamento, ma si propone anche di generare conoscenza in relazione a tale trasformazione (Lewin, 1947). Questo approccio implica un coinvolgimento attivo con l'azienda e si articola in un processo iterativo che comprende l'analisi del problema, l'intervento attivo e l'apprendimento riflessivo contribuendo anche allo sviluppo della conoscenza scientifica (Coughlan & Coghlan, 2002). La ricerca è stata svolta in un'organizzazione italiana non-profit del terzo settore che ha manifestato la necessità di avviare una riflessione sulle caratteristiche personali e sugli stili di leadership più efficaci adottati dai loro dirigenti (che svolge il ruolo di presidente del comitato), che svolgono volontariamente tale ruolo. Questa esigenza è nata a seguito di criticità emerse non solo in relazione ai risultati economici, ma anche a tensioni interne ai comitati e alle difficoltà nel rinnovamento delle cariche che si articolano in mandati dalla durata di 4 anni. La natura non-profit dell'organizzazione dovrebbe differire dalle realtà profit solo per finalità e principi e non per efficienza e livello di responsabilità e competenza delle funzioni apicali presenti.*

L'ente non-profit è un'organizzazione purpose-driven, che opera con un forte impegno sociale nel settore sportivo, con l'obiettivo di creare un impatto positivo e duraturo a livello comunitario. Il suo scopo va oltre la mera pratica sportiva, mirando a promuovere il benessere e la salute dei cittadini, la tutela dei beni comuni, la sostenibilità ambientale e la diffusione di principi fondamentali come la dignità umana, la non violenza, la solidarietà, la pace e l'interculturalità.

L'organizzazione è presente su tutto il territorio nazionale ed è strutturata in comitati territoriali, i quali fanno riferimento ai rispettivi comitati regionali. In particolare, un comitato regionale ha richiesto il nostro supporto per affrontare criticità emerse in sei comitati territoriali.

Lo studio è stato articolato in tre fasi, descritte di seguito.

- *Fase 1: Analisi delle dinamiche organizzative*

Nella prima fase, sono state condotte interviste semi-strutturate con i membri del comitato regionale e dei comitati territoriali. L'obiettivo era ricostruire le dinamiche organizzative e individuare i tratti distintivi della personalità dei presidenti in carica nell'ultimo mandato. Per ottenere un quadro chiaro e completo, le interviste non includevano domande dirette sui tratti della personalità, ma affrontavano temi legati alla storia del comitato, alla sua gestione attuale e all'andamento del bilancio nel tempo. Nella Tab.1 vengono descritte le informazioni riguardanti gli intervistati che rappresentavano i vari comitati.

Tab. 1: Informazioni riguardante le interviste

Intervista	***Ruolo degli intervistati***	***Territorio di afferenza***
1	*Presidente, segretario e consigliere*	*Comitato territoriale A*
2	*Presidente*	*Comitato territoriale B*
3	*Presidente, vicepresidente e segretario*	*Comitato regionale*
4	*Presidente, vicepresidente, consigliere e 3 membri del comitato*	*Comitato territoriale C*
5	*Segretario e consigliere*	*Comitato territoriale D*
6	*Presidente e segretario*	*Comitato territoriale E*
7	*Presidente e segretario*	*Comitato territoriale F*

Fonte: elaborazione degli autori

Sono state realizzate le interviste per un totale di 415 minuti. Le interviste sono state condotte in presenza da due ricercatrici e sono state registrate e trascritte per essere analizzate.

- *Fase 2 - Rilevazione percezioni degli stili di leadership*

Nella seconda fase, è stato somministrato un questionario a tutti i membri dei comitati, chiedendo loro di descrivere quale stile di leadership, a loro avviso, fosse stato adottato dal presidente durante l'ultimo mandato. La compilazione del questionario è avvenuta in forma anonima e ha richiesto solo pochi minuti. Sono state ricevute 35 risposte in totale.

- *Fase 3 - Analisi e definizione delle linee guida*

Infine, l'ultima fase ha riguardato l'analisi dei risultati e la definizione di linee guida volte a supportare i comitati nel rafforzare il ruolo del manager, valorizzandone le caratteristiche personali e affinando lo stile di leadership. L'obiettivo non era solo il miglioramento delle performance economiche, ma anche la creazione di un ambiente di lavoro coeso, collaborativo e pienamente in linea con i valori fondamentali dell'organizzazione non-profit.

Results. *Attraverso le tre fasi di analisi sono stati individuati gli andamenti dei bilanci, gli stili di leadership adottati e le caratteristiche personali del presidente nell'ultimo mandato.*

Di seguito, proponiamo una tabella a doppia entrata che illustra gli stili di leadership di ciascun comitato, disposti nelle righe (Delegating, Participating, Telling e Selling), e i tratti della personalità nelle colonne (Dark e Light Triad). I comitati, inseriti in corrispondenza dello stile di leadership adottato nell'ultimo mandato, sono colorati in verde se le loro performance finanziarie sono state eccellenti negli ultimi anni, in arancione se sono state discrete e in rosso se sono state in perdita. All'interno della matrice sono riportate le citazioni degli intervistati relative al presidente in carica, con evidenze dei tratti della personalità riscontrati.

Nel caso del comitato A, caratterizzato dallo stile di leadership Delegating, vengono descritti non solo i tratti della personalità dell'attuale presidente, ma anche quelli delle persone che, pur non ricoprendo formalmente il ruolo di presidente, prendono in pratica le decisioni, poiché, nei fatti, il potere è esercitato da altri.

Tab. 3: Stili di leadership e tratti della personalità

Stili di leadership		**Delegating**	**Participating**			**Telling**	**Selling**	
Tratti della	**Comitati e andamento dei bilanci**	**Comitato territoriale A**	**Comitato territoriale B**	**Comitato regionale**	**Comitato territoriale C**	**Comitato territoriale F**	**Comitato territoriale D**	**Comitato territoriale E**
Dark Triad	**Narcisismo**	Tratto della personalità riferito ai membri del comitato che effettivamente prendono decisioni al posto del presidente: *"Nel corso del tempo il Comitato è stato modellato su misura, di quelle persone che ci sono da tempo. Ci sono delle cose che sono sempre state fatte così e non si possono cambiare. Se viene tolto il tassellino crolla la piramide".*	*"Ho riorganizzato tutto il Comitato di tasca mia […] Se devi criticare o modificare qualcosa, devi farlo dall'interno, mai dall'esterno".*					*"Io dico che bisogna tenersi anche le persone mature perché io lavoro […] Abbiamo provato a fare partnership con le scuole ma c'è povertà di cultura, non so se sia un mio pregiudizio".*
	Machiavellismo	Tratto della personalità riferito ai membri del comitato che effettivamente prendono decisioni al posto del presidente: *"Le mie idee sono andate un po' in fumo perché non ho avuto la libertà di esercitare il potere di presidente in maniera consona perché c'erano altre persone con personalità più forti e con una presenza storica all'interno del comitato".*						
	Psicopatia	Tratto della personalità riferito ai membri del comitato che effettivamente prendono decisioni al posto del presidente: *"Il Comitato funziona solo così ed è destinato a finire perché non si possono fare cambiamenti e per andare avanti, vengono sfruttate tutte le risorse che arrivano".*						
Light Triad	**Kantianesimo**	*"Sento di non avere esercitato il potere di presidente perché di fatto mi sono appoggiato tantissimo sugli altri membri della Giunta e del Consiglio".*	*"Il mio compito è stato quello di formare e far conoscere tutti gli ambiti istituzionali dell'organizzazione".*	*"Abbiamo promosso tante attività per far partecipare le persone".*	*"Il presidente è stato poco presente e ci ha lasciato massima libertà perché c'è fiducia sul modo di lavorare".*	*"Abbiamo un Consiglio che funge anche da Giunta e c'è partecipazione di tutti i componenti […] Abbiamo ricostruito l'intero Comitato".*	*"Il presidente si ricandiderà con l'appoggio della segreteria che fa tutto […] non è molto presente perché questo non è il suo principale lavoro".*	*"Noi le Giunte le facciamo seriamente, spieghiamo tutto e parliamo delle decisioni".*
	Umanesimo	*"Le persone che sono nel Comitato mi stanno a cuore […] C'era una sensibilità e una coincidenza di valori ed etica".*	*"Se dobbiamo prendere qualsiasi decisione ci sentiamo con tutti i membri della Giunta. Non è il mio parere quello che detta legge".*	*"Serve una cultura sociale e partecipativa […] Io credo nei valori dell'organizzazione".*	*"Il nostro punto di forza è la coesione del gruppo che interviene e supporta nel momento in cui c'è bisogno".*	*"Io sono molto presente anche con i membri del Comitato, li seguo, li sprono, perché non sempre le cose a livello associativo sono automatiche".*		*"Sono una mediatrice. Alcuni dirigenti non sono al servizio dell'associazione e bisogna ribaltare questa logica".*
	Fiducia nell'umano	*"Siamo veramente appassionati. Non soltanto al lato pratico ma anche a quello umano".*		*"Servono le capacità di lavorare in gruppo e di collaborare con tutte le persone […] La difficoltà delle associazioni è quella di motivare le persone per dare un senso di utilità al volontariato".*	*"Tutto nasce da un legame che si crea tra le persone […] è importante che le persone sviluppino la propria predisposizione e il proprio spazio […] lavorare con passione e credere in quello che si fa per costruire il gruppo".*	*"C'era anche un rapporto umano non indifferente".*		*"Li abbiamo aiutati molto. Abbiamo anticipato dei soldi […] Nel nostro comitato riusciamo ad assicurare tutti i volontari, cosa che non succede sempre".*

Source: Elaborazione degli autori

L'analisi ha evidenziato che gli stili di leadership fondati sulla partecipazione attiva e sul coinvolgimento del team si sono dimostrati, nel tempo, i più efficaci in termini di performance. Tali approcci hanno stimolato una maggiore proattività tra i membri dei comitati, contribuendo a un clima collaborativo e orientato agli obiettivi comuni.

È emerso, inoltre, che i tratti della personalità rivestono un ruolo cruciale nell'andamento complessivo del comitato. Le decisioni dei dirigenti influenzano non solo i risultati economici, ma anche la motivazione, il senso di appartenenza e il coinvolgimento dell'intero gruppo di lavoro. In particolare, i tratti della Dark Triad sono stati associati a performance peggiori: atteggiamenti egocentrici, manipolativi e privi di empatia hanno avuto un impatto negativo sulle dinamiche relazionali all'interno dei team. Questo effetto risulta ancora più marcato nel contesto dell'organizzazione analizzata: un ente non-profit la cui missione si fonda su valori quali partecipazione, condivisione e inclusività. In tale cornice valoriale, comportamenti narcisistici e manipolativi si rivelano chiaramente disallineati e controproducenti.

Inoltre, è stato osservato che la combinazione tra i tratti della Dark Triad e uno stile di leadership di tipo "delegating" - che lascia ampi margini di autonomia ai collaboratori senza un'adeguata supervisione - ha favorito la prevalenza di personalità egocentriche e manipolative, con conseguenti ricadute negative sulla coesione del team e sulle performance finanziarie nel medio-lungo periodo.

È tuttavia importante sottolineare che risultati economici negativi o mediocri non possono essere ricondotti esclusivamente alle caratteristiche individuali del dirigente: anche scelte strategiche non adeguate o fattori esterni, come cambiamenti normativi o crisi settoriali, possono influire significativamente sull'andamento complessivo dell'organizzazione.

Secondo la letteratura, ogni individuo presenta sia tratti luminosi che oscuri della personalità (Kaufman et al., 2019). Ciò che distingue un leader efficace è la capacità di adattarsi rapidamente ai cambiamenti, affrontandoli con consapevolezza. Per sviluppare questa competenza, è essenziale un percorso di formazione continua volto a rafforzare le abilità necessarie alla guida in contesti complessi (Kaletta & Reuther, 2021). Un manager efficace sa accompagnare l'evoluzione di team e organizzazioni, promuovendo valori condivisi e un clima collaborativo. In questo contesto, la leadership "agile" - flessibile, adattabile e orientata alla cooperazione - si lega ai tratti della Light Triad, tra cui empatia, trasparenza e relazioni positive, ritenuti fondamentali per il successo organizzativo (Kaletta & Reuther, 2021) in particolare nelle realtà non-profit, fondate su principi di condivisione, uguaglianza. Migliorare i tratti della personalità e gli stili di leadership dei manager richiede un approccio integrato, sviluppato e condiviso insieme ai comitati dell'organizzazione non-profit. L'obiettivo è rafforzare la connessione tra personalità e leadership, promuovendo non solo una maggiore coesione del team, ma anche un miglioramento sostenibile dei risultati finanziari nel tempo.

I punti chiave delle linee guida condivise includono:

1) *Sviluppo dell'autoconsapevolezza, affinché i manager possano adattare il proprio comportamento in base alle situazioni.*
2) *Coaching e mentoring, per favorire la crescita delle competenze e lo sviluppo di uno stile di leadership più flessibile possibile.*
3) *Formazione specifica su comunicazione efficace, gestione dei conflitti e adattabilità dello stile di leadership, aspetti essenziali per operare con successo in contesti dinamici e complessi come quelli delle organizzazioni non-profit.*
4) *Ricezione di feedback continui da parte dei collaboratori, per migliorare l'efficacia della leadership e promuovere l'apprendimento esperienziale dei dirigenti.*

I punti chiave dopo essere stati discussi con i comitati sono stati poi integrati negli obiettivi del nuovo mandato. La loro attuazione è avvenuta sotto la supervisione delle due ricercatrici, incaricate di monitorare nel tempo le azioni intraprese e di valutare l'efficacia dei progressi e dei miglioramenti raggiunti. Questa strategia potrà essere implementata da tutte le organizzazioni non-profit per rafforzare la propria leadership e ottenere risultati più solidi e sostenibili nel tempo.

Research limitations. *Sebbene questa ricerca offra spunti significativi e contribuisca ad ampliare la conoscenza sul ruolo del manager all'interno delle organizzazioni non-profit, è fondamentale riconoscerne alcune limitazioni, al fine di delineare possibili direzioni per futuri sviluppi.*

Una prima limitazione riguarda l'ambito dello studio, circoscritto all'analisi di un singolo caso. Sebbene il caso selezionato abbia consentito un'analisi approfondita e dettagliata, la generalizzabilità dei risultati risulta limitata. L'estensione della ricerca a un campione più ampio permetterebbe di ottenere una visione più completa e comparativa del fenomeno.

Inoltre, la realizzazione di uno studio longitudinale consentirebbe di valutare con maggiore accuratezza l'impatto delle soluzioni proposte, non solo in termini di performance immediate, ma anche rispetto alla loro sostenibilità nel lungo periodo. Questo tipo di approccio permetterebbe di monitorare l'evoluzione dei comportamenti manageriali, la stabilità degli stili di leadership adottati e la loro influenza sul clima organizzativo e sui risultati economici nel tempo.

Managerial implications. *Questa ricerca ha offerto importanti contributi sia teorici che manageriali.*

Dal punto di vista teorico, lo studio ha arricchito la letteratura esistente esplorando i tratti di personalità in relazione agli stili di leadership e ai risultati economici di un'organizzazione non-profit. Negli ultimi quindici anni, la ricerca si è concentrata principalmente sui tratti oscuri della personalità (Kaufman et al., 2019; Moshagen et al., 2018), trascurando quelli positivi, creando una lacuna nella comprensione integrata dei tratti della personalità (Kaufman et al., 2019). La

nostra analisi ha contribuito a colmare questo gap, confermando, in linea con studi precedenti (Mathieu et al., 2014) che i tratti della Dark Triad influenzano negativamente le dinamiche relazionali e le performance complessive. Inoltre, lo studio ha esaminato come i tratti luminosi e oscuri influenzino i team e le performance organizzative, proponendo una tabella a doppia entrata utile anche per future ricerche sulle relazioni tra leadership, tratti di personalità e performance economico-finanziarie.

Dal punto di vista manageriale, le soluzioni proposte offrono uno strumento pratico per formare manager consapevoli e preparati, in grado di affrontare con efficacia situazioni complesse e di migliorare le performance nel lungo periodo. Sebbene sviluppati in un caso specifico, queste osservazioni sono applicabili anche ad altri enti non-profit, che si trovano a fronteggiare sfide sempre più complesse, come la sostenibilità economica delle loro attività.

Originality of the paper. *L'originalità dell'articolo emerge da diversi elementi innovativi. In particolare, l'integrazione dei tratti della personalità nei modelli di leadership e performance finanziaria costituisce un contributo teorico rilevante. L'articolo esplora infatti le possibili interazioni tra vari tratti della personalità, gli stili di leadership e i risultati economici a lungo termine all'interno di un'organizzazione non-profit. Questo approccio si distingue dalla letteratura esistente, che tende a focalizzarsi su singoli tratti o dimensioni, trascurando la complessità delle loro interazioni. Inoltre, l'articolo colma un importante gap nella ricerca empirica esistente, in particolare riguardo alla mancanza di studi che esplorano sia i lati chiari che oscuri dei comportamenti dei manager nelle organizzazioni non-profit. L'approfondimento sugli effetti dannosi delle Dark Triad sui team arricchisce la letteratura con nuove evidenze empiriche.*

Key words: *organizzazioni non-profit; stili di leadership; tratti della personalità; performance; ricerca-azione*

Redefining business for a sustainable future: firm transformation through a purpose-driven logic

MARIA CRISTINA DARDANO[1] MONIA MELIA[2]

Abstract

Purpose-driven businesses are increasingly recognized as emerging models capable of addressing contemporary social and environmental challenges while maintaining economic performance.

This study explores the transformation of traditional firms into purpose-driven organizations, focusing on the Italian company Bionike. Using a qualitative case study approach, the research investigates how corporate purpose can be integrated into a firm's strategic orientation and business model. The findings reveal a multidimensional transformation process, grounded in internal identity and shaped by interactions with the broader stakeholder ecosystem. This study contributes to the literature on purpose-driven transformation by identifying key alignments, such as the integration of strategy and business model, and the essential role of ecosystem-driven purpose alignment. In doing so, it offers both theoretical insights and practical guidance for organizations seeking to foster sustainable and responsible business transformation.

Framing of the research. *The evolving role of business in society has gained increasing attention within both academic and managerial domains. Firms are no longer perceived as economic entities focused on profit maximization, but as influential actors capable of addressing complex social and environmental challenges. This shift calls for the integration of sustainability into the core of organizational strategies, processes and value creation mechanisms (Carballo, 2023; Lyon et al., 2024; Jimenez et al., 2021; Shakeel et al., 2020; Geissdoerfer et al., 2020; Geissdoerfer et al., 2023).*

One of the most recent developments within this evolving landscape is the emergence of purpose-driven businesses (PDBs). Despite their growing relevance in practice, the academic understanding of PDBs remains conceptually underdeveloped, with limited theoretical consolidation (Lyon et al., 2021; Henderson, 2021; George et al., 2023). PDBs are firms that pursue multidimensional value creation by embedding social and environmental goals alongside financial objectives. They don't merely comply with external demands but proactively seek to generate positive societal impact, positioning moral and ethical considerations at the core of their strategic orientation (Lyon et al., 2024; Gionfriddo et al., 2024; Rey et al., 2019). PDBs are socially oriented organizations that inspire others by promoting sustainability and adopting management practices centered on human dignity, which are integral to their operations (Gionfriddo et al., 2021).

Such firms often act as institutional entrepreneurs by promoting systemic change across industries and advocating for policy frameworks that enhance social and environmental well-being (Henderson, 2021; Lyon et al., 2024). Becoming a PDB requires more than formulating a purpose statement; it entails the diffusion of purpose throughout the organizational structure, aligning decision-making processes, resource allocation, and employee engagement around a common mission (Gartenberg, 2022; George et al., 2023). PDBs typically adopt a shared value logic, aiming to simultaneously deliver economic, social, and environmental returns. Some are founded with an explicit purpose orientation ("profit for purpose"), while others progressively integrate it into their existing business model ("profit with purpose") (Gionfriddo et al., 2024). Transitioning toward a purpose-driven model often involves a profound transformation. This includes redefining corporate identity, reconfiguring governance and operational structures, and adopting new business models that integrate responsibility and sustainability as core design principles (Lyon et al., 2024; Carballo, 2023; Henderson, 2021; Rey et al., 2019). As Sebhatu and Enquist (2022) argue, such transformations are not merely reactive but represent strategic choices aimed at long-term societal relevance and organizational resilience.

Transformation demands collaborative engagement with a broad set of stakeholders, including governments, civil society and industry peers, and requires investments in capabilities that enable systemic innovation (Loorbach & Wijsman, 2013; Müller & Pfleger, 2014). Within this context, the concept of Creating Shared Value (CSV) offers a critical lens through which companies can reconceptualize their role, aligning business success with the generation of mutual benefit for both the firm and society (Porter & Kramer, 2019).

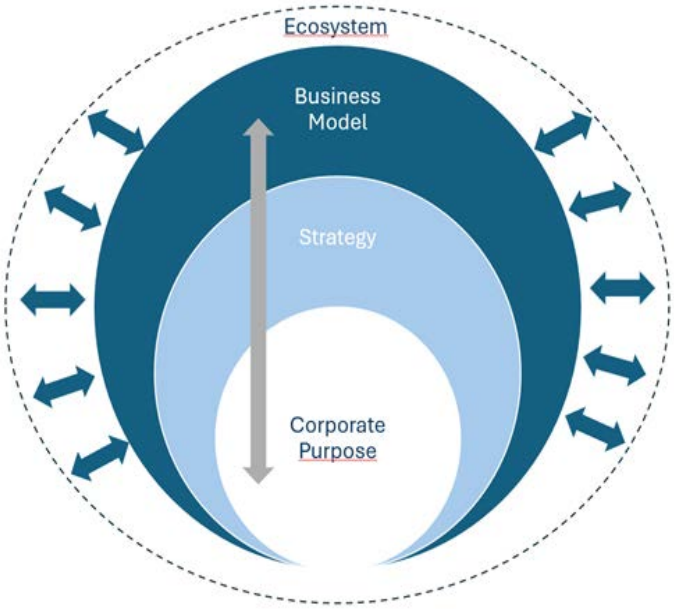
Theoretical Framework. *This study introduces a theoretical framework that considers purpose as a strategic catalyst, as the organization's core reason for existence and as a guiding principle for long-term value creation. It is a theoretical synthesis grounded in the literature on purpose-driven businesses and business transformation towards them.*



Literature points out as authentic purpose emerges from the organization's cultural, historical and identity-based foundations, while also reflecting its role within society (Jimenez et al., 2021; Lyon et al., 2024; Von Ahsen & Gauch, 2022; Rey et al., 2019; Waddock, 2020). Rather than representing a static objective, purpose is conceptualized as a dynamic construct, which continuously requires aligning of firm's values, vision, strategy and performance indicators (Jimenez et al., 2021; Rey et al., 2019). Effective implementation requires conceptual clarity, strategic integration and organizational alignment across all levels (Gartenberg, 2022; Rey et al., 2019). Embedding purpose within the business model is crucial to ensuring coherence between aspirational narratives and operational realities, thereby mitigating the risk of "purpose-washing" (Sebhatu & Enquist, 2022; Rey et al., 2019).

Moreover, purpose orientation influences core components of the business model, including the value proposition, mechanisms of value creation and systems of value delivery. A purpose-aligned value proposition typically encompasses offerings that contribute to customers' economic and social well-being, while fostering consumer engagement in co-creating sustainable and responsible outcomes (Kropfeld & Reichel, 2024; Osterwalder & Pigneur, 2011; Ernst et al., 2023).

Strategic alignment of business models with purpose reshapes internal operations, reconfigures value chains, and transforms organizational structures to reflect broader commitments to social and environmental responsibility (Shakeel et al., 2020). This shift entails a redefinition of corporate value creation logics, expanding beyond economic performance to incorporate societal and ecological outcomes. Key levers of this transition include the design of the value proposition, allocation of business resources, operational processes and profit formulas. Purpose-driven business model transformation enables stronger customer relationships, fosters sustainable consumption patterns, and enhances long-term organizational resilience and legitimacy of firm (Osterwalder & Pigneur, 2011; Kropfeld & Reichel, 2024; Ernst et al., 2023).

The framework further emphasizes the role of the stakeholder ecosystem in shaping purpose implementation. Purpose is not solely an internal construct; rather, it is co-created through interaction with a broad network of internal and external stakeholders. This process-based view highlights the importance of dialogic engagement, reciprocity and mutual influence in defining corporate identity and stakeholder expectations (Rey et al., 2019; Sebhatu & Enquist, 2022).

Accordingly, corporate purpose should emerge through iterative co-creation rather than hierarchical imposition. This approach enhances stakeholder trust, facilitates the alignment between strategic intent and stakeholder interests and reduces the likelihood of symbolic adoption. The stakeholder ecosystem may function as either an enabler or a constraint in the organizational shift toward a purpose-driven paradigm, underscoring the interdependent nature of transformation processes in contemporary business systems.

Source: Our elaboration

Purpose of the paper. *Despite the growing interest in the transformation of firms into PDBs, existing research has primarily focused on firms that were purpose-oriented from inception, typically exhibiting dual purpose of financial viability and societal impact (Carballo, 2023). As a result, less attention has been given to traditional firms undergoing transformation toward purpose-driven models or to those that operate with a strong sense of purpose without formally identifying as such. Moreover, while entities such as B-Corps, social enterprises and other hybrid organizations are*

frequently labeled as purpose-driven, the conceptual boundaries of their identity remain insufficiently defined and analytically underexplored (Lyon et al., 2024).

This study seeks to fill this gap by identifying the key drivers that enable and shape the transformation of firms into purpose-driven companies. Accordingly, it aims to analyze the integration of purpose into a firm's strategy and business model and how the broader ecosystem, particularly the stakeholder environment, can act as a catalyst in supporting and fostering the adoption of a purpose-driven approach.

Methodology. *Given the lack of specific literature on the transformation of firms according to a purpose-driven approach, an inductive research design has been chosen, focusing on the qualitative analysis of a single case study (Yin, 2009). The case study approach is particularly suitable for this research for the novelty of the topic (Yin, 2009) and the exploratory nature of the research, which aims to understand a contemporary phenomena in its real context (Eisenhardt, 1989). It allows the collection of rich, in-depth data from multiple sources (Blasco-Arcas et al., 2020) and follows a holistic research design (Halinen & Törnroos, 2005).*

The selected case is Bionike, chosen for three main reasons. First, Bionike is a long-established company that was founded in 1960 and has always focused on individual well-being. In recent years, this focus has evolved and intensified, so that the company is clearly on its way to becoming a purpose-driven business. Second, the case offers a high potential for detection, as the transformation process under investigation is "transparently observable" (Eisenhardt, 1989). Third, Bionike actively supported the research process by participating in in-depth problem-centred interview. BioNike is a leading brand in the dermocosmetic market belonging to the Sodalis Group, an independent European company engaged in the personal care, health, and beauty industries. The Group is guided by a strategic commitment to sustainability and people-centered value creation.

Data collection was developed in two research phases and is currently still ongoing. The first phase, carried out between October 2024 and February 2025, focused on the collection of secondary data to investigate and contextualize Bionike's ongoing transformation into a purpose-driven company. Specific attention was paid to how the firm has been reinforcing its long-standing commitment to sustainability. The data sources included online documents, sustainability reports, news articles, and publicly available content from the company's website.

The second phase, which began in February 2025 and is currently in progress, involves the collection of primary data through a series of planned semi-structured interviews with Bionike's ESG Manager, Dr. Federica Brunetti. The interview, which lasted approximately one hour, was audio-recorded, transcribed verbatim and subsequently analyzed and coded according to the theoretical framework outlined above.

Given that the research is still underway, this paper presents preliminary reflections and early insights based on the current stage of the study. Results and a more comprehensive analysis will be developed and integrated as the research progresses.

Results. *The study's findings are structured according to our theoretical framework.*

Purpose-Driven Strategic Alignment - *Corporate purpose is deeply embedded in the firm's strategy core elements (mission, vision, values and goals) and fully integrated into its business model. Purpose represents the fundamental reason for a company's existence, expanding beyond economic value creation to incorporate social and environmental impact. For Bionike, corporate purpose represents the key driver for its transformation towards a purpose-driven business model. Its mission is to deliver high-performance products and high-quality dermocosmetics while maintaining a strong commitment to innovation and sustainability. Rather than undergoing a fundamental redefinition, this purpose has evolved to explicitly incorporate social and environmental value creation, as sustainability has always been an integral part of Bionike's identity. Since 2023, the company has formally structured and implemented this long-standing commitment.*

"Bionike's commitment to sustainability has been deeply rooted in its corporate values for years, but it has become more concrete in recent times. The year 2023 marked a pivotal moment when this commitment was translated into action through targeted initiatives and the development of a three-year ESG action plan. This process began with a comprehensive assessment of ESG-related issues, conducted across all companies within the Sodalis Group.

Supporting communities, promoting art, and prioritizing people's well-being have always been core values for Bionike. Over time, these priorities, particularly environmental concerns, have gained even greater significance as awareness of the urgent need for action, such as combating climate change, has grown. Addressing these challenges is essential to driving meaningful change.

Even before formalizing its ESG strategy, Bionike was already taking steps in this direction-tackling the issue of microplastics and advancing eco-packaging solutions, with a focus on recycled rather than merely recyclable materials. While sustainability had long been an integral part of Bionike's approach, 2023 marked a decisive shift: the company formally committed to a structured and proactive sustainability strategy, taking concrete action to make a lasting impact."
Federica Brunetti, ESG Manager Bionike.

BioNike has been dermatological experience and scientific innovation, committed to guaranteeing high-performance, high dermo-affinity products for the wellbeing of even the most sensitive skin. The company's values include science and

innovation, bellessere (a concept that merges well-being and beauty), quality and safety, inclusion and social responsibility, ethics and transparency, and a strong commitment to sustainability. Its vision is to establish the science of bellessere, integrating dermatological innovation and scientific research to promote both well-being and beauty. Bionike embodies a broader commitment to life itself-dedicated not only to skin health but also to the well-being of people and the environment in which we live.

"The Bionike's purpose has not changed. The mission is always the same. This commitment to the environment, people and social issues has certainly been reinforced. Bionike was born with the mission of caring for the most sensitive skin. This commitment to environmental, social and governance sustainability has been implemented and formalized over the last few years. The name Bionike originates from the Greek words Bio (life) and Nike (victory), symbolizing the "victory of life." Embracing this etymology, we have committed to taking concrete action for both skin health and the world we live in. We understand that our business cannot exist independently of environmental responsibility, respect for future generations and the well-being of our employees. Our conception of sustainability is crucial, as it extends beyond environmental considerations to encompass a comprehensive, 360-degree approach. This entails integrating corporate strategies with sustainability principles, ensuring that sustainability issues take a decisive and central role, driving all business decisions and strategic directions."

Federica Brunetti, ESG Manager.

Bionike has always maintained a strong social focus within its corporate purpose. The company is committed to enhancing employee welfare and well-being by investing in work-life balance, diversity and inclusion, as well as professional development and training. Moreover, Bionike actively supports the broader community by funding research projects, assisting vulnerable people, and providing financial aid to social initiatives.

"For Bionike, well-being also means the well-being of individuals within the socio-cultural context they belong to. This is why we are deeply engaged in our social environment. We believe that personal well-being cannot be separated from the social and environmental context in which individuals live. Our commitment extends to corporate welfare initiatives aimed at promoting work-life balance for our employees, as well as ongoing support for local communities and associations. Our approach ensures that value is shared within the community. Bionike is highly committed to social issues within the community and the broader context in which it operates. The company frequently makes donations to hospitals and provides a significant number of products. The financial statements explicitly detail the monetary value of these contributions to healthcare institutions. During the COVID-19 pandemic we provided extensive product donations and financial support. We supplied hospitals with essential items such as hand sanitizers and creams for healthcare workers, who endured long hours wearing gloves. We support centers that provide assistance to women who are victims of violence, as well as those that accommodate mothers and children facing difficult circumstances. We also prioritize initiatives that promote positive social impact. This year, we actively foster female talent within our team, where women make up 75% of Bionike's workforce.We support centers that assist women who are victims of violence rather than those that provide aid to mothers and children in difficult situations. Our commitment to sustainability extends across all areas of our operations."

Federica Brunetti, ESG Manager

Purpose-Driven Business Model Alignment - *The purpose-driven business model transformation enables firms to strengthen their social, ethical and environmental bias. Moreover, it reinforces sustainable competitive advantage and resilience by aligning profit generation with broader societal and environmental goals.*

After formalizing its commitment to sustainability, Bionike has mainly undergone a transformation in some key dimensions of the Business Model, that is value proposition, activities, resources and partnerships. The company's value proposition is based on four core pillars: dermatological expertise and scientific innovation, high performance while respecting sensitive skin, Italian manufacturing with cutting-edge technologies, and a strong focus on sustainable formulations and packaging. Bionike is integrating sustainability into its supply chain by revising its key activities and resource management. In procurement, the company prioritizes sustainable raw materials and collaborates with suppliers to ensure the responsible sourcing of ingredients. It has also developed more sustainable formulations by reducing the use of microplastics and conducting biodegradability tests on rinse-off products to minimize environmental impact. To enhance operational efficiency and reduce waste, Bionike aligns production with sales network demand, optimizes stock levels, and prioritizes local suppliers to minimize environmental impact and transport costs. Furthermore, it seeks to reduce the environmental footprint of logistics by using European intermediaries for non-EU orders and subcontractors located near the production site. The company has also redesigned its packaging to enhance recyclability, incorporating recycled materials, eliminating non-essential components, and promoting recycling, reuse, and reduction strategies. Some product packaging has been innovated to be both compostable and recyclable. According to Sodalis Group strategy, Bionike monitors its carbon footprint to define reduction and mitigation plans. It has installed water recovery systems and currently relies on renewable energy sources. Additionally, its production facilities are equipped with advanced technologies that optimize resource management and improve energy efficiency.

"Sustainability is a key principle in all product launches and relaunches, influencing not only marketing strategies but also production processes. We are committed to continuously improving our overall environmental footprint. This is a daily effort that encompasses multiple areas, from packaging choices-developing eco-friendly solutions based on the principles of reduce, reuse, and recycle-to the adoption of renewable energy sources for our production processes, such as the installation of photovoltaic systems. For existing products, we continuously seek ways to improve their environmental impact, while new product development is guided by sustainability criteria. This includes formulation choices, sourcing raw materials from sustainable sources, and optimizing packaging-such as reducing paper use, eliminating plastic cellophane, utilizing certified paper, removing unnecessary outer cartons, and replacing paper inserts with QR codes. We are currently assessing our greenhouse gas emissions through a Carbon Footprint analysis, aiming to quantify both direct and indirect emissions. This evaluation will enable us to define concrete reduction and mitigation plans, identifying areas where we can effectively cut CO_2 emissions within production and across the supply chain. While it is not always possible to eliminate emissions entirely, we are committed to offsetting them where necessary. Furthermore, we are actively collaborating with all partners across the supply chain-both upstream and downstream-to measure emissions and implement targeted actions to reduce our overall environmental impact. Additionally, we focus on waste reduction, ensuring greater efficiency in waste management during production. Formulation choices are equally critical, with a strong emphasis on sourcing raw materials from sustainable origins. Bionike has been a pioneer in eliminating microplastics, well ahead of regulatory requirements. While legislation banning microplastics was introduced only some years ago, with phased implementation depending on product categories, we had already embarked on this complex and challenging transition in 2018-2019, proactively anticipating the regulatory developments."

Federica Brunetti, ESG Manager

For the future, the company aims to establish criteria for identifying the most sustainable partners and suppliers.

"Over the coming year, we will work on defining and establishing ESG evaluation criteria for our suppliers. Currently, when onboarding new suppliers, we conduct audits and assessments through our internal team, selecting partners based on geographic location and specific requirements. However, a formalized set of ESG evaluation criteria has not yet been implemented. Developing and integrating these standards into our supplier selection process will be a key focus for the future."

Federica Brunetti, ESG Manager

The company has engaged numerous partners in its sustainability journey. Its strong social commitment emerges from the several collaborations established with a broad spectrum of stakeholders, including associations, research institutes, dermatologists and scientific societies.

"As a brand, Bionike is highly active and committed to various initiatives, not only from an environmental perspective but also in the social and governance domains. The company collaborates with hospitals and supports centers that assist women who have experienced violence, as well as facilities that provide shelter for mothers and children in difficult circumstances. Additionally, Bionike is dedicated to supporting positive social initiatives. Over the past year, the company has funded research conducted by IEO Monzino and donated products to various organizations, including Centro Ambrosiano and associations supporting women affected by violence. Contributions have also been made to SOS Villaggio dei Bambini, a nonprofit organization assisting children whose mothers are victims of violence. Furthermore, Bionike is set to collaborate with Loto Onlus by donating makeup products for events dedicated to women undergoing chemotherapy. The company also supports Banco dell'Igiene, a nonprofit organization to which it donates hygiene products. The company adopts a comprehensive approach to sustainability, addressing multiple dimensions of social and environmental responsibility. A key aspect of Bionike's sustainability strategy is research. The company views sustainability as an integral part of innovation and actively fosters partnerships with dermatologists, research institutes, and scientific societies to enhance its formulations. From an environmental perspective, a particularly significant partnership is the collaboration with WorldRise, a nonprofit organization dedicated to the conservation of the Mediterranean Sea. Bionike has been working with WorldRise since 2022, and the partnership has been renewed for the current year, reinforcing the company's commitment to marine environmental protection."

Federica Brunetti, ESG manager

Purpose Alignment Driven by the Ecosystem - *The ecosystem plays a key role in the transformation process of Bionike's purpose-driven strategy. It includes multiple stakeholders who influence and support the company's transition. First and foremost, the Sodalis Group, to which Bionike belongs, has acted as a key driver of this transformation. As part of a larger corporate group, Bionike benefits from the opportunity to share performance insights and align with a common strategic direction within the group.*

"Being part of this group has facilitated the formalization of our sustainability journey. In 2023, at the group level, we officially committed to sustainability by defining a three-year ESG action plan for the entire Sodalis Group, encompassing all its subsidiaries. Within the group, some companies had already embraced sustainability practices, such as Bionike and our French subsidiary, L'Arbre Vert, which was founded with a strong natural and environmentally conscious identity. Other companies, like Deborah, have also integrated more sustainable practices over time, aligning with the group's overall strategy. As a group, we decided to implement a collective approach, ensuring that all companies

within the group adhere to this three-year ESG plan. For instance, Bionike's Carbon Footprint assessment was completed and ISO-certified last year. Given its strategic importance, the group has decided to extend this initiative across all its subsidiaries, both in Italy and internationally, to standardize and enhance sustainability efforts."

Federica Brunetti, ESG manager

Second, among stakeholders, consumers play a crucial role in that they demand transparent communication about corporate activities, particularly in relation to sustainability. They are very careful to avoid companies that engage in purpose-washing or greenwashing.

"The year 2023 marked a turning point, bringing our sustainability initiatives into concrete action and necessitating external communication of our efforts. As part of this process, we expanded the sustainability section of our website, which had previously been underdeveloped or nonexistent. We also published our first sustainability reports to formalize and reinforce our commitments. Additionally, we developed targeted communication strategies for both internal and external stakeholders to ensure transparency regarding our initiatives. Consumers today are particularly attentive to these issues, and sustainability has become a key driver in their purchasing decisions. Environmental impact, in particular, is one of the most significant factors influencing consumer choices. This presents a challenge, as it is now essential to communicate corporate sustainability actions accurately to avoid any perception of greenwashing. Special attention must also be given to the mode of communication, ensuring that stakeholders are informed not only about corporate sustainability initiatives but also about the specific environmental and sustainability benefits of individual products, such as their eco-friendly formulations."

Federica Brunetti, ESG Manager

Research limitations. *This study is not without limitations, which should be considered when interpreting its contributions. First, the empirical evidence is part of an ongoing research effort, and data collection-particularly through qualitative interviews-is still in progress. As such, the findings presented here are preliminary and should be viewed as provisional insights rather than definitive conclusions. Second, the study relies on a single-case design. While this approach enables an in-depth, contextually rich examination of organizational dynamics, it inevitably constrains the extent to which the findings can be generalized to other settings, particularly those characterized by divergent institutional logics, competitive pressures, or industry structures. Future research could address this limitation by incorporating comparative case studies or larger samples spanning multiple sectors and organizational forms, thereby enhancing external validity and analytical generalizability. Third, the study does not systematically investigate the antecedents, mechanisms, or contingencies that enable or inhibit organizational transformation, nor does it empirically assess its performance implications. These limitations offer fertile ground for future inquiry.*

Managerial implications. *From a managerial perspective, this study offers valuable insights for companies aiming to transition into purpose-driven businesses. First, in contrast to Lyon et al., (2024) and in line with Gionfriddo et al. (2024), it suggests that firms can adopt a purpose-driven orientation without initially being certified or formally classified as hybrid organizations, with the possibility of institutionalizing their sustainability commitment at a later stage.*

Second, the study outlines a potential pathway for firms seeking to integrate environmental and social objectives alongside economic goals. This transformation begins with the articulation or reformulation of a corporate purpose that explicitly aims to generate both environmental and social value in conjunction with economic performance. It then proceeds with the alignment and integration of the company's overall philosophy, including its strategy, mission, vision, and core values (Jimenez et al., 2021; Rey et al., 2019; Carballo, 2023; George et al., 2021), as well as the key dimensions of its business model (Osterwalder & Pigneur, 2011; Kropfeld & Reichel, 2024; Ernst et al., 2023).

Finally, the study underscores the strategic relevance of organizational embeddedness within a broader ecosystem, which can significantly shape and support the transformation process itself (Sebhatu & Enquist, 2022; Rey et al., 2019).

Originality of the paper. *This paper offers original insights to the emerging literature on purpose-driven businesses by focusing on the transformation of traditional firms toward purpose-oriented models. To the authors' knowledge, limited research has explored this transition as a systemic process that integrates sustainability by leveraging the interplay between a firm's internal foundations and its external stakeholder environment.*

The study conceptualizes transformation as emerging from the organizational core-rooted in its strategy and business model-while underscoring that its full enactment requires active engagement with the broader ecosystem in which the firm is embedded.

By synthesizing the key drivers of this transformation, the paper advances a more integrated understanding of how companies can effectively operationalize purpose. The insights generated can inform both companies undertaking purpose-driven change and policymakers seeking to create enabling environments for responsible business transformation.

Key words: *purpose; purpose-driven businesses; business transformation; strategy; business model transformation; ecosystem*

The relevance of biodiversity practices for business: A purpose-driven perspective

MAURO CAPESTRO[1] STEFANO DENICOLAI[2]

Abstract

Biodiversity loss is a serious risk for society as well as for business. As consequence, organizations are introducing new frameworks based on new services to reduce the effects of their business activities on the environment to protect biodiversity. Due to these relevant global changes, entrepreneurs and managers have started to adopt more inclusive and socially responsible strategies. In this context, purpose-driven organizations that pay more attention to the sustainable use of natural resources and adopt a people-oriented approach are emerging. In this sense, a key role could be played by stakeholders, from business partners to clients, that can support the company' strategies in pursuing sustainable goals, such as biodiversity. The implementation of biodiversity practices might affect business processes, pushing companies to innovate products and services as well as to promote the innovation of business models to reach and satisfy new market needs. Through a multiple case studies approach, the study tries to assess from a purpose-driven perspective, how companies implement biodiversity practices and what are the effects of biodiversity on business. The results of analysis emphasize the relevance of both stakeholders as well as of digital technologies and culture for biodiversity goals and of biodiversity for innovation.

Keywords: *biodiversity, purpose driven business, stakeholder theory, digital technologies, innovation*

Framing of the research. *In the field of environmental sustainability an important issue concerns the prevention and promotion of biodiversity (Jones and Solomon 2013). Biodiversity loss poses serious risks to business operations, threatening resource availability, supply chains, and ecosystem services, which is has been defined as the benefits that human populations and organizations derive-directly or indirectly-from proper ecosystem functioning (Costanza et al., 1997; Whiteman et al., 2013). As consequence the role of businesses in the economic system is profoundly changing. Organizations are introducing new frameworks (mainly based on new services) and (new digital) tools to reduce the impacts of their activities on the environment and protect biodiversity (Reale et al., 2019). Due to these recent global changes, businesses and entrepreneurs have started to adopt more inclusive and socially responsible strategies. In this context, purpose-driven organizations are emerging. Such organizations focus their strategies and actions on the needs of society and pay more attention to the sustainable use of natural resources, adopting a people-oriented approach in their activities (Hollensbe et al., 2014). Purpose-driven companies offer an unprecedented way of functioning as "purpose" is at the heart of its activity and business model, and it aims to profoundly transform the nature of performance (George et al., 2023).*

Purpose-driven organizations hold the ambition to put their economic model and their search for profit at the service of a social or environmental goal (George et al., 2023). A purpose-driven model reflects three essential organizational components: (1) why an organization exists (purpose logic), (2) which it is (purpose identity), and (3) what it does (purpose strategy). These components represent a human-centered, relational, and anthropomorphized view of the organization and its work (Sluss and Ashforth, 2007). A purpose-driven organization offers products and services with the aim of solving societal problems and responding to people's needs rather than only having the objective of making profits. In this regard, a purpose-driven firm focuses the marketing vision on the fusion between purpose and profit, which requires changes in policies and practices, such as: (1) extending the company's key stakeholders beyond customers, (2) try to balance diverse and conflicting goals, also through the use of digital technologies, (3) developing (new) marketing strategies that support purpose-driven brands (Blocker et al. 2024).

Contributing to this topic, a growing number of scholars and practitioners are recently looking at managing sustainability and biodiversity issues by considering the role played by stakeholders (Bronzetti et al., 2023) respect the activation of sustainable business solutions that could positively affect biodiversity practices (Henriques and Sharma, 2005). Specifically, for biodiversity practices, scholars refer to the activities that can help to tackle the loss of biodiversity (Salmi et al., 2023). Boiral and Heras-Saizarbitoria (2017) proposed a framework that differentiates biodiversity

DOI 10.7433/SRECP.SP.2025.01

practices into: (i) internal practices that are implemented by the firm itself; and (ii) external practices implemented in association or collaboration with various stakeholders.

Another important aspect in motivating operational practices to tackle biodiversity issues is linked to the diffusion of ecological knowledge. Specifically, ecological knowledge is vital in influencing biodiversity culture and shaping learning about biodiversity in the social context. Stakeholders are integrated into this learning process (Smith et al., 2020) because of their key role for value co-creation (Boiral and Heras-Saizarbitoria, 2017). According to stakeholder theory, in developing their overall strategies, companies and organizations must consider the interests and expectations of their various stakeholders, defined as "any identifiable group or individual who can affect the achievement of an organization's objectives, or who is affected by the achievement of an organization's objectives" (Freeman and Reed 1983, p. 91). Some studies have highlighted the importance of stakeholders' engagement and involvement in managing complex environmental issues and promoting proactive environmental strategies (e.g., Buysse and Verbeke 2003; Cragg and Greenbaum 2002).

In addition to stakeholders, also digitalization plays a key role in managing sustainable goals (Broccardo et al., 2023). Emerging digital technologies may lead to variations in how organizations involve stakeholders in sustainable practices. Indeed, in the last years, there has been growing attention on how digital technologies (especially the new ones included in the Industry 4.0 paradigm) are supporting organizations in the processes optimization, including environmental sustainability concerns (Piccarozzi et al., 2022, 2023). Digital technologies can serve as solutions for facing biodiversity issues in different ways, as they can be used to offer innovative regenerative solutions in agriculture (Cumming et al., 2020), but also to tackle biodiversity loss playing a complementary role alongside existing technology, or supporting other innovation processes (Ziegler et al., 2022).

The connection between biodiversity (from a purpose-driven perspective) and innovation emerges as a promising field of work. In fact, some scholars (Henderson 2021; George et al. 2023) argue that purpose-driven firms are better suited to introduce innovations thanks to the aim of improving environment and human well-being. In other words, purpose-driven businesses might outperform other businesses in various fields, including innovation, and also better contribute to society (George et al. 2023).

Pursuing biodiversity goals from a purpose-driven perspective could affect business innovation, in terms of processes products, services and business models. In the management literature, it has been found that different forms of diversity, such as gender, culture, education, background and cognitive (Mitchell, 2008; Østergaard et al., 2011), as well as the diversity of cooperation and relationships among companies and stakeholders (Vence and Trigo, 2009) have positive effects on innovation processes. Diversity is considered a driver of innovation (Hewlett et al., 2013). In the context of sustainability (and biodiversity), companies have started to innovate their business models to include also environmental and social considerations (Feger and Mermet, 2022). These sustainable business models are designed to integrate sustainability into companies to create also ecological and social values, to adapt the firm to the changing external environment. This perspective will drive the next wave of innovation and growth in the global economy and will also contribute to reshape businesses and the relationships with society (Porter and Kramer 2019).

Purpose of the paper. *Despite the relevance of biodiversity for business and society, there is a lack of studies that explore how it relates with business. The main purpose of the study is to identify new theoretical patterns (Sabherwal and King, 1991) about how biodiversity is dealt with by companies and how it can be related to innovation from a purpose-driven perspective. We attempt to reach our research goals by selecting "information-rich" cases (Patton, 2015), summarizing varied or extensive raw data, establishing relationships between findings and research objectives and developing a theoretical framework based upon "the underlying structure of experiences or processes that are evident in the text data" (Thomas, 2006, p. 238). Specifically, through our study we aim at answering to the main following research questions:*

RQ1: How do companies implement biodiversity practices?

RQ2: What are the effects of biodiversity practices on business?

RQ3: What are the effects of biodiversity practices on innovation?

RQ4: Does and how the pursuing of biodiversity goals allow companies to affect positively innovation?

The purpose pf the study is to identify new theoretical patterns (Sabherwal and King, 1991) about the relationships between biodiversity and business innovation. We attempt to answer the study's research questions by selecting "information-rich" cases (Patton, 2015), summarizing varied or extensive raw data, establishing relationships between findings and research objectives and developing a theoretical framework based upon "the underlying structure of experiences or processes that are evident in the text data" (Thomas, 2006, p. 238).

Methodology. *Because of the exploratory nature of our research, we adopted a bottom-up inductive approach (e.g. Gioia et al., 2013; Thomas, 2006) "wherein theories are formulated by drawing general inferences from particulars or cases of empirical data" (McAbee et al., 2017, p. 278). In doing so, the qualitative method through a multiple case study approach (Yin, 2014) using multiple material sources from in-depth interviews to secondary company's data extracted online (companies' websites and companies' LinkedIn webpages), is the more suitable for a deeper first understanding of the phenomenon. This is a preliminary version of the research that aims at analyzing data coming from different companies of different industries that consider biodiversity goals into their business strategy. Currently we have collected data about five different Italian companies detailed in Table 1.*

Company 1 is a medium-sized leading nature-tech company aiming at favoring biodiversity through technology. The company's goal is to create Europe's largest ecological corridor, consisting of interconnected biodiversity oases, to restore 40% of global biodiversity. The honeybee is a key bioindicator that Company 1 assesses by collecting and interpreting data through innovative proprietary systems to monitor the health of bees, pollinators and their connection to ecosystems. Biodiversity is an integral part of the business.

Company 2 is a medium-sized digital company mainly focused on (healthy) food production (recipes) and delivery. It's main goal bases on the idea that delivering the "right quantity" of ingredients for the different dishes and recipes an individual chooses to eat can totally eliminate food waste and, consequently, having a positive impact on nature. Indeed, the company's desire is to have a positive sustainable impact on the entire ecosystem to sustain nature and protect biodiversity, which is important to offer several ingredients for its own customers.

Tab. 1: Case studies

Company	***Founded***	***Size (employees)***	***Industry/Activity***	***Interviewed***
Company 1	*2017*	*Medium-sized*	*Technology provider; Consulting*	*Marketing manager*
Company 2	*2019*	*Medium-sized*	*Food delivery services*	*Co-founder*
Company 3	*2018*	*Medium-sized*	*Innovation and technology business consulting services; Training services*	*Marketing manager and Agronomist*
Company 4	*2022*	*Small-sized*	*Bio-technology solutions*	*Co-founder*
Company 5	*2019*	*Small-sized*	*Health food production*	*Founder / Marketing manager*

Source: Authors' elaboration

Company 3 is a medium-sized tech-company that offers several consulting services for businesses and other organizations with the aim of transforming territories and industrial districts into sustainable places, safeguarding the environment by saving resources, combating climate change and valuing biodiversity. In this case, biodiversity is strategically relevant for the company's business.

Company 4 is a small-sized innovative start-up that offers bio-solutions and in particular molecules of plant origin for dermo-cosmetic and pharmaceutical use, obtained by innovative patented biotech processes that are gentle, respectful and low energy. Pure active ingredients with proven efficacy, generated thanks to the know-how of the research team and the constant and valuable collaboration with Italian universities and public research institutions. Biodiversity has a strategic and business value.

Company 5 is a small-sized company operating in the food industry that makes available, through the application of natural biotechnology, functional fibers and antioxidants that are already present in nature. Company 5 looks for sustainable solutions to naturally improve nutrition today conditioned by wrong patterns and ultra-processed foods. Their mission is to protect people's health and preserve the environment, thus biodiversity is the core of business.

We performed two steps of analysis: a preliminary desk analysis of companies' website and LinkedIn webpage and a content analysis of the interviews done to extract common concepts useful for our research goals. We interviewed marketing managers and co-founders (with marketing competences) because of our interest in the market perspective of the phenomenon. The interviews aimed at investigating the link between business and biodiversity, the firms' activities (practices) adopted for biodiversity goals, and the effect of these practices on innovation.

Results. *The evaluation of the five companies started with the desk analysis of company's website and LinkedIn webpage to assess what they do, in terms of activities, and how biodiversity is part of the business. A summary of the main results of the desk analysis that can allow us to have some preliminary insights related to our research goals is reported in Table 2.*

Company 1 bases the business on 3 main pillars (services): (1) the monitoring through technologies of the nature habitat health (data on pollinators, bees, flora, etc.); (2) regeneration of low-biodiversity lands, providing nectariferous species of trees and plants, selected according to the specific characteristics of the land; and (3) education programs to raise awareness of biodiversity issues among businesses and communities. Moreover, Company 1 provides additional services, such as education. In this regard, through LinkedIn, it publishes news and information as well as webinars about biodiversity. On the company's website there is a blog and a podcast supported by various business partners to spread the culture of biodiversity. Finally, Company 1 offers to the citizens, the possibility to "adopt" a beehive (monitored through the app) managed by beekeeper that periodically send the honey produced by the "adopted" bees. In addition, there is also the opportunity to "adopt" a solitary bee house, and a nectariferous tree. For these two kinds of activities, Company involves different stakeholders, such as beekeepers, landowners, research centers and universities, and other business partners, as well as citizens in pursuing biodiversity practices.

Company 2 is a digital company offering a new way of sustainable grocery shopping (health food). The kits are provided in compostable containers of portioned, ready-to-cook ingredients that allow to have zero food waste at a sustainable cost. It offers a large variety of ingredients to ensure the possibility of cooking several different recipes for several different cultures (people). In doing so, Company 2 creates synergies with host territory, involving various stakeholders (producers, bistros, restaurants, pick-up points, etc.) with the intention of enhancing and protecting biodiversity as key factor of the ecosystem. The main goal is to optimize resources and reduce waste, generating a real change to protect "People, Work and the Planet". In addition, to support clients, Company 2 has partnered with nutrition

experts (biologist nutritionists) who will provide a personalized diet plan designed on client needs. A highly personalized service, new to the market, flexible and tailor-made that favors collaborations with several different actors in the food industry. In this way, Company 2 reduces food waste with positive effects on environmental sustainability and on the prevention of biodiversity loss. Moreover, Company 2 is also active on promoting, also through the involvement of other actors (partners, universities, etc.) the culture of sustainability and biodiversity mainly through the LinkedIn page, by publishing news on these topics.

Tab. 2: Main results of desk analysis

Company	***Products/Services***	***Collaboration strategies***	***Digital tools for biodiversity practices***
Company 1	▪ *Monitoring* ▪ *Regeneration* ▪ *Education* ▪ *Innovative service for citizens: adopting a beehive / tree / bee*	▪ *With their clients to control bees' life* ▪ *With other organizations (universities and research centers) to develop new solutions* ▪ *Involvement of the clients of their clients*	▪ *IoT* ▪ *Sensors* ▪ *Satellite imagery* ▪ *AI* ▪ *App*
Company 2	▪ *Food production (recipes) and delivery for individuals and organizations* ▪ *Personalized nutrition*	▪ *With suppliers to assure ingredients variety* ▪ *With other organizations (universities, research centers and consultants) for technical aspects*	▪ *Digital platform,* ▪ *App (for service delivery, for personalized nutrition, for B2B relationship)*
Company 3	▪ *Nature-based solutions* ▪ *Local and industrial resource efficiency solutions services* ▪ *Biodiversity monitoring and innovative regeneration services* ▪ *Open Innovation* ▪ *Venture Capital*	▪ *Involvement of clients to favor biodiversity practices and promote them in the client's network.*	▪ *Sensors* ▪ *Satellite imagery* ▪ *Virtual collaboration tools*
Company 4	▪ *R&D and production of science-based and plant-derived active ingredients for the Personal Care and Health Care markets.*	▪ *Very important collaboration with research centers, universities and other organizations (mainly consultants) for the development of innovative solutions*	▪ *Smart production technologies instrumental for the business based on biodiversity*
Company 5	▪ *Production of functional fibers and antioxidants for health food that are already present in nature.*	▪ *With different organizations (from business partners to universities, research centers and consultants) to develop innovative solutions*	▪ *Smart production technologies instrumental for business biodiversity-based* ▪ *Digital platform*

Source: Authors' elaboration

Company 3 is a tech-company that provides nature-based consulting solutions, including its own technologies, to improve environmental sustainability reducing the use of natural resources. This is done to address major critical environmental issues and provide resilience to the Planet of the Future. Company 3 develops and aggregates technologies, solutions, innovations and skills to transform the industrial supply chain and territories into resources for people and the environment, in order to combat the scarcity of natural resources by limiting their extraction and promoting the reuse of those already present, promote the regeneration of biodiversity and counter climate change, creating a true circular symbiosis between people, economy, business and the environment. Company 3 activity starts with the analysis of an actor's needs and tries to involve all the main client' stakeholders into the project. In this case, it aims at creating a superior value for sustainability and biodiversity goals. Company 3, like the other two ones, uses the LinkedIn page (with the participation of different other actors) to promote the culture of sustainability and biodiversity through the publishing of information and events on the topics.

Company 4 is a bio-technology innovative start-up mainly focused on the development and production of science-based plant-derived active ingredients for the Personal Care and Health Care markets. Company 4 believe that combining expertise and networking with Italian research excellence produces the best results. For this reason, it considers (all) stakeholders particularly important for the business and the purposes of the business. Through a close integration of activities involved in the supply chain, Company 4 recovers plant residues from selected organic crops in a process of continuous collaboration among different partners, with the ambition of generating even more effective products than the reference product. For Company 4, the best projects arise from the complementarity of skills and the active and inclusive involvement of all partners, but also from an open approach to the needs of the client. Active ingredients for cosmetics designed and tailored for clients seeking exclusivity and innovation. Company 4 uses company's LinkedIn account to promote the concept of biodiversity and its positive effects on life and individuals.

Company 5 is focused on delivering on the market health food by providing sustainable solutions to naturally improve nutrition today conditioned by wrong patterns and ultra-processed foods. The Company's mission is to protect people's health and preserve the environment. Through the application of natural biotechnology, Company 5 develops innovative foods and supplements with high nutraceutical value. In doing so, Company 5 collaborates with different partners. Moreover, with their patented technology, Company 5 is rewriting the future of the food industry, addressing

environmental and biodiversity challenges with sustainable solutions in harmony with the circular economy. Social media is used to spread culture about biodiversity.

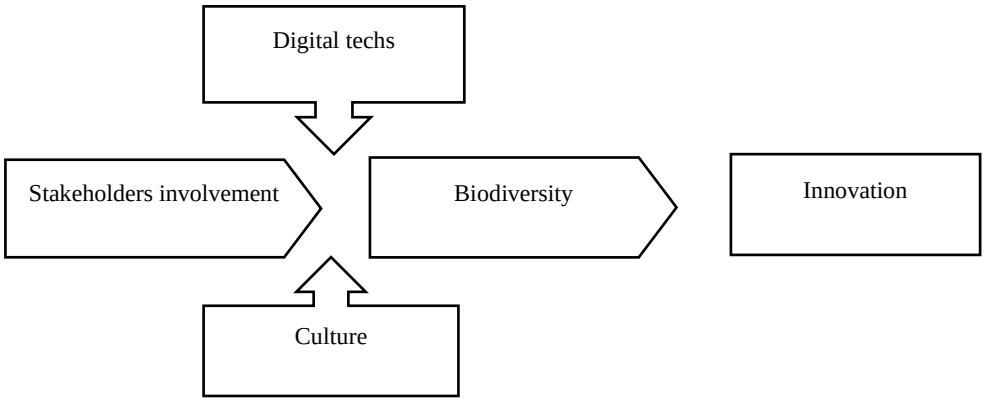
In addition to the desk analysis of companies' website and LinkedIn pages, we analyzed the interviews done with managers and a co-founder of the five companies considered in this study. The content analysis of the interviews done allowed us to have some in-sights into our research goals. Firstly, all companies consider tackling biodiversity issues as a key purpose of the business.

"We perceived the key value of biodiversity for society and focused our business activities on this perspective." (Company 1)
"Biodiversity protection and promotion is a key aspect for our business because it allows to satisfy a large variety of customer needs." (Company 2)
"When we interact with our clients, we highlight the relevance that Nature Based Solutions for resource efficiency have for biodiversity and how it is important for society." (Company 3)
"Today there is the necessity and responsibility to face environmental is-sues. We cannot do business without this purpose." (Company 4)
"The ethical aspect related to the negative effects of mass production on biodiversity has changed the way we do business." (Company 5)

As far as the role of stakeholders for biodiversity issues is concerned, through the analysis of interviews emerged that without the involvement of stakeholders is difficult to reach sustainable and biodiversity goals, because of the complexity of these topics.

"In addition to our clients, also citizens are directly involved in the business because of the relevance of biodiversity. Moreover, we collaborate with different research, universities and other institutions." (Company 1)
"In our business we need of the involvement of other organizations and of clients." (Company 2)
"Biodiversity needs of stakeholders' involvement. Biodiversity loss is a social issue that needs the participation of different actors." (Company 3)
"We have to involve stakeholders and institutions and share with them culture of bio-solutions to reach sustainable goals." (Company 4)
"Everyone has to participate actively. For example, scholars are useful to doing outreach to affect the culture." (Company 5)

In addition to stakeholders, from the content analysis of interviews emerged two other factors that could be relevant for the management of biodiversity practice/issues. Specifically, companies stressed the role of both digital technologies, currently essentials to monitoring, preserving and promoting biodiversity, as well as of culture, which is essential to understand the relevance of biodiversity for society.



"To provide our services we need technology and data to precisely meet need of beekeepers as well as of individuals that adopt a beehive…Technology is for us necessary to assure biodiversity." (Company 1)
"In promoting our Nature Based Solutions, we consider technologies necessary to reach efficient sustainable results. Moreover, technologies allow us to monitor biodiversity and act immediately." (Company 3)
"Culture is important. Understanding the relevance of biodiversity affects the social approach to the topic." (Company 5)

Finally, through interviews we aimed at exploring the effects of biodiversity on business. Interestingly, we found that biodiversity positively affects innovation.

"When we noticed that people were interested in biodiversity issues, we basically modified our business model to involve individuals." (Company 1)
"Biodiversity allows us to satisfy different people needs. In this way we can innovate our business also promoting personalized nutrition." (Company 2)
"In our solutions, we offer to the clients the opportunity to innovate the business models." (Company 3)
"Biotechnology can certainly be an extraordinary lever of innovation to face biodiversity issues." (Company 4)
"Offering bio-solutions is very innovative because probably these situations could have been addressed with chemical or other industrial solutions." (Company 5)

The results of desk and content analyses of the five companies here considered allowed us to depict a possible conceptual framework (Figure 1) that summarize how the different variables relate among them, highlighting the double face of biodiversity promotion or loss prevention, as output of innovative services and a driver for innovation.

Fig. 1: Theoretical framework proposed

Source: Authors' elaboration

Research limitations. *The study has some limitations that could be thought as hints for the future research. Firstly, the study is based only on the analysis of five companies. More case studies belonging to different industries can improve the understanding of the phenomenon. Moreover, the study is based on a qualitative exploratory analysis. A more comprehensive stream of research that considers a quantitative approach and other variables in addition to those reported in Figure 1, such as culture, is needed to better understand cause-effect relationships among the different variables.*

Managerial implications. *Although this is only a preliminary step of the study, it has different implications for companies and policymakers. Firstly, a purpose-driven perspective is the right approach to manage biodiversity in the business context. In doing so, companies should consider the involvement of stakeholders to foster the process of transition towards sustainable and purpose-driven businesses that favor biodiversity and, as consequence, business innovation (products, processes and business model innovation). The involvement of stakeholders leads to an integrated strategy that accelerates the process of transition towards sustainable businesses that favor biodiversity (Leclère et al., 2020). Moreover, companies should consider the use of digital technologies (various kinds of technologies for various kinds of activities and purposes) to reach positive results in terms of biodiversity protection and promotion. Digital technologies allow to favor the development of an efficient ecosystem of services (preventing, monitoring but also promoting) needed for biodiversity (Pimm et al., 2015). By reaching biodiversity goals, companies hod to innovate their own business model, as well as products and services, to reach both business and individuals' needs.*

Finally, the results of analysis highlighted the relevance of culture for this kind of topic. Culture is a cross-sectional factor that affects all the linkages of the different variables analyzed with biodiversity. In this sense, policymakers should contribute to improve the social context, not only through rules and regulations, but also through promotion policies for organizations and citizens to favor learning about biodiversity. Social learning describes the process through which new ecological knowledge translates into business (Siebenhüner and Arnold, 2007) and social actions (Siebenhüner et al., 2016) regarding biodiversity.

Originality of the paper. *The research is one of the first studies that aims at assessing how biodiversity relates to business innovation from a purpose-driven perspective. Based on a multiple case studies approach, the study theoretically introduces a new framework that highlights the double role of biodiversity as output of innovative services mostly developed through the involvement of different stakeholders, and as driver for business innovation. Moreover, the study highlights the relevance of both digital technologies and culture. In this sense, policymakers should support companies in adopting the digital technologies needed to handle biodiversity as well as foster activities to promote the biodiversity-based culture.*

When the Lights Go Out: Orchestrating Social Innovation with Hybrid Funding

JORDANA RECH GRACIANO DOS SANTOS[1] IAN MCCARTHY[2] DOUGLAS WEGNER[3]

Abstract

In recent years, social innovation has emerged as an important strategy for addressing complex urban and societal challenges, involving diverse actors from the public, private, and nonprofit sectors. Within this dynamic context, the concept of orchestration - defined as the coordination and alignment of multiple actors towards a common goal - has gained increasing relevance, particularly in multi-stakeholder initiatives focused on urban regeneration. However, empirical understanding of how orchestration unfolds in practice within social innovation projects remains limited.This study explores how orchestration is enacted in multi-stakeholder social innovation projects by examining urban regeneration initiatives in Italy. Using a multiple case study approach, we analyze six projects that differ in their governance models, initiating actors, and funding sources. The research is ongoing. To date, we have conducted six in-depth interviews with key actors involved in these initiatives, allowing us to draw preliminary conclusions about orchestration practices. Early findings suggest that orchestrators play a central role in articulating shared goals, building trust, navigating power imbalances, and adapting governance structures over time to sustain collaboration.

Framing of the research. *Social innovation has become an important approach to addressing grand societal challenges that transcend sectors, geographies, and communities. Social innovation creates novel processes, services, or products to solve social problems for collective benefit (Beckman et al., 2023). Examples include microcredit programs in India (Sheikh et al., 2023), public innovation hackathons in Germany (Mair, 2018), and healthcare models leveraging the unique skills of visually impaired individuals (Bouchard, 2012). These initiatives highlight the potential of social innovation to generate systemic change and foster inclusive progress. However, realizing this promise requires collaboration among diverse actors, including businesses, governments, and civil society organizations.*

Cross-sectoral collaboration plays a critical role in creating systemic transformations. For instance, coordinated efforts between pharmaceutical companies, public authorities, and nonprofits were instrumental in the global response to the COVID-19 pandemic, facilitating vaccine development and distribution that saved millions of lives (Bacq & Lumpkin, 2021; Cabral, 2024). Similarly, partnerships between firms and civil society organizations have successfully reduced deforestation, improved community well-being, and generated economic benefits for businesses and underserved stakeholders (Barnett et al., 2020; Gatignon & Capron, 2023; McGahan & Pongeluppe, 2023). These cases underscore the necessity of multi-stakeholder collaboration in addressing grand societal challenges effectively (Dentoni and Bitzer, 2015). And in some cases, this responsibility relies on the shoulders of the orchestrators. Orchestration as a theoretical construct highlights the role of central organizations, or anchor firms, in establishing a new value creation meaning for a network of actors (Dattée et al., 2018; Jacobides et al., 2018) Orchestration focuses on aligning diverse actors and is therefore often used to explain ecosystem dynamics which involve participants with technological, economic and cognitive interdependencies for value creation (Nambisan et al., 2019; Williamson and de Meyer, 2012).

The orchestration of social innovation ecosystems is essential for their success. Due to the collaborative nature of social innovation and the complexity imposed by the context, several stakeholders-instead of individual leaders-may play a vital role in orchestrating collaborative networks (Wegner et al., 2023). To orchestrate can be defined as the ability to effectively build, manage, govern and adapt networks for social change (Busch and Barkema, 2019). An organization, alliance, or collective of entities typically orchestrates by facilitating coordination, mediating power dynamics, and aligning diverse goals (Mair et al., 2023; Porter et al., 2020). However, power imbalances and competition within multi-actor collaborations often hinder progress, heightening the risk of conflict and relationship breakdowns (Baker et al., 1998; Gulati & Gargiulo, 1999). Policies designed to promote ecological sustainability can inadvertently exacerbate social inequities or disempower certain stakeholders (Avelino, 2021). These challenges underscore the need for deeper inquiry into how actors collaborate, coordinate, and cooperate in social innovation projects.

Despite these notable examples, management scholarship often falls short of capturing the complexity of such collaborations. Existing literature prioritizes free-market solutions or the business case for collaborations such as leveraging relationships with public or civil society organizations-while overlooking the broader societal challenges these partnerships aim to address (Cabral et al., 2019). Furthermore, significant gaps remain in understanding how contextual factors, stakeholder heterogeneity, and the characteristics of social problems shape the orchestration processes critical to effective collaboration (Wegner et al., 2023).

Purpose of the paper. *This article contributes to the growing body of literature on the orchestration of multi-stakeholders' collaboration for social innovation. By examining how the orchestrator navigates power dynamics, aligns objectives, and fosters collective impact, the study addresses critical gaps in understanding the operationalization of multi-actor partnerships (Bellandi et al., 2021; Bacq & Eddleston, 2018). The central research question guiding this study is: How do orchestrators manage multi-stakeholder social innovation projects in the context of urban regeneration? This study seeks to advance theoretical understanding while offering practical insights for stakeholders committed to addressing today's pressing societal challenges.*

Methodology. *A multiple case study approach was employed to systematically and comprehensively analyze the orchestration in a social innovation project, allowing the development of clearer and richer insights into the phenomenon (Yin, 2014). This case will analyze six social innovation projects connected to the purpose of urban regeneration and development of communities, orchestrated by different organizations, according to Table 1.*

The case selection process followed Siggelkow's (2007) recommendation to find cases that maximize learning opportunities. We looked, therefore, for projects that meet the following criteria: (a) projects developed by their members to produce social innovation through the collaboration of multiple actors; (b) projects that involve different categories of stakeholders, namely public, private, civil society, and NGOs; (c) cases that are a meaningful learning opportunity about the general pattern of collaborative networks for social innovation.

This study is focused on the Italian context of social innovation projects focused on urban regeneration. The context was chosen because Italy faces many social and economic challenges, such as the low ratio of young people in the total population, challenges with immigration and high rates of unemployment (ISTAT, 2024). Moreover, this is also in line with the goals of the Italian Ministry of University and Research, as they defined a "Social Innovation Policy agenda" in 2012 and can generate insights for academic research for exploring the connection between innovation policy and social innovation initiatives (Calderini et al., 2023).

The data collection phase will occur in two different phases. The first focuses on secondary data on the company's website and reports, business cases, and academic studies. The second phase refers to qualitative data collected from interviews to ensure the validity of the findings, which will be triangulated to confirm the validity and increase the robustness. In projects 1,2 and 3, the first author also took part in the company's routines, talking with other employees and understanding more about the projects. So, field notes related to these projects are also helpful and are part of the study. In Table 1, there is a list of all the projects that this project is focused on.

Projects	***Location***	***Name***	***Responsible***	***Goal***	***Data***
Project 1	*Rome*	*Officina Mezzogiorno*	*Italiacamp Srl*	*Innovation and Social Regeneration Hub*	*Project Manager* *CEO of the company* *Communities Manager* *President of the Board of the Association*
Project 2	*Milan*	*Milano Luiss Hub*	*Nonprofit Organization*	*A multipurpose center repurposed from an old disused workshop*	
Project 3	*Rome*	*Opificio*	*Italiacamp Srl*	*A place of urban regeneration aligned with the organization's mission to create social impact and positively influence the territory and community in which it operates.*	
Project 4	*Bréscia*	*Casa del Parco Adamello*	*Avanzi Discover*	*Territorial regeneration and enhancement of local resources and energies through the activation of spaces.*	*Responsible area for impact assessment* *Community Manager*
Project 5	*Fermo*	*SpazioBetti*	*Avanzi Srl*	*Welfare and social inclusion; Training, guidance, and employment; Culture and social engagement.*	*Researcher on Urban development*
Project 6	*Torino*	*Cascina Fossata*	*Sharing Srl*	*In the former Olympic Village of Turin, social housing*	*Facility Manager*

Results. *From the preliminary interviews, it was possible to categorize the projects according to the different types of financing and the leading actor orchestrating the project, as shown in Table 2. Four of the six projects were funded by specific programs such as the Social Innovation Fund. This fund supports innovative models that address emerging social needs through the involvement of private sector actors and financing, following the principles of impact finance. For example, Spazio Betti, led by the Municipality of Fermo, involves partners such as NuovaRicercaAgenziaRES and Avanzi spa SB, with private funding from Banca Popolare Etica.*

Officine Mezzogiorno, coordinated by the Municipality of Lecce, involves partners such as Italiacamp and The Qube, with Ferrovie dello Stato Italiane S.p.A funding. Milano Luiss Hub is a collaboration between the Municipality of Milan, LUISS University, Fondazione Brodolini, and Italiacamp. It is driven by public-private cooperation but not by a specific public call.

Cascina Fossata is a redevelopment initiative managed by Società Sharing and financed by FASP - Fondo Abitare Sostenibile Piemonte, with contributions from banking foundations such as Compagnia di San Paolo and Fondazione CRT, as well as Cdp Investimenti Sgr. It includes collective housing, hospitality services, educational spaces, cultural

activities, and a public garden. Private investment has been central to the projects of Casa del Parco Adamello, where Avanzi Discover created a benefit corporation for project management, and Opificio, supported by Horizon Real Estate with financing from Alba Leasing and BPER Banca, owned and coordinated by Italiacamp SRL.

Tab. 2: Comparison of typology of partners between the projects

Project	***Typology Partner***	***Typology finance***	***Instrument***
Officine Mezzogiorno	*67% non profit* *33% for profit*	*SpA*	*SIINC (Social Impact Incentives)*
Spazio Betti	*67% non profit* *33% for profit*	*Bank*	*Concession*
Opificio	*100% for profit*	*Bank*	*Agreement*
Casa del Parco Adamello	*83% non profit* *17% for profit*	*Benefit Corporation*	*Concession*
Milano Luiss Hub	*100% for profit*	*Foundation*	*Public-private cooperation*
Cascina Fossata	*83% non profit* *17% for profit*	*Bank*	*Real estate investment trust*

In the interview with the projects where most of the partners are from non-profit, some keywords emerge from the interview, highlighting their understanding of the project and their experience in the project. In the non-profit projects, the municipality plays a key role in facilitating the initiative, particularly in cases where the property is publicly owned. In such instances, legal and administrative actions are required to transfer rights from one party to another. Besides property rights, another concern is the financial model and the project's inability to receive financial support. Table 3 presents interview quotes, keywords, and preliminary first-order codes.

Table 3 - Preliminary analysis of the quotes

Quotes	***Keywords***	***First-order code***
"Once the spotlights fade from the project, I often see that we are not exactly forced to act, but we do it anyway. We do it because financial resources drive us. Ultimately, that's the reality-associations, groups, and organizations need money to keep going."	*Financial Resources drives the project*	*Financial Support over time*
"There are law enforcers, local governments, especially municipalities, that have programs related to your money generation. "	*Local government programs*	
"I think welfare ecosystems are specific foundations, and we think especially of most bottom-up actors. We also work with real estate companies, and they come from other reasons."	*Investment ability*	
"I know they offer more money, instead of ideas."	*Offers money*	
You see, the municipality is the beneficiary of the fund, that is, the municipality that makes the application to receive this funding. And then there is an implementing body.	*Beneficiary of the fund*	
"I see it's very often a risk now in our welfare model, or where everything is much more based on tenders. When the money is over, everything is over."	*When the money is over, everything is over.*	
"But, indeed, mistakes were also made in terms of the people's skills in the initial team, that is, there was a big imbalance between the operational side and the operational needs."	*Imbalance in the team*	*Intellectual Capital of the team*
"Of how to balance a little bit the engagement side of the story, to being economically resilient and stable."	*Team Development*	
"Especially in this project, where we made the agents besides the consultants, it happened. I think that there were some conflicts in terms of actors."	*Conflict between actors from different backgrounds*	
"It helped with the relational capital that they could set up. And then the local partnership was also strong."	*Relational Capital*	

Other first-order codes that appeared in the projects on the non-profit side were team dynamics, especially regarding the necessary skills to develop the project. In a few instances, it was the case of challenges and imbalance of the team, where the role of the orchestrator is to balance and act. This is aligned with earlier research by Grabski-Walls and Ambos (2024), which says that orchestrators work with ecosystem participants to enhance ecosystem capabilities through brokering activities that ease identity tensions and amplify resource tensions, building the resources needed to tackle social challenges.

Research limitations. *It is important to note that this study is part of an ongoing project and will continue to evolve. As more data is collected and further analysis is conducted, new conclusions and insights will emerge, adding to our understanding of how orchestrators can manage social innovation and overcome challenges such as contextual factors, stakeholder heterogeneity, and the characteristics of social problems.*

Managerial implications. *This study provides broadly applicable insights beyond exchanges as orchestrators and extends to other contexts. It addresses urban challenges and explores collaboration opportunities across different funding models. Our findings show that central organizations can initiate change and encourage participation without abandoning their profit-oriented approach. The multi-level process model highlights how orchestrators introduce collective tension management to address grand challenges better. Moreover, it offers insights into maintaining projects over time. Furthermore, it presents potential benefits for policymakers and governments by demonstrating how underutilized spaces or old buildings can be repurposed effectively, contributing to sustainable urban development.*

Originality of the paper. *The originality of these papers lies in the intersection of studies in social innovation through urban regeneration. They give new perspectives on projects that have not been seen before, focusing on specific characteristics and skills acquired over time. This brings new contributions to the literature on orchestrators, especially in the context of infrastructure, where they must deal with different challenges and stakeholders to develop the project.*

Keywords: *social innovation; urban regeneration; role of orchestratorsy*

The New Longevity Economy: its Definition and its Ecosystem

GIULIA NEVI[1] LUCA DEZI[2]

Everyone Desires Long Life, Not One Old Age
Jonathan Swift

Abstract

Il presente lavoro analizza la nuova economia della longevità quale ecosistema dell'innovazione. Se ne vuole proporre una prima definizione al fine di distinguerla dalla più conosciuta Silver Economy in quanto l'economia della longevità non si limita a rispondere ai bisogni immediati della popolazione anziana, ma promuove un approccio più ampio e sistemico al prolungamento della vita umana. Lo scenario contemporaneo di una popolazione più longeva richiede una serie di rivoluzioni per la nostra società. Il contributo, attraverso l'analisi di report, contributi scientifici e summits consente di mappare gli stakeholders di questo nuovo ecosistema, delineando e rappresentando le principali attività e obiettivi di ciascuno di essi. Il contributo offre prospettive per future ricerche e posiziona per la prima volta l'economia della longevità nel panorama scientifico del management, stabilendo un'importante base per studi futuri.

Framing of the research. *Lo scenario contemporaneo sta facendo i conti con una popolazione sempre più anziana. In Europa, gli anziani sono più di 90 milioni, tale "rivoluzione demografica" prevede che nel mondo nel 2025 si potranno contare 1,2 miliardi di anziani per arrivare ad un raddoppio nel 2050, come recentemente esposto in Scott (2023) il 50% dei bambini dei paesi sviluppati arriverà a toccare la soglia dei 90 anni (Scott, 2023).*

L'aumento della longevità è un traguardo importante che pone sfide e ristrutturazioni socio-economiche sostanziali, (Scott, 2021), ma oltre al traguardo di vivere una lunga vita cresce anche l'interesse sul come arrivare al finish line, in sostanza aumenta sempre di più il voler arrivare ad essere anziano godendo di una buona salute, riducendo così il cosiddetto gap tra life span ed health span. È in questo contesto che sta emergendo la cosiddetta economia della longevità, un settore in espansione, ma ancora poco definito nei suoi confini e nelle sue caratteristiche.

Le stime di Allied Market Research Group confermano il crescente interesse verso questo settore: il valore complessivo delle terapie per la longevità e l'anti-invecchiamento ha raggiunto 25,1 miliardi di dollari nel 2020 e si prevede che crescerà fino a 44,2 miliardi entro il 2030, per un tasso di crescita annuale composto (CAGR) del 6,1% (Allied Market Research, 2022). Tuttavia, nonostante questa crescita, la longevity economy si scontra con sfide strutturali significative. Secondo PricewaterhouseCoopers (2024) il settore è "frammentato e manca di una definizione univoca, generando incertezza nei mercati e negli investitori". Le barriere normative rappresentano un ulteriore ostacolo: "l'invecchiamento non è ufficialmente riconosciuto come una malattia, complicando i processi di approvazione di nuovi prodotti". A questo si aggiungono le sfide scientifiche, con "dibattiti ancora aperti sulle teorie dell'invecchiamento e prove limitate sull'efficacia di molte delle attuali soluzioni". Infine, la sostenibilità economica del settore resta incerta, a causa degli "elevati costi di sviluppo e dei lunghi tempi di commercializzazione", mentre la questione dell'accessibilità solleva interrogativi critici sulle "possibili disparità socioeconomiche nell'accesso alle terapie per la longevità" (PricewaterhouseCoopers, 2024). Queste sfide evidenziano la necessità di un'azione coordinata tra comunità scientifica, regolatori, investitori e policy makers per sbloccare il pieno potenziale dell'economia della longevità e garantirne uno sviluppo equo e sostenibile.

Il concetto di ecosistema è stato indagato da diverse prospettive il cui fulcro è la differenza in termini di attori, relazioni, valori e obiettivi, conoscenza, territorio e ubicazione, ad esempio Scaringella e Radziwon (2018) hanno identificato ecosistemi di business, innovazione, conoscenza e imprenditorialità, mentre Aarikka-Stenroos e Ritala (2017), concentrandosi su questioni legate agli attori, hanno aggiunto l'ecosistema delle piattaforme e quello dei servizi. Adner (2017) definisce l'ecosistema come "la struttura di allineamento dell'insieme multilaterale di partner che devono interagire affinché una proposta di valore focale si concretizzi". In esso, gli imprenditori possono competere e cooperare tra loro, ma il punto centrale di questo tipo di ecosistema non è l'imprenditore e il paesaggio che facilita la sua avventura imprenditoriale, bensì l'innovazione.

Le imprese modellano i loro processi di innovazione in funzione del proprio ruolo e della posizione occupata all'interno degli ecosistemi. Questi ultimi trascendono i confini di un singolo settore, offrendo un ambiente

DOI 10.7433/SRECP.SP.2025.01

multidimensionale e complesso in cui le attività imprenditoriali si impegnano nella ricerca dell'innovazione (Klimas e Czakon, 2022). I diversi attori partecipano attivamente alla creazione, allo sviluppo e alla trasformazione delle strutture dell'ecosistema, ridefinendo costantemente i confini e la distribuzione delle risorse nei processi innovativi. In questo modo, essi si adattano alle evoluzioni dell'ecosistema, contribuendo alla sua crescita e trasformazione (Silva et al., 2024). Le soluzioni e i prodotti dell'economia della longevità operano in un ambiente in cui le università, i centri di ricerca, le grandi aziende farmaceutiche, i governi e gli investitori giocano un ruolo chiave nello sviluppo e nella commercializzazione delle innovazioni legate alla necessità trasversale di promuovere la longevità. Longevità non significa solo arrivare ad essere centenari, ma anche estendere l'aspettativa di vita, per questo l'attenzione è elevata in termini di terapie oncologiche e malattie rare.

Purpose of the paper. *Alla luce delle sfide poste, della crescente rilevanza di questa economia, il presente extended abstract mira a definire l'economia della longevità e mappare l'ecosistema che la sostanzia rispondendo alle seguenti domande di ricerca: cos'è l'economia della longevità? Chi e come compone l'ecosistema dell'economia della longevità?*

Methodology. *Si è adottato un approccio qualitativo adeguato a esplorare le domande di ricerca "cosa", "come", "quando", "chi" e "dove" (Gioia et al. 2013) particolarmente indicato quando la teoria non è disponibile, è scarsa o è nascente (Graebner et al. 2012). Si è così proceduto a mappare l'ecosistema dell'innovazione (Talwar et al., 2020) attraverso l'analisi del contenuto di report e articoli scientifici sull'economia della longevità (* in bibliografia) e un'analisi di casi specifici relativi a conference verticali sul tema della longevità. Sono stati analizzati i programmi, gli attori presenti e i contenuti di due eventi medici: Medical Longevity Summit, Longevity Med Summit; e di quattro eventi non medici, ossia il Global Longevity Summit, il Vatican Longevity Summit, in parte legato al Milan Longevity Summit, la Longevity Investor Conference. L'analisi dei dati è stata svolta seguendo l'approccio seguito da Wilson et al. (2022) e da Klimas and Czakon (2022) codificando i dati in maniera da individuare i vari tipi di attori (chi?), i ruoli distinti (cosa?), le diverse fasi (quando?) e il diverso impegno nei processi (come?). Per codificare e analizzare i dati, si è seguito il processo convenzionale della ricerca qualitativa che consiste nella riduzione dei dati, nella loro visualizzazione e nella loro verifica (Miles e Huberman 1994).*

Results. *L'analisi dei report di organizzazioni internazionali e delle pubblicazioni scientifiche presenti ha permesso di individuare una prima definizione di economia della longevità, esposta nella sezione successiva, mentre l'analisi di casi specifici ha consentito di mappare il nuovo ecosistema della longevità, delineato più avanti.*

Definizione dell'economia della Longevità

Volendo trovare una definizione esaustiva di longevity economy ci si scontra con il delineare i suoi confini di sviluppo. Secondo Fengler et al. (2024), la longevity economy si riferisce ai "contributi economici delle persone di età pari o superiore a 50 anni". Tuttavia, organizzazioni internazionali come il World Economic Forum (WEF) offrono una visione più ampia: "la longevity economy presenta un'opportunità unica per affrontare le sfide dell'invecchiamento sbloccando al contempo potenziale economico e sociale. Concentrandosi sull'invecchiamento, l'innovazione e la collaborazione, mira a garantire sicurezza finanziaria, migliorare la salute e rafforzare le connessioni sociali. Non si tratta solo di adattarsi ai cambiamenti, ma di creare sistemi che promuovano resilienza, equità e sostenibilità per tutti, sottolineando la necessità urgente di approcci strategici all'invecchiamento" (WEF, 2024) Il settore della longevità è particolarmente dinamico nelle aree in cui si intersecano più ambiti, come le piattaforme di salute digitale che uniscono il monitoraggio della salute a funzioni di connessione sociale, oppure i prodotti finanziari integrati con incentivi per il benessere. Tuttavia, l'economia della longevità rappresenta un fenomeno complesso che sfugge a una definizione semplice e deve essere distinta dal più tradizionale concetto di "Silver Economy". Mentre quest'ultima si concentra principalmente su prodotti e servizi che soddisfano i bisogni immediati e i modelli di consumo degli adulti più anziani (Colurcio et al.2022a), l'economia della longevità abbraccia un approccio più ampio e sistemico al prolungamento della vita umana, integrando elementi di edonismo e estetica.

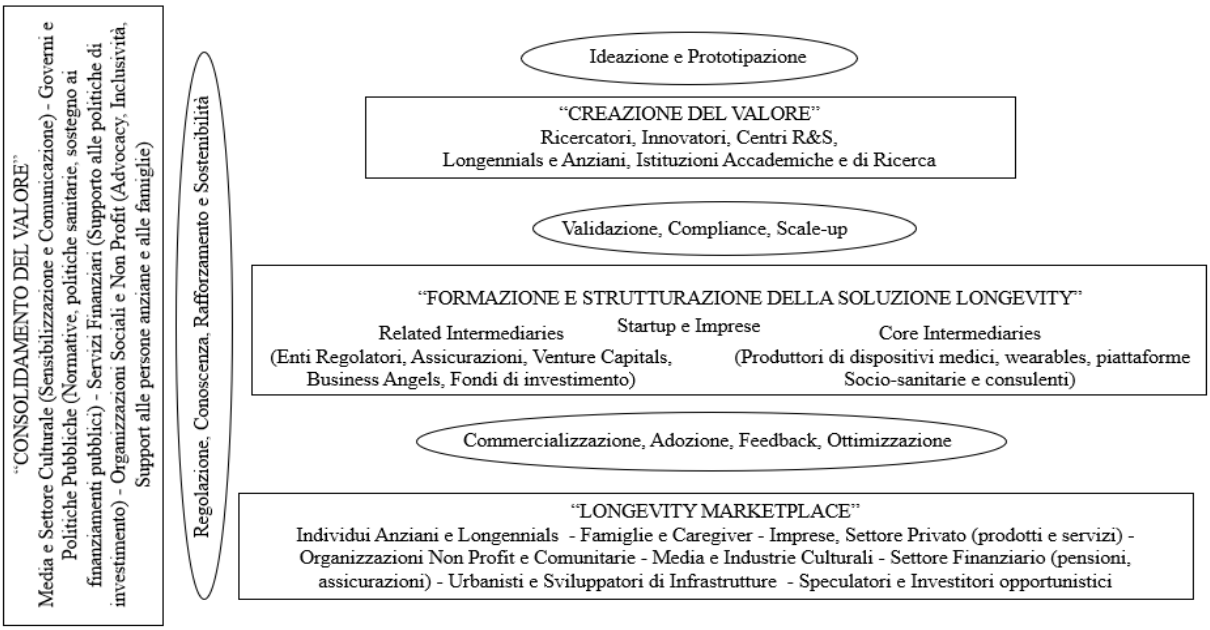
Si vuole parlare di economia della longevità, e non semplicemente di "settore", perché il concetto va oltre la definizione tradizionale di un comparto economico specifico e circoscritto. L'economia della longevità non si riferisce a un'unica industria o a un mercato ben delimitato, ma afferisce ad un ecosistema ampio e interconnesso che comprende diversi settori, attori e dinamiche economiche, sociali e tecnologiche legate all'aumento della longevità dell'individuo. A differenza di un settore economico tradizionale, che può essere definito in base a specifici prodotti, servizi o catene del valore (ad esempio, il settore farmaceutico o quello assicurativo) e dall'interconnessione di diverse dimensioni quali ad esempio tecnologia, funzione d'uso e mercato-clienti, l'economia della longevità abbraccia una pluralità di ambiti, tra cui la sanità, l'innovazione tecnologica, la finanza, le politiche pubbliche e i servizi. Ai contestatori più arguti, che d'altra parte ci troverebbero in parte con loro concordi vista la vasta lettura sulla difficoltà di definire un settore, che utilizzassero il criterio della domanda per definire la longevità quale settore economico per ribadire la presente riflessione si potrebbe portare ad esempio la vicina Silver economy. Quest'ultima si tratta di un'economia la cui domanda proviene principalmente da una fascia di popolazione specifica, ma la varietà dei settori coinvolti (e delle domande) e l'impatto sistemico fanno sì che la Silver Economy sia più un'economia trasversale che un settore chiuso e delimitato e che si può al massimo condurre ma non mortificare al concetto di macro-settore (Colurcio et al., 2022b). Se fosse un settore, potremmo delimitare chiaramente quali aziende ne fanno parte. Ma la Silver Economy attraversa e modifica più settori, creando un effetto a catena su tutta l'economia (Colurcio et al., 2022b). Uguale concettualizzazione si estende all'economia della longevità, suo obiettivo non è limitarsi al soddisfacimento dei bisogni immediati di una popolazione che invecchia, ma si estende alla costruzione di un modello sostenibile di vita lunga e di qualità, che riguarda tanto gli

anziani di oggi quanto le generazioni future. Questo ecosistema coinvolge un'ampia rete di attori: aziende, istituzioni finanziarie, enti regolatori e organizzazioni sociali, tutti chiamati a contribuire a una trasformazione economica che va oltre il mero profitto. L'economia della longevità, infatti, non è solo un'opportunità di mercato, ma una necessità strategica per ripensare il nostro modo di vivere, lavorare e innovare in un mondo in cui la durata della vita continua ad aumentare.

Si può affermare che l'economia della longevità emerga come risposta e catalizzatore in una società che invecchia, sostenuta da due forze distinte ma interconnesse: da un lato, la spinta verso l'invecchiamento attivo da parte della società, e dall'altro, la ricerca edonica individuale di una decelerazione o addirittura di un'inversione del processo di invecchiamento. Questa ricerca di piacere e bellezza si riflette in un crescente interesse per stili di vita salutari, estetiche di giovinezza e esperienze che promuovono il benessere psicologico e fisico. Questa duplice natura, che concerne sia l'adattamento della società a una vita più lunga sia il desiderio personale di mantenere la giovinezza e il benessere, distingue nettamente l'economia della longevità dalla Silver Economy, che è più focalizzata sui servizi. Il Silver Economy Forum (2024) ha evidenziato come la transizione verso una longevità economica rappresenti un'opportunità promettente di crescita, da cui la società può trarre beneficio in termini di invecchiamento attivo e in salute, contribuendo a ridurre e ottimizzare la gestione di risorse scarse.

Pertanto, la definizione di economia della longevità adottata in questo documento, considerata la più completa al momento attuale, è quella fornita dalla Commissione Europea (2024), che definisce: "l'economia della longevità emerge come un concetto trasformativo. Riconosce non solo l'invecchiamento, ma un cambiamento significativo nella durata della vita, obbligandoci a sfruttare la flessibilità e le capacità dell'età. Questa nuova economia non si limita a vivere più a lungo: si tratta di garantire che questi anni prolungati siano più sani, produttivi e soddisfacenti. Essa trascende l'attenzione per i gruppi di età più avanzata e capitalizza il dividendo della longevità a tutte le età, riconoscendo il prezioso contributo sociale ed economico degli individui più anziani al di là delle loro esigenze sanitarie. rappresenta una sofisticata convergenza di molteplici settori che si occupano non solo delle esigenze dell'attuale invecchiamento della popolazione, ma dell'intero ciclo di vita del potenziamento e dell'estensione della longevità". Come recentemente classificato dal World Economic Forum (WEF), la nuova economia della longevità comprende un insieme di industrie interconnesse, tra cui: sanità e biotecnologie (inclusi diagnostica, medicina personalizzata e assistenza preventiva), servizi finanziari (pianificazione del pensionamento, gestione delle pensioni e prodotti di investimento specifici per l'età), assicurazioni (assistenza a lungo termine e coperture sanitarie specializzate), alloggi (strutture di vita assistita e adattamenti per anziani), tecnologia (sistemi di monitoraggio della salute e dispositivi di assistenza) e beni di consumo (prodotti progettati per le popolazioni anziane). La traiettoria di sviluppo di questo macro-settore suggerisce un futuro in cui le soluzioni per la longevità diventeranno sempre più personalizzate ed efficaci, supportate da intuizioni basate sui dati e dalla collaborazione intersettoriale. Questa evoluzione è accelerata da diversi fattori chiave, tra cui tecnologie di sequenziamento genetico sempre più accessibili, che offrono informazioni personalizzate sulla salute; banche dati multiomiche in espansione, che forniscono una comprensione più profonda dei processi di invecchiamento; applicazioni avanzate dell'intelligenza artificiale negli interventi legati all'età; un mercato in crescita per prodotti e servizi finanziari personalizzati adattati all'allungamento della vita; tecnologie emergenti che supportano la vita indipendente e la connessione sociale; e innovazioni nella progettazione del posto di lavoro e nello sviluppo delle competenze per una forza lavoro multigenerazionale. È evidente che stiamo parlando di un'area economica che include settori come la ricerca sul cancro, il diabete, la demenza, l'Alzheimer e altre patologie legate all'invecchiamento. Ma non si limita a questo; riguarda anche l'alimentazione, l'autonomia e il benessere complessivo delle persone, oltre ai servizi finanziari e previdenziali, ai dispositivi per il benessere e alla vita sociale e comunitaria. Stabilire con precisione quali imprese possano essere ricondotte all'economia della longevità risulta pertanto complesso, poiché essa si intreccia e converge con molteplici discipline e vari stakeholder.

Longevity Economy: il suo ecosistema di innovazione



Analizzando i programmi, la struttura, i workshop, i relatori e le aziende partner presenti a questi eventi, è possibile delineare l'ecosistema dell'innovazione della longevità che risulta essere un sistema complesso e interconnesso sostenuto da una rete di collaborazioni tra settore pubblico, privato, organizzazioni non profit e comunità locali. Analizzando i programmi, la struttura, i workshop, i relatori e le aziende partner presenti a questi eventi, è possibile delineare gli attori principali. La mappatura qui proposta riflette il percorso delle soluzioni di longevità, dal concetto iniziale alla commercializzazione finale, utilizzando una struttura simile a quella utilizzata in Wilson et al. (2022) e permette di identificare: chi, cosa, quando e come, tabella 1. Dall'analisi degli eventi si conferma che l'ecosistema si sostiene sullo sviluppo di soluzioni innovative e integrate per affrontare sia le sfide dell'invecchiamento sia promuovere una vita più lunga e più sana. L'analisi degli eventi sulla longevità evidenzia non solo l'interconnessione tra progresso scientifico, dinamiche economiche e implicazioni sociali, ma anche alcune criticità legate alla loro natura altamente commerciale e orientata a un pubblico elitario. La maggior parte delle conferenze si svolge in luoghi esclusivi (Gstaad, Londra, Riyadh), con costi di partecipazione spesso elevati e un pubblico composto principalmente da investitori, fondatori di start-up e dirigenti aziendali. Ciò solleva interrogativi su chi beneficerà realmente delle nuove tecnologie anti-invecchiamento: si tratta di progressi per la popolazione generale o piuttosto di nuovi servizi e deformazioni del mercato del lusso. Il longevity global è composto da 878 membri, il 44% imprenditori, il 15% investitori, il 38% ricercatori", quindi gran parte degli attori sono imprenditori e ricercatori in cerca di validazione e sbocco al loro progetto di innovazione. Queste

ultime seguono un percorso che a partire dalla ricerca e dall'innovazione, passano attraverso la validazione e la strutturazione, per arrivare infine in pochissime al mercato. Il processo inizia con l'ideazione e la prototipazione, in cui il valore nasce grazie alla ricerca, all'innovazione e allo sviluppo di nuove soluzioni. In questa fase sono coinvolti ricercatori, innovatori, centri di ricerca e sviluppo, longennials e istituzioni accademiche. Questa attività porta alla creazione del valore, momento in cui si generano idee, tecnologie e modelli di business in risposta ai bisogni della longevità. Successivamente, il passaggio dalla teoria alla pratica richiede una fase di validazione, compliance e scale-up, in cui le idee vengono testate, adattate alle normative, il livello trasversale spiegato più avanti, e sviluppate su larga scala per poter raggiungere il mercato. A questo punto entra in gioco la formazione e strutturazione della soluzione longevity, che coinvolge startup e imprese. Gli attori principali in questa fase sono gli intermediari, suddivisi in due categorie: da un lato, gli enti regolatori, le assicurazioni, i fondi di investimento, i venture capital e i business angels, che forniscono supporto normativo ed economico; dall'altro, i produttori di dispositivi medici, i wearable, le piattaforme socio-sanitarie e i consulenti, che trasformano il concetto in un prodotto concreto; e le imprese e le startup del settore.

Una volta sviluppata, la soluzione viene commercializzata, adottata dal mercato e ottimizzata attraverso il feedback degli utenti e degli investitori. Qui si inserisce il longevity marketplace, l'ambiente in cui le soluzioni vengono offerte e utilizzate. Vi partecipano anziani, longennials, coloro che sono i destinatari specifici, famiglie, caregiver, imprese e in generale il settore privato con i suoi prodotti e servizi, i media e l'industria culturale, il settore finanziario con pensioni, investimenti e assicurazioni, urbanisti e sviluppatori di infrastrutture, oltre a speculatori e investitori, tabella 1 in appendice.

Si individua così come diversi attori siano presenti in maniera trasversale alle diverse fasi di sviluppo e funzionamento dell'ecosistema contribuendo al consolidamento del valore, abbiamo ad esempio i media e il settore culturale, che influenzano la percezione sociale della longevità; i governi, le istituzioni che con le politiche pubbliche stabiliscono regolamenti e finanziamenti che possono favorire o limitare la crescita del settore; il settore finanziario, che assicura il supporto economico attraverso strumenti del credito quali pensioni e investimenti, mentre le organizzazioni sociali e non profit offrono advocacy, supporto alle persone anziane e alle loro famiglie, favorendo un ambiente più inclusivo, equo e sostenibile. Questa struttura evidenzia l'interconnessione tra ricerca, innovazione, mercato e regolamentazione, mostrando come la longevity economy sia un ecosistema complesso che richiede la collaborazione di attori diversi per sviluppare soluzioni efficaci e sostenibili per l'invecchiamento attivo, figura 1. La codifica ha permesso di rilevare la presenza ricorrente di quattro principali categorie di attori: attori scientifici e clinici, prevalentemente attivi nella fase di ideazione, prototipazione e validazione (come ricercatori, medici, centri R&S); attori intermediari, tra cui regolatori, assicurazioni, venture capital e produttori di dispositivi, presenti soprattutto nelle fasi di scale-up e strutturazione della soluzione; attori finanziari e industriali, con un ruolo centrale nella fase di commercializzazione e ottimizzazione del valore; infine, attori di mercato e sistema, ovvero cittadini anziani, famiglie, imprese e policy maker, presenti nel marketplace e nelle fasi di consolidamento dell'impatto sociale ed economico.La distribuzione degli attori nei diversi eventi conferma una differenziazione funzionale tra summit di natura clinico-scientifica e summit orientati al business e alla policy. I primi, come il Medical Longevity Summit, si collocano prevalentemente nelle fasi intermedie del processo - validazione, compliance, strutturazione tecnica - con un forte focus sulla robustezza scientifica delle soluzioni e sulla regolamentazione medico-sanitaria. I secondi, come la Longevity Investor Conference o il Vatican Longevity Summit, presidiano le fasi terminali del processo - diffusione, commercializzazione, consolidamento - e coinvolgono attori con un orientamento finanziario, istituzionale o socioculturale. L'analisi comparativa rivela inoltre la presenza di pattern relazionali ricorrenti: in particolare, una crescente ibridazione dei ruoli, con attori tradizionalmente scientifici coinvolti in attività imprenditoriali e viceversa; l'emergere di coalizioni temporanee tra investitori, startup e policy maker per facilitare l'ingresso nel mercato di soluzioni validate; e l'attivazione di reti di lungo periodo tra istituzioni pubbliche, enti regolatori e comunità locali, finalizzate a consolidare l'accettabilità sociale delle innovazioni. In questo contesto, i longennials e i caregiver si configurano come figure-ponte tra la dimensione della creazione del valore e quella della sua adozione diffusa, svolgendo un ruolo attivo sia nella fase di co-design sia in quella di feedback e ottimizzazione. Nel complesso, il processo che emerge dall'analisi degli eventi si configura come un ecosistema dinamico e stratificato, nel quale gli attori non agiscono in sequenza lineare ma in modalità interattiva e spesso sovrapposta, con gradi diversi di impegno e di potere decisionale. L'approccio metodologico utilizzato ha consentito di ricostruire tali dinamiche, offrendo una lettura sistemica delle condizioni che facilitano o ostacolano l'innovazione longevity, e dei modelli organizzativi e relazionali che ne determinano il successo nei diversi stadi del ciclo di vita.

Fig. 1: Ecosistema della Longevità

Elaborazione degli autori

Research limitations. *Lo studio presenta alcune limitazioni che devono essere considerate nella valutazione dei risultati e delle implicazioni proposte. L'analisi si basa prevalentemente su dati secondari di eventi verticali sul tema, report e studi accademici. Questa impostazione, se da un lato consente una visione d'insieme e una sintesi delle conoscenze esistenti, dall'altro può limitare la capacità di cogliere dinamiche emergenti, percezioni degli attori coinvolti e variazioni contestuali che indagini più empiriche potrebbero cogliere. Inoltre, la natura concettuale dell'analisi, volta a strutturare e mappare l'ecosistema dell'economia della longevità, implica un certo grado di astrazione che potrebbe non tenere pienamente conto delle specificità operative e delle complessità pratiche che caratterizzano l'interazione tra gli attori del settore. L'assenza di validazione empirica diretta attraverso metodi quali interviste, survey o studi di caso rappresenta il principale limite, in quanto non permette di testare direttamente l'applicabilità e la concretezza del modello proposto nelle diverse realtà economiche e sociali. Per superare queste debolezze, ricerche future dovrebbero integrare approcci metodologici più articolati, combinando analisi qualitative o quantitative, coinvolgendo direttamente stakeholders chiave attraverso studi sul campo, e valutando l'effettiva implementazione delle soluzioni proposte nonché comprendere come evitare di generare e perpetrare disuguaglianze e inequità che già attualmente, in una società non progettata per la longevità, generano una riduzione della vita (Emanuel, 2021). Infine sarà importante interrogarsi su quanto la nuova economia della longevità sarà longeva e quali fattori possono contribuire a questo.*

Managerial implications. *Le implicazioni manageriali della longevity economy sono molteplici e richiedono una profonda revisione delle strategie di business, nonché un rinnovamento nell'innovazione dei prodotti e dei servizi e nelle modalità di interazione con un mercato in costante evoluzione. La sfida manageriale consiste nel saper integrare le innovazioni emergenti, tipiche della nicchia della longevity economy, nel regime consolidato, senza trascurare le dinamiche globali che ne guidano l'evoluzione. In tal senso, è necessario sviluppare strategie di integrazione e adattamento capaci di superare le barriere istituzionali e normative, promuovendo un dialogo costruttivo tra attori innovativi e strutture consolidate. I dirigenti devono creare strutture organizzative che facilitino la collaborazione tra scienziati e professionisti di business, sviluppando competenze interne per valutare innovazioni scientifiche complesse e tradurle in proposte di valore concrete per il mercato.*

Da un punto di vista strategico, le imprese devono ripensare i propri modelli di business per rispondere alle esigenze di una popolazione che invecchia, offrendo soluzioni personalizzate e integrate che uniscano salute, benessere e accessibilità. Tale approccio richiede un'attenzione particolare all'esperienza del cliente, considerando una clientela caratterizzata da bisogni, preferenze e capacità di spesa eterogenee. L'invecchiamento attivo, insieme alla crescente digitalizzazione, impone lo sviluppo di prodotti e servizi user-friendly, con interfacce intuitive e tecnologie assistive in grado di abbattere le barriere d'uso.

Sul fronte dell'innovazione e della ricerca e sviluppo, è indispensabile che le imprese investano in soluzioni volte a migliorare la qualità della vita, quali tecnologie per il monitoraggio della salute, telemedicina, dispositivi indossabili e piattaforme digitali per la prevenzione. In questo contesto, la collaborazione con istituzioni accademiche, startup e centri di ricerca si configura come un elemento cruciale per accelerare lo sviluppo e l'adozione di nuove tecnologie. In un settore in evoluzione come quello della longevity, i manager devono adottare un approccio di "regulatory foresight", anticipando cambiamenti normativi e contribuendo attivamente alla definizione di standard emergenti anziché subirli passivamente. I leader devono sviluppare competenze specifiche nella gestione di partnership complesse, implementando

sistemi di governance che bilancino autonomia e integrazione. La "coopetizione" diventa un modello prevalente che richiede nuovi approcci alla negoziazione e alla protezione della proprietà intellettuale. Inoltre i teams di R&S richiedono l'integrazione di competenze diverse (gerontologia, design, ingegneria, scienze comportamentali, scienze della vita), imponendo ai manager di creare ambienti collaborativi che favoriscano la cross-fertilizzazione. Diventa poi necessario integrare processi di validazione clinica/scientifica sin dalle prime fasi dello sviluppo prodotto, richiedendo competenze di regulatory intelligence e gestione dei rapporti con autorità scientifiche.

Dal punto di vista operativo, i manager devono affrontare le sfide legate alla scalabilità e alla sostenibilità economica delle soluzioni proposte. In particolare, la regolamentazione e i sistemi di rimborso sanitario assumono un ruolo centrale, rendendo essenziale una gestione efficace delle relazioni con enti regolatori e assicurazioni. Inoltre, l'adozione di modelli di business innovativi, come il pay-per-use, abbonamenti o modelli di finanziamento pubblico-privato, potranno influenzare significativamente la diffusione e la sostenibilità delle soluzioni dedicate alla longevità.

Infine, le imprese devono considerare anche l'impatto organizzativo e culturale delle trasformazioni in atto, ponendo particolare attenzione alla gestione delle risorse umane in un contesto intergenerazionale e all'adozione di politiche di inclusione e accessibilità rivolte sia ai clienti che ai dipendenti senior. I manager devono valutare attentamente il giusto equilibrio tra disruption digitale e approcci consolidati, considerando che nel mercato della longevity la fiducia e la reputazione giocano un ruolo cruciale. Le strategie di fusione e acquisizione possono rappresentare una via efficace per combinare innovazione tecnologica e credibilità di mercato. Parallelamente, la comunicazione e il branding devono evolversi per superare gli stereotipi legati all'invecchiamento, valorizzando il ruolo attivo degli anziani nella società e nell'economia e costruendo messaggi che enfatizzino benessere, empowerment e innovazione. Sarà poi fondamentale progettare esperienze cliente che considerino sia l'utilizzatore finale (anziano o longevo) sia altri stakeholder coinvolti nel processo decisionale (familiari, caregiver) e definire modelli di prezzo che garantiscano accessibilità economica pur mantenendo sostenibilità finanziaria, esplorando schemi di pagamento flessibili, modelli subscription e partnership con assicurazioni/sistemi sanitari. Le imprese e i cittadini devono cominciare a tenere in considerazione la ristrutturazione del percorso di vita di un individuo longevo che potrebbe avere nuovi tipi di bisogni o maturarne di tradizionali ma in fasi di vita differenti rispetto a quelle passate, ad esempio crisi di identità, necessità di formazione continua, nuove strutture del credito. La complessità dell'ecosistema della longevity economy richiede un approccio manageriale che integri diverse dimensioni trasversali a tutti i livelli operativi. La governance dell'innovazione etica emerge come elemento fondamentale, con la necessità di istituire comitati e processi decisionali che tutelino costantemente la dignità e l'autonomia dei consumatori, dalla fase di ideazione fino alla commercializzazione dei prodotti e servizi. La resilienza strategica si configura come capacità essenziale in un settore caratterizzato da rapidi cambiamenti demografici, tecnologici e normativi, richiedendo lo sviluppo di competenze organizzative orientate all'adattamento attraverso approcci di scenario planning e strategic foresight specificamente calibrati sulle dinamiche di lungo periodo che contraddistinguono la longevity economy. Questi elementi trasversali, integrati in una visione sistemica, costituiscono il fondamento per un approccio manageriale efficace in un contesto che richiede non solo competenze tecniche, ma anche una profonda comprensione delle dimensioni umane, etiche e sociali dell'invecchiamento. La complessità dell'ecosistema della longevity economy richiede un approccio manageriale che integri diverse dimensioni trasversali a tutti i livelli operativi. Questa integrazione diventa particolarmente critica quando si considera che le opportunità di mercato e di innovazione non dipendono solo dalla maturità tecnologica, ma da processi di allineamento sociali fondamentali per il successo in questo settore.

Originality of the paper. *Il presente studio espone la differenza tra Silver Economy e Longevity Economy evidenziando come la recente definizione proposta dalla Commissione Europea sia ad oggi la più adeguata a descrivere questa nuova dimensione. Inoltre, si tratta del primo studio a mappare gli stakeholders e il più ampio ecosistema dell'economia della longevità offrendo e aprendo nuove linee di ricerca sia a livello teorico sia manageriale.*

From Purpose to Impact: A Multi-Level Framework for Embedding Human-Centered Values in Service Ecosystems

MUHAMMAD JUNAID SHAHID HASNI[1] MARIA DELLA LUCIA[2] ERICA SANTINI[3]
STEFAN LAZIC[4]

Abstract

In a world marked by systemic crises and shifting social expectations, purpose has emerged as a central organizing principle for businesses. Yet the translation of purpose into actionable strategies remains fragmented, especially across different levels of service ecosystems. This paper proposes a conceptual framework that integrates Needs Theory (NT), Humanistic Management (HM), and Transformative Service Research (TSR) to explore how purpose-driven strategies can be operationalized at the micro (individual), meso (organizational), and macro (societal) levels. Drawing on a narrative literature review and emerging case examples, the framework outlines how human-centered values such as autonomy, dignity, inclusion, and shared value can inform service design, organizational culture, and stakeholder governance. This paper contributes to ongoing debates around sustainable value creation and ethical management by offering a multi-theoretical and multi-level lens to guide future empirical work on purpose-driven service transformation.

Framing of the research. *The notion of "purpose" has gained increasing traction in management discourse, not merely as a motivational tool but as a strategic orientation that redefines the role of business in society (Henderson, 2020; Mayer, 2021; Cucino et al., 2023). As consumers, employees, and policymakers demand greater alignment with ethical, environmental, and social values, firms are under pressure to move beyond performative responsibility and toward meaningful, systemic impact. Purpose has been recognized as a critical factor in shaping the main agenda of both individuals and organizations in the 21st century (Besley & Ghatak, 2017; George et al., 2023). This shift reflects social transformations (Hollensbe et al., 2014) and the impact of global crises that have exposed the limitations and vulnerabilities of profit maximization as a dominant guiding principle. Individuals, particularly among younger generations, are seeking meaningful work that aligns with their personal values and contributes to a greater social good (Gartenberg et al., 2016; Rosso et al., 2010). Consumers value brands' ethical conduct, transparency, and alignment with social and environmental values. Social and environmental movements advocate for justice, equality, and well-being (Accenture, 2018).*

This shift has reshaped the expectations placed upon businesses and their role in society (Blocker et al., 2024). A purpose-driven transformation in business is meant as a "strategic approach that extends beyond profit to encompass societal impact and stakeholder value" (Carreno, 2024, p. 1). The UN Global Compact (2022), the world's largest corporate sustainability initiative, underscores the importance of integrating purpose into business strategy as a means to foster long-term resilience and sustainable value creation. The institutionalization of purpose-driven business principles has also gained traction through influential academic and policy frameworks, including initiatives such as B Corporation certification and the Conscious Capitalism movement (Marquis, 2020). Business leaders and institutions have increasingly endorsed a broader, stakeholder-oriented conception of corporate responsibility that encompasses employees, communities, and the environment (Brammer et al., 2012). Organizations that invest in human well-being and demonstrate commitment to fairness and inclusion tend to benefit from enhanced employee engagement, talent retention, and innovation (Bailey et al., 2017; George et al., 2021).

However, while the business case for purpose is well-acknowledged, its implementation remains ambiguous. How can organizations embed purpose in a way that moves beyond branding or leadership rhetoric? How can businesses activate systems and structures that place human well-being and dignity at the center of their design and delivery logic?

This paper addresses these questions by proposing a multi-level conceptual framework rooted in the integration of three complementary theoretical perspectives: Needs Theory, Humanistic Management, and Transformative Service

Research. Together, they provide the foundation for a people-centered, purpose-aligned model of value creation in business and service ecosystems.

NT, particularly as articulated in Maslow's hierarchy of needs (Maslow, 1943) and Self-Determination Theory (Deci & Ryan, 2000), provides a psychological foundation for understanding fundamental human motivations (Cooke and Mills, 2008).

The study of human needs has evolved from rigid hierarchical models to dynamic, adaptive frameworks that recognize the uncertainty of human motivation. Traditional theories, such as Maslow's hierarchy, conceptualized needs in a sequential order, proposing that the self-actualization stage comes after once basic physiological and social needs are met. However, present research found that human needs are interdependent, context-sensitive, and influenced by several factors such as social, economic, and cultural (Suh, 2007). Purpose-driven individuals pass through these needs animatedly, seeking fulfillment not only for personal growth but also as a means of contributing to broader societal well-being. When workers, work communities, and organizations recognize this interplay of purpose and commitment throughout different ladders of the hierarchy of needs, they can create environments that support self-sufficiency, competence, and belongingness. ultimately fostering a sense of purpose and commitment. Purpose-driven service organizations use purpose oriented insights to provide work environments and service models that align individual fulfillment with collective progress (Hollensbe et al., 2014). By connecting needs theories with purpose based business practices, organizations can create shared values-driven models that do not simply pursue profit but also focus on ethical responsibility and human well-being. Hence, in purpose-driven service ecosystems, sustainability and human well-being become central goals for businesses that create environments that merely empower individuals, support communities, and drive meaningful societal transformation.

Unlike profit-driven models, Humanistic Management (HM) views individuals as ends in themselves, focusing on meaningful work and well-being (Melé, 2016; Dyck, 2020). This approach emphasizes dignity, ethics, and legitimacy (Pirson, 2020) by incorporating shared governance, ethical decision-making, and stakeholder inclusivity (Pirson & Turnbull, 2011). Despite HM being born with a strong individual-level emphasis within the business context, it has evolved to embed the multi-level nature of responsible managerial actions (Pirson, 2020; Laasch et al., 2020). Extending beyond organizations, HM contributes to ethical business cultures and societal well-being by integrating fairness, integrity, legitimization, company image, and reputation into the investigation (Pirson, 2015; Laszlo, 2019; Gomes et al., 2022; Shrivastava & Zsolnai, 2022). HM distinguishes people as naturally valuable, individually capable, and worthy of meaningful work that impacts both individual and societal well-being along with business progress. Service organizations that adopt a stakeholder-centered approach provide a friendly and healthy workspace and environment to the employees for their personal growth, work-life balance, and ethical leadership. By combining social and environmental responsibility into decision-making, HM helps in carrying out sustainable practices that associate financial success with societal well-being. This comprehensive and all-inclusive approach improves inter-organizational cooperation, urges ethical market behaviour, and directs purpose-driven innovation.

In this regard, Service Research has developed a stream of literature, i.e., Transformative Service Research (TSR), examining how some services might foster social change and individual and community well-being (Davis & Pechmann, 2013). At the core of TSR is well-being, conceptualized through both subjective and objective dimensions. While well-being reflects a state of thriving that characterizes the ongoing process of succeeding across various stages of work and life domains. Moving beyond efficiency and profitability, TSR focuses on value co-creation across different levels (Alexander et al., 2018). TSR emphasizes empowerment, accessibility, and inclusivity in service ecosystems (Andreassen et al., 2016) yet requires deeper exploration of systemic barriers and inequalities influencing service participation and outcomes (Galeone & Sebastiani, 2021). Studies have found that service-led well-being transformation requires collaborative and shared value creation within service ecosystems (Blocker & Barrios, 2015; Wieczerzycki et al., 2025). Scholars underlined that a purpose-driven approach supports the delivery of TSR principles at the service ecosystems level through stakeholder engagement, social impact, and sustainable service models (Berry et al., 2025; Dodds et al., 2022). It can assist service organizations in designing and implementing services that empower consumers and employees and create an ecosystem that enhances both individual and society flourishing.

Through bibliometric analysis, the study examines the evolution of research on these theories, investigating their co-occurrence and how purpose driven approaches interplay their core concepts at different levels.

Purpose of the paper. *This paper aims to assess how organizations embed purpose in a way that moves beyond branding or leadership rhetoric and how businesses activate systems and structures that place human well-being and dignity at the center of their design and delivery logic. In response to pressing environmental, social, and economic challenges, a growing body of literature is converging around the need for purpose-driven organizations (PDOs) that prioritize not only profitability but also societal and planetary well-being (Mayer, 2020; Henderson, 2021). This transformation represents a fundamental shift from the shareholder primacy model (Friedman, 1970) to an economics of purpose rooted in systemic innovation and inclusive value creation.*

Purpose-driven companies are characterized by their commitment to solving problems for people and the planet, not profiting from creating them (Mayer, 2020). Their mission is not merely aspirational but actionable and measurable through their governance, finance models, partnerships, and innovation strategies. These firms operationalize purpose through clear alignment across strategy, employee engagement, and stakeholder relationships, as emphasized by Henderson (2021) in her theory of architectural innovation.

According to Gionfriddo et al. (2024), purpose within PDOs is articulated along three integrated dimensions:

1. *Purpose: A socially-oriented reason for being that transcends profit, expressed in a company's mission and implemented across strategy and governance.*
2. *People: The centrality of individuals, inclusion, and the elimination of organizational inequalities, promoting a regenerative and human-centric organizational culture.*
3. *Impact: A commitment to measuring and maximizing positive social and environmental outcomes over time.*

These dimensions are not only theoretical but are reflected in the practices of exemplary Italian firms such as Aboca and Loccioni, where ownership structures, long-term visions, and ethical investment reinforce the integration of purpose at all organizational levels (Cucino et al., 2023; Gionfriddo et al., 2024).

Furthermore, Henderson (2021) emphasizes that a shared purpose enhances a firm's capacity for systemic or architectural innovation the reconfiguration of social and technical systems rather than incremental improvements. Purpose thus becomes a strategic enabler that allows organizations to break from dominant industry logic, reimagine value creation, and drive institutional change.

However, this shift is not without managerial challenges. The dynamics of PDOs require new competencies in vision alignment, relational governance, and inclusive leadership, capable of navigating complex trade-offs and creating trust-based ecosystems. Trust and shared purpose serve as invisible assets, enabling firms to form relational contracts, foster stakeholder alignment, and sustain innovation beyond market transactions (Henderson & Van den Steen, 2015). Purpose is not, therefore, a label but an organizing logic that, when embedded across operations, culture, and partnerships, can reorient firms toward the common good. Purpose-driven organizations, when authentically committed and structurally equipped, become powerful agents of regenerative innovation.

The emerging model of purpose-driven organizations reflects a significant shift in how businesses conceive value not just as economic output but as social, environmental, and human progress. What makes this transformation especially interesting is that it cannot be explained or operationalized by a single theory. Instead, it sits at the intersection of several complementary paradigms: Transformative Service Research (TSR), Needs Theory (NT), and Humanistic Management (HM). Here, TSR focuses on how service ecosystems can generate uplifting changes in individual and collective well-being. In a PDO context, this lens helps explain how services and business models can be intentionally designed to reduce inequality, increase access, and enhance life quality. Moreover, this lens underlines the importance of stakeholder inclusion, co-creation, and impact measurement in aligning purpose with delivery. TSR links directly with the "impact" dimension of PDOs making purpose tangible through outcomes that matter to people and the planet. NT (e.g., Maslow, Deci & Ryan's Self-Determination Theory) helps explain why purpose matters to employees, customers, and society. It gives a psychological foundation for purpose by emphasizing both the fulfillment of basic human needs, i.e., autonomy, competence, and relatedness, and the role of meaningful work in enabling personal flourishing and motivation. This aligns directly with the "people" pillar of PDOs recognizing that human-centered organizations are more resilient, innovative, and trusted. Finally, HM places human dignity, ethical reasoning, and stakeholder value at the center of managerial decision-making. It critiques the shareholder primacy model and calls for a governance model rooted in relational trust, justice, and moral legitimacy, and the integration of values into business strategy not just outcomes. This is deeply aligned with the "purpose" pillar of PDOs grounding mission and vision in ethical responsibility, not market positioning.

Methodology. *This paper adopted systematic literature reviews (SLRs) to investigate how NT, TSR, and HM collectively enhance the understanding of a purpose-driven approach and how their interaction better responds to a purpose-driven approach to shaping business management. The preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) protocol suggested by Moher et al. (2009) was employed to identify studies indexed in Scopus to ensure transparency and robustness in the studies' selection process (Mongeon and Paul-Hus, 2016). Moreover, we used Boolean operators in our search string, such as "AND" and "OR" to establish a logical conjunction between the keywords, "humanistic management*" OR "humanistic*", AND "need theor*", AND "transformative service*" OR "service*", ensuring that only publications containing all these terms are retrieved within the domain of "title, abstract, and keywords" of the publications in the Business, Management, and Accounting domains. The asterisk (*) is used to account for variations in the keywords. Following the PRISMA approach, the final pool of selected articles was further analyzed using bibliometric descriptive and co-occurrence analyses.*

The initial search based on distinct search strings gave a limited number of articles, only 35. The final sample data were organized into two Microsoft Excel files (.csv) for descriptive analysis using Bibliometrix (Siemieniako et al., 2021) on Biblioshiny using RStudio (version 2024.12.1+563) and co-occurrence analysis (Mariani et al., 2023) using VOSviewer (version 1.6.20) software (Van Eck & Waltman, 2010). The descriptive analysis examined publication trends, prolific authors, highly cited works, influential countries, visualizations of WordCloud and TreeMap, and key topics, main anchored word, and their interconnections, with linkage strength determined by keyword associations (Nalbant & Aydin, 2025).

Results. *The bibliometric and thematic content analysis reveals a growing and diversifying scholarly interest in the intersection between Needs Theory (NT), Humanistic Management (HM), and Transformative Service Research (TSR) as foundational pillars in the study and practice of purpose-driven organizations (PDOs). Our results offer key insights across three analytical levels: (1) publication and citation trends, (2) keyword mapping through word cloud, TreeMap, and co-occurrence clusters, and (3) thematic clusters derived through content analysis.*

The publication trend over the last 54 years (from 1971 to 2025) indicates that studies on investigated sets of keywords were first published in 1971 (Gross, 1971). Over time, the number of publications has notably increased since 2019 with 23 articles in the last seven years (2019 to 2025). Furthermore, studies have been dispersed across various journals. The Humanistic Management Journal has emerged as the leading journal. Geographically, the most productive countries include China, the USA, and the UK, while the USA leads in total citations, suggesting higher international impact and reach. These patterns reflect both a global diffusion of interest in purpose-driven research and the heterogeneity of its disciplinary applications, from public policy to marketing and organizational behavior.

The most frequent keywords in the literature such as human, job satisfaction, healthcare quality, social welfare, and service industries confirm the centrality of well-being-oriented service logic in the purpose-driven business paradigm. Key terms tied to NT (e.g., Maslow's hierarchy of needs, self-care, awareness), HM (e.g., ethics, collaboration), and TSR (e.g., co-creation, service encounter) reinforce the relevance of these theoretical domains in shaping organizational purpose.

Similarly, words like self-care, co-creation, and awareness explain the role of the service ecosystem in inspiring people at individual and community levels. Interestingly, the emergence of terms like female, male, and human experiment hints at increased sensitivity to ethical considerations, demographic inclusivity, and diversity critical aspects of both TSR and HM frameworks.

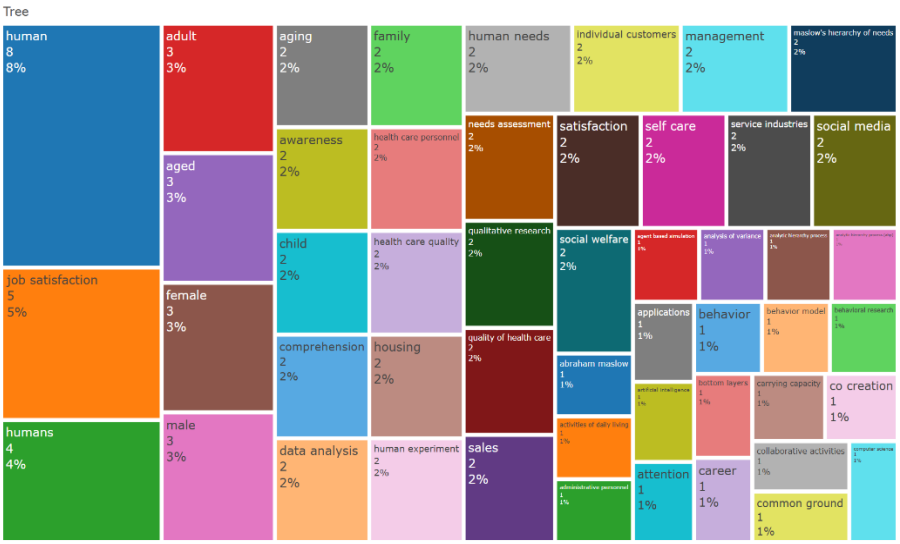

Fig. 1: Wordcloud

Source: Authors' own work

The TreeMap of bigrams from research titles further confirms the relevance of recurring concepts such as human, job satisfaction, healthcare quality, family, and aging. These reflect the multi-level engagement of PDOs, from individual well-being to systemic design, aligning closely with TSR's emphasis on uplifting changes in service ecosystems. Simultaneously, references to Maslow's hierarchy of needs and human needs connect to NT's psychological framing of purpose, while the presence of awareness and self-care points to internalized drivers of pro-social behavior.

Fig. 2: TreeMap

Source: Authors' own work

To translate the foundational insights from NT, HM, and TSR into actionable strategies, we propose a multi-level framework that conceptualizes how human-centered values such as dignity, autonomy, inclusion, and shared well-being can be embedded across three interconnected levels of service ecosystems: micro, meso, and macro.

At the micro level, purpose is expressed through the satisfaction of core human needs (Deci & Ryan, 2000), such as autonomy, competence, and relatedness. This level focuses on meaningful work and psychological safety, employee empowerment and well-being, customer co-creation experiences, and recognition of individual dignity in service encounters. Here, NT provides the foundation, showing how human needs and motivations can be fulfilled within service interactions, leading to deeper personal engagement and trust.

At the organizational (meso) level, the framework emphasizes governance structures, leadership behaviors, and culture-building that align operations with values. Key mechanisms include ethical and participatory leadership, purpose-aligned strategy and measurement systems, relational governance and stakeholder integration, internal social innovation, and learning environments. Humanistic Management becomes essential here, embedding human dignity and moral responsibility in decision-making processes, work design, and institutional identity.

At the macro level, service ecosystems are shaped by collaborative, cross-sectoral engagement aimed at addressing systemic challenges. PDOs act as agents of regenerative change by engaging in cross-sector partnerships for sustainability, but also promoting inclusive governance and civic participation, supporting policy advocacy and community building, and generating positive externalities (e.g., well-being, resilience, equity) This layer is deeply informed by TSR, which focuses on how service design and delivery can transform communities and foster systemic well-being.

Research limitations. *The study lacks empirical evidence and validation as it is theoretical and bibliometric. Future studies should consider this framework of TSR, HM, and NT for an empirical-based model. The keywords and databases are not all-inclusive. This study relied on a predetermined set of keywords and only one database, Scopus, which may limit the exclusivity of these key constructs. Future studies can include more keywords to provide more generalized outcomes and use other prominent databases while searching for relevant literature. These databases may include indexed and non-indexed databases to add well-published contributions along with grey literature. Also, the analysis is primarily limited and focused on titles and abstracts which may not provide full depth of conceptual relationships of key constructs, i.e., TSR, HM, and NT. Future studies can overcome this limitation by considering keywords-based conceptual associations to provide more in-depth literature insights.*

Managerial implications. *The proposed multi-level framework offers concrete guidance for managers, leaders, and policy-makers seeking to embed human-centered values into the core logic of their organizations and service ecosystems. It serves a dual function: both as a diagnostic tool and as a design heuristic. Managers can use the framework to map how purpose and human-centered values are currently distributed across the organization and its environment. Beyond diagnosis, the framework acts as a strategic design guide to help managers develop aligned interventions across the organization. Purpose, when operationalized at all three levels, becomes more than a mission statement it becomes a guiding logic for strategic decisions, employee relations, innovation, and stakeholder engagement.*

Originality of the paper. *This study explores how literature addresses organizations embedding purpose driven actions that move beyond branding or leadership rhetoric and how businesses activate systems and structures that place human well-being and dignity at the center of their design and delivery logic. The value of the resulting framework lies in its recognition that purpose is both a design and alignment challenge. Indeed, micro-level flourishing is unsustainable without meso-level support, but at the same time, meso-level culture cannot thrive without macro-level enabling conditions. Purpose-driven organizations, therefore, must strategically align values and practices across all three levels, ensuring coherence between individual experience, organizational integrity, and ecosystemic impact.*

Changing for Good: Conceptualizing life-affirming organizations

STEFAN LAZIC[1] MARIA DELLA LUCIA[2]

Abstract

Life-affirming heterodoxy encompasses approaches that call for a shift away from the extractivist economy and the pursuit of exponential growth, characteristic of neoliberal capitalism. Instead, it advocates for a new economic orthodoxy grounded in principles that prioritize life and safeguard the integrity of socio-ecological systems. These principles require a fundamental redefinition of business purpose and management practices. This article conceptualizes life-affirming organizations (LAOs) as values-based and purpose-driven entities that help catalyze this transformative shift in both the economy and society toward the creation of life-affirming systems. For this purpose, we adopt a multiparadigmatic approach to review and integrate two heterodox approaches in business management and development - Humanistic Management and Regenerative Development. Though rooted in different disciplines and offering different perspectives, both share a commitment to advancing the common good. Using bibliometric literature reviews and qualitative thematic analysis, we develop a framework for LAOs by synthesizing the humanistic "inside-out" perspective with the regenerative "outside-in" lens guided by life-affirming principles. The former, grounded in dignity, extends human agency from individuals to organizations and systems. In contrast, the latter views organizations as embedded within complex socio-ecological systems shaped by more-than-human agency. By integrating anthropocentric and ecocentric foundations, LAOs interweave living beings, organizational structures, and ecological systems to chart pathways for transformative, purpose- and values-driven change. This concept yields theoretical and practical contributions, offering guidelines to support human-nature synergy and the thriving of all life within businesses and human organizations.

Framing of the research. *The current crises of the Anthropocene are disrupting the multiscale interactions among humans, their social structures, and the natural world (Bebbington et al., 2019; Sanford, 2019). These crises highlight the need for a comprehensive and holistic shift away from the still dominant neoliberal paradigm focused on growth and profit. Progress toward a clear and compelling alternative for systemic change requires interdisciplinary research (Haider et al., 2018), offering a critical stance on the dominance of anthropocentrism to reshape the interactions among nature, space, and society based on new foundational premises (Collard et al., 2018). Over the years, different conceptual and theoretical proposals have been advanced in an attempt to catalyze the shift, frequently being positioned within the "diverse economies" frame (Gibson-Graham, 2008). This work is also placed within this search for the ways in which humans can organize business and other activities to achieve the change in practice and shift the relationships between human enterprises and the natural world (Heikkurinen et al., 2016; Lovins, 2015).*

Recently, Waddock (2022, p.275) has systematized previous contributions into the concept of "life-affirming heterodoxy," new economic models that prioritize life and the integrity of socio-ecological systems. These models emphasize the interdependence and mutual well-being of people, nature, and complex living systems, while also bridging the long-standing divide between anthropocentric and ecocentric perspectives that has hindered the development of a "viable alternative" to mainstream economics (Harnesk & Isgren, 2022, p. 1678). Waddock (2022) envisions this alternative paradigm as a "new life-affirming economic orthodoxy" (p.275) that integrates various strands of economic heterodoxy into a cohesive framework. This integration is grounded on principles and values originating from a multidisciplinary literature that give life to both human and natural systems and sustain their evolution (Waddock & Kuenkel, 2019). The principle of "Relationality and connectedness" focuses on the multiple interactions between living beings and the environment. "Stewardship of the whole" addresses the multiscale maintenance of human and natural health in the system. "Cosmopolitan-localist governance" emphasizes novel forms of participatory governance rooted in a local context but linked to global systems. "Co-creation of the collective value" prioritizes dignity and well-being, promoting the societal common good over profit. "Regenerativity, reciprocity, and circularity" describes resource circularity within natural regenerative capacities that are supported through mutually beneficial relationships among beings. Finally, "equitable markets and trade" that develops as an outcome of the interaction between the previous five principles, secures market access and sufficiency of local producers through honest trade practices.

These foundational principles provide a broad basis for establishing a new economic orthodoxy replacing the dominant neoliberal paradigm. They also open pathways for identifying business and management theories aligned with economic heterodoxies - ones that redefine business purpose by shifting toward relational value, ecological regeneration,

and social equity - enabling the translation of this vision into more localized and managerial applications. Humanistic Management (HM) and Regenerative Development (RD) are heterodox approaches in business management and development that have recently emerged from multidisciplinary research fields and practices aimed at moving beyond growth-and-profit-centered managerial models to drive systemic transformation in the economy and society. HM draws from studies in responsible management, entrepreneurship, cooperative capitalism, and business ethics. It is based on the intrinsic dignity and ethical value of human beings and aims to humanize businesses and society (Pirson & Lawrence, 2010). In contrast, RD originates from environmental and systems thinking. It seeks to align human activities with ecological processes and to generate net positive outcomes for planetary health (Bellato et al., 2022; Reed, 2007).

Purpose of the paper. *Informed by Waddock's call (2022) for "new life-affirming economic orthodoxy" (p.275) that integrates various strands of economic heterodoxy into a cohesive framework, this paper aims to conceptualize Life-affirming organizations (LAOs) as catalysts for transformative change in economies and societies toward the creation of life-affirming systems. The purpose is to envision the form of human organizations that could apply life-affirming principles in practice and through this contribute to the search for alternative business models for reshaping economies towards a new economic orthodoxy. HM and RD are the heterodox approaches to business management and development selected to ground this concept. Rooted in different disciplines offering distinct perspectives on change, both approaches share a commitment to advancing the common good grounded in values-based foundations. The leading research questions are: What makes an organization life-affirming? How can the foundations of HM and RD be integrated into the framework that defines LAOs?*

Methodology. *This paper adopts a multiparadigmatic approach (Gioia & Pitre, 1990) to review and integrate heterodox approaches in business management and development with the aim of conceptualizing LAOs. This approach is chosen as it facilitates the generation of more holistic insights by bridging diverse worldviews and exploring complex phenomena beyond the limitations of a single paradigm (Gioia & Pitre, 1990). The diverse disciplinary foundations underlying HM and RD provide the integrative insights needed for driving transformative change toward the creation of life-affirming systems. The research design includes Systematic Literature Reviews (SLRs) conducted with the PRISMA method (Moher et al., 2009) and bibliometric and thematic content analyses (Abbott & Monsen, 1979; Caputo et al., 2021). Results were systematized through the lens of Waddock's (2022) life-affirming principles in an integrated framework that defines LAOs.*

SLRs (Donthu et al., 2021) were performed with the strings "humanistic management" and "regenerative development" in Scopus and Web of Science databases in areas of economics, organizational, management, and business studies published in English until December 2023. For HM, 372 articles were screened, then narrowed to 80 after several rounds of filtering, with 13 added through snowballing, for a total of 93. For RD, 410 articles were screened, arriving at 85 and adding 11 through snowballing to reach a final sample of 96 articles. SLR was chosen as a method to select the literature as it is effective for a manageable sample size, allowing us to precisely identify relevant literature within our research domains while excluding publications from unrelated fields. In this case, SLRs followed PRISMA protocol for literature selection (Moher et al., 2009).

The final samples were examined through co-occurrence analyses (Caputo et al., 2021) and thematic content analysis (Abbott & Monsen, 1979). The co-occurrence analysis, conducted with VOSviewer (1.6.20), was used as it enables the identification of key concepts in samples and measurement of the strength of interconnectedness among them (Caputo et al., 2021) based on keyword frequency and linkages. The default minimum occurrence setting was adjusted from five to two to capture a broader conceptual network (van Eck & Waltman, 2010). In the HM sample, 35 keywords were grouped into four clusters, while in the RD, 48 keywords formed five clusters. Thematic content analysis of the samples was performed with Atlas.ti software (version 9), a widely used software in qualitative research (Zhang & Wildemuth, 2009). Following four rounds of coding and reduction, the HM sample yielded 176 codes grouped into 8 categories. The RD sample produced 148 codes and the same number of categories. In both samples, these categories were synthesized into four macro-level themes. The process involved iterative refinement and deeper exploration of relationships among codes, categories, and themes.

Waddock's (2022) broadly defined life-affirming principles, combined with a reflexivity approach (Alvesson et al., 2008) that examines how knowledge is produced within the literature and its broader social context, informed the systematization of the results of the co-occurrence and thematic content analysis. Reflexivity also enabled us to connect conceptual insights and practical implications, leading to the identification of actionable guidelines for developing life-affirming organizations. The outcome of this final step was the creation of a framework for LAOs, conceptualized as open human organizations that can foster human-nature synergy and secure the flourishing of all living beings, encompassing responsible, financially viable economic activities rooted in local contexts.

Results.

Core theoretical foundations and themes in HM and RD streams

The study identified the key theoretical foundations of HM and RD, which were reflected in co-occurrence clusters and across macro themes of thematic analysis encompassing meso-level categories (code groups) and micro-level codes.

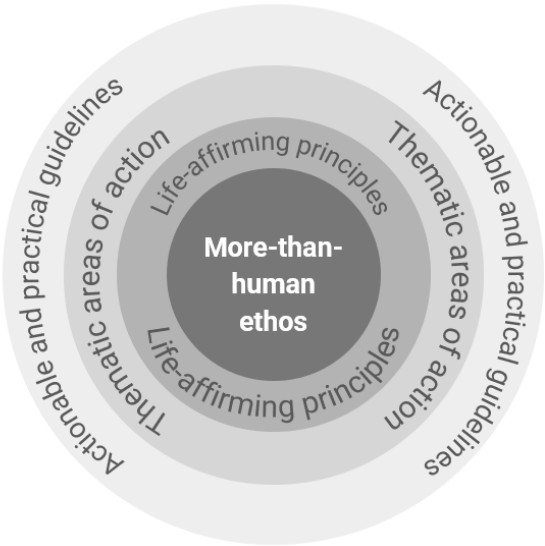
In the HM stream, three core themes emerged prominently, focused on dignity, business ethics, and leadership, alongside managerial practices on individual, organizational, and societal levels informed by these principles. Dignity is understood as a universal attribute granted to all individuals within (and beyond) an organization, supporting value-creation (Pirson, 2017), collaborative governance (Pirson & Turnbull, 2011), and inclusive decision-making (Bachmann et al., 2018). Dignity is closely linked to the care for others and mutuality in the business environment, fostering

interpersonal relationships, social value creation, and environmental stewardship (Dierksmeier, 2016). Business ethics extends dignity in business practices, affecting corporate governance, innovation, and the relationships between the organization and society. Ethically-driven organizations promote employee trust (Spitzeck, 2011), diversity (Melé, 2016), and workplace freedom (Dierksmeier, 2016), while advancing the common good (Dyck, 2020), aligning internal values with social needs (Laszlo, 2019), and collaborating with other organizations for collective progress (Pirson & Lawrence, 2010). Leadership is a crucial element in shaping firms' cultures that prioritize dignity, well-being, and morality over efficiency and profits (Dillon, 2021). Leaders grounded in humanistic values help safeguard human rights and the cultural identity of the organization (Melé, 2003). They also promote participatory governance, collaborative actions, and power decentralization (Pirson & Turnbull, 2011) to support viewing organizations as communities of people (Melé, 2003).

In RD, themes reflect the multidisciplinary and systemic nature of this stream. We identify three themes addressing essential characteristics of the RD paradigm, along with the content exploring the need for the regenerative mindset in the current world. Holistic transformation is at the core of regenerative actions guided by living systems thinking (Bellato et al., 2022; Du Plessis & Brandon, 2015), which observes organizations and environments as dynamic, interdependent, and constantly evolving. This theme emphasizes the interconnectedness between humans, other living beings, and nature in co-evolving, bioregional socio-ecological systems (Bellato et al., 2023; Mehmood et al., 2020). It promotes a shift from fragmented to integrated worldviews, recognizing place-based development as essential to shaping regenerative actions (Benne & Mang, 2016). Collective co-creation emerges as a key mechanism for translating systems thinking into actionable, localized strategies that foster productive relationships among organizations, people, and the environment. All stakeholders are seen as co-creators (Spiller et al., 2010), contributing to systemic health, and supporting the exchange of energy, capital, and resources. These exchanges are supported by participatory governance structures that embrace pluriversal forms of knowledge, and local-specific practices, and ensure inclusivity in decision-making processes. These prominent themes converge in the idea of anthropo-bio harmonization, which underscores the need for synergy between human organizations and nature to promote collective well-being and ecological health. It highlights multiscale relationships that respect ecosystem boundaries and advocate for adaptive human behavior. This perspective also calls for a reconnection with nature - emotionally, cognitively, and spiritually - helping organizations align with the complexity of the natural systems in which they operate (Du Plessis & Brandon, 2015).

Framework for LAOs

Our proposed framework conceptualizing LAOs systematizes and integrates the multidisciplinary literature on HM and RD into four concentric circles (Figure 1). At its center lies a more-than-human ethos, which grounds and sustains the six core principles of LAOs (second circle). The outer circles translate these principles into thematic areas of action and practical guidelines that can inform place-specific interventions (third and fourth circles). These are derived from thematic and co-occurrence analyses, by reflexively examining the findings to construct actionable narratives that can be translated into context-specific actions. Further reflexive analysis was performed through the lenses of life-affirming principles, interlinking them with the content from the analyses. The framework's components are interconnected and mutually influential, ensuring holistic impact and functionality across scales, also correcting fragmented structures frequently present in classic and top-down enterprise models.



Grounded in a more-than-human ethos (Gherardi & Laasch, 2021), the framework highlights the complexity, interdependence, and uniqueness of LAOs (Bellato et al., 2022b; Caniglia, 2019), along with the need for bioregional adaptive responses to achieve systemic harmony (Bellato et al., 2023; Mang & Reed, 2012). LAOs are understood as communities of people embedded within and responsible for the health of broader biosystems. The core principles of LAOs recognize the intrinsic value of all life forms and actively foster co-existence between humans and nature, serving as stewards of ecological and social regeneration.

The relational nature of life-affirming organizations emerges through the connections they foster - both internally, among departments and teams, and externally, with broader society - reflecting the principle of "relationality and connectedness." These multi-scale relationships support organizational cohesion and social inclusivity, contributing to a more equitable economy. By applying living systems thinking, organizations gain insight into the dynamics of their surrounding environments and enhance bioregional harmony through stewardship and active engagement in local networks. The principle of "stewardship of the whole" is rooted in a regenerative mindset centered on care, responsibility, and holistic well-being. Life-affirming organizations act as pillars of healthy societies by promoting socio-ecological justice and facilitating interactions within the organization and the society to support system-wide thriving. "Cosmopolitan-localist governance" is grounded in essential human dignity and ethical behavior, shaping inclusive, participatory decision-making structures. Leadership in life-affirming organizations protects the value of each individual and ensures that diverse voices contribute to shaping organizational direction. Collaborative governance forms shape networks within and beyond an organization to secure the creation of the integral common good that benefits all employees and stakeholders. The principle of "co-creation of collective value" is expressed through participatory cultures that empower all members of the organization to contribute to shared goals. Life-affirming organizations function as communities where people interact meaningfully, fostering transformative learning, social innovation, and a shift from individualistic goals to communal well-being. Their activities align with human motivations while maintaining socio-ecological responsibility. "Regenerativity, reciprocity, and circularity" are supported by ethical, relational, and regenerative practices that sustain mutually beneficial relationships within and beyond the organization. This principle reinforces human-nature synergy, promoting net positive impacts that restore ecosystems and respect natural boundaries. Life-affirming organizations give back to nature through place-based, context-specific actions that regenerate socio-

ecological systems and support circular flows of resources, energy, and capital. Finally, the principle of "equitable markets and trade" reflects a shift in how economic activities are designed and carried out. They act in service of the systemic intercations among the previous five principles, supporting the life-affirming perspective instead of advancing economic reasoning as the sole purpose of organizations' actions. Life-affirming organizations prioritize ethical exchanges, stakeholder well-being, and humanistic values over profit maximization and perpetual growth. By adopting ecological worldviews and codes of ethics, they contribute to stable, sustainable economies that protect the environment and promote the flourishing of all life.

Actionable guidelines facilitate the application of each principle in practice and their translation into context-specific actions. To establish interconnectedness, organizations need to secure interactions among individuals, between individuals and organizations, and between organizations with other entities. It is achievable by identifying and understanding the dynamics of these relationships and by changing the purpose of the relationships to include diverse social groups that co-exist in the organization's environment. Stewardship is established through nurturing practices that maintain and improve human and non-human health both inside and beyond the organization. The successful stewarding role of one organization is achievable by understanding and using the patterns of exchange of resources, energy, and capital among actors to improve the health of the whole organization and system. Governance is built by creating space for employees' and stakeholders' participation in relevant decision-making processes that can be achieved through horizontal structures where power is distributed and divided. It also asks for context-specific monitoring tools to assess the impact of an organization's actions on both human and non-human systems. Identification of the collective goals that can be beneficial both for the organization and those involved, and actions that lead to their achievement, helps in securing the co-creation of collective outcomes. These goals do not necessarily have an economic value but are linked to the improvement of the well-being of those involved beyond the financial conditions. Organizations need to understand the functioning of the socio-ecological metabolism to which they belong and support the circularity of resources for securing their regeneration. It requires giving back to nature and improving its health to achieve reciprocity in their relationships. Lastly, to ensure equitable markets and trade, organizations need to create services or products that adapt to natural boundaries and respect the social, ecological, economic, and other limitations of the environment. These activities need to secure the organization's responsibility toward its environment and financial flows that can guarantee social responsibility toward its employees and broader society.

Fig. 1: Conceptual framework for life-affirming organizations Source: Authors

Research limitations. *LAOs are conceptualized on HM and RD, two heterodox approaches to business management and development selected as the foundation for this framework. As the research focuses on these two approaches, the contributions to the framework are currently limited to their perspectives. However, the framework could be expanded to incorporate other heterodox approaches that address more-than-human well-being and human organizations. Further research is needed to implement the framework in real-world settings and evaluate the ways in which its principles and guidelines translate into context-specific actions. Such practical applications offer insights into the framework's potential to support transformative processes and foster life-affirming organizations and systems. Field-based implementation could also generate practitioner-driven evidence to refine and strengthen the framework's content.*

Managerial implications. *This conceptual paper integrates diverse strands of heterodoxy in business management and development into a cohesive framework for creating values-based, purpose-driven organizations. These organizations aim to support both human and non-human well-being while maintaining sustainable financial practices. The paper provides a strong theoretical foundation along with actionable guidelines for applying life-affirming principles in practice, enabling the development of organizations and systems whose core purpose is to sustain all forms of life. By challenging the predominantly anthropocentric approaches to organizational and managerial theories (Kortetmäki,*

Heikkinen & Jokinen, 2022), LAOs promote organizational democracy, shared decision-making, and management free from power abuse (Garriga & Melé, 2004). Rather than prescribing fixed pathways, the framework offers adaptable guidance for context-specific actions, allowing for flexibility across diverse places and management settings. It encourages grounding organizational design, leadership, and decision-making in a more-than-human ethos and principles valuing life and socio-ecological systems. Managerial implications exhibit the potential of including more-than-human ethics and stewardship of the whole socio-ecological system as key components of internal organization for strengthening relationships among organizations' members and with organizations' enviornment, inclusive stakeholder management for collective contribution, and innovative ways for assessing the impact of organizations' activities for the creation of the common good beyond individual or purely financial gains. Managers inspired by these principles act as transformative leaders, guiding the organizations toward a purpose centered on the flourishing of all life. LAOs can serve as prototypes for responsible, values-based, and purpose-driven organizations capable of fostering systemic change from the ground up.

Originality of the paper. *The integration of heterodox approaches in business management and development into a cohesive framework remains largely unexplored. This paper takes the first step in bridging two approaches - HM and RD - by synthesizing the humanistic "inside-out" perspective with the regenerative "outside-in" lens. This integration aims to catalyze the emergence of life-affirming organizations that act for the good of all forms of life. The outcome of this work contributes to the ongoing research within the "diverse economies" frame (Gibson-Graham, 2008), and especially around the analyses of economic heterodoxies for the creation of "a new life-affirming orthodoxy" (Waddock, 2022, p.275). The article responds to Waddock's call to interconnect diverse heterodox approaches into a comprehensive whole and overcome theoretical boundaries in constructing a new orthodoxy that could respond to "grand challenges" of the Anthropocene (Waddock & Kuenkel, 2019). Multiparadigmatic approach allowed to bridge diverse theoretical constructions, to ensure an implementation of a systemic perspective within LAOs that can ensure comprehensive value creation within one organization and in its environment. It supports more-than-human well-being to extend the positive impact of the organization's actions and goes beyond financial rationale to focus on non-economic results of its activities. HM brings dignity, ethics, and legitimacy into business management and development, while RD extends systems thinking and the principle of anthropo-bio harmonization from socio-ecological systems to organizations. The conceptualization of LAOs is novel and marks the first attempt to scale the discourse on life-affirming heterodoxy to the levels of business management and place development. This scaling down is essential to operationalizing economic heterodoxies within real-world managerial practices, as businesses and institutions are key agents in shaping socio-ecological systems.*

Key words: *life-affirming heterodoxy; multiparadigmatic lens; humanistic management; regenerative development; life-affirming organization; purpose-and-values driven*

Generativity, responsible innovation and biodiversity: the contribution of business to the common good

MARTINA TAFURO[1] VALENTINA CUCINO[2] GIANLUCA GIONFRIDDO[3] ANDREA PICCALUGA[4]

Abstract

The multiple and severe crises of our time are deeply rooted in an economic model driven by relentless growth and profit maximization. This model has not only accelerated environmental degradation and resource depletion but has also exacerbated social inequalities and weakened collective well-being. These consequences have been intensified by cultural shifts that prioritize individualism, consumerism, and immediate gratification, often at the expense of long-term prosperity. In response to these challenges, we propose generativity as a powerful alternative, a cultural and practical approach capable of fostering creativity, innovation, collaboration, and the development of new social and economic frameworks that emphasize long-term well-being over short-term gains. Generativity encourages regenerative practices, i.e., practices that systematically sustain ecological balance and social equity, positioning businesses as key agents of change.

Central to this transformation is the concept of corporate purpose, which serves as a guiding principle for businesses to define their role in society beyond profit generation. More specifically, a pro-social corporate purpose reflects an organization's commitment to align its strategic economic goals with broader social and environmental concerns. By integrating purpose into their core identity, businesses can contribute to the common good, foster stakeholder engagement and strengthen their capacity to address complex global challenges. By creating shared value, purpose-driven organizations are better equipped to balance financial performance with social impact, offering meaningful contributions to their communities while enhancing employee motivation and trust.

Closely tied to this vision is the concept of responsible innovation, which emphasizes the ethical and societal dimensions of technological and organizational advancements. Responsible innovation ensures that businesses adopt forward-looking strategies that prioritize long-term social value, inclusiveness and accountability. This approach requires organizations to anticipate potential risks, engage stakeholders in decision-making processes, and actively design innovations that contribute to societal well-being. By integrating responsible innovation into their practices, businesses can transition away from purely performance-driven models and adopt more sustainable strategies that foster resilience and adaptability.

Generativity, purpose, and responsible innovation are all deeply connected to the concept of biodiversity, which plays a vital role in counteracting the growing dominance of uniformity and de-differentiation in economic and social systems. Biodiversity, in this context, extends beyond environmental conservation to encompass diverse business models, organizational structures and innovative approaches. By promoting variety in entrepreneurial practices and encouraging flexible solutions, biodiversity reinforces resilience and strengthens the capacity of businesses to thrive.

Our research aims to provide empirical evidence of the connections between generativity, corporate purpose, responsible innovation and biodiversity. To achieve this, we have designed a quantitative study that involves distributing structured questionnaires to 200 micro-enterprises and 200 SMEs across Italy. The questionnaire explores multiple dimensions of these themes using Likert scales (5-point and 7-point) and multiple-choice questions informed by recent literature and validated by two research groups.

We anticipate that our findings will offer valuable insights into how generativity shapes corporate purpose, how responsible innovation can strengthen biodiversity, and how these interconnected themes collectively foster purpose-driven business practices. By examining micro-enterprises and SMEs, often overlooked in research on responsible business, our study highlights the potential of these smaller organizations to act as catalysts for meaningful change. Ultimately, our goal is to build a conceptual framework that supports businesses in transitioning from a growth-focused economic model to one that prioritizes generativity and biodiversity. By integrating purpose into their strategies, businesses can unlock new pathways to responsible innovation, biodiversity preservation and shared value creation.

Framing of the research. *This research is situated within the broader context of the pressing crises that define the contemporary world, which have been significantly influenced by the societal shift from a culture of necessity to one of desire, particularly in the wealthier nations (Bauman and Magatti, 2007). More specifically, Magatti argues that the paradox of desire lies in the fact that, despite living in an age obsessed with it, desire is actually diminishing. Modernity attempts to define, possess, and satisfy desire, reducing it to concepts like happiness, interest, and utility, which ultimately strip it of its depth. In this transformation, desire is desecrated rather than safeguarded, leading to an endless yet futile attempt to fill what can never truly be satisfied. This transformation, while accompanying an unprecedented era of economic growth, has also triggered a series of severe social, environmental, and economic problems that characterize the "anthropocene", an epoch defined by human-induced changes to the planet (Magatti and Giaccardi, 2024). These interconnected challenges, ranging from environmental degradation to rising social inequalities, demand an urgent and multifaceted response. Central to this response is the need for a profound shift in our cultural, social, and economic paradigms, particularly in how we approach business and its role in society (Giaccardi and Magatti, 2022). In addressing these crises, the project will focus on two core elements: generativity and corporate purpose, exploring how these concepts can drive the necessary change.*

Generativity, in this context, refers to both a cultural and practical response to crises, emphasizing long-term and system thinking, and the cultivation of systems that generate positive, lasting outcomes for society and the environment (Magatti and Giaccardi, 2014; Magatti and Giaccardi, 2024). The study will explore how generative practices - those that focus on nurturing wellbeing, life, culture, and the environment can provide a viable alternative to current patterns of exploitation and consumption. The concept of corporate purpose, which has gained prominence in recent years (e.g., George et al., 2023), will be examined as a critical tool for guiding organizations toward the need to contribute to the common good.

Purpose of the paper. *The purpose of this paper is to develop a deep understanding of how generativity and corporate purpose can contribute to a shift toward biodiversity. This study seeks to explore how these two concepts can serve as critical drivers in transforming business models, especially in the context of SMEs, towards more responsible, sustainable, and biodiverse approaches. By combining these two emerging fields, we aim to provide a fresh perspective on how businesses can align their operations with broader societal and environmental goals, moving beyond traditional profit-maximization strategies to focus on long-term value creation and positive social impact (Asselle and Piccaluga, 2019).*

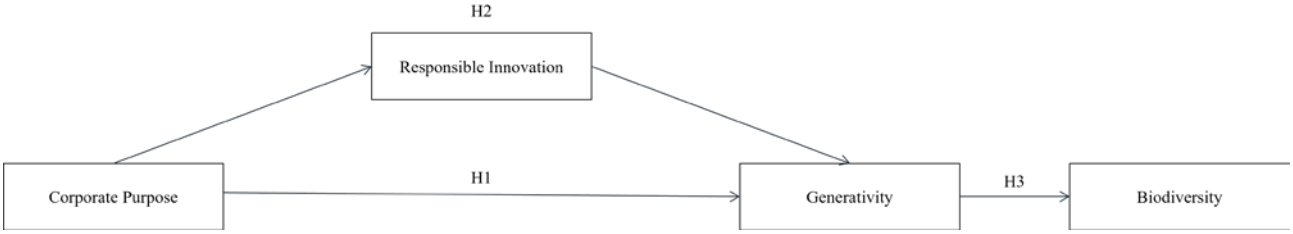
Generativity is a central concept in this paper, representing the drive to create new, life-affirming systems that promote ecological sustainability, social well-being, and economic equity. Generative practices are those that focus on long-term solutions rather than short-term gains, emphasizing responsible innovation that not only seeks profitability but also aims to restore and regenerate the environment, create social value, and contribute to the common good (Magatti and Giaccardi, 2014; Magatti and Giaccardi, 2024). We will investigate how generativity can be embedded within the corporate purpose of SMEs, fostering a culture that prioritizes responsibility, long-term sustainability, and the creation of shared value. Generative businesses are not merely reactive to crises but proactive in designing solutions that address the root causes of these issues, contributing to the regeneration of both their communities and the environment.

Corporate purpose, as explored in this paper, extends beyond the traditional view of a company's role in society. It is no longer sufficient for a business to operate solely to maximize profit. A company's purpose must now include creating value for all its stakeholders: employees, customers, local communities, and the broader society. George et al. (2023) define purpose in for-profit companies as "the essence of an organization's existence by explaining what value it seeks to create for its stakeholders. In doing so, purpose provides a clear definition of the firm's intent, creates the ability for stakeholders to identify with, and be inspired by, the firm's mission, vision, and values, and establishes actionable pathways and an aspirational outcome for the firm's actions" (p. 1847). We will examine how SMEs can embrace a purpose-driven approach, integrating it into their strategic vision and daily operations. The integration of corporate purpose with generativity presents an opportunity to transition from a purely financial-driven mindset to one that actively contributes to the common good (Cucino et al., 2023). Consequently, we formulated our first research hypothesis:

***Hypothesis 1 (H1):** Corporate purpose positively contributes to generativity.*

This paper will investigate how the combination of generativity and corporate purpose can also drive responsible innovation within companies. Von Schomberg (2013) defines responsible innovation as "a transparent, interactive process by which societal actors and innovators become mutually responsive to each other with a view to the (ethical) acceptability, sustainability and societal desirability of the innovation process and its marketable products" (p. 19). By fostering an innovative mindset that embraces generative principles and aligns with a clear corporate purpose, SMEs can develop solutions that address the most pressing global challenges, such as environmental degradation, inequality, and resource scarcity. We will explore how SMEs can use responsible innovation not just to compete in the market, but to become agents of change that help drive a shift toward more generative systems. Consequently, we formulated our second research hypothesis:

***Hypothesis 2 (H2):** Responsible innovation positively moderates the relationship between corporate purpose and generativity, such that the relationship is stronger when responsible innovation is high.*



Additionally, the paper will explore how these concepts, generativity and corporate purpose, interact with biodiversity, another crucial factor in the sustainability transition. Biodiversity is not just an environmental issue but a central component of both social and economic well-being. The preservation of biodiversity is critical to maintaining

healthy ecosystems, which in turn support human life and prosperity. We will explore how SMEs, through their generative and purpose-driven activities, can contribute to the protection and restoration of biodiversity, whether by implementing sustainable practices, promoting circular economies, or innovating products and services that benefit both nature and society. By connecting these themes, we aim to offer a holistic framework for understanding how SMEs can drive sustainability at both the business and societal levels. Consequently, we formulated our third research hypothesis:

Hypothesis 3 (H3): *Generativity positively contributes to biodiversity.*

Through the empirical analysis of Italian micro-enterprises and SMEs, we will collect data that supports the theoretical connections between these concepts, testing the following research model:

Fig. 1: Research model

This research will provide valuable insights into how SMEs can actively contribute to the achievement of sustainability goals, offering evidence-based recommendations for businesses to align their strategies with generativity and corporate purpose. The findings will contribute to the growing body of literature on sustainable business practices, particularly in the context of smaller enterprises, and offer a new perspective on how these businesses can serve as catalysts for positive social, environmental, and economic change. While much research has focused on large corporations as the primary drivers of change, small and medium-sized enterprises (SMEs) have often been overlooked despite their potential to influence broader economic and social dynamics. This study intends to bridge that gap by focusing on SMEs, particularly Italian micro-enterprises and small businesses, to understand how they can integrate generativity and purpose into their practices. The research will seek to answer how these enterprises can move from being seen as merely profit-driven entities to becoming key contributors to societal well-being and environmental sustainability. By exploring the interconnections between generativity, corporate purpose, responsible innovation, and biodiversity, we aim to develop a comprehensive framework that will guide SMEs in their transition toward sustainability, providing empirical evidence of how they can contribute to the solution of the crises we face today.

Methodology. *The methodology for this research consists of three key phases: design, data collection, and data analysis. In the design phase, we developed a structured questionnaire for CEOs and general managers of micro-enterprises and SMEs in Italy, aimed at assessing the influence of generativity on corporate purpose, the impact of responsible innovation on biodiversity, and the combined effects of these factors. The constructs are defined based on recent literature, and each of them is measured following established frameworks. For generativity, we take into account three generativity phases and three dimensions with a 7-points Likert scale. The first phase, "creative generativity", assesses the business's ability to generate new ideas and projects. The second phase, "organizational generativity", focuses on how the business supports and nurtures ideas and projects over the long term. The third phase, "transitive generativity", evaluates the business's ability to help projects grow autonomously, with respondents rating their company's support for ongoing innovation. As far as concerns dimensions, we measure the "intertemporal" dimension to understand how the company creates value with a medium-to-long-term perspective, taking into account future generations. The "intersubjective" dimension examines the extent to which the company engages, values, and nurtures external partners. Lastly, the "contextual" dimension assesses how the company stimulates change and inspires new initiatives in the surrounding community, city, or territory.*

For corporate purpose, we refer to the construct developed by Jasinenko & Steuber (2023), which emphasizes the perceived organizational purpose by employees and its alignment with both internal values and external societal needs. The measurement of corporate purpose is grounded in a scale that evaluates four dimensions of purpose: authenticity, guidance, contribution and inspiration. This approach allows us to capture the perception of purpose as a guiding principle in strategy, with a focus on its impact on common good.

For responsible innovation, we employed the scale developed by Zhang et al. (2023). This scale focuses on four factors: anticipation, reactivity, inclusion and reflexivity. Companies are asked to rate how their innovation practices contribute to these areas, using a 7-points Likert scale. The scale is designed to capture both the degree to which innovation is integrated with responsible practices and the extent to which the organization prioritizes the inclusion of stakeholders in its innovation processes.

Finally, biodiversity is measured based on its key components: monitoring, restoration, compensation and prevention, measured with a 5-points Likert scale. This approach is informed by established practices for assessing biodiversity conservation efforts in organizations. The items capture the extent to which companies are currently engaging in biodiversity-related actions, as well as their willingness or potential interest in doing so. This approach aligns with

standard practices for assessing biodiversity conservation in organizations and helps to gauge both the current state of engagement and the potential for future involvement.

In the data collection phase, we collected data through the method of Computer-Assisted Telephone Interviews (CATI) to ensure a high response rate and representative sample. This method allows us to conduct structured interviews with business owners, managers, and directors, providing strategic insights into their organizational practices. The CATI method will facilitate real-time data collection, ensuring accuracy and reducing errors typically associated with other survey methods. The interviews will be conducted with 200 micro-enterprises and 200 SMEs across Italy, ensuring a diverse sample that reflects different industries and regional contexts. Respondents will be asked to provide their answers to the questions based on their company's current practices regarding generativity, corporate purpose, responsible innovation, and biodiversity.

In the data analysis phase, we will employ both descriptive and inferential statistical methods. Specifically, we will test our hypotheses through multiple regression models based on Structural Equation Modeling (SEM), also considering the impact of control variables such as firm size, industry, and regional context influence the results. SEM will be used to examine the causal connections and the strength of relationships between the themes, allowing us to test the theoretical framework. SEM will help us assess direct and indirect effects, providing a comprehensive understanding of the relationships between the variables. This multivariate approach will allow us to identify patterns, assess their significance, and offer a robust picture of how generativity, corporate purpose, responsible innovation, and biodiversity influence sustainability outcomes.

Results. *We anticipate that our findings will offer robust insights into the dynamic relationship between generativity, corporate purpose, innovation, and biodiversity. We expect to identify key patterns that demonstrate how generativity drives purpose-driven business strategies, fostering long-term biodiversity and innovation. Specifically, we hypothesize that companies with a strong generative orientation will demonstrate greater commitment to sustainable practices, enhanced stakeholder engagement, and increased innovation linked to social and environmental impact. Additionally, we expect our findings to reveal how biodiversity-focused strategies - both in ecological terms and in promoting diverse organizational models - enhance business adaptability and long-term viability.*

In addition to testing the proposed hypotheses, this research aims to develop a comprehensive framework for the "Generative Principle" that can serve as a practical guide for businesses. This framework will outline actionable strategies and best practices to help organizations foster generativity, leveraging corporate purpose, responsible innovation and biodiversity initiatives. By doing so, the study seeks to provide managers and decision-makers with concrete tools to enhance their positive impact on prosperity. We will analyze how responsible innovation practices strengthen biodiversity initiatives, drive environmentally conscious decision-making and helping businesses navigate the complexities of today's volatile landscape. Furthermore, we aim to provide evidence that companies embracing these interconnected themes are better positioned to transition from growth-focused capitalism to sustainability-driven models.

Research limitations. *We acknowledge several potential limitations in our study. First, the sample size, while extensive, is limited to Italian micro-enterprises and SMEs, which may restrict the generalizability of our findings to other regions or larger firms. Additionally, as our data relies on self-reported questionnaires, there is a risk of response bias. Future research should expand the scope by including international comparisons and exploring sector-specific dynamics to build on our insights.*

Managerial implications. *Our findings will offer actionable insights for managers and business leaders seeking to integrate generativity into their strategic frameworks. By adopting generativity-driven practices, firms can develop purpose-driven strategies that balance economic performance with social and environmental responsibility. Managers will gain guidance on how to foster organizational cultures that embrace innovation, collaboration, and long-term thinking. In particular, our research emphasizes the importance of cultivating a workplace environment that actively encourages experimentation, knowledge-sharing, and collective problem-solving. Managers who embed generativity principles into their leadership styles can enhance employee engagement, foster greater innovation, and improve decision-making processes that prioritize long-term value creation over short-term gains. Moreover, these insights can support businesses in building stronger stakeholder relationships, as a generative approach often aligns corporate values with social and environmental objectives.*

Additionally, the insights on biodiversity will inform businesses on how promoting diversity in organizational structures, products, and partnerships can drive resilience and innovation. By aligning these strategies with corporate purpose, managers can position their firms as forward-thinking leaders in sustainability, meeting the growing demand for ethical, environmentally responsible business practices.

Our research further highlights that by adopting generativity-focused strategies, managers can leverage biodiversity as a tool for fostering adaptability in rapidly changing market conditions. By diversifying supply chains, encouraging multi-disciplinary collaborations, and engaging in open innovation processes, firms can reduce their dependency on rigid business models and enhance their capacity to innovate in response to emerging challenges.

Originality of the paper. *This paper will offer a novel approach by integrating the emerging fields of corporate purpose and generativity within the broader context of responsible innovation and biodiversity. While current literature tends to treat these topics as separate entities, we seek to merge them into a unified framework that consider the inherent complexity of pressing societal and environmental challenges of our time. The originality of this paper lies in its conceptualization of the "Generative Principle", which serves as the central framework linking these diverse yet*

interrelated concepts. Additionally, we place a strong emphasis on the role of businesses as transformative agents capable of bridging the gap between theoretical models and real-world applications in the pursuit of biodiversity. The exploration of how businesses can contribute to generativity through actions that foster social equity and environmental well-being is particularly timely, given the current urgency for change in both societal structures and organizational practices.

A key element that distinguishes this research is its focus on micro-enterprises and SMEs, which have traditionally been overlooked in strategic and sustainability-oriented studies. While large corporations have long been the focal point of discussions on corporate responsibility and sustainable practices, smaller companies are often neglected, despite their substantial potential to foster positive change in local economies and broader societal contexts. This paper will fill an important gap in the literature by examining how micro-enterprises and SMEs can actively contribute to generativity, corporate purpose, responsible innovation and biodiversity, thus serving as key catalysts for social and environmental transformation. Through this unique lens, we aim to demonstrate that smaller enterprises, far from being mere bystanders, can drive innovation and sustainability within their respective sectors and communities.

The paper also stands out for its empirical research design, which involves surveying Italian micro-enterprises and SMEs to gather data that supports the theoretical framework. By employing a quantitative approach, this study will offer robust empirical evidence that connects the concepts of corporate purpose, responsible innovation, generativity, and biodiversity. The use of a survey allows us to directly capture insights from businesses actively engaged in sustainability practices, providing a clearer understanding of how these smaller entities are contributing to environmental and social well-being. Furthermore, this research aims to contribute to the literature by offering new insights into how businesses can shift from traditional profit-driven models to more purpose-driven models, thereby promoting a broader transition toward a sustainability-focused economy.

Keywords: *generativity; purpose; biodiversity; responsible innovation*

Open innovation 2.0 for sustainability: the different way to implement business model innovation

ROSARIA FERLITO[1] ROSARIO FARACI [2]

Abstract

This paper examines how startups and incumbent firms engage in Open Innovation 2.0 within innovation ecosystems to foster sustainability-oriented business model innovation. Despite the increasing importance of open innovation in driving sustainable transitions, the specific pathways adopted by different types of firms remain underexplored.

The study addresses the following research question: How do startups and incumbent firms engage in Open Innovation 2.0 to foster sustainability?

Using a multiple-case study methodology, we analyzed seven Italian benefit corporations, consisting of three startups and four incumbent firms, to identify distinct sustainable open innovation patterns.

Our findings reveal that startups and incumbents adopt notably different approaches. Startups primarily follow two distinct patterns: (1) Corporate Venture Capital (CVC)-driven sustainable innovation, where corporate venture capitalists support and orchestrate startup-driven sustainability initiatives by providing critical resources and strategic guidance; and (2) Pro-social innovation, in which social incubators facilitate ecosystem-based sustainable business development through active knowledge-sharing and stakeholder engagement.

Conversely, incumbents pursue two alternative patterns: (3) Innovability, characterized by the integration of sustainability and innovation within structured collaborative frameworks aimed at maintaining competitive advantage; and (4) Industrial symbiosis innovation, emphasizing interorganizational resource exchange and circular value creation within the innovation ecosystem.

This study contributes to the literature by clarifying how startups and incumbent firms pursue sustainability through leveraging innovation ecosystems, highlighting differences in governance mechanisms, relationships, and value creation processes. By distinguishing between startup-driven and incumbent-driven mechanisms, the research emphasizes how governance structures, collaborative dynamics, and value creation processes differ according to the type of firm involved.

From a managerial perspective, the study provides valuable insights into how diverse firms can effectively leverage open innovation ecosystems to enhance sustainable innovation.

Framing of the research. *Over the years, scholarly research has demonstrated that firms operate within networks that significantly influence their competitive advantage (Ritala et al., 2009). This relationship is particularly relevant in innovation activities, where success often depends on integrating knowledge from diverse external sources (Chesbrough, 2003). Consequently, Chesbrough introduced the open innovation paradigm, where firms acquire ideas and technologies externally and leverage their own ideas and technologies to other firms to reduce costs and accelerate the introduction of novel solutions (Chesbrough, 2003).*

In 2014, this concept evolved and was defined as a "distributed innovation process that relies on purposively managed knowledge flows across organizational boundaries, using pecuniary and nonpecuniary mechanisms aligned with the organization's business model to guide and motivate knowledge sharing" (Chesbrough & Bogers, 2014). Knowledge flows take various forms, including outside-in and inside-out (Chesbrough, 2017), as well as outside-out and inside-in (Gutmann et al., 2023). The European Commission labeled this advanced understanding as 'Open Innovation 2.0' (European Commission, 2016; Di Minin et al., 2018) to emphasize that sharing and co-creating innovation can benefit a broader spectrum of stakeholders (Curley & Salmelin, 2017).

This paradigm closely relates to the concept of innovation ecosystems, wherein innovation emerges from interactions among various actors, frequently spanning multiple industries and technological domains (Corsaro et al., 2012). Specifically, an innovation ecosystem is defined as a "group of autonomous firms and individuals whose actions, decisions, and investments are complementary, meaning their collective value is greater than the sum of individual contributions" (Baldwin, 2020). The collective value arises from relational rents derived from specific resources, knowledge-sharing routines, complementary capabilities, and effective governance (Dyer & Singh, 1998). Effective

governance involves orchestration mechanisms that are "particularly necessary for future-oriented value creation aimed at both incremental and radical innovation" (Ritala et al., 2009, p. 572).

Furthermore, existing literature underscores a robust connection between open innovation processes and their impacts on triple bottom line performance (Curley, 2015). Specifically, the collaborative principle suggests that firms should transcend short-term economic goals by integrating environmental and social considerations into innovation processes, thereby adopting a long-term outlook (Kennedy et al., 2017; Costa & Matias, 2020). Consequently, innovation is increasingly assessed not merely by its novelty but also by its contribution to enhancing sustainability performance within ecosystems (Kennedy et al., 2017).

Purpose of the paper. *Open innovation oriented toward radical sustainability improvements requires distinct strategic and organizational patterns (Kennedy et al., 2017). Although scholarly interest in Open Innovation 2.0 has been growing, there is still a limited understanding of how firms harness ecosystem-based logics to implement sustainable business models. This paper seeks to address this gap by investigating whether startups and incumbent firms adopt different approaches when engaging with innovation ecosystems to drive sustainable transitions.*

Accordingly, the study addresses the following research question: How do startups and incumbent firms engage in Open Innovation 2.0 to foster sustainability?

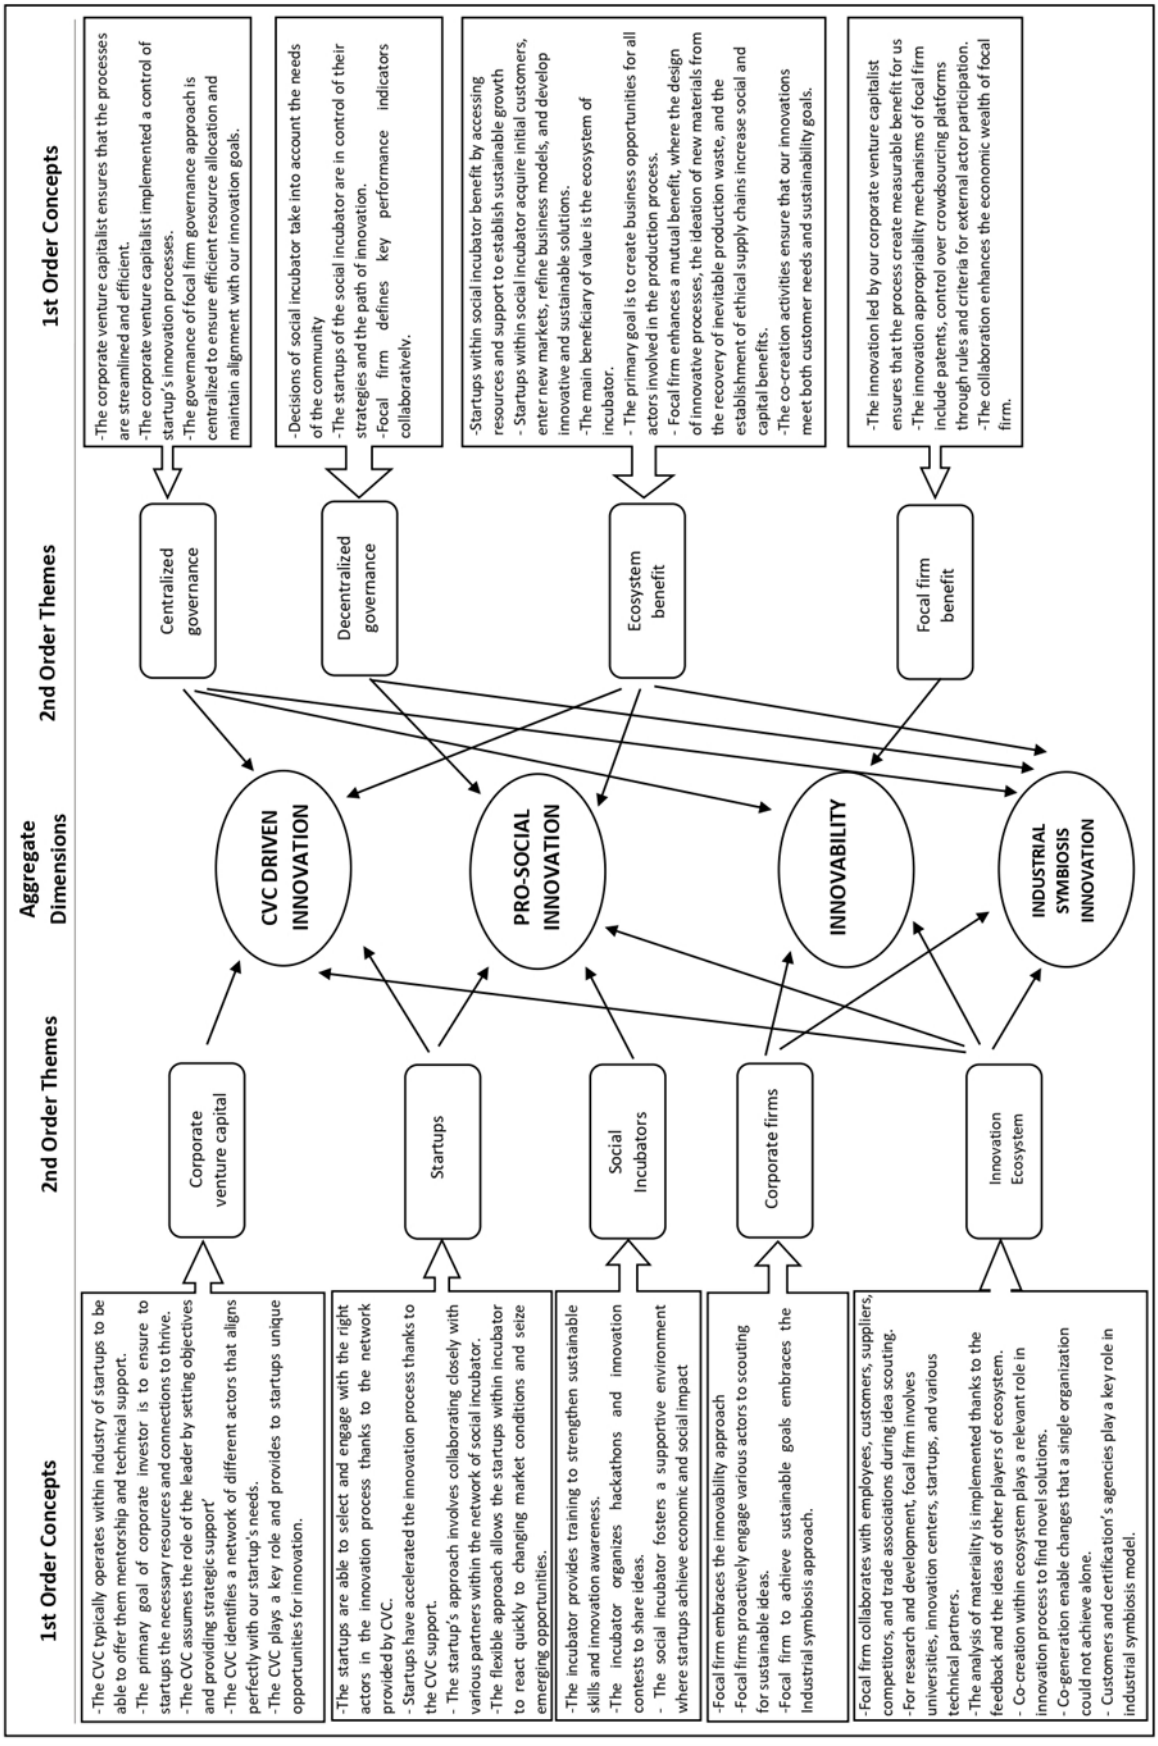
The aim is to develop a nuanced understanding of the innovation practices adopted by these two categories of firms, shedding light on their distinct pathways toward sustainability through open and collaborative dynamics.

Methodology. *In seeking insights, we adopted an inductive approach to investigate Open Innovation 2.0 patterns for achieving sustainable goals. This research employed a multiple-case study methodology, as comparative analysis provides in-depth understanding of complex social phenomena (Eisenhardt, 1989). The selected cases consisted of Italian benefit corporations ('società benefit'). We chose this category of firms because, by law, they pursue a dual mission: profitability and the common good. Consequently, these corporations are mandated to innovate their products, processes, and business models from a sustainability perspective (Mion & Loza Adaui, 2020).*

Our research design incorporated both interviews and secondary data sources. Specifically, the data collection phase comprised three main stages:

Firstly, benefit corporations were identified through the AIDA database (Aida Bureau Van Dijk, 2024). We analyzed company websites and impact reports to include in the sample only those firms explicitly emphasizing sustainable innovation in their strategies and business models.

Secondly, we conducted seven semi-structured interviews with representatives from seven Italian benefit corporations, three startups and four incumbent firms. We defined:



- *Startups as newly established enterprises aimed at developing and commercializing innovative products, services, or solutions. They seek to disrupt traditional industries by introducing novel technologies and addressing unmet market needs. Given the complexity, non-linearity, and resource demands of innovation processes (Chesbrough, 2003), startups often form strong external collaborations to overcome inherent constraints (Rothaermel & Deeds, 2004; Fukugawa, 2018).*
- *Incumbent firms as established enterprises with significant market presence, extensive experience, ample resources, stability, and an established customer base.*

Data collection occurred from September 2023 to January 2024. Interviews were conducted remotely via Zoom, lasted between 30 and 90 minutes, and were recorded and transcribed. A structured interview protocol ensured consistent coverage of topics, facilitating comparisons across case studies (Gioia et al., 2013). The protocol was divided into two sections: the first focusing on general firm information—such as mission, core values, industry, history, and product offerings, as well as the interviewee's role; the second section comprised questions based on literature regarding innovation ecosystems and Open Innovation 2.0. Questions addressed business processes for achieving dual missions, as well as key players, partners, and stakeholders. Consistent with Gioia, Corley, and Hamilton's approach (Gioia et al., 2013), terms such as 'ecosystem' and 'open innovation' were intentionally avoided. Secondary data—including company documents, online media articles, and official websites—were analyzed to triangulate interview insights (Yin, 2013).

Finally, collected data were analyzed following the methodology developed by Gioia et al. (2013), involving a three-step coding process: open coding, axial coding, and theoretical coding. Aggregate dimensions form the foundation for the results presented in this paper (Figure 1).

Throughout the analysis, intermediate findings were frequently reviewed with a senior researcher not involved in data collection to ensure internal consistency and external validity. Additionally, an external researcher with substantial expertise in innovation was included in the analysis process to mitigate bias, playing the role of 'devil's advocate.'

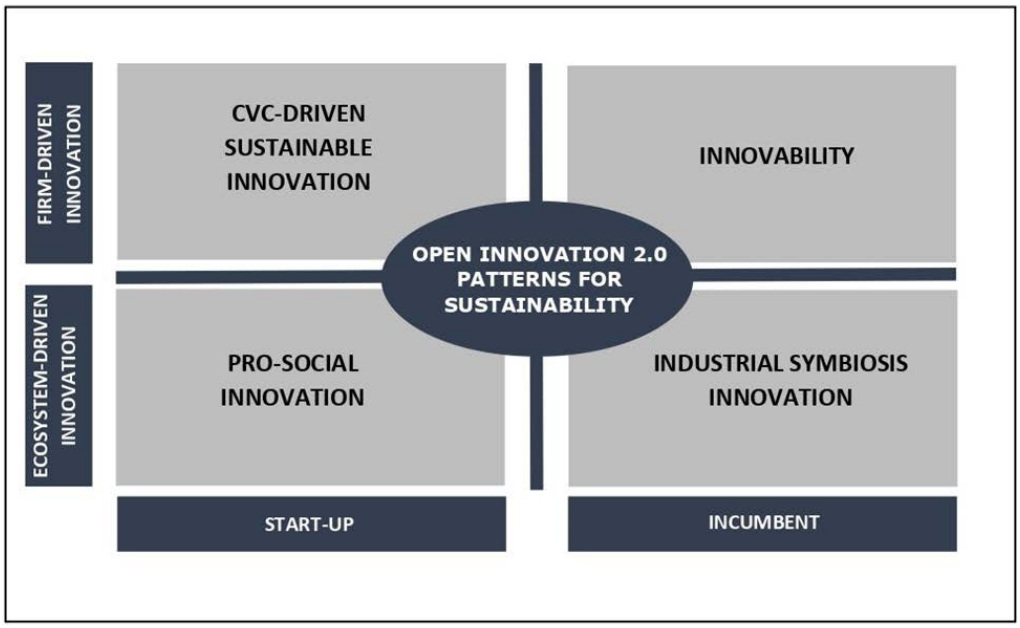


Figure 1 Data Structure

Results. *We identify four distinct Open Innovation 2.0 patterns aimed at sustainability: two patterns implemented by incumbent firms and two adopted by startups (Figure 2). To provide an in-depth description of these patterns, we focused*

on three key features drawn from literature on open innovation and innovation ecosystems: the actors involved and their relationships, governance structures, and the value captured.

Figure 2 Patterns of open innovation 2.0 for sustainability

1 - CVC-driven Sustainable Innovation Pattern:

In this pattern, impact investing is combined with a sustainability-oriented Open Innovation 2.0 approach, primarily adopted by startups during the exploitation phase. Specifically, regarding actors and their relationships, this innovation pattern mainly involves two types of organizations: the corporate venture capitalist (CVC) and the startup.

The corporate venture capitalist typically operates within the startup's industry to offer mentorship and technical expertise. It designs a tailored innovation ecosystem specifically structured to meet the startup's needs by carefully selecting relevant actors to participate in the innovation process. Consequently, the startup collaborates within an innovation ecosystem explicitly created to facilitate innovation exploitation.

Moreover, the findings indicate that interactions between these two actors follow a top-down approach (Autio, 2022). Startups depend on external partners to enhance their innovation capabilities and overcome internal limitations. The corporate venture capitalist, possessing essential resources and reputation, assumes a leadership role by setting objectives and providing strategic guidance.

Thus, governance within this Open Innovation 2.0 pattern is characterized by closed-system orchestration, with the corporate venture capitalist acting as the orchestrator. The CVC aims to capture a significant share of the created value and facilitates mechanisms for value appropriation by the startup. It seeks either to internalize the co-created value by integrating innovative solutions into its processes or commercializing new sustainable products. Alternatively, the corporate venture capitalist may choose to capture value through the development of the startup itself.

Despite this arrangement, the sustainability-oriented startup also captures substantial value, enabling it to overcome constraints related to the 'liability of newness and smallness' (Raju et al., 2011; Marozzo et al., 2023). Startups gain access to tangible and intangible resources, including human capital, facilitating increased awareness of sustainable production processes and deeper market and industry insights. Additionally, startups have the opportunity to establish valuable relationships with the investor's customers, partners, and distribution channels.

2 - Pro-social Innovation Pattern:

This pattern is implemented by social incubators involving startups aiming to introduce innovative business models addressing sustainability challenges. Specifically, our study highlights a pattern in which the incubator facilitates collaboration between startups and numerous partners within its ecosystem. The primary activities involving startups include creating sustainability-oriented businesses, training to strengthen sustainable skills and awareness, and crowdsourcing sustainable ideas through hackathons and innovation contests (Cappa, 2022; Franco et al., 2021).

Social incubators typically engage a broader array of stakeholders compared to traditional incubators. Interviewees emphasized the crucial roles of government entities, academia, and non-profit organizations in identifying relevant social and environmental challenges.

Concerning governance, our analysis identifies flexible and collaborative mechanisms. Governance is flexible as the incubator allows startups to independently manage their relationships within the ecosystem, reflecting a decentralized decision-making structure. It is also collaborative, actively engaging all ecosystem stakeholders, and decision-making processes, although autonomous, consistently consider community needs. Therefore, governance in this Open Innovation

2.0 pattern is characterized by open-system orchestration, where the ecosystem guides innovation processes with the social incubator serving as the orchestrator.

Furthermore, we characterize this open innovation pattern as pro-social due to its broader and collaborative distribution of created value, aimed at achieving collective benefits. Startups significantly benefit from participating in this incubator ecosystem. Initially, startups typically lack a customer base, cannot directly apply a predefined business model, and must establish their credibility and relevance. Their primary focus is initially on establishing viability, followed by sustainability and growth (Ojaghi et al., 2019). Consequently, the value captured by startups within an incubator's ecosystem, supported by collaborative approaches, effectively addresses their core needs.

3 - Innovability Pattern:

This pattern is implemented by incumbent firms that enhance and maintain their competitiveness through business models built on the principle of 'Innovability', defined as the integration of innovation and sustainability (De la Vega Hernández & Barcellos de Paula, 2020; Hall & Wagner, 2012; Hart & Milstein, 2003).

The primary actor is the focal firm, which proactively engages other ecosystem participants to achieve shared objectives, overcoming potential barriers to knowledge sharing. The other ecosystem actors can be grouped into three core activity categories: (1) sustainable idea scouting and the definition of key performance indicators (KPIs), (2) research and development (R&D), and (3) financial partnerships.

During the idea scouting phase, the focal firm actively seeks innovative ideas externally, following the 'outside-in' logic of open innovation (Chesbrough, 2017). Co-creation thus becomes a critical factor for successful innovation. Participants collaborating at this stage include employees, customers, suppliers, competitors, and trade associations. Additionally, the focal firm defines its objectives and KPIs based on materiality analysis.

In terms of research and development activities, the focal firm engages universities, innovation centers, technicians, startups, production partners, competitors, patent and certification agencies, and suppliers to facilitate the exchange of experiences, skills, knowledge, and technologies. Although financial stakeholders are not directly involved in open innovation processes, their indirect role is crucial as they provide financial resources, encourage sustainable business practices, facilitate sustainable investments, and promote greater business transparency.

Governance in this pattern operates through closed-system orchestration. Innovation processes are centralized, providing the focal firm with the necessary resources and legitimacy to initiate and manage innovation effectively. Acting as the orchestrator, the focal firm centrally coordinates the ideas, resources, and capabilities of other actors, primarily for its benefit (Nambisan & Sawhney, 2011). Furthermore, it takes deliberate actions to manage relationships among ecosystem participants, ensuring alignment with established goals.

The analyzed case studies illustrate that innovation co-created through open and collaborative approaches is ultimately aimed at developing sustainable products via interactions among multiple stakeholders in the value network. Other ecosystem actors capture value through strengthened relationships with the focal firm, increased economic benefits, and the assurance of environmental sustainability.

4 - Industrial Symbiosis Innovation Pattern:

In the exploration phase of innovation, incumbent firms adopt a sustainability-oriented Open Innovation 2.0 pattern rooted in the principles of industrial symbiosis. Specifically, this pattern involves the active engagement of incumbent firms in exchanging resources within their ecosystems.

The process begins when customers initiate an active, creative, and collaborative engagement aimed at co-creating value. Customers provide post-processing materials, post-consumption waste, and recyclable materials to the focal firm, which then regenerates these resources into new materials and products. Thus, co-creation in this context extends beyond traditional crowdsourcing methods (Cappa et al., 2016), incorporating direct and strategic customer involvement.

Additionally, our interviews revealed the significant role of universities and research centers in enhancing collaboration. Certification organizations also play a vital role by emphasizing product sustainability, lifecycle assessment, and cooperation across all ecosystem participants.

Within this pattern, while the entire ecosystem collaborates to shape and drive the innovation process, the focal firm coordinates the interactions. Interorganizational collaboration demands careful orchestration and effective network management (Paquin & Grenville, 2019). Thus, governance involves a balance between centralized orchestration by the focal firm and cooperative decision-making processes among ecosystem participants, combining elements of both closed and collaborative governance.

Ultimately, the goal is to create multiple business opportunities and value for all ecosystem actors. Exchanges among various stakeholders generate mutual benefits, including innovative process designs, creation of new materials from unavoidable production waste, and the development of ethical supply chains, thereby enhancing both economic and sustainability outcomes.

To clarify the differences among the various models and enhance their comparability, we introduce a comparability matrix based on three key features derived from the literature on open innovation and innovation ecosystems: the actors involved and their interrelationships, the governance mechanisms in place, and the types of value captured (Table 1).

Table 1 Characteristics of patterns of open innovation 2.0 for sustainability

PATTERNS / ELEMENTS OF INNOVATION ECOSYSTEM	CVC-DRIVEN SUSTAINABLE INNOVATION	PRO-SOCIAL INNOVATION	INNOVABILITY	INDUSTRIAL SYMBIOSIS INNOVATION
ACTORS AND RELATIONSHIP (Casalegno et al., 2020; Costa, and Matias, 2020)	-Corporate Venture Capitalist -Startup -New Tailored Innovation Ecosystem -Top-down approach	-Incubator -Startup -Innovation ecosystem of incubator -collaborative, adaptive and flexible approach	-Focal firm -Ecosystem of Focal firm -Co-creation approach	-Dissimilar businesses of different industry -New Tailored Innovation Ecosystem -collaborative, adaptive and flexible approach
GOVERNANCE (Schepis et al., 2021; Dagnino et al., 2016; Dhanaraj and Parkhe, 2006; Holgersson et al, 2022)	-Closed-system orchestration -CVC as orchestrator -Centralized approach	-Open-system orchestration -Collaborative orchestration -Decentralized approach	-Closed-system orchestration -Focal firm as orchestrator -Centralized approach	-Hybrid-system orchestration both centralized and decentralized -Centralized approach: focal firm as orchestrator -Decentralized decision-making process
VALUE CAPTURE (Chesbrough, 2007)	-Internalization of novel solutions in CVC's business model -sale of new sustainable products -startup growth	-Collaborative distribution of value created -Collettive benefit -Startup creation	-Focal firm capture the most of value created -Focal firm growth	-Collaborative distribution of value created -Collettive benefit

Research limitations. *This study has several limitations that should be acknowledged. First, the analysis relies on a limited sample of seven case studies, with only three specifically focusing on startups. As ongoing research, this work would benefit from an expanded empirical base to strengthen the robustness and generalizability of the findings. Future research could involve a broader range of case studies to verify and further validate these preliminary results. Although our initial findings provide meaningful insights, additional empirical evidence is necessary to confirm and extend our conclusions. Specifically, further studies could address whether additional open innovation patterns exist beyond those identified here and determine if there are other critical dimensions beyond the three features analyzed in this research.*

Managerial implications. *Our study offers several practical implications for managers. Sustainable innovation should become a strategic priority across all business types. The innovation patterns identified provide novel approaches to sustainable innovation, which managers can consider integrating into their business models.*

Managers should actively identify key stakeholders within the innovation ecosystem, establish meaningful collaborations, and pursue partnership opportunities or develop ecosystems proactively.

Startup managers need to carefully examine appropriate governance methods for their contexts, while managers of incumbent firms should evaluate how best to adjust their decision-making structures to support sustainable transitions using Open Innovation 2.0 principles. This adjustment may involve developing decentralized governance structures.

Incumbent firm managers must be prepared to thoroughly analyze the dynamics of sustainable innovation ecosystems and adapt their business strategies accordingly. Such adaptation requires an open mindset toward innovation, the ability to foster effective relationships with diverse ecosystem stakeholders, and flexibility in modifying governance mechanisms and value-capture strategies to align with evolving ecosystem dynamics.

Originality of the paper. *This study provides practical implications for managers. Sustainable innovation should be strategically prioritized across all business types. The patterns identified offer innovative approaches to sustainability, and managers may benefit from integrating these into their business models.*

Managers should actively identify key stakeholders within the innovation ecosystem, establish effective collaborations, and pursue partnership opportunities or ecosystem development proactively.

Startup managers should closely evaluate governance mechanisms suited to their context, while incumbent firm managers should explore adapting their decision-making structures to facilitate sustainable transitions based on Open Innovation 2.0 principles. Such adaptations may involve decentralizing governance to better align with sustainability goals.

Moreover, incumbent firm managers should closely examine the dynamics of innovation ecosystems and adapt their business practices to the identified patterns. Achieving this requires cultivating an open mindset toward innovation, building effective relationships with various ecosystem actors, and demonstrating flexibility in governance and value-capture strategies in response to evolving ecosystem dynamics.

Key words: *open innovation 2.0; sustainability; innovation ecosystem; sustainable innovation patterns; startups; incumbents*

Humane Entrepreneurial Orientation: Strategic Posture and Performance Implications Across Italian Firms

ROSANGELA FEOLA[1] CHIARA CRUDELE[2] GIOVANNI BALDI[3] MASSIMILIANO VESCI[4]
ANTONIO BOTTI[5]

Abstract

This study investigates the emergence and performance implications of Humane Entrepreneurial Orientation (HEO) across a diverse sample of Italian industrial firms. Building on the theoretical framework of Humane Entrepreneurship, this research explores the relationship between HEO-derived from the integration of Entrepreneurial Orientation (EO), Human Resource Orientation (HRO), and Sustainability Orientation (SO)- and firms' financial, social, and environmental performance. To gather data, a structured survey was administered to 200 firms randomly selected from the AIDA database, ensuring a comprehensive and representative sample of micro, small, medium, and large enterprises. Using cluster analysis, the study identifies the presence of HEO across organizations. Additionally, regression analysis is employed to examine the relationship between Humane Entrepreneurial Orientation and firm performance, assessing its impact on key outcomes in the economic, social, and environmental domains. The findings are expected to contribute to the theoretical development of HEO, providing a deeper understanding of how Humane Entrepreneurship influences firms' performance. Moreover, they offer practical implications for managers seeking to cultivate sustainable, inclusive, and ethically driven business models that generate long-term competitive advantage.

Framing of the research. *In recent years, the entrepreneurial discourse has increasingly converged with global calls for sustainable and inclusive development, prompting a rethinking of the firm's role in society. As business environments grow more complex and socially accountable, there is a growing demand for models of entrepreneurship that reconcile competitive advantage with ethical, human-centered, and sustainability-driven practices. In this evolving landscape, Humane Entrepreneurship (HumEnt) has emerged as a promising paradigm that embeds the wellbeing of people and the planet into the core logic of entrepreneurial action (Kim et al., 2018; Parente et al., 2018).*

Theoretically, the HumEnt framework, as proposed by Parente et al. (2018) integrates principles from Servant Leadership theory (Barbuto and Wheeler 2006; Greenleaf 1977; Russell and Stone 2002; Van Dierendonck 2011) and Corporate Social Responsibility Theory (CSR - McWilliams and Siegel 2001), and operationalizes them through the concept of Humane Entrepreneurial Orientation (HEO). HEO consists of three interrelated strategic orientations: Entrepreneurial Orientation (EO), reflecting proactiveness, risk-taking and innovation (Covin and Slevin, 1989); Human Resource Orientation (HRO), which centers on empathy, equity, enablement, and empowerment of employees (Kim et al., 2018); and Sustainability Orientation (SO), denoting a firm's commitment to both environmental and societal wellbeing (Muñoz and Dimov, 2015; Parente et al., 2021). All together, these dimensions represent an enlarged strategic posture that positions HEO not as peripheral, but as integral to business success across financial, social, and environmental domains.

While the theoretical foundations of HumEnt are increasingly articulated and supported by recent efforts to develop validated measurement tools (Parente et al., 2021; Vesci et al., 2023), empirical studies remain limited in number and scope (Vesci et al, 2024 a,b). Buratti et al. (2022) focuses on social enterprises suggesting that the adoption of the HumEnt perspective can make Community Enterprise more able to survive and grow in depleted contexts. De˛ Bicka et al. (2022), investigates HumEnt employees' perception and to what extent elements of the HumEnt model are implemented in the practices of firms. Anggadwita et al. (2021) proposes a third study centered on the implementation of Humane Entrepreneurship in educational context. All these studies are primarily based on case analyses (Vesci et al. 2023; Buratti et al. 2022), often relying on a limited number of firms or single-sector samples, which may not fully capture the diversity of approaches to humane entrepreneurship across different types of organizations. Although useful, these studies may offer only a partial view of how HEO is enacted in practice, leaving unexplored the broader population of firms that may

embody humane entrepreneurial orientations without institutional recognition. There remains a significant gap in understanding the natural diffusion, internal variation, and real-world impact of HEO across firms with different characteristics and strategic profiles.

Purpose of the paper. *This paper aims to broaden the empirical understanding of Humane Entrepreneurial Orientation by examining how its core dimensions-EO, HRO, and SO-manifest across a diverse and randomly selected set of firms. Specifically, the study pursues two objectives: first, to identify clusters of firms on the basis of the HEO dimension (Vesci et al. 2024b); and second, to assess how these clusters relate to multidimensional performance outcomes, including financial stability, social impact, and environmental responsibility. Additionally, the study employs regression analysis to examine the effects of the HEO dimensions on firm performance, providing a deeper insight into their individual and combined impact. By adopting an inclusive and exploratory approach, the paper contributes to the refinement of the HumEnt construct and its operationalization in empirical research. In doing so, it sheds light on the strategic postures that underpin sustainable competitive advantage and offers evidence-based insights for both scholars and practitioners interested in embedding humane principles into entrepreneurial ecosystems.*

Methodology. *This study adopts a positivist research paradigm and a quantitative, exploratory design to investigate how Humane Entrepreneurial Orientation (HEO) manifest itself across a heterogeneous population of firms, and how it relates to multidimensional performance outcomes. In line with the study's dual aims- (1) to identify clusters of firms based on their alignment with the dimensions of Humane Entrepreneurship, and (2) to analyze the relationship between these clusters and firms' financial, social, and environmental performance-a quantitative method with structured survey was employed.*

The empirical investigation was conducted through an online questionnaire administered to a random sample of 200 Italian firms selected from the AIDA database (Analisi Informatizzata delle Aziende Italiane), which provides comprehensive, verified data on companies across various sectors and sizes. The selection focused exclusively on industrial enterprises, ensuring sectoral consistency. Firms were classified based on their size-micro, small, medium, and large-according to standard criteria using revenue and number of employees (European Commission, 2003). Additionally, to capture geographical diversity, the sample was stratified across Italy's major macro-regions: North, Center, South, and Islands. Notably, no pre-selection was made based on certifications (e.g., B Corp, EMAS, Great Place to Work), ensuring an inclusive and unbiased representation of the broader business landscape. The questionnaire was designed using scales drawn from the extant literature on Humane Entrepreneurship. Entrepreneurial Orientation (EO) was measured using the nine-item scale developed by Covin and Slevin (1989), capturing innovativeness, risk-taking, and proactiveness. Sustainability Orientation (SO) was assessed through seven items adapted from Muñoz and Dimov (2015), reflecting firms' strategic commitment to environmental and societal responsibility. Human Resource Orientation (HRO) was operationalized using the eight-item scale proposed by Kim et al. (2018), incorporating empathy, equity, enablement, and empowerment dimensions. All items were measured on a 7-point Likert scale (1 = strongly disagree, 7 = strongly agree). Firm performance was captured through three composite indicators: financial performance (e.g. profitability, revenue growth, and return on investment) adapted from Chirico et al. (2011), social performance (e.g. employee well-being, stakeholder engagement, and corporate social responsibility) adapted from Asiaei and Jusoh (2017), and environmental performance (e.g. environmental impact reduction) adapted from Gopalakrishna-Remani et al. (2022). Respondents were asked to self-assess their organization's performance in these areas over the past three years relative to industry peers.

Data are analyzed in two stages. First, a cluster analysis is performed to identify distinct strategic postures based on firms' responses to the EO, HRO, and SO items. This step allows for the empirical identification of emergent configurations of Humane Entrepreneurship beyond predefined labels or typologies. In the second stage, ANOVA and post-hoc tests are conducted to assess whether the identified clusters differed significantly in terms of their reported financial, social, and environmental performance. Finally, multiple regression analysis is conducted to explore the predictive relationships between HEO dimensions and firm performance outcomes. This statistical approach provides a deeper understanding of how different combinations of humane strategic orientations contribute to overall firm success.

Results. *The empirical analysis aims to identify distinct clusters of firms based on the Humane Entrepreneurial Orientation (HEO). Through cluster analysis, we expect to uncover different types of firms ranging from companies that exhibit a balanced and integrated alignment across Entrepreneurial Orientation (EO), Human Resource Orientation (HRO), and Sustainability Orientation (SO) to those that emphasize only one or two of these dimensions. This typology moves beyond normative classifications or certification-based assumptions, offering a data-driven perspective on how humane entrepreneurship is embedded in diverse business contexts*

Regression analysis further tests the relationship between HEO and firm performance across financial, social, and environmental dimensions. Preliminary results indicate that firms with a high degree of alignment across all three HEO components tend to exhibit superior performance across multiple metrics, supporting the theoretical proposition that humane entrepreneurship fosters sustainable competitive advantage. Specifically, a fully integrated humane strategic posture is positively associated with financial profitability, employee well-being, and environmental responsibility, suggesting that firms do not need to trade off economic and social/environmental goals but can achieve synergies among them. Conversely, firms that underemphasize human resource or sustainability dimensions-despite maintaining a strong entrepreneurial orientation-tend to exhibit weaker performance in social or environmental domains, even when financial indicators remain stable. This reinforces the idea that a partial or symbolic adoption of humane entrepreneurship may be insufficient to generate long-term organizational benefits.

Additionally, exploratory analyses suggest that sectoral and size-related patterns influence the adoption of humane strategic postures. For instance, larger firms may exhibit a more structured approach to integrating HEO principles, while SMEs might demonstrate flexibility in their implementation but face resource constraints that affect their ability to maintain a balanced orientation. Furthermore, geographic differences may emerge, with firms in different regions displaying varying degrees of emphasis on sustainability and employee well-being. These contextual insights contribute to a deeper understanding of the enabling and constraining factors that shape the practical adoption of humane entrepreneurship.

Research limitations. *Despite its contributions, this study presents several limitations that warrant consideration. First, the use of self-reported data for both strategic orientation and firm performance may introduce common method bias and social desirability effects. Although the survey design aimed to minimize these risks, future research would benefit from triangulating self-reported measures with objective data or third-party assessments to enhance the robustness of findings. Second, the cross-sectional nature of the analysis restricts the ability to examine how Humane Entrepreneurial Orientation (HEO) evolves over time. Longitudinal studies are needed to capture the dynamic interplay between entrepreneurial posture and performance outcomes, particularly in response to changing organizational or environmental conditions. Finally, the generalizability of the findings is limited to the Italian context. While the random sampling strategy increases internal validity, institutional and cultural differences across countries may influence the interpretation and application of humane entrepreneurship principles. Cross-national comparative studies would offer valuable insights into how contextual factors shape the enactment of HEO.*

Managerial implications. *This study offers several significant implications for managers who are seeking to align competitive strategy with a HEO. In an era where businesses are increasingly scrutinized not only for their financial performance but also for their social and environmental impact, aligning corporate strategies with humane values is becoming essential for long-term success. By identifying distinct clusters of firms based on their Humane Entrepreneurial Orientation (HEO), the research provides a diagnostic framework through which organizations can evaluate their current strategic posture and identify areas for development. This framework allows managers to assess how well their firm integrates key elements such as entrepreneurial dynamism, employee well-being, and societal responsibility-not as isolated initiatives, but as interconnected strategic levers that can drive sustainable performance across multiple dimensions. The study's findings expect that firms exhibiting a balanced integration of the three core dimensions of HEO-Entrepreneurial Orientation (EO), Human Resource Orientation (HRO), and Sustainability Orientation (SO)-tend to outperform others in financial, social, and environmental dimensions. This highlights the importance of pursuing a holistic approach to strategy, rather than focusing narrowly on one domain such as innovation or sustainability alone. In fact, the research indicates that firms that successfully integrate all three dimensions are better positioned to create sustainable value, foster employee loyalty, and engage meaningfully with broader society. Managers are therefore encouraged to embed HEO not just in external communications or formal policies, but deeply into the day-to-day practices of leadership, human resource management, and strategic decision-making. By making these values an integral part of organizational culture, companies can enhance their ability to adapt to changing market demands, navigate complex regulatory environments, and meet the expectations of increasingly conscious consumers and investors.*

Moreover, the study challenges the common assumption that only certified or "best-in-class" firms, such as those with B Corp certification or other recognized sustainability labels, can effectively operationalize humane entrepreneurship. While such certifications are undoubtedly valuable, this research underscores that even in the absence of formal recognition, firms of all sizes and stages of development can cultivate a humane strategic posture that supports long-term competitiveness and resilience. This creates opportunities for a broader set of organizations-especially SMEs, startups, and emerging businesses-to consider HEO as a viable and accessible model for growth. For small and medium-sized enterprises (SMEs) in particular, HEO can serve as a unique differentiator in a competitive marketplace, offering a path to build a reputation for ethical business practices and social responsibility, which can be critical for attracting customers, talent, and investment.

The research also highlights the importance of HumEnt in translating this enlarged strategic posture into actionable strategic outcomes, since managers and entrepreneurs are key to embedding humane values in every facet of the organization, from day-to-day operations to strategic decision-making. By investing in human resources empathy, empowerment, and ethical social and environmental responsibility, companies can build a culture that not only promotes entrepreneurial innovation but also prioritizes the well-being of employees and the broader community. Furthermore, managers must be equipped with the tools, skills, and competencies necessary to translate humane values into tangible outcomes. This requires ongoing investment in leadership training and development, as well as a commitment to continuous learning about how to integrate human-centered practices into business operations (Kim et al. 2018). Leaders should be encouraged to model the behaviors they wish to see in their teams, demonstrating empathy, transparency, and a commitment to social and environmental stewardship. By doing so, they can set the tone for the entire organization, reinforcing the idea that doing good is not only the right thing to do, but also a driver of long-term business success.

In sum, this study provides a valuable framework for entrepreneurs and managers seeking to navigate the complexities of modern business environments, where the integration of human-centered and sustainability-driven values is no longer optional but essential for long-term success. The insights gleaned from this research encourage firms to adopt a more inclusive, balanced, and humane approach to strategy, one that harmonizes entrepreneurial dynamism with social

responsibility and environmental stewardship. By doing so, businesses can not only create a competitive advantage but also contribute meaningfully to the broader goal of building a more sustainable and ethical global economy.

Originality of the paper. *This study provides a novel contribution to the field of Humane Entrepreneurship by advancing the operationalization of the Humane Entrepreneurial Orientation (HEO) construct. By leveraging validated multi-dimensional scales and applying a data-driven clustering approach, the study identifies firms that reflect varying degrees of alignment between Entrepreneurial Orientation (EO), Human Resource Orientation (HRO), and Sustainability Orientation (SO). This methodological advancement enables a more nuanced analysis of how these three dimensions interact in practice and how different levels and presence of HEO in sample's firms relate to firm performance across financial, social, and environmental indicators. Furthermore, by complementing cluster analysis with regression techniques, the study provides robust statistical evidence on the impact of humane entrepreneurship on firm outcomes, reinforcing the theoretical and practical relevance of HEO.*

From a methodological standpoint, the research design contributes to the literature by offering a replicable and adaptable framework that can be applied across different industries, firm sizes, and geographic contexts. By decoupling humane entrepreneurship from formal certifications and investigating its organic distribution in the business landscape, the study provides a fresh perspective on the strategic integration of HEO. This perspective challenges the assumption that only explicitly ethical or sustainability-oriented firms can leverage HEO for competitive advantage. Instead, the findings suggest that humane entrepreneurship is a strategically relevant paradigm for a broader spectrum of firms, including SMEs and industrial enterprises that may not traditionally be associated with sustainability-driven business models. Ultimately, this study contributes to bridging the gap between theory and practice by demonstrating that humane entrepreneurship is not merely a normative ideal but a measurable, performance-relevant orientation that can enhance long-term competitiveness and resilience. By providing empirical insights into the configurations and performance implications of HEO, the research informs both scholars and practitioners, offering a foundation for future studies and managerial applications in the field of sustainable and human-centered entrepreneurship

Ruolo dei facilitatori nell'Open Social Innovation: processi di co-creazione a supporto della fragilità

CHIARA PALAGONIA[1] VALENTINA CUCINO[2] ANDREA MARIO CUORE PICCALUGA[3]

Abstract

Il presente lavoro analizza approfonditamente il ruolo cruciale svolto dai facilitatori negli ecosistemi di Open Social Innovation, ponendo particolare attenzione ai processi partecipativi indispensabili per affrontare sfide sociali complesse quali la fragilità umana, il cambiamento climatico, le pandemie e le disuguaglianze. L' Open Social Innovation, intesa come paradigma che mobilita risorse, competenze e conoscenze tra numerosi stakeholder - imprese, cittadini, istituzioni pubbliche e società civile - emerge come risposta efficace alle sfide emergenti e come modello per la co-creazione di soluzioni condivise. Nonostante l'interesse crescente, la letteratura evidenzia ancora una notevole lacuna nell'analisi del contributo specifico dei facilitatori, figure essenziali per orchestrare e guidare dinamiche di apprendimento collettivo e co-creazione. Mediante una metodologia qualitativa e un approccio longitudinale che ha coinvolto interviste semi-strutturate e l'analisi di documenti ufficiali nel periodo 2020-2025 - con particolare riferimento al concorso Make To Care - questo studio individua quattro percorsi operativi attraverso cui i facilitatori generano impatti sociali: il coinvolgimento degli utenti guida, l'amplificazione delle soluzioni esistenti, la creazione di alleanze centrate sui problemi e il rafforzamento degli ecosistemi locali. Il modello proposto contribuisce al dibattito teorico e offre strumenti pratici per la gestione di ecosistemi di innovazione sociale, proponendo strategie replicabili per trasformare le sfide in opportunità di sviluppo sostenibile e inclusivo.

Inquadramento della ricerca. *Le grandi sfide sociali contemporanee, come la fragilità umana, il cambiamento climatico, le pandemie e le crescenti disuguaglianze, richiedono modelli innovativi basati su azioni collettive e imprenditoriali che coinvolgano cittadini, governi, istituzioni e organizzazioni sia private sia della società civile (Chesbrough & Di Minin, 2014; Bogers et al., 2020; McGahan et al., 2021; Seelos et al., 2023). In questo scenario complesso e in continua evoluzione, l'Open Social Innovation si configura come un paradigma fondamentale, capace di favorire processi partecipativi di co-creazione che coinvolgono stakeholder eterogenei (Mair & Gegenhuber, 2021; Bertello et al., 2022; Mair et al., 2023). Tale modalità non solo consente la generazione di nuove soluzioni innovative, ma permette anche di potenziare e amplificare quelle già esistenti, agevolando l'apprendimento condiviso e accelerando la risoluzione delle problematiche sociali (Chesbrough & Di Minin, 2014; Bogers et al., 2020). Tuttavia, rimane ancora un importante gap di ricerca per quanto concerne il ruolo e l'impatto specifico dei facilitatori nella gestione e nell'implementazione di tali processi, soprattutto in contesti caratterizzati da elevata fragilità umana (Terstriep et al., 2021; Audretsch et al., 2022; Cucino et al., 2023). Questo studio si propone, quindi, di approfondire come i facilitatori possano operare efficacemente per orchestrare la co-creazione, favorendo l'integrazione delle conoscenze e delle competenze provenienti da diverse fonti, al fine di affrontare le sfide sociali più urgenti in maniera rapida e sostenibile.*

Obiettivo del paper. *L'obiettivo principale di questo studio è duplice. In primis, si intende analizzare in modo approfondito il ruolo dei facilitatori nel promuovere e orchestrare processi partecipativi di co-creazione all'interno degli ecosistemi di Open Social Innovation. L'analisi mira a evidenziare come tali figure, grazie all'uso di metodologie partecipative e strumenti di coordinamento, riescano a mettere in connessione competenze eterogenee e a favorire l'emergere di soluzioni innovative capaci di rispondere a sfide sociali complesse. In secondo luogo, il lavoro si propone di sviluppare un modello generalizzabile per la creazione e la gestione di ecosistemi di innovazione sociale, con particolare attenzione alle condizioni necessarie per replicare e scalare le soluzioni sviluppate. Il modello proposto intende fornire un framework operativo che possa essere utilizzato da manager, responsabili di progetto e decisori politici per implementare strategie di l'Open Social Innovation in vari contesti, trasformando le problematiche in opportunità di sviluppo sostenibile e inclusivo.*

Le domande di ricerca principali a cui il presente studio intende rispondere sono: in che modo i facilitatori attivano e sostengono processi partecipativi di co-creazione? Quali sono le strategie operative che consentono di generare impatti sociali misurabili, come l'inclusione e il miglioramento della qualità della vita? Infine, come possono essere integrate le

prospettive teoriche classiche dell'Open Innovation con quelle emergenti relative all'innovazione sociale per formulare un modello operativo applicabile a diversi contesti?

Metodologia. *Per rispondere alle domande di ricerca, è stata adottata una metodologia qualitativa di tipo induttivo (Denzin&Lincoln, 2011; Corbin& Strauss, 2014), che ha permesso un'esplorazione approfondita su come le persone fragili siano state coinvolte attivamente come partner nei processi di innovazione sociale. Il contesto empirico scelto per lo studio è rappresentato dall'iniziativa MakeToCare, lanciata nel 2016 da Sanofi-Genzyme, la divisione specializzata di Sanofi operante in ambiti quali malattie rare, disturbi ematici rari, neurologia, immunologia e oncologia. Make To Care è concepita come un concorso che consente agli innovatori di presentare le proprie soluzioni originali legate alla fragilità umana a un vasto ecosistema di attori, il quale comprende imprese, venture capitalist, ospedali, pazienti e varie istituzioni. Per queste caratteristiche, Make To Care rappresenta un punto di raccolta significativo di innovazioni sociali, caratterizzato da procedure e tempistiche ben definite, da obiettivi chiaramente non profit e dalla volontà esplicita di sviluppare reti di cura efficaci e collaborative.*

Nel dettaglio, il concorso Make To Care si configura come una call annuale rivolta a maker e innovatori che hanno sviluppato soluzioni pratiche per rispondere ai bisogni quotidiani, sia personali che di persone a loro care, come genitori, amici o altri individui che vivono condizioni di fragilità o disabilità. Seguendo un approccio di care design (Hamington, 2019), Make To Care stimola una riflessione critica e collettiva volta a produrre risultati orientati direttamente alle esigenze degli utenti finali (Von Hippel, 1986). Inoltre, l'iniziativa promuove la costruzione di una comunità tra gli innovatori operanti nel campo della fragilità, mantenendo una stretta connessione con la Maker Fair di Roma (www.makerfairerome.eu). Ogni anno, le candidature pervenute vengono valutate e le soluzioni più promettenti vengono presentate durante un evento pubblico annuale che si svolge in autunno a Roma. I finalisti e, soprattutto, i vincitori hanno l'opportunità di entrare in contatto con partner accademici e industriali facenti parte della rete Make To Care. I partecipanti provengono da diverse categorie, tra cui studenti delle scuole superiori o universitari, giovani ricercatori universitari, persone fragili, genitori e parenti di persone fragili, nonché associazioni di pazienti fragili.

Per garantire robustezza ed efficacia nella ricerca, è stato adottato un approccio di raccolta dati multi-fonte basato sulla triangolazione (Jick, 1979; Eisenhardt, 1989). In una prima fase, sono stati raccolti dati secondari relativi al concorso attraverso rapporti ufficiali, video interviste, comunicati stampa e articoli accademici; in una seconda fase, sono state condotte interviste semi-strutturate. I dati primari sono stati raccolti tramite interviste semi-strutturate svolte in due fasi principali (nel 2021 e nel 2025) con inventori vincitori e finalisti di progetti di innovazione sociale nel concorso MakeToCare. Inoltre, ulteriori dati secondari sono stati ottenuti mediante siti web, notizie online, documenti ufficiali e materiali multimediali, garantendo così una solida triangolazione dei dati raccolti.

Le interviste hanno coinvolto attori chiave, come utenti guida, esperti di innovazione, organizzatori e responsabili di progetto. L'utilizzo della tecnica dello "snowball sampling" ha facilitato l'accesso a una gamma diversificata di testimonianze, arricchendo l'analisi con numerose prospettive. Per rispondere alle nostre domande di ricerca, abbiamo impiegato una metodologia qualitativa di tipo induttivo (Denzin e Lincoln, 2011; Corbin e Strauss, 2015), che ha facilitato un'esplorazione approfondita del modo in cui i facilitatori hanno svolto un ruolo attivo nei processi di innovazione, contribuendo in maniera significativa alla generazione di valore sociale. In particolare, abbiamo adottato il metodo descritto da Gioia et al. (2013) per raccogliere e analizzare i dati, prestando un'attenzione specifica al valore creato in relazione alle teorie esistenti.

Le interviste sono state registrate, trascritte e successivamente sottoposte a codifica tematica, processo che ha permesso di identificare categorie di primo ordine relative al coinvolgimento degli utenti guida, all'amplificazione delle soluzioni esistenti, alla creazione di alleanze centrate sui problemi e al rafforzamento degli ecosistemi locali. Queste categorie, individuate inizialmente, sono state poi aggregate in temi di secondo ordine mediante un processo iterativo di confronto tra i ricercatori, che ha permesso di evidenziare le dinamiche chiave emergenti.

La triangolazione dei dati, ottenuta integrando le informazioni derivanti dalle interviste con quelle provenienti dall'analisi documentale, ha assicurato la robustezza dei risultati e ha reso possibile lo sviluppo di una visione complessiva del fenomeno studiato. L'approccio adottato ha inoltre consentito di identificare i meccanismi fondamentali che favoriscono l'apprendimento condiviso e la replicabilità delle soluzioni innovative, elementi essenziali per la costruzione di un modello operativo di Open Social Innovation. In particolare, l'analisi ha evidenziato come il feedback continuo, le dinamiche di gruppo e la capacità di orchestrare le risorse in maniera efficace rappresentino fattori determinanti per il successo dei processi di co-creazione.

La fase finale dell'analisi ha previsto la sintesi dei temi di secondo ordine in dimensioni teoriche, mediante l'individuazione delle unità minime di significato alla base delle dinamiche osservate. Questo procedimento ha portato all'elaborazione di un modello che evidenzia il contributo specifico dei facilitatori e la modalità con cui essi orchestrano il flusso di conoscenze e competenze, creando condizioni favorevoli per l'innovazione sociale. La combinazione di dati primari e secondari ha consentito di identificare con precisione gli attori chiave, di chiarire i processi che supportano il potenziamento delle innovazioni e di individuare gruppi specifici da sottoporre ad ulteriori approfondimenti.

Risultati. *L'analisi dei dati ha evidenziato che i facilitatori operano attraverso quattro percorsi interconnessi, ciascuno dei quali contribuisce in maniera specifica a generare impatti sociali positivi. Questi percorsi sono: il coinvolgimento degli utenti guida, l'amplificazione delle soluzioni esistenti, la creazione di alleanze centrate sui problemi e il rafforzamento degli ecosistemi locali.*

Nel primo percorso, il coinvolgimento diretto degli utenti guida emerge come elemento fondamentale. Le testimonianze raccolte rivelano che questi soggetti, grazie alla loro conoscenza diretta delle problematiche quotidiane, forniscono un contributo essenziale all'identificazione di idee innovative. I facilitatori, organizzando workshop, incontri tematici e sessioni di brainstorming, riescono a creare spazi di dialogo in cui le esperienze personali si trasformano in soluzioni condivise. Questo approccio iterativo favorisce non solo l'identificazione di bisogni reali, ma rafforza anche il senso di appartenenza e l'empowerment all'interno della comunità, contribuendo a creare un ambiente in cui l'innovazione si nutre di input provenienti da diverse fonti.

Il secondo percorso riguarda l'amplificazione delle soluzioni esistenti. In questo ambito, i facilitatori agiscono da catalizzatori, stimolando un processo continuo di feedback e revisione che consente di perfezionare le innovazioni inizialmente sperimentali. Attraverso incontri periodici, piattaforme digitali e sessioni di revisione, le soluzioni vengono adattate alle esigenze emergenti e diffuse su scala più ampia. Tale processo è particolarmente rilevante in contesti caratterizzati da risorse limitate, dove l'agilità e la capacità di "fare di più con meno" diventano imperativi strategici. L'iterazione costante tra feedback degli stakeholder e revisione dei prototipi permette di migliorare la qualità delle soluzioni, rendendole più robuste e facilmente replicabili.

Il terzo percorso si concentra sulla creazione di alleanze centrate sui problemi. In questo caso, i facilitatori svolgono un ruolo mediatore, mettendo in relazione attori appartenenti a settori diversi - aziende, istituzioni, organizzazioni non governative e cittadini - per formare reti collaborative focalizzate sulla risoluzione di problematiche specifiche. Le alleanze così costituite permettono di integrare risorse, conoscenze e competenze, creando sinergie che favoriscono la co-creazione di soluzioni innovative. L'esperienza del concorso Make To Care ha dimostrato che la formazione di tali reti collaborative non solo migliora la capacità di rispondere alle sfide sociali, ma contribuisce anche a creare modelli replicabili che possono essere adattati ad altri contesti e territori.

Il quarto percorso riguarda il rafforzamento degli ecosistemi locali. I facilitatori operano sul territorio per connettere attori locali, favorire il trasferimento di conoscenze e condividere buone pratiche. Questo approccio permette di costruire reti locali resilienti e di creare una cultura dell'apprendimento continuo. Le soluzioni innovative sviluppate vengono adattate e replicate in contesti diversi, generando un impatto sistemico e duraturo sulla comunità. Il rafforzamento degli ecosistemi locali non solo sostiene lo scaling delle innovazioni, ma contribuisce anche a creare un ambiente favorevole alla co-creazione e al dialogo tra attori locali, favorendo l'emergere di una governance più inclusiva e partecipativa.

Le evidenze raccolte sottolineano come l'orchestrazione delle attività di facilitazione sia il fattore chiave che permette di tradurre le dinamiche di Open Social Innovation in impatti sociali concreti. In particolare, l'integrazione dei quattro percorsi operativi evidenzia la natura multidimensionale dei processi di co-creazione e il ruolo centrale dei facilitatori come mediatore e coordinatore. Le strategie adottate dai facilitatori - dalla promozione di workshop e incontri, alla gestione di feedback continui, fino alla creazione di reti collaborative - sono state in grado di favorire un apprendimento condiviso e di incrementare la capacità di scaling delle soluzioni sviluppate. I risultati, quindi, dimostrano che una gestione integrata e orchestrata dei processi innovativi, supportata da una solida rete di stakeholder, può generare impatti sociali significativi e duraturi.

Limitazioni della ricerca. *Nonostante i contributi significativi emersi dall'analisi, il presente studio presenta alcune limitazioni che offrono interessanti spunti per ulteriori ricerche. In primo luogo, il focus esclusivo sul contesto italiano, e in particolare sul caso MakeToCare, potrebbe limitare la generalizzabilità dei risultati. Le specificità culturali, istituzionali e organizzative del territorio italiano rappresentano variabili che potrebbero non replicarsi in altri contesti internazionali o in settori differenti. Ciò suggerisce la necessità di studi comparativi che possano testare la validità del modello proposto in ambienti diversi.*

Un ulteriore limite riguarda la concentrazione dell'analisi su innovazioni ben documentate e visibili, escludendo potenzialmente pratiche emergenti o soluzioni innovative non ancora riconosciute ufficialmente. Questo approccio potrebbe comportare la mancata considerazione di modelli di facilitazione che, pur essendo efficaci, non hanno ricevuto la stessa attenzione mediatica o accademica. Inoltre, l'approccio qualitativo adottato, sebbene offra una ricca interpretazione delle dinamiche, comporta una certa soggettività nelle interpretazioni dei dati. L'adozione di metodi quantitativi integrativi potrebbe contribuire a convalidare gli indicatori di impatto sociale e a verificare la replicabilità del modello in maniera più oggettiva.

Infine, il ruolo delle tecnologie digitali nel facilitare i processi di Open Social Innovation merita ulteriori approfondimenti. Sebbene il presente studio evidenzi l'importanza di strumenti digitali e piattaforme collaborative, l'analisi non ha esaminato in modo esaustivo il loro impatto quantitativo sui processi di scaling e sull'apprendimento condiviso. Ricerche future potrebbero esplorare come le tecnologie emergenti possano potenziare ulteriormente la capacità dei facilitatori di orchestrare le attività e di favorire la diffusione di soluzioni innovative.

Implicazioni manageriali. *I risultati dell'analisi offrono numerosi spunti pratici per manager, responsabili di progetto e decisori politici. In un contesto caratterizzato da sfide sociali sempre più complesse, l'adozione di strategie di Open Innovation supportate da una facilitazione efficace si configura come una leva strategica per trasformare le criticità in opportunità di sviluppo sostenibile e inclusivo.*

Una delle principali implicazioni manageriali riguarda l'importanza di investire nella formazione dei facilitatori. Queste figure devono essere dotate di competenze trasversali, che spaziano dalla gestione delle dinamiche di gruppo alla capacità di utilizzare strumenti digitali avanzati per il coordinamento delle attività. Solo attraverso una formazione mirata è possibile garantire che i facilitatori siano in grado di orchestrare processi di co-creazione efficaci, facilitando il dialogo e l'apprendimento condiviso tra gli attori coinvolti.

Un'altra implicazione riguarda lo sviluppo di sistemi di monitoraggio e valutazione degli impatti sociali. Le organizzazioni dovrebbero implementare strumenti che consentano di misurare in maniera accurata gli effetti delle iniziative di Open Social Innovation, valutando indicatori quali l'inclusione, il miglioramento della qualità della vita e la sostenibilità delle soluzioni adottate. Tali sistemi permetterebbero di orientare le strategie future e di apportare modifiche tempestive alle iniziative in corso, ottimizzando l'efficacia degli interventi.

Inoltre, l'integrazione delle tecnologie digitali si rivela essenziale per facilitare la comunicazione tra i vari stakeholder e per garantire un flusso costante di informazioni e feedback. Le piattaforme collaborative, i social network e le applicazioni per la gestione dei progetti possono contribuire in modo significativo a rafforzare le reti locali e a favorire lo scaling delle soluzioni innovative. Investire in infrastrutture tecnologiche e in programmi di formazione specifici diventa quindi fondamentale per consolidare i processi di co-creazione.

Infine, la promozione di collaborazioni intersettoriali, che coinvolgano settore pubblico, privato e terzo settore, costituisce un elemento chiave per la gestione delle sfide sociali. L'esperienza del concorso Make To Care evidenzia come la creazione di alleanze tra attori diversi, mediate da facilitatori esperti, possa amplificare l'impatto delle innovazioni, favorendo lo scambio di risorse e competenze e creando una rete di supporto capace di rispondere in maniera coordinata alle problematiche sociali. Tale modello di collaborazione integrata offre spunti preziosi per la definizione di politiche pubbliche orientate al bene comune e per l'adozione di strategie di Open Innovation che mettano al centro il contributo di ogni stakeholder.

Originalità della ricerca. *L'originalità del presente lavoro risiede nell'approfondimento sistematico e integrato del ruolo dei facilitatori negli ecosistemi di Open Social Innovation, una dimensione che fino ad oggi è stata trattata in maniera superficiale nella letteratura. Il modello proposto integra prospettive teoriche classiche, che hanno evidenziato l'importanza dei flussi conoscitivi e della collaborazione esterna, con evidenze empiriche raccolte sul campo, offrendo una visione multidimensionale e operativa delle dinamiche di facilitazione.*

Il focus sui facilitatori come agenti di cambiamento - capaci di orchestrare l'azione collettiva e di favorire l'apprendimento condiviso - amplia il tradizionale concetto di leadership, spostando l'attenzione dalla mera gestione delle risorse alla capacità di connettere e integrare competenze e conoscenze eterogenee. Questo approccio innovativo, supportato dai dati raccolti, fornisce strumenti utili sia per la teoria che per la prassi manageriale, offrendo un modello replicabile che possa essere applicato in diversi contesti per affrontare sfide sociali complesse.

Inoltre, l'adozione di un approccio longitudinale ha permesso di monitorare l'evoluzione delle strategie di facilitazione nel tempo, evidenziando i meccanismi chiave - quali il feedback continuo e il processo di scaling - che favoriscono la replicabilità delle soluzioni innovative. L'integrazione di tali elementi in un modello operativo rappresenta un contributo significativo al dibattito accademico e offre una base empirica solida per la progettazione di interventi e politiche mirate all'innovazione sociale. La capacità di coniugare la teoria con la pratica, offrendo strumenti operativi per la gestione degli ecosistemi, rende questo lavoro particolarmente rilevante per manager, responsabili di progetto e decisori politici.

Parole chiave: *Open Social Innovation; facilitatori; fragilità; co-creazione; ecosistema; analisi qualitativa;*

Track 8
Retailing & Service Management

Disclosing the AI Identity: How Virtual Assistant Transparency Shapes Consumer Perceptions and Purchase Behavior

SIMONE AIOLFI[1] CHIARA BACCHILEGA[2] SILVIA BELLINI[3] DAVIDE PELLEGRINI[4]

Abstract

Artificial intelligence (AI) is transforming consumer-brand interactions, particularly in e-commerce, where AI-powered virtual assistants play a central role in customer engagement. A key challenge in AI-driven service interactions is AI transparency - the explicit disclosure of an AI's non-human nature - which can influence consumer trust, perceived quality, and purchase behavior. While previous research has broadly examined AI acceptance, this study provides a focused empirical analysis of how AI transparency shapes consumer perceptions and decision-making processes. Using structural equation modeling (SEM) with validated theoretical constructs, this research examines how AI transparency influences trust in the retailer, perceived quality, ease of use, customer inspiration, and purchase intention. The findings indicate that AI transparency exerts a positive influence on consumer trust in retailers and perceived quality, thereby shaping consumers' attitudes toward AI-driven interactions. However, satisfaction with the AI service agent does not directly influence purchase intention, suggesting that other factors, such as customer inspiration, play a more significant role in driving consumer behavior. Additionally, while privacy concerns and risk perception were included as boundary conditions, they were not found to have statistically significant effects on key consumer outcomes. From a managerial perspective, these insights underscore the necessity for companies to adopt a balanced AI transparency strategy, ensuring clarity while addressing potential concerns about automation and privacy. This study contributes to the growing body of literature on AI ethics and consumer psychology, offering both theoretical advancements and practical guidance for businesses seeking to integrate AI-powered virtual assistants while maintaining high levels of consumer trust and engagement.

Framing of the research. *The advent of artificial intelligence (AI) in marketing has prompted a paradigm shift in consumer-brand interactions, with the processing of a great amount of data occurring in real time. AI-powered virtual assistants, chatbots, and recommendation systems have profoundly influenced the way in which businesses engage with customers, playing a pivotal role in enhancing personalization and efficiency. For instance, conversational shopping has emerged as a paradigm through which AI-enabled technologies, such as chatbots, virtual assistants, and voice assistants, serve as digital intermediaries between consumers and businesses. The employment of conversational interfaces, including chatbots and voice assistants, has enabled businesses to respond to consumer queries in a more timely and customized manner, thereby fostering a dynamic and engaging interaction experience. (Wang et al., 2020). These technologies have been observed to be more effective than conventional methods, particularly when they offer an automated alternative to non-interactive scenarios (Puntoni et al., 2021). However, these advancements have also introduced new challenges, particularly in terms of consumer trust, privacy concerns, ethics, and perceived risk. The degree of consumer trust in AI-driven services varies considerably, and their impact on consumer behavior, privacy concerns, and perceived quality remains a subject of debate. While some consumers value the efficiency and tailored experiences offered by AI-driven services, others are skeptical due to concerns over transparency, privacy, and trustworthiness, particularly in a context where consumers are increasingly aware of the value of their personal data (Chen et al., 2022).While AI represents a cutting-edge technological innovation that facilitates daily life and "makes everything run more smoothly", it also brings potential threats and possible negative effects on a personal, social, and cultural levels.*

A review of the extant literature on AI in marketing reveals both opportunities and challenges. On the one hand, AI enables firms to analyze vast amounts of data, improving customer segmentation and enabling real-time personalized interactions (Manyika, 2011). On the other hand, its application in marketing requires careful consideration of transparency and ethical implications. A growing body of research has demonstrated that the implementation of AI-

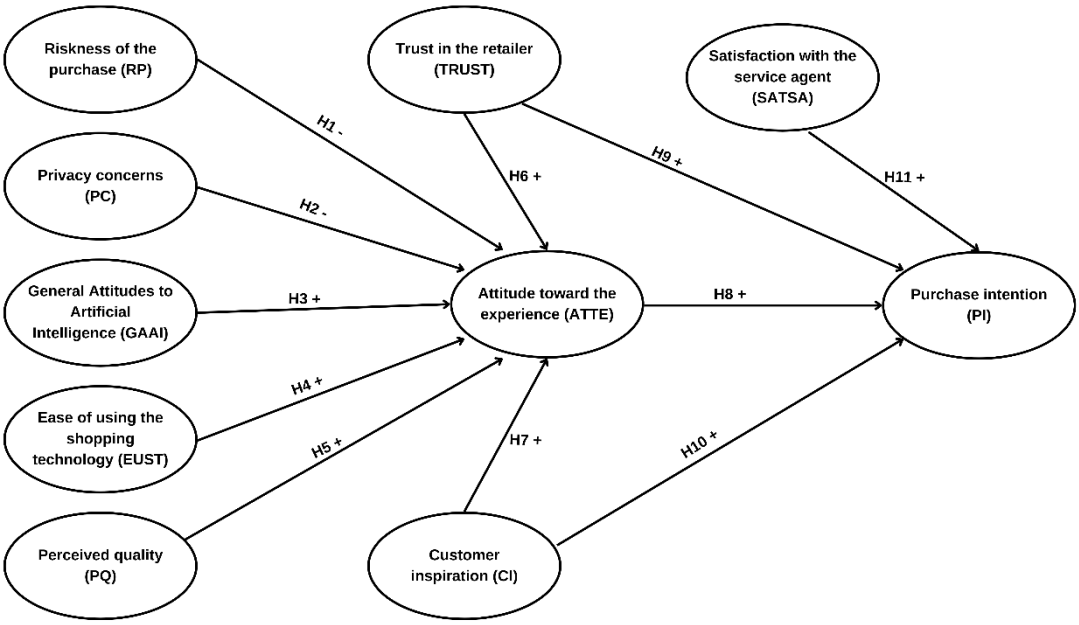
driven personalization strategies can effectively enhance customer experience and promote enhanced customer engagement with the appropriate adoption of transparent communication strategies and adherence to ethical principles (Gao & Liu, 2023). The advent of AI technology has made it significantly more feasible for marketers to obtain large volumes of consumer data, as well as diverse types of data, efficiently. Machines can now receive visual, audio, or linguistic input directly without human intervention and promptly process it (Chen et al., 2022). While companies have employed AI in various capacities, academic research appears to be lagging in its examination of consumer perceptions of benefits and concerns. A limited number of studies have examined consumers' perceptions of and receptivity to AI-driven marketing activities, including personalized advertisements, recommendations, chatbots, and virtual assistants (Chen et al., 2022). Nevertheless, consumers' perceptions have been identified as a pivotal factor in determining the efficacy of AI applications. They play a crucial role in enhancing the effectiveness of AI-driven marketing activities by providing valuable insights, informing strategic design, and developing more effective engagement methods (Chen et al., 2022).

In particular, the field of AI has demonstrated a notable capacity to enhance marketing endeavors. This enhancement is achieved through the acquisition of insights from online word-of-mouth or sentiment analysis, the modeling of interactive marketing responses, the prediction of churn (i.e., customer abandonment), and the automatic adaptation of websites, advertisements, and pricing to better align with customers' personalization preferences. These applications aspire to provide a customized experience for both potential and existing customers, thereby fostering an intimate relationship with consumers. According to Flavián et al. (2024), companies and service providers are introducing AI applications, AI-driven robotics, and other automation technologies to increase productivity and offer consumers improved experiences and options. Companies such as Amazon rely extensively on AI algorithms to develop personalized offerings, use robots to prepare shipments, and machine learning to coordinate deliveries, achieving higher levels of efficiency than purely human-based companies. In 2022, global sales of professional service robots experienced a 48 percent surge (Flavián et al., 2024). Experts predict that certain sectors, such as financial services, will be fully automated by 2030. In such a scenario, the economic impact of AI on national GDP could be approximately 20 percent in countries such as China and the US (Flavián et al., 2024). While automation is expected to enhance consumer experiences and quality of life by increasing efficiency, the technological impact on users' psychological well-being frequently exhibits an opposing effect (Flavián et al., 2024). This phenomenon can be attributed to user acceptance of technology, perceptions, and purchasing and consumption behaviors.

A growing body of research has examined consumer trust in AI. Bandura's (2001) social cognitive theory emphasizes the role of transparency in reducing uncertainty and fostering trust. However, other scholars argue that excessive AI transparency can heighten consumer concerns about data security and decision-making biases (Lemon & Verhoef, 2016). The role of AI in consumer decision-making is further elaborated by Puntoni et al. (2021), who highlight the importance of perceived competence and ethical AI practices. Consumer responses to AI are also shaped by psychological factors, including perceived anthropomorphism and control (Chintalapati & Pandey, 2022). Research has shown that enhancing transparency in AI can foster consumer trust when coupled with robust data protection policies and effective communication strategies (Darke et al., 2016). While prior studies have examined consumer adoption of AI, there is a notable lack in understanding how transparency in AI-driven interactions affects key consumer attitudes and behaviors. A pivotal component of AI-driven customer service is AI transparency, defined as the extent to which consumers are cognizant of their interaction with an AI system as opposed to a human agent. In this study, AI transparency is specifically operationalized as a virtual assistant that explicitly discloses its AI nature at the inception of the interaction. This transparency may influence consumer perceptions in a positive way by enhancing trust and reducing uncertainty (Gao & Liu, 2023) or in a negative way by triggering concerns about data security and the reliability of decision-making (Chintalapati & Pandey, 2022).



In light of the divergent perspectives that currently exist on the subject and building upon the foundational work established by previous literature examining AI-mediated marketing interactions and consumer attitudes, the present study aims to address the existing gap in knowledge regarding the impact of AI transparency on key consumer perception factors. These factors include, but are not limited to, perceived quality, trust in retailers, satisfaction with AI-assisted service agents, and ultimately purchase intention. To this end, the study employs structural equation modeling (SEM) to provide empirical evidence on the effects of AI transparency on consumer decision-making.

Purpose of the paper. *The primary objective of this research is to investigate how consumers respond to AI-powered service agents when their AI identity is explicitly disclosed. In this study, AI transparency is specifically operationalized as a virtual assistant that explicitly discloses its AI nature at the beginning of the interaction. This study investigates how AI transparency influences consumer perceptions and behavior in e-commerce environments, particularly when interacting with AI-powered virtual assistants. The study will examine whether disclosing an AI service agent's identity fosters consumer trust or, conversely, leads to skepticism and concerns over privacy and perceived risk. Specifically, we propose a conceptual model (Figure 1), based on established theories in consumer behavior and AI adoption, structured around the relationships among the following factors:*

- *General attitude toward artificial intelligence (GAAI): defined as consumers' perceptions of AI in general, and it is a significant predictor of technology acceptance and effectiveness of interaction with a virtual assistant. As posited by Schepman and Rodway (2020), a positive attitude toward AI can facilitate the adoption of innovative technologies, while a negative attitude can generate resistance.*

- *Attitude toward experience (ATTE): it is a key variable for measuring how consumers subjectively evaluate the quality of their interaction with the service. This variable could be influenced by multiple factors, such as the simplicity of the procedure, perceived efficiency, and the reliability of the assistance received. The extant literature suggests that a positive attitude toward a shopping experience can positively influence the propensity to repeat the experience and build brand loyalty (Chun et al., 2017).*
- *Ease of using the shopping technology (EUST): it is a pivotal variable in assessing how intuitive and user-friendly consumers perceive technology to be. Inman & Nikolova (2017) emphasize that ease of use can influence consumers' adoption and use of technology. Consumers' perceptions of technology could vary depending on their prior experience with AI and the transparency of its presence. Technology perceived as too complex could reduce the effectiveness of interaction and discourage future use.*
- *Privacy Concerns (PC): it represents a significant factor in the adoption of AI-based technologies. As the use of chatbots and virtual assistants increases, consumers are becoming increasingly aware of the implications in terms of protecting personal data (Martin et al., 2017). Recent studies highlight how consumers are often concerned about control and transparency over the use of their personal information. In the context of this research, it is plausible that individuals aware of their interaction with a virtual assistant may demonstrate higher levels of concern compared to those lacking this awareness, adversely impacting their perception of the service.*
- *Riskiness of the Purchase (RP): The perception of risk constitutes a pivotal component in the realm of purchase behavior, particularly within digital environments. Consumers may regard interaction with a virtual assistant as less secure, particularly in situations where they are not explicitly informed about the origin of the responses they receive (Campbell et al., 2001). A disclosed virtual assistant could mitigate this risk, as consumers would be aware of the identity of the service provider.*
- *Satisfaction with the service agent (SATSA): it reflects the consumer's level of appreciation for the service received. The extant literature indicates that high satisfaction with the service can result in increased brand loyalty and a greater propensity for purchase intention (Wan et al., 2016). In the context of this research, the explicit identification of the assistant as "virtual" could influence the perception of competence and service quality, determining the final satisfaction level.*
- *Perceived quality (PQ): it refers to the comprehensive assessment by the consumer of the degree to which the service's characteristics align with their expectations, with the possibility that the service will exceed these expectations. In the context of a virtual assistant-mediated shopping experience, factors such as the responsiveness speed, the precision of the information provided, and the platform's navigability can influence this perception (Faruk et al., 2018).*
- *Trust in the retailer (TRUST): it is a critical factor in motivating purchases, as it mitigates psychological impediments associated with the security of online transactions (Darke et al., 2016). Trust is cultivated through transparency, reliability, and the perceived quality of service (Tax et al., 1998). The utilization of a virtual assistant has the potential to influence this trust in various ways.*
- *Customer Inspiration (CI): it refers to the capacity of an interaction to evoke desires or motivations that facilitate purchase decisions. A consumer can be inspired by an interaction that is fluid, personalized, and perceived as innovative. As Böttger et al. (2017) have noted, a technology's capacity to inspire consumers is closely related to its perceived relevance and ability to provide added value. If AI is perceived as a useful tool that is seamlessly integrated into the interaction, consumers may experience heightened motivation to make a purchase.*
- *Purchase intention (PI): it is a critical component in comprehending consumer behavior, as it pertains to the probability of a consumer proceeding with a purchase after their interaction with a service. The marketing literature demonstrates that this intention is influenced by numerous factors, including perceived quality, service experience, and the trust placed in the brand or retailer (Dhruv et al., 1998).*

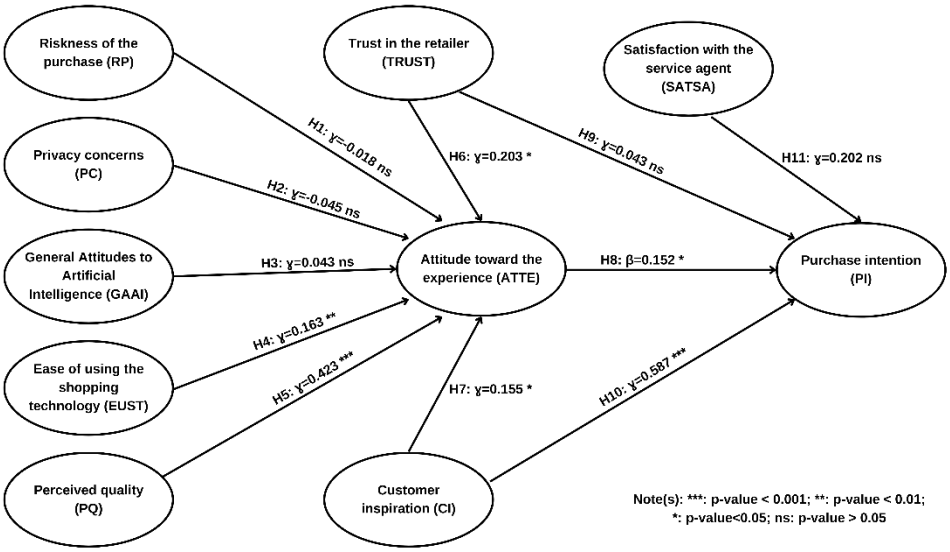
Fig. 1: Conceptual model

Source: Authors' elaboration.

Methodology. *This study employs a quantitative research approach using survey data collected from 250 respondents. The structured questionnaire was distributed in September 2024 via social media platforms (Facebook, Instagram), ensuring broad accessibility to potential respondents. The rationale for selecting an online sample aligns with previous research, which has demonstrated that online respondents tend to be more familiar with AI-based interactions, making them a more relevant population for examining AI transparency effects in marketing contexts (Aiolfi et al., 2022). The sample is characterized by a balanced gender distribution, with 48% of respondents identifying as male and 52% as female. A significant proportion of the sample is comprised of younger individuals, with 44% falling within the 16-25 age bracket. In terms of education, most respondents have obtained a high school diploma (46%) or a university degree (45%). With respect to AI interaction, 38% of respondents reported frequent engagement with AI-based systems within the last year, while 42% indicated limited usage, having employed them only a few times. Furthermore, 32% frequently interacted with virtual assistants via chat, with an additional 50% engaging on an occasional basis. These observations suggest that the sample is digitally engaged and familiar with AI-driven technologies, rendering it well-suited for examining perceptions of AI transparency.*

Prior to responding to the survey, participants were exposed to a visual stimulus (see Figure 2) depicting a conversation in which the virtual assistant transparently identifies itself using the label "Marco, virtual assistant". This introduction was designed to reinforce AI transparency.

Fig. 2: Visual stimulus of AI transparency



Source: Authors' elaboration

After the presentation of the stimuli, the subjects completed survey items that measured the model variables. These survey items employed constructs and validated scales from prior literature (see Appendix A) that were prior translated into Italian and adapted to the context of the research. In addition to the measures discussed above, demographic questions were included. As far as the analytic procedures, the measurement 1-7 Likert scales were adapted from previous studies and validated through confirmatory factor analysis (CFA) to ensure reliability and construct validity (Beatty & Ferrell, 1998). Cronbach's alpha (Santos, 1999) was utilized to assess reliability, with all values exceeding the 0.70 threshold (see Appendix A). Convergent validity was substantiated by examining factor loadings (Anderson & Gerbing, 1988) and composite reliability, both of which satisfied the recommended cut-off values. Discriminant validity was assessed using the Fornell and Larcker (1981) criterion, ensuring that the average variance extracted (AVE) exceeded the squared correlations between constructs. The measurement model, which assesses relationships among the key variables of consumer perception analysis in the context of AI transparency, was tested prior to structural model analysis, following the recommendations of Anderson and Gerbing (1988) and Sethi and King (1994).

Results. *The model fit, tested with LISREL 8.80, was assessed through key indices, resulting in a good fit with satisfactory results indicating the robustness of the model: $\chi^2 = 69.456$, df = 6, p = 0.000, RMSEA = 0.206 (90% CI: 0.164 - 0.251), CFI = 0.982, NFI = 0.980, NNFI = 0.861, SRMR = 0.0177. These indices suggest that the model provides an adequate representation of the data, with the comparative fit index (CFI) and normed fit index (NFI) exceeding the recommended threshold of 0.90, and a low standardized root mean square residual (SRMR), supporting a well-fitting model.*

Fig. 3: SEM model

Source: Authors' elaboration.

The results of the path analysis are shown in Figure 3. As shown, riskiness of the purchase (H1: $\gamma = 0.018$, $p > 0.05$), privacy concerns (H2: $\gamma = 0.045$, $p > 0.05$) and general attitude toward artificial intelligence (H3: $\gamma = 0.043$, $p > 0.05$) do not significantly influence attitude toward the experience, suggesting that these concerns and general attitudes may not be primary determinants of how consumers perceive their interactions. Conversely, the ease of using shopping technology (H4: $\gamma = 0.163$, $p < 0.01$) positively affects attitude toward the experience, supporting the idea that a more intuitive and user-friendly shopping technology fosters a more favorable perception of the service. Additionally, perceived quality (H5: $\gamma = 0.423$, $p < 0.001$) emerges as a strong predictor of the attitudes towards the experience, highlighting that higher perceived service quality enhances consumers' motivation and engagement with the shopping experience.

Trust in the retailer (H6: $\gamma = 0.203$, $p < 0.05$) is significantly and positively associated with attitude toward the experience, suggesting that consumers who trust the retailer are more likely to perceive their shopping experience positively. However, this factor does not directly impact purchase intention (H9: $\gamma = 0.043$, $p < 0.05$) indicating that while it contributes to attitude formation, it does not directly translate into purchasing behavior. Similarly, satisfaction with the service agent does not significantly predict purchase intention (H11: $\gamma = 0.202$, $p > 0.05$).

Customer inspiration (H7: $\gamma = 0.155$, $p < 0.05$) significantly impacts attitude toward the experience, indicating that when consumers feel inspired by the interaction, they evaluate their experience more favorably. It also significantly predicts purchase intention (H10: $\beta = 0.587$, $p < 0.001$), meaning that when consumers feel inspired by their shopping experience, they are much more likely to make a purchase. Finally, attitude toward the experience (H8: $\beta = 0.152$, $p < 0.05$) has a positive effect on purchase intention, demonstrating that consumers with a positive perception of their experience with the AI-virtual assistant are more likely to proceed with a purchase. Table 1 summarizes the SEM's results.

Tab. 1: Summary Structural Model

Hypothesis	Coeff.	P-value	Hypothesis
H1: Riskiness of the purchase → Attitudes towards the experience	-0.018	> 0.05	Rejected
H2: Privacy concerns → Attitudes towards the experience	-0.045	> 0.05	Rejected
H3: General attitudes to Artificial Intelligence → Attitudes towards the experience	0.043	> 0.05	Rejected
H4: Ease of using the shopping technology → Attitudes towards the experience	0.163	< 0.01	Accepted
H5: Perceived quality → Attitudes towards the experience	0.423	< 0.001	Accepted
H6: Trust in the retailer → Attitudes towards the experience	0.203	< 0.05	Accepted
H7: Customer inspiration → Attitudes towards the experience	0.155	< 0.05	Accepted
H8: Attitudes towards the experience → Purchase intention	0.152	< 0.05	Accepted
H9: Trust in the retailer → Purchase intention	0.043	> 0.05	Rejected
H10: Customer inspiration → Purchase intention	0.587	<0.001	Accepted
H11: Satisfaction with the service agent → Purchase intention	0.202	> 0.05	Rejected

Source: Authors' elaboration.

To conclude, the findings highlight that ease of use, perceived quality and consumer inspiration play a crucial role in shaping a positive attitude and acts as determinants of attitudes, emphasizing the importance of intuitive and reliable platforms. The attitude toward experience and customer inspiration are key drivers of purchase intention. Interestingly, while trust in the retailer enhances attitude toward the experience, it does not directly influence purchase intention, suggesting that trust alone is not enough to drive sales.

Research limitations. *Despite the valuable insights it provides, this study is not without its limitations. First, the sample consists exclusively of Italian consumers, which may restrict the generalizability of the findings across different cultural contexts. Future research should replicate this study in other geographical settings to account for potential cultural differences in AI acceptance and consumer behavior. Second, the study focuses on AI-driven customer service interactions within an e-commerce context. While this sector is particularly relevant for AI adoption, it does not fully capture the breadth of AI applications in other domains, such as healthcare, financial services, or public administration, where consumer expectations and trust mechanisms may differ. Third, the data were collected through an online survey distributed via social media platforms. While this method ensures access to a digitally engaged audience, it may introduce selection bias, limiting the representation of consumers who are less active online or have lower familiarity with AI technology. In light of these limitations, future studies should consider employing mixed-method approaches, incorporating both experimental designs and qualitative studies, or conducting offline surveys to enhance external validity.*

Managerial implications. *From a management perspective, the research highlights the need for companies to carefully balance AI transparency with user reassurance strategies. The findings suggest that while AI disclosure can foster trust and improve the perceived quality of customer interactions, it can also raise concerns about privacy and data security. Companies and retailers implementing AI-powered customer service should therefore develop communication strategies that emphasize both transparency and consumer protection, ensuring that AI adoption is aligned with ethical and regulatory standards.*

Transparency in AI interactions emerges as a key driver of consumer trust, satisfaction, and purchase intention. Companies should consider AI transparency not only as an ethical practice, but also as a strategic tool to enhance perceived service quality and build consumer trust. Retailers should clearly disclose the AI nature of virtual assistants, as transparency improves perceived service quality and fosters trust, which contributes to a more positive attitude toward the experience but does not directly increase purchase intention. Therefore, trust should be leveraged to improve experiential factors that, in turn, drive purchases. However, excessive transparency may raise privacy concerns among certain consumer segments, requiring a balanced communication strategy that reassures users about data security with privacy regulations (e.g., GDPR, CCPA) and offers users control over their data sharing preferences to reduce skepticism and promote engagement while maintaining an efficient AI-driven service. Therefore, companies should ensure that AI systems clearly communicate their nature while maintaining an intuitive and seamless interaction experience. In this context, customer inspiration is a key driver of consumer attitudes and behaviors, influencing both attitude toward the experience and purchase intention. While privacy concerns and ease of use shape perceptions of AI-assisted interactions, inspiration itself is not directly affected by these factors but plays a mediating role in the decision-making process.

Although privacy concerns may initially appear to be a barrier, this study shows that they were not statistically significant in the tested model. However, effective privacy management remains important to reduce perceived risk and foster trust, especially in sensitive sectors or with privacy-conscious consumers. This reinforces the importance of transparent and responsible AI practices. Because customer inspiration effects purchase intention, retailers should design AI interactions that go beyond basic transactional tasks and encourage AI transparency. Implementing AI-driven recommendations, personalized product suggestions, and proactive engagement strategies can increase customer inspiration and drive purchase behavior. For example, retailers should use AI-powered virtual assistants to create engaging and interactive shopping experiences, such as AI-curated shopping lists, voice-activated product explorations, and immersive digital showrooms that drive discovery and conversion.

In addition, the research underscores the critical role of retailer trust in shaping consumer perceptions with AI-powered interactions. However, our findings indicate that trust in the retailer does not directly influence purchase

intention. Instead, trust contributes to a positive attitude toward the AI-assisted experience, which in turn affects customer inspiration and purchasing behavior. Companies need to complement AI transparency with high service quality and reliability, as trust remains a fundamental element of AI-enabled consumer experiences.

When managed effectively, AI transparency can enhance the perceived quality and satisfaction with the AI service agent. However, satisfaction with the AI agent was not found to have a significant effect on purchase intention. This suggests that while enhancing AI responsiveness, accuracy, and personalization can improve the user experience, other factors play a more decisive role in shaping purchasing behavior, such as trust in the retailer or ease of use. Consequently, retailers are advised to prioritize AI design strategies that not only enhance user satisfaction but also fortify the broader consumer decision-making process.

While AI-powered customer service can streamline interactions and reduce costs, some consumers still prefer human involvement in complex purchasing decisions. Retailers should implement seamless AI-to-human transitions and ensure that customers can easily escalate questions to a human representative when needed. A strong reputation, coupled with transparent AI communications, will ensure that consumers feel secure in their interactions and foster long-term loyalty.

In summary, retailers embracing AI must balance transparency, personalization, and privacy considerations to optimize consumer trust and engagement. A well-executed AI strategy can enhance customer experience, build long-term loyalty, and drive revenue growth in an increasing digital retail landscape.

Originality of the paper. *This study makes a significant contribution to the expanding corpus of research on AI in marketing by empirically examining the effects of AI transparency in consumer interactions. Whereas prior studies have primarily explored AI adoption and consumer trust in broad terms, this research provides a more focused and contextualized analysis of how explicit AI disclosure influences key psychological and behavioral outcomes across the customer journey. A distinguishing aspect of this study is its focus on a specific AI-driven customer interaction scenario, in which an AI-powered virtual assistant clearly identifies itself as a non-human entity. The analysis of consumer responses to this disclosure provides a nuanced understanding of how AI transparency shapes consumer attitudes and decision-making processes, extending prior research by demonstrating that AI transparency influences not only trust and perceived quality, but also a potential driver of customer inspiration and engagement, which in turn drive purchase intention. Furthermore, this study integrates privacy concerns and risk perception as boundary conditions. Although these variables were not found to be statistically significant in the final model, their inclusion highlights the contextual complexity of AI-enabled experiences and invites future research to examine these factors across different consumer segments or sectors. This comprehensive approach offers significant contributions to the field, providing both theoretical advancements in AI ethics and practical implications for businesses. Finally, by integrating structural equation modeling (SEM) with validated theoretical constructs, this study provides a robust empirical framework that advances current understanding of how transparency in AI interactions can serve as both a strategic tool and an ethical imperative for businesses aiming to maintain consumer trust while innovating through automation.*

Scales summary

Variable	Items	Cronbach's alpha	Mean
Attitude toward the experience (ATTE) *adapted from Chun et al. (2017)*	**ATTE1:** How much did you like the service provided by the AI virtual assistant? Disliked it very much / Liked it very much **ATTE2**: How enjoyable was the experience of the service provided by the AI virtual assistant? Not at all enjoyable / Very enjoyable **ATTE3**: How fun was the experience of the service provided by the AI virtual assistant? Not at all fun / Very fun **ATTE4**: How good was the experience of the service provided by the AI virtual assistant? Not at all good / Very Good	.917	3.929
Perceived quality (PQ) *adapted from Faruk et al. (2018)*	**PQ1**: This service provided by the AI virtual assistant is of high quality. **PQ2**: This service provided by the AI virtual assistant is a superior service. **PQ3**: This service provided by the AI virtual assistant is of very good quality.	.889	3.919
Customer inspiration (CI) *adapted from Böttger et al. (2017)*	**CI1:** I was inspired to buy something. **CI2:** I felt a desire to buy something. **CI3:** My interest to buy something was increased. **CI4:** I was motivated to buy something. **CI5:** I felt an urge to buy something.	.939	3.574
Purchase intention (PI) *adapted from Dhruv et al. (1998)*	**PI1**: I would purchase the product. **PI2**: I would consider purchasing this product with a 10% discount. **PI3**: There is a good chance that I would consider purchasing this product.	.890	3.777
Ease of using the shopping technology (EUST) *adapted from Inman & Nikolova (2017)*	**EUST1**: I believe that my interaction with this technology will be clear and understandable. **EUST2**: It will be easy for me to become skillful in using this technology. **EUST3**: I would find this technology easy to shop online.	.922	.221
Privacy concerns (PC) *adapted from Martin et al. (2018)*	**PC1:** I believe I have control over what happens to my personal information. **PC2:** It is up to me how much the company uses my information. **PC3:** I have a say in how my information is used by the company. **PC4:** I have a say in whether my personal information is shared with others.	.914	3.187
Riskness of the purchase (RP) *adapted from Campbell et al. (2001)*	**RP1**: Buying a product through this chat would be risky. (R) **RP2:** There is a good chance that a problem will arise if you purchase a product via chat **RP3:** I would be worried that I would be disappointed if I bought the product from this chat. (R) Note: the items marked with R have been reversed	.909	3.287
Satisfaction with the service agent (SATSA) *adapted from Wan et al. (2016)*	**SATSA1**: The service provided by this AI virtual assistant is good. **SATSA2**: The service provided by this AI virtual assistant is better than I expected. **SATSA3**: I am happy with the service provided by this AI virtual assistant.	.921	3.908
Trust in the retailer (TRUST) *adapted from Tax et al. (1998) and Darke et al. (2016)*	**TRUST1:** I believe that I could trust this retailer. **TRUST2:** I could depend on this retailer. **TRUST3:** I think this retailer would be reliable in meeting its promises. **TRUST4:** This retailer probably has high integrity.	.950	3.816
General Attitudes to Artificial Intelligence (GAAI) *adapted from Schepman & Rodway (2020)*	**GAAI1:** There are many beneficial applications of AI. **GAAI2:** I am impressed by what AI can do. **GAAI3:** AI can have positive impacts on people's wellbeing. **GAAI4:** Artificial Intelligence is exciting. **GAAI5:** AI can provide new economic opportunities for this country. **GAAI6:** AI systems can perform better than humans. **GAAI7:** Much of society will benefit from a future full of AI. **GAAI8:** I am interested in using AI systems in my daily life. **GAAI9:** An AI agent would be better than an employee in many routine jobs.	.908	3.584

Socio-Demographic Clustering and Localized Competition: A Spatial Analysis of Grocery Retail Markets in France

MICHELE BADOLATO[1]

Abstract

This paper investigates the role of socio-demographic clustering in shaping grocery retail performance in France. We use IRIS data to segment consumers into 12 clusters and build a turnover allocation model with a distance decay function. The results show that the market shares, competition intensity, and store performance in each cluster vary greatly across them, stressing the importance of matching the store type of offer with the preferences of the surrounding consumers. Findings offer actionable insights for optimizing store locations and formats in competitive markets

Target Journals: *Journal of Retailing and Consumer Services; Journal of Retailing*

Framing of the research. *The grocery retail market is highly concentrated and strongly competitive, with store performance significantly influenced by geographic layout and surrounding consumer demographics. This is particularly evident in France, where the top eight grocery retailers account for 98% of the total market share, and the national CR4 has increased from 66.5% to 75% between 2018 and 2024. These market dynamics, coupled with regulatory barriers, are crucial for policymakers aiming to safeguard consumer interests through merger regulations and retailer market power oversight (Turolla, 2010; Allain et al., 2017). Additionally, they present challenges for both established competitors and new entrants seeking to expand their presence.*

While national competition is important, retail competition is primarily localized, centered around the concept of retail catchment areas-geographical zones from which stores or shopping centers draw the majority of their customers, typically measured by walking distance or driving time (Dolega et al., 2016).

The theoretical basis for this study lies in the frameworks of spatial competition and retail catchment concepts, which are significant areas of interest for both scholars and practitioners, and they have been explored extensively in the literature, tracing back nearly a century to the foundational works of William J. Reilly (1929, 1932), who applied spatial interaction theory to retail markets (Brown, 1993). The characteristics of the catchment area are primarily shaped by three factors: demand, supply, and consumer interaction. The demand side is dictated by population size and distance, regarded as the determinants of a catchment area's retail sales. In contrast, the characteristics of a store, so its attractiveness, significantly influence its catchment area on the supply side. The share of customers a retail outlet attracts from a region is represented by the entropy-maximising model, which is inversely proportional to the distance and directly proportional to the outlet's attractiveness (Birkin et al., 2010). While demographic factors like population size and household incomes within catchment areas significantly influence shoppers' behaviour and retail performance (Kuruvilla and Joshi, 2010), the extent to which malls can attract customers largely depends on their size and positioning strategy. In few words, larger (and well positioned) the store, higher is its attractiveness, and wider is expected to be its catchment area. Furthermore, subsequent research has expanded on these theories, incorporating models focused on demand-side factors (Birkin et al., 2010), uncertainty in catchment areas (Rasouli and Timmermans, 2013), retail agglomeration dynamics on a national scale (Dolega et al., 2016), and more recently, catchment analysis has been refined to account for purchasing power variations (Yim Yiu et al., 2024) or it has been redefined using mobile data (Guan et al., 2025).

Despite the growing interest of academic researchers, few works on catchment area have been made on grocery industry specifically, which, in the sphere of retailers, is the one most susceptible to the distance customer-to-store. In the paper of Allain et. al (2017) on grocery market mergers in France, the researchers assumed that, on average, consumers are willing to drive up to 30 minutes to reach a hypermarket, while they drive 10 to 15 minutes to reach a supermarket or a discount store. While these distances are a rule of thumbs in the industry, they tend to ignore the real effect of distance inside the catchment area, considering a consumer really close to the store as attracted as one that lives almost 30 minutes far away from it. In addition, a hypermarket of many thousands of square meters should have a higher catchment area that one large just a thousand square meters. In our research, we tried to implement a simple, yet more sensible, model of retail catchment depending on a decay function, which captures the decline in store attractiveness (based on size and store type) with increasing distance.

The other pillar of our research is based on customer segmentation, a cornerstone for retail planning, enabling firms to tailor their strategies based on the heterogeneity of consumer preferences. Geodemographic segmentation has been

DOI 10.7433/SRECP.SP.2025.01

studied intensively in marketing (Gonzalez-Benito & Gonzalez-Benito, 2004; 2005; Carpenter & Moore, 2006), since it offers a valuable framework for capturing spatial market heterogeneity, identifying behavioural patterns such store formats and attributes preferences. Ultimately, methods like k-means clustering have been use for intelligent customers segmentation, providing actionable insights into customer behaviour (Tabianan et al., 2022). Finally, research examining the interaction between socio-economic characteristics and grocery store performance remains limited, with few exceptions. Addressing this gap, our study investigates how localized socio-economic clustering influences store performance and market share

Purpose of the paper. *This study bridges two key areas of research - socio-demographic clustering and spatial competition modelling - to propose a novel approach to evaluating store performance at a neighbourhood level. Specifically, we investigate how socio-economic clustering at the IRIS level (the smallest statistical geographic units in France) serves as a proxy for consumer behaviours that shape local grocery market dynamics. At the same time, we apply a turnover allocation model based on a decay function inspired by the Huff Model, incorporating both store attractiveness and distance between the store and IRIS units. This dual approach enables a more comprehensive analysis of grocery retail competition and the interaction between different consumer clusters and store formats.*

To address these research gaps, we formulate the following questions:

1. *What is the grocery market structured in terms of concentration and competition at a micro-local level in the south of France?*
2. *Do geodemographic clusters influence the performance of different grocery retail formats?*

First, using a two-step clustering approach, we segment IRIS units (the smallest statistical geographic units in France) into 12 distinct socio-economic clusters, capturing latent heterogeneity in consumer attributes at a fine scale.

Then, we estimated the retail catchment area and the turnover made by each store in each IRIS. Retail catchment modelling has historically been centred around consumer-based approaches, with one of the most well-known being the Huff Model (Huff, 1964). The Huff Model estimates the probability of a consumer at location i choosing a retail centre j based on store attractiveness and distance decay. In these last decades, the model evolved under vary aspects. For example, it has been showed that the decay of patronage linked with duration of travel can be adjusted by assigning a power value to the β parameter, with larger values representing a more rapid decay (Joseph and Kuby, 2011). A substantial body of literature has evaluated various aspects of the distance decay parameter and estimation of its values, often through survey or study of transaction data (e.g. Huff, 1964; Dennis et al., 2002; Gonzalez-Benito and Gonzalez-Benito, 2005; Birkin et al., 2010).

However, while the Huff Model is consumer-focused, our study introduces a turnover-based allocation model that shifts the perspective from consumers selecting stores to retailers distributing turnover among surrounding IRIS units. This difference is crucial: instead of modelling consumer choice like in the Huff Model, we aim to spatially allocate store revenue based on the distribution of store attractiveness and local grocery expenditure. The application of our model enables the computation of localized competition metrics, including the Herfindahl-Hirschman Index (HHI), a competition intensity index, and market shares at both the brand and store format levels. Our findings offer a comparative evaluation of different grocery store formats, such as discount and premium outlets, within distinct socio-economic clusters. The results indicate that store performance is not solely determined by consumer attraction but is also shaped by initial location choices within specific socio-economic environments.

Methodology.

Data Collection and Preparation

For our research, we focused our attention on a specific area of France, the Alpe-Maritimes department due to a duality of reasons. First, the territory seems large and diverse enough to understand different consumers patterns, and second, there is an abundance of interesting data for both consumers and stores. The study merged two primary datasets to carry out the analysis: a Consumer Dataset, build with several variables from ArcGIS standard demographics dataset sourced from data supplied by Michael Bauer Research GmbH; and a Store Dataset, directly provided by Nielsen IQ Panorama Trade-dimension.

The consumer dataset includes socio-demographic and economic variables at the IRIS level, the smallest statistical French area. We chose IRISs considering that they are the highest granular data at the geographical level. For each statistical unit, the dataset included variables such as geographical indicators (municipality and province of the IRIS…) population size and density, total households, average household size and households' type (single, with children, seasonal house…), educational attainment, job occupation and unemployed population, number of workers by place, median household income, purchasing power index, spending patterns, and geographical position of the IRIS (latitude and longitude). The total number of IRISs that covers the departments of the Alpes Maritimes is five hundred with an average population size of 2,194 per unit, and a total of over 1 million inhabitants. Furthermore, we calculated the percentages of several variables over the total number of people of the IRIS: for example, the percentage with a high school degree, or percentage of unemployed people. The last added variable was the average price per square meter in euro of residential buildings, recovering the data from the real estate listing website Seloger.com. The final version of the consumer dataset counted 72 variables for 500 IRISs in 163 different municipalities. Only 8 out 163 municipalities however have a population larger than 30,000 people and more than 10 IRISs present in the territory, with only the municipality of Nice with a metropolitan population over 300,000 people and more than 100 IRIS.

Our second dataset, contains detailed information of all the grocery stores in the Alpes-Maritimes department, including store locations (including latitude, longitude, city and zip code), retail format classifications, brand and owning company, sales area, and total turnover. In total we have a database with 537 grocery stores active in the area in 2024, divided in the following retail formats: 23 Hypermarkets (over 2.500 square meters),124 Supermarkets (between 400 and 2.500 square meters), 238 Minimarkets (comprehending Traditional Stores of 100 square meters or less, and Superette ranging between 100 and 400 square meters), 35 Discount stores, 50 Organic stores, and 57 Click & Drive points. For our analysis, we used all stores apart from Click & Drive, reaching a total of 480 groceries with a turnover of approximately 3.9 billion euros. Finally, we calculated the turnover per square meter of each store.

Socio-Demographic Clustering

This study employs a structured methodological approach to allocate store turnover across IRIS units using socio-economic clustering and a distance decay function. This approach allows for a refined understanding of local retail market dynamics by integrating consumer segmentation with spatial competition modelling. To capture heterogeneity in local consumer markets, we employ a two-step clustering with a k-means approach to classify IRIS units into 12 socio-economic clusters. The k-means clustering algorithm partitions observations into clusters by minimizing within-cluster variance and has been used widely in the literature for consumer studies (Gonzalez-Benito & Gonzalez-Benito, 2004, 2005; Tabianan et al., 2022) The methodology consists of the following steps:

1. *First step geographical categorization: IRIS units are initially grouped into Urban, Suburban, and Rural categories based on population density, number of businesses, and proximity to major cities. This allowed us to perform a subsequent k-means approach focused on each of these different geographical IRIS groups. The idea behind this is that Urban and Rural populations are different in terms of consumer behaviors and shopping opportunities. We prefer to compare, for instance, urban struggling neighbourhoods with urban rich areas instead of comparing the pure geographical variables with the socio-economic variables without any control of them. Doing that, we divided the 500 IRISs in 128 Rural, 126 Suburban, and 246 Urban areas. The larger number of urban IRISs is mainly due to the fact that the larger cities, such Nice, have smaller but more IRISs relative to the rural municipalities.*
2. *Socio-Demo Clustering: Within each broad category, IRIS units are further segmented using k-means clustering based on the following variables:*
    - *Demographic Indicators: Population Density, age distribution, population of French and foreign origin.*
    - *Housing and Household Characteristics: Number of households, average household size, seasonal housing percentages.*
    - *Employment and Education: Occupational structure and number of businesses, unemployment rates, and education levels.*
    - *Spending Behaviour and Economic Indicators: Expenditures on food, beverages, alcohol, and personal care; purchasing power indices; and median household income.*

The k-means clustering algorithm is executed multiple times to ensure stability in the cluster assignments. Due to the number of IRISs in the different geographic categories and by using the elbow method we divided the Rural and Suburban IRISs in three different clusters, while the Urban IRISs have been divided into six clusters. After looking at the main differences in terms of variables we assigned a qualitative tag to each of them with the objective to sum up the differences in the variables 'values. Hereafter the list of the twelve clusters:

- *Rural Isolated Agricultural and Elderly (30 IRISs)*
- *Rural Isolated Mid-Low-Income Workers (60 IRISs)*
- *Rural Residential Mid-High-Income Families (38 IRISs)*
- *Suburban Affluent Elders (17 IRISs)*
- *Suburban Mid-High-Income Families (69 IRISs)*
- *Suburban Young Working Class (40 IRISs)*
- *Urban Mid-High-Income Professionals (20 IRISs)*
- *Urban Elderly and Touristic (50 IRISs)*
- *Urban Middle-Class Families (63 IRISs)*
- *Urban Working-Class Families (53 IRISs)*
- *Urban Multiethnic Low-Income Families (21 IRISs)*
- *Urban Dynamic Young Professionals (39 IRISs)*

Turnover Allocation Model

As mentioned above, the objective of our model is to spatially allocate store revenue based on the distribution of store attractiveness and local grocery expenditure, basing our assumptions on the famous Huff Model but shifting the perspectives from the consumers to the retailers. To develop the model first we start with the distance calculation. We georeferenced each store location and linked to IRIS centroids, allowing for the calculation of driving distances, with a maximum threshold of 35 minutes' drive to ensure practical relevance. This threshold captures consumer mobility patterns within a reasonable shopping distance. To ensure more attachment to the reality we decided to use a driving distance considering the roads and infrastructure instead of moving with a classic distance calculation measure such as Euclidean distance.

After the calculation, a distance decay function is formulated to model the declining influence of a store as distance increases. The weight assigned to each IRIS-store relationship is given by:

$$W_{ij} = e^{(-\beta \cdot D_{ij})}$$

Where:

- W_{ij} *: Weight associated to the distance between IRIS* i *and store* j*.*
- D_{ij} *: Distance between IRIS* i *and store* j *(in minutes' drive)*
- β *: Decay parameter which control distance sensibility (higher means faster decay).*

The decay parameter β *is further specified as:*

$$\beta = \alpha 0 + \alpha 1 \cdot log(sales_{area}) + k = \sum_{k=1}^{K} \gamma_k \cdot Store_k$$

Where:

- $sales_{area}$ *: store sales area in square meters, that represents the attractiveness of the store*
- K *: number of types of stores (hypermarket, supermarket, discount, minimarket, organic).*
- γ_k *: coefficients linked to each type of store.*
- $Store_k$*: Dummy variable indicating the effect of the type of store (Supermarket, Discount, Hypermarket, Minimarket, and Organic Shop).*

To estimate β*, we employ the Nelder-Mead optimization algorithm, which iteratively refines the decay parameter to minimize errors between observed and predicted store turnover distributions. After calculating the decay weight, to blend more with reality, we decided to determine a cutoff threshold to avoid store making a very small amount of their turnover in faraway IRISs. We decided to opt for a small value but still relevant of 0.1 since after this value the turnover weight of the stores was fairly small.*

Moreover, we compute the total spending per IRIS i *as:*

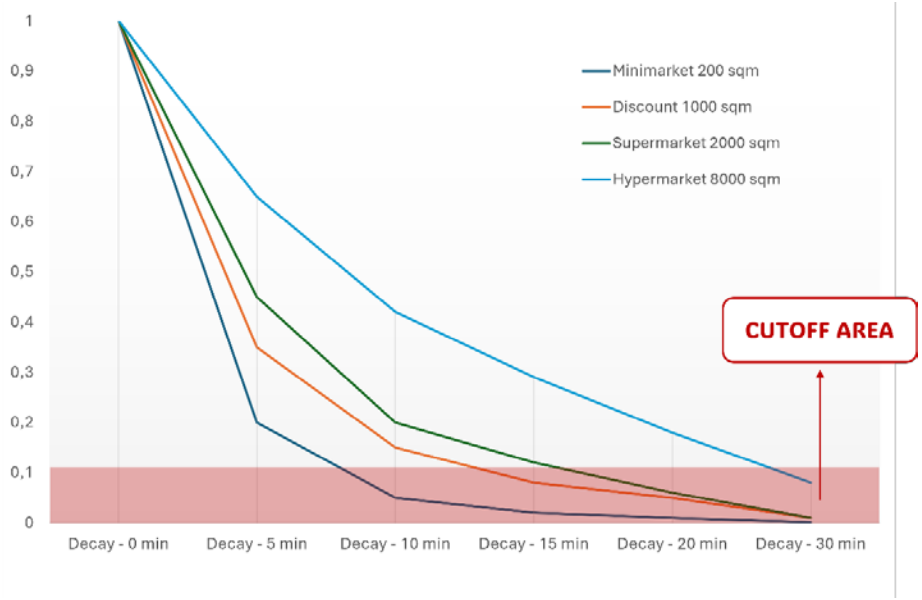
$$S_i = (avg_spend_i \cdot population_i) + (seasonal_houses_i \cdot 0.2 + workers_i \cdot 0.2) \cdot avg_spend_i$$

Where seasonal houses, also addressable as second or holiday homes, and worker population, are weighted at 20% to account for their partial contribution to local demand. These values have been estimated considering the information about days spent by French people on their second houses and percentage of grocery shopping made in the hours immediately after work.

The turnover contribution of each IRIS to a store is then calculated as:

$$T_{ij} = S_i \cdot W_{ij}$$

And normalized as:



$$\tilde{T}_{ij} = \frac{T_{ij}}{\sum_i T_{ij}} \cdot T_j$$

where:

- T_{ij} *represents the turnover contribution from IRIS* i *to store* j*.*
- S_i *is the total consumer spending in IRIS* i*.*
- W_{ij} *is the decay-weighted store influence on IRIS* i*.*

This methodological framework extends traditional retail catchment modelling by focusing on turnover allocation rather than consumer choice. Unlike the Huff Model, which estimates the probability of consumer visits, our model redistributes store turnover across spatial units based on local socio-demographic factors and store attractiveness. This novel approach allows for a more precise evaluation of store performance at a micro-geographic level, offering valuable insights into the spatial distribution of grocery retail success. In the figure below an illustrative results of the attractiveness decay function depending on the store size and type.

Figure 1 - Decay Function and variations for type of store

Indexes Calculation

After the turnover allocation we had available the estimation of how much turnover has been made by each store in each IRIS. To finish our analysis, we summed up the turnover of stores owned by the same company (f) and then calculated the market shares in each IRIS simply by making the percentages of the turnover of a specific company over the total turnover on the IRIS. We repeated the process by summing up the turnover made by each type of store (discount, hypermarket…) and calculated their market share in the IRISs. Below, the formula:

$$Market\ Share_{Fi} = \frac{\sum_{j=1}^{f} \tilde{T}_{ij}}{\sum_{j' \in J} \widetilde{T_{ij'}}}$$

Starting from this point, we developed other two indexes: HHI and Competition Intensity Index.

The Herfindahl-Hirschman Index (HHI) is a widely used measure of market concentration in economics and competition analysis. We calculated it for each IRIS, so at a micro-local level, and it is defined as follows:

$$HHI_i = \sum_{f' \in F} (Market\ Share_{fi} \cdot 100)^2$$

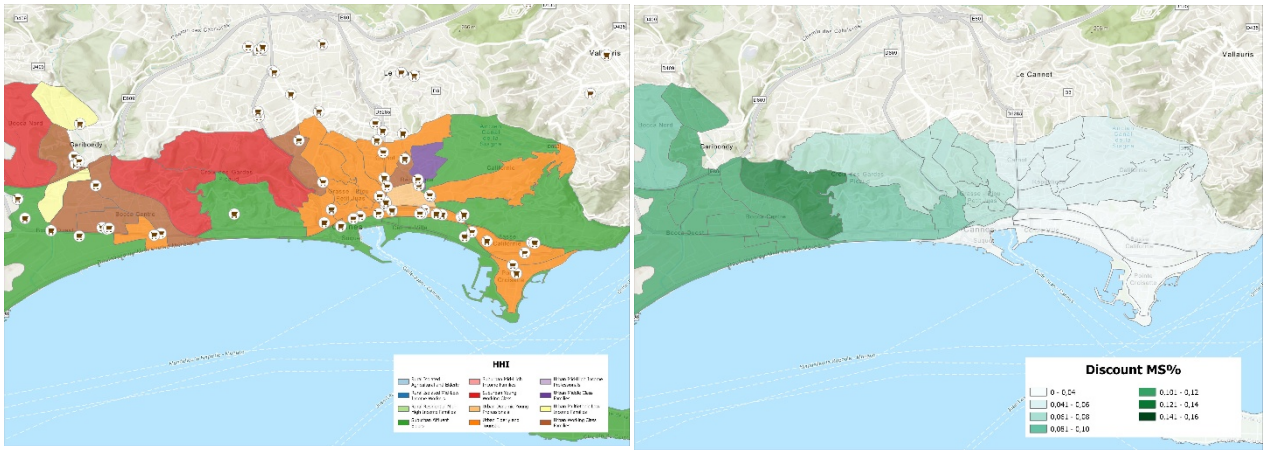
In our local HHI we have the square of the market share of all the firms f' each IRIS i, with a value that range from 0 to 10,000, where values near zero show a perfect competitive market while 10,000 is the value for a monopolistic market. An industry is considered highly concentrated when HHI values are higher than 2,500.

Finally, to measure competition intensity, we developed a Competition Intensity Index (CII) based on the spatial distribution of competing stores. This index is constructed by summing the decay-weighted competitive presence of all stores j within a given IRIS i . The decay function applies decreasing weights to competitors as their distance from the focal area increases, ensuring that nearby stores exert a stronger competitive influence with values near 1, than those farther away with values approaching zero.

Below the simple formula:

$$CII = \sum_{j' \in J} decay\ weight_{ji}$$

By aggregating these weighted values, the index provides a continuous measure of local competitive pressure, enabling comparisons across different geographic regions and market structures.



Results.

Market Shares and Socio-Economic Clusters

The market share analysis, linked with the population clusterization of the IRISs, reveals significant heterogeneity across clusters, reflecting differences in consumer preferences and competitive dynamics. Discount and premium store formats exhibit distinct performance patterns, particularly in urban areas where income disparities and household structures are more presents and can influence shopping behaviours. The results indicate that discount stores perform better in clusters characterized by lower-income households, higher unemployment rates, and a lower purchasing power.

Discounts almost double their market share in these IRIS, touching peaks of over 18% of market shares in comparison to an average value of 9%. On average, discount's market shares on the three clusters with a lower median income range between 9 and 12%, while on other urban and suburban clusters show average values between 5% and 8%. Conversely, premium brands, such Casino and Carrefour, show stronger performance in affluent areas with higher education levels, patronised mainly by young and middle-aged professionals, and with a middle-high median income level. On the figure below you can see an example of the city of Cannes. At our left we can see the different clusters present in the city, with the red, the brown, and the yellow ones, being respectively Suburban Young Working Class, Urban Working-Class Families, and Urban Multiethnic Low-Income Families clusters. We see that are found mainly on the left part of the city, which, when looking at the market share discount map, shows the greatest values, coloured in bright green.

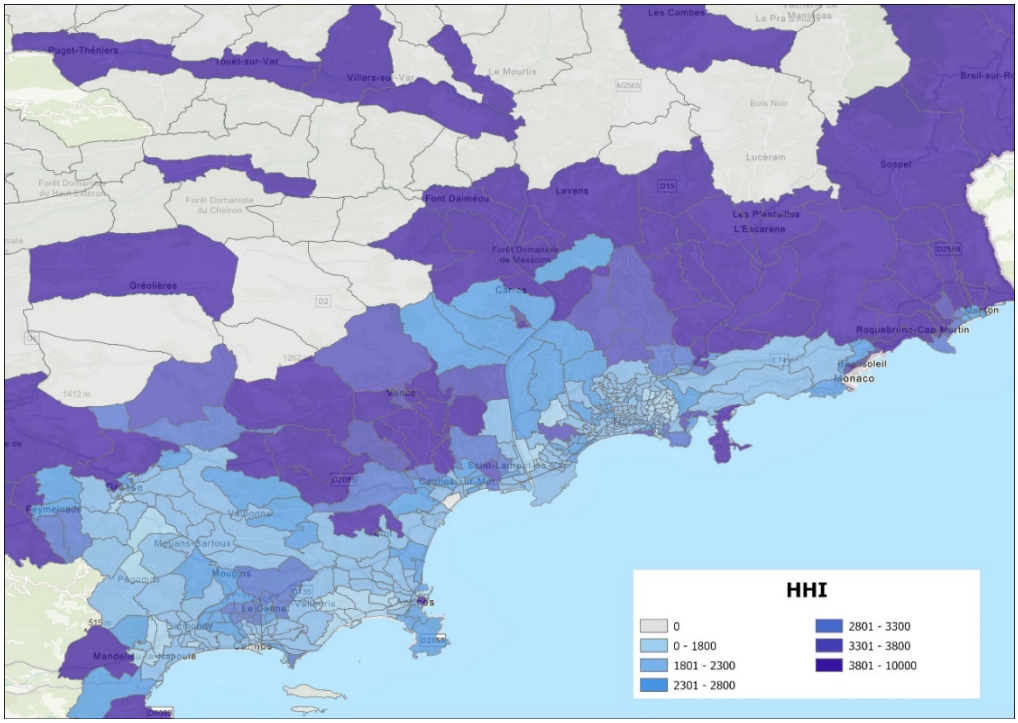


Figure 2 - Cannes Socio-Economic Clusters (left) and Market Shares of Discount Stores (right)

Herfindahl-Hirschman Index (HHI)

The HHI analysis provides insights into the degree of competition across different geographical areas. With our novel approach we are now able to look at the concentration index not merely at a city or provincial level, but a micro-local level, which can be helpful for both policymaker and industry manager to understand the real degree of concentration, and the real possibilities of consumer choices, available in a specific neighbourhood. Our results show that the French grocery retail market exhibits moderate to high concentration, with an average HHI of 2,600, slightly exceeding the threshold for oligopolistic competition.

Figure 3 - HHI of Alpes Maritimes

However, looking at the figure above, we can see that significant spatial disparities emerge:

- *Urban areas show moderate HHI values, often ranging between 1,800 and 2,300, suggesting a more balanced competitive landscape with multiple players. Leading incumbents, however, tend to maintain a large share of the local market even in the city centres, with shares often approaching 40% of the market in specific IRISs.*
- *Suburban and rural areas tend to generally have higher HHI values, indicating reduced competition and potential monopolistic tendencies due to limited store availability. Our model observes that in 27 IRISs, with an affected population of approx. 27,000 people, there is an effective monopoly, with only 1 grocery company able to attract the consumers of the area.*
- *Food deserts (shows in grey in the figure below) are identified in several rural regions, where no grocery store maintains a competitive area of attraction, forcing residents to travel long distances for groceries. 74 out 500 IRISs (15% of the total) are considered "food deserts", but in terms of population are just 30,000 out of almost 1,1 million people, so less than 3% percent of the total population of the area.*

Competition Intensity

To complement the HHI, we introduce a Competition Intensity Index (CII), which accounts for the spatial distribution of competing stores through a decay-weighted function. The CII provides a continuous measure of competitive pressure, incorporating both store proximity and attractiveness. The CII ranges from 0 to 27, with an average value of 7, indicating substantial variations in competitive pressure across regions. Notably, urban areas exhibit particularly high values, reflecting their dense retail environments and heightened market rivalry. Especially the city of Nice, having around 300,000 inhabitants, is the only municipality with a CII higher than 20, with an average value of 14, while other minor cities like Antibes and Cannes, show smoother average CII values, respectively 9 and 7. To interpret this number at a managerial level is like to imagine that 1 point corresponds to a store completely influencing the area, being very close to it. As can be expected, suburban, and especially rural IRISs have much smaller CII values, ranging from zero to four.

Research limitations. *While this study provides valuable insights into localized grocery retail competition and socio-demographic clustering, some limitations should be acknowledged. First, the turnover allocation model relies on estimated decay functions rather than actual consumer transaction data, which could introduce biases in the spatial distribution of revenues. Future research could refine this approach by incorporating real purchase data or mobile tracking information to enhance accuracy. Second, although the socio-economic clustering method effectively captures consumer heterogeneity, it does not account for dynamic changes in population composition, such as migration patterns, working force composition, or seasonal fluctuations in touristic areas, which may affect market dynamics. Lastly, the analysis focuses on a single department (Alpes-Maritimes), and while the findings are broadly applicable to similar regions, further validation in other geographic contexts would strengthen the generalizability of the results.*

Managerial implications. *The findings of this study hold significant managerial and strategic value for grocery retailers, particularly in optimizing store locations and adapting retail formats to local consumer demographics. By leveraging socio-economic clustering, retailers can tailor store assortments, pricing strategies, and promotional efforts to better align with neighbourhood characteristics. For instance, discount retailers may benefit from expanding in low-income urban clusters, while premium brands should prioritize affluent areas with high education levels. Additionally, the Competition Intensity Index (CII) provides a new tool for firms to assess local competitive pressures and refine market entry strategies. Finally, a grocery manager could apply this method to understand in which areas have better performance and consider which are the clusters of population more akin to its store's offer when looking at a new store location.*

From a policy perspective, the study offers insights for regulators and urban planners concerned with market concentration and food accessibility. The identification of food deserts highlights the need for targeted interventions, such as incentives for grocery store openings in underserved areas or policies that promote competition in highly concentrated markets. Furthermore, the micro-local analysis of HHI values can serve as a valuable input for merger control decisions, ensuring that market dominance does not reduce consumer choice at a neighbourhood level.

Originality of the paper. *This paper makes a novel contribution to the literature on spatial competition and retail market analysis by integrating socio-demographic clustering with a spatially explicit turnover allocation model. Unlike traditional approaches that analyse competition at a city or regional level, this study operates at a micro-local scale, enabling a more granular understanding of how different grocery formats interact with local consumer segments. The development of the Competition Intensity Index (CII) further extends existing competition metrics by incorporating the spatial distribution of competing stores and their attractiveness. Additionally, the application of a decay-weighted turnover model-inspired by the Huff Model-provides a more realistic estimation of grocery store performance across IRIS units. By bridging socio-economic segmentation with spatial competition analysis, this research offers both theoretical advancements and practical tools for industry stakeholders and policymakers.*

Key words: *retail competition; catchment area; market concentration; socio-demographic clustering; spatial analysis;*

Sustainable value propositions and the purchasing gap: a consumer-centric analysis

GIULIA GOGIALI[1] GIULIA NEVI[2] DILETTA BARTOLESCHI[3] LUCA DEZI[4]

Abstract

Sustainable business models (SBMs) integrate environmental, social, and economic dimensions into their value propositions, yet little research has explored how consumers perceive and respond to these propositions. This study investigates the extent to which consumer awareness of sustainable business practices influences purchasing decisions and whether the perception of sustainable value can provide a competitive advantage for companies. Using a qualitative approach based on 21 semi-structured interviews, the research employs thematic coding and sentiment analysis performed with Python to systematically assess consumer attitudes. The results indicate that while sustainability is generally perceived positively, its direct influence on purchasing behavior remains limited, with a significant proportion of neutral responses. However, sustainability is more widely recognized as a strategic advantage for businesses, suggesting that firms can strengthen their market positioning by effectively communicating the added value of their sustainable practices. The findings offer valuable insights for both research and management, highlighting strategic opportunities for firms aiming to enhance consumer engagement in the sustainability transition.

Framing of the research. *Sustainability has increasingly become a central concern in both academic literature and business practice, driven by growing environmental challenges, regulatory pressures, and changing consumer expectations (Azmat et al., 2023). Companies are progressively adopting sustainable practices not merely as a response to external pressures but also as a strategy to differentiate themselves in the marketplace (Bager & Lambin, 2020). In this context, sustainable business models (SBMs) have emerged as a promising approach to creating, delivering, and capturing value in ways that benefit not only the organization but also society and the environment (Neesham et al., 2023; Peric et al., 2017; Azmat et al., 2023). Unlike traditional business models, SBMs incorporate environmental, social, and ethical dimensions into their core value proposition, aiming to achieve long-term viability while addressing stakeholder concerns (Neesham et al., 2023; Roome & Louche, 2016). However, the extent to which consumers recognize and reward this sustainable value proposition remains an open question. in fact, little attention has yet been paid in the scientific literature to the implications of adopting sustainability in specific components of the business model, such as the value proposition (Ilyas & Osiyevskyy, 2022). SBMs are commonly described as frameworks that integrate three essential elements: sustainable value proposition, value creation and delivery mechanisms, and value capture systems (Vehmas et al., 2024; Bocken et al., 2014). The sustainable value proposition refers to what kind of value is offered to customers, society, and the environment through products or services; the value creation and delivery mechanisms encompass how the organization generates this value sustainably, often requiring innovations in supply chains, production processes, and stakeholder engagement; finally, the value capture system deals with how the company translates sustainable value into economic returns, such as profitability, brand loyalty, or pricing power (Vehmas et al., 2024; Bocken et al., 2014). As mentioned above, despite significant academic interest in these models, a key challenge persists in understanding how consumers perceive and respond to the sustainable value created by companies. To date, the majority of studies on sustainable business models have concentrated on developing sustainable value propositions, while limited attention has been given to how customers perceive and interpret the value delivered through these propositions (Lukkanen & Turan, 2022). Several studies have highlighted that the perception of sustainability by consumers can influence purchasing behavior, particularly among ethically conscious and environmentally aware segments (Lukkanen & Turan, 2022; Duarte et al., 2024; Malhotra et al., 2024). Nevertheless, consumer behavior regarding sustainable products and services often presents inconsistencies, commonly referred to as the "attitude-behavior gap" (Park & Lin, 2020), where positive attitudes toward sustainability do not always translate into purchasing actions. The discrepancy between intention and*

actual purchasing behavior also remains poorly understood (Park & Lin, 2020) and is specifically referred to as the "ethical purchasing gap" (Nicholls & Lee, 2006; Park & Lin, 2020). Given the complexity of consumer behavior and the multi-faceted nature of sustainability, further research is needed to explore how consumers perceive the sustainable value proposition and whether this perception can act as a source of competitive advantage for companies.

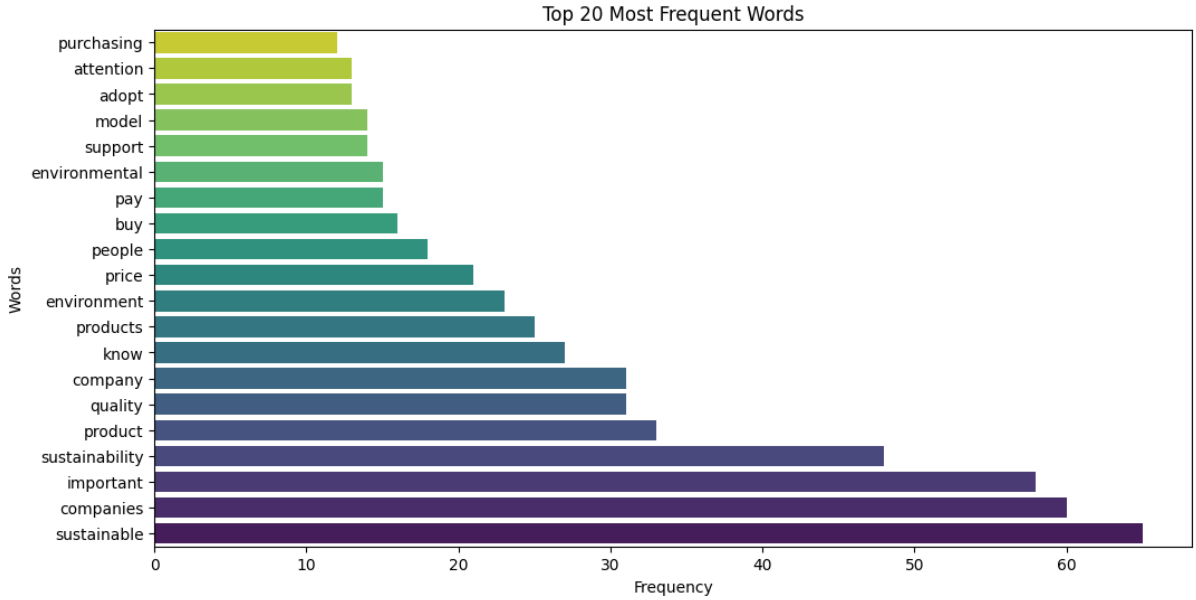
Purpose of the paper. *This study seeks to explore how consumers perceive the sustainable value proposition and whether this perception can provide a competitive advantage to companies. Specifically, the research addresses two key questions:*

RQ1: To what extent does consumer awareness of sustainable business practices influence their purchasing decisions?

RQ2: Can the perception of sustainable value provide a competitive advantage to companies adopting sustainable practices?

If consumers perceive sustainability as a core component of value, companies adopting SBMs could benefit from increased customer loyalty, premium pricing, and enhanced brand reputation (Sudjono, 2024; Agu et al., 2024; Ameyaw et al., 2024). Conversely, if sustainability remains a secondary consideration, the potential for competitive advantage may be limited (Jiao et al., 2022). The originality of this research lies in its dual approach: it combines qualitative insights from semi-structured interviews with advanced text analysis techniques to uncover patterns in consumer attitudes toward sustainability. The findings are expected to offer valuable implications not only for academic discourse but also for managerial practice, providing actionable insights for companies seeking to leverage sustainability as a competitive advantage.

Methodology. *This study adopted an exploratory and qualitative research approach (Thomas, 2006), using semi-structured interviews as the primary data collection tool. A diverse sample of consumers was selected, segmented by age and education level, to capture variations in the perception of sustainable value propositions (Tab. 1). The interview framework was designed to explore participants' attitudes toward sustainable business models, their understanding of sustainable value, and the contextual factors influencing their purchasing decisions. All interviews were audio-recorded and transcribed. A dataset was constructed containing the following variables: participant ID, age, education level, occupation, question, response, and category. Thematic coding was performed manually to categorize responses according to their relevance to each research question (Byrne, 2021). This process allowed for the identification of key themes and ensured that responses were systematically associated with the most relevant RQ. Following this thematic classification, a sentiment analysis was conducted for each RQ (Stine, 2019), leveraging Python-based text analysis techniques. Descriptive statistical analyses were applied to explore general trends in the data, while sentiment scores were computed to assess the polarity of responses (Poria et al., 2020). The sentiment analysis was performed by assigning sentiment scores to the responses within each thematic category, enabling a structured interpretation of consumer attitudes. This approach facilitated a deeper understanding of how consumers perceive the relationship between sustainability and purchasing behavior (RQ1) as well as the potential competitive advantage of sustainable business practices (RQ2). By integrating qualitative thematic analysis with computational text analysis, this study provides a comprehensive evaluation of consumer perceptions regarding sustainability, offering both interpretative depth and data-driven insights.*



Tab. 1: Interviewees

INT. ID	***AGE***	***EDUCATION LEVEL***	***OCCUPATION***
INT. 1	*23*	*Bachelor's degree*	*Student*
INT. 2	*27*	*Master's degree*	*Architect*
INT. 3	*35*	*High school diploma*	*administrative secretary*
INT. 4	*31*	*Bachelor's degree*	*Trader*
INT. 5	*46*	*High school diploma*	*Public Employee*
INT. 6	*36*	*High school diploma*	*Military*
INT. 7	*25*	*Master's degree*	*Corporate Employee*
INT. 8	*24*	*High school diploma*	*Student*
INT. 9	*53*	*Bachelor's degree*	*Employment Consultant*
INT. 10	*31*	*Bachelor's degree*	*Corporate Employee*
INT. 11	*63*	*Middle high school*	*Not employed*
INT. 12	*38*	*Master's degree*	*Architect*
INT. 13	*57*	*Middle high school*	*Craftsman*

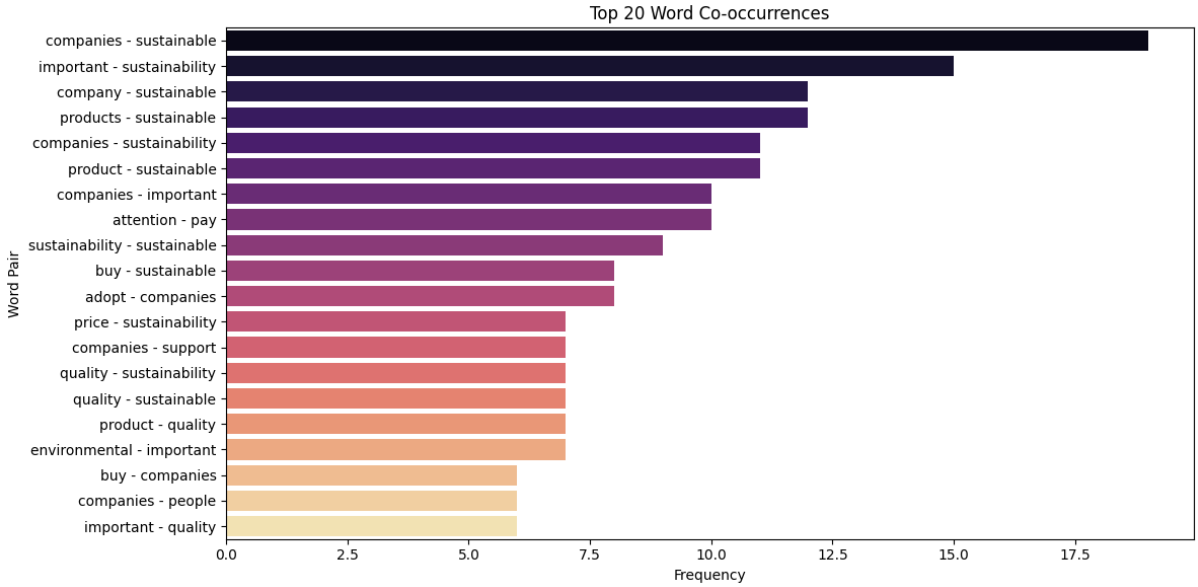
INT. 20	*33*	*Master's degree*	*Social worker*
INT. 21	*66*	*High school diploma*	*Retiree*

Results. *The results suggest that participants view sustainability not only as a criterion in their decision-making processes but also as an ethical value that guides their purchasing behavior. The frequent appearance of words (Fig. 1) such as "companies" (60 occurrences), "important" (58 occurrences), "product" (33 occurrences), and "quality" (31*



occurrences), as revealed by the frequency analysis, confirms that respondents associate sustainability with an improvement in quality, indicating a perception that companies adopting sustainable practices offer more valuable and responsible products.

Fig. 1: Word frequency graphic

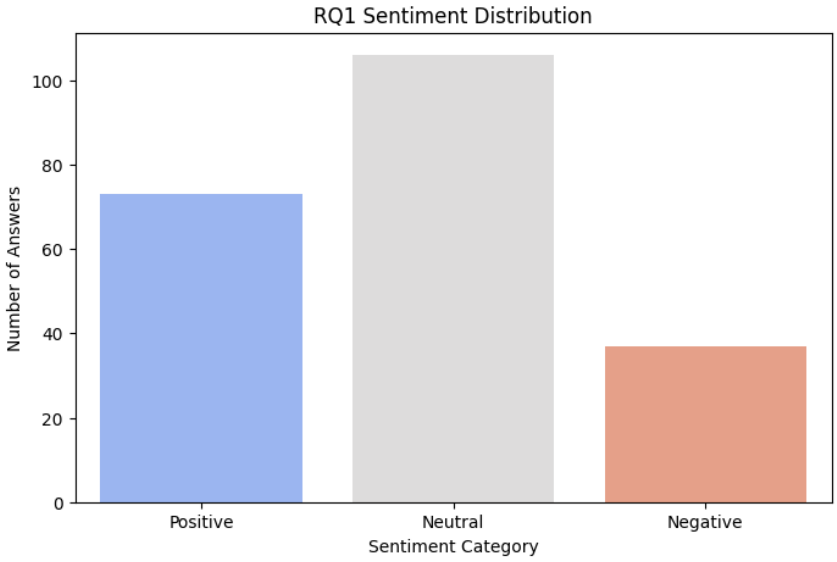
The lexical co-occurrence analysis revealed significant connections between key terms (Fig. 2). For example, the co-occurrence of the terms "important-sustainability" (16 occurrences) suggests that consumers consider sustainability a crucial factor in their purchasing decisions. At the same time, the occurrence of "attention - pay" (11 occurrences), "buy - sustainable" (8 occurrences), "price - sustainability" (7 occurrences), "quality - sustainability" (7 occurrences), "product - quality" (7 occurrences), "important - quality" (6 occurrences) emerges, indicating that while sustainability is relevant, product quality and purchase are key dimensions.In line with the exploratory and data-driven nature of the study, the analysis was guided by the most salient patterns identified through the data mining process. Specifically, factors such as quality, availability, and price emerged as the most significant drivers of user interest and engagement. Conversely, other dimensions—including customer loyalty—did not show a meaningful presence in the data and, in some cases, appeared to play a marginal or even inverse role. As such, the discussion deliberately concentrates on the empirically grounded insights, prioritizing those variables that demonstrated clear relevance within the dataset. This methodological choice ensures that the interpretation remains faithful to the evidence, while acknowledging that less prominent factors, though potentially of theoretical interest, were beyond the scope of this data-focused investigation and could be tested in future studies.

Fig. 2: Co-occurrence graph

The associations emerged also confirm that a positive perception of the environmental and social benefits of a product can guide consumers toward more responsible choices, provided that the products are perceived as good quality and not excessively expensive. This is further supported by the qualitative analysis:
INT.1: "Sustainability factor is important as much as quality, and still even though maybe the price is higher I might still consider buying";
INT.2: "Sustainability is certainly a factor I consider, although I also let myself be guided by other elements such as convenience."
INT.6: "Sustainability is definitely a deciding factor for me. If I know a product is made sustainably, I prioritize that over the cost factor."

From the sentiment analysis, it emerged that the responses related to RQ1, i.e., consumer awareness regarding sustainable business practices, were mostly neutral (105 responses) (Fig. 3, Fig.4). Most of the responses collected have a neutral tone, suggesting that many respondents do not express a clear or strong opinion about the influence of sustainability on their purchasing decisions. This could indicate limited awareness or uncertainty in linking sustainability to their consumption choices. A lower number of responses show positive sentiment (75 responses), indicating that consumers view sustainable practices favorably and consider them an influential factor in their purchasing decisions. A minority of 35 responses have a negative tone, suggesting that some consumers are skeptical or believe that sustainability does not influence their purchasing choices or that sustainable practices have little credibility or are ineffective. Sentiment analysis suggests that although there is a degree of awareness and appreciation for sustainability in purchasing decisions, many consumers remain neutral, perhaps due to a lack of information or limited influence of this factor compared to other purchasing criteria (such as price, quality, availability).

Fig. 3: RQ1 Sentiment Distribution



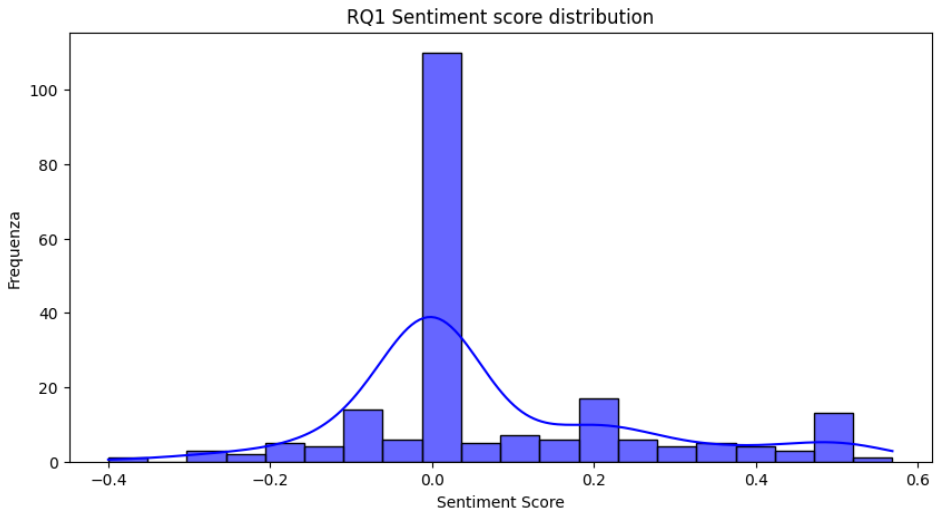


Fig. 4: RQ1 Sentiment Score Distribution

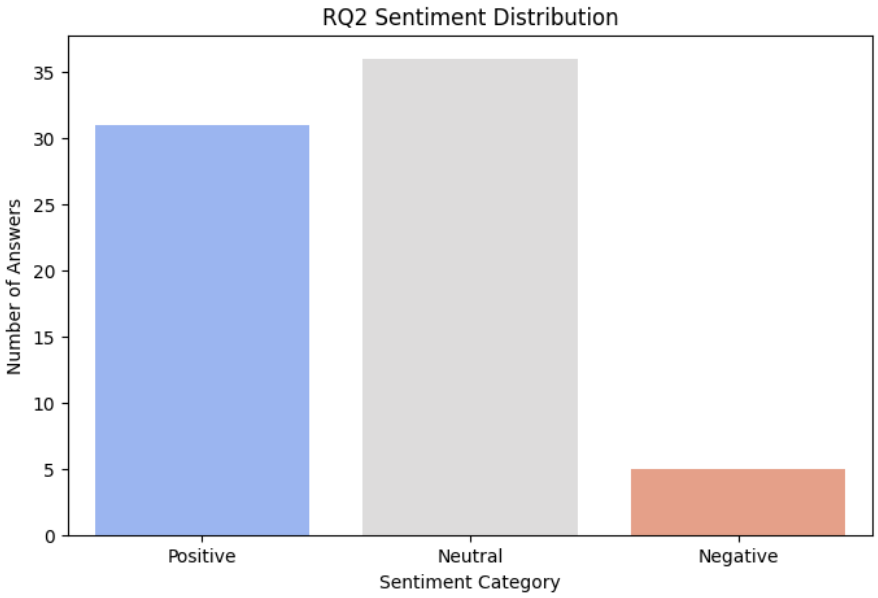
This suggests that sustainability is generally perceived positively or in a neutral way, and participants are willing to consider it an influential factor in their purchasing decisions, as also revealed in the semistructured interviews:
INT.1: "Even if I pay a little more I know I did a good deed, I feel better"
INT.3: "If I know a product is sustainable, I avoid harming the environment and also support the people working there. So, yes, I choose the more sustainable one over the one that is not."
INT.4: "I believe it can benefit the environment and raise awareness among people, and it is right to consider all this."
INT.7: "For me, it is very important that a company adopts a sustainable business model, and it is a factor that can lead me to choose it over others."
INT.12: "For some companies, I've stopped buying because they don't adopt sustainable practices; in fact, I avoid them completely."
INT. 13: "We're still in the early stages on this issue, but I think in the future it could have a positive impact. I believe it's important to continue down this path, so yes, I am influenced by this."
INT.20: "I stop buying from companies I find out are not sustainable."

However, the sentiment analysis associated with RQ2 revealed some ambivalence, with a more balanced distribution between positive and neutral responses (31 positive, 35 neutral, 5 negative), suggesting that sustainability is seen as a possible competitive advantage, although many remain uncertain (Fig. 5, Fig. 6). The positive perception is indeed relevant and suggests that companies could benefit from sustainable practices in terms of image and market positioning. The very low number of negative responses thus indicates that most respondents do not view sustainability as a disadvantageous factor for companies. The sentiment results confirm the ethical purchasing gap, as people's interest in the ethical aspects of sustainability clearly emerges from the interviews, but when it comes to purchasing, and thus quality and price, sentiment remains mostly neutral.

Fig. 5: RQ2 Sentiment Distribution



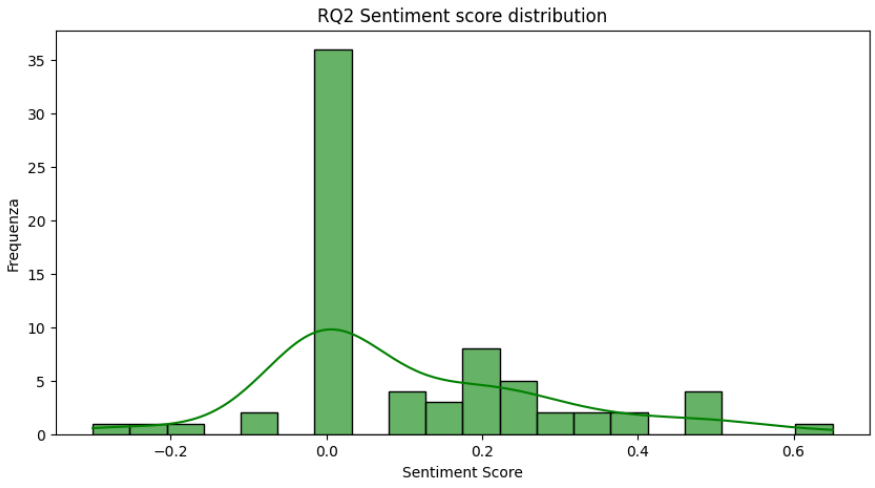


Fig. 6: RQ2 Sentiment Score Distribution

Moreover, the analysis of open-ended responses revealed partial knowledge regarding the concept of sustainable business models. Although some participants demonstrated a good understanding, many stated they had a limited view, particularly regarding the social aspects of sustainability. However, when provided with clarifications on the topic, some participants developed a more positive and favorable view toward sustainable practices. This indicates the presence of an information gap that could be addressed through awareness campaigns and educational programs, contributing to a more comprehensive and shared understanding of sustainability in business practices.
INT. 13: "There is still a lack of strong awareness on this issue. We hear a lot about sustainability, but attention is still limited."

Finally, the analysis highlighted how price perception is a central element in purchasing decisions. Despite the higher price associated with sustainable products, respondents showed a willingness to pay a premium price, provided that the sustainability-related benefits are clearly communicated.
INT.4 "what I truly want is to purchase a valid product, not just a price."
INT.16: "I care about the price, but if I could choose a sustainable product at a slightly higher price, I would buy it."

This result suggests that companies adopting sustainable practices could justify higher pricing policies by emphasizing the added value of sustainability, thus potentially gaining a competitive advantage in strengthening their reputation for environmental and social responsibility.

Research limitations. *This study presents some limitations that should be considered when interpreting the results. First, the small sample size may limit the generalizability of the findings, highlighting the need for further research on a larger population to validate the observed trends. Additionally, a brief explanation of certain sustainability-related concepts was provided during the interviews to ensure a common understanding among participants. While this may have influenced their reflections to some extent, the aim was to facilitate a more informed discussion rather than directly shape their responses. Finally, although the findings highlight price as a significant barrier to purchasing sustainable products, the study does not explore in depth the relationship between respondents' stated willingness to pay a premium price and their actual financial capacity. Future research could further investigate this aspect by examining the connection between purchase intentions and real economic personal and family constraints.*

Managerial implications. *The findings of this study offer valuable insights for businesses seeking to integrate sustainability into their strategies. The sentiment analysis highlights that while many consumers recognize the importance of sustainable business practices, their impact on purchasing decisions remains nuanced. Given the prevalence of neutral responses, companies should focus on enhancing consumer awareness by clearly communicating the tangible benefits of sustainability, such as cost savings, product quality, and ethical responsibility. For businesses aiming to leverage sustainability as a competitive advantage, it is crucial to align sustainability messaging with consumer values and expectations. The positive sentiment observed in RQ2 suggests that firms adopting sustainable practices can strengthen their brand image and market positioning. However, to translate this perception into actual consumer behavior, companies must emphasize transparency, credibility, and differentiation in their sustainability initiatives. Additionally, the thematic analysis reveals that sustainability alone may not be a decisive factor in purchasing choices unless it is combined with other key drivers such as affordability, convenience, and perceived value. This underscores the need for companies to integrate sustainability into a broader value proposition rather than relying solely on ethical appeal anchoring to the value's wheel of the individual. Finally, businesses should consider targeted communication strategies based on demographic segmentation, as age and education levels may influence how consumers perceive and respond to sustainability efforts and their awareness of them. By leveraging data-driven insights from sentiment analysis, companies can refine their marketing strategies, enhance customer engagement, and foster and leverage a more sustainability-conscious consumer base.*

Originality of the paper. *This study makes a great contribution to the existing literature by shifting the focus from the traditional design of sustainable business models to the consumer's perception of sustainable value propositions, an area that remains underexplored in sustainability research and with a new methodological approach. The extended abstract reflects the prevailing enthusiasm and widespread discourse surrounding sustainability; however, it also highlights the persistent gap between rhetoric and concrete action. While there is significant awareness and goodwill, true transformative change remains elusive, as meaningful engagement and tangible commitments are still insufficient.*

While much of the previous literature predominantly examines sustainability from a firm-centric perspective, analyzing the adoption of green technologies, operational efficiency, and corporate social responsibility, this paper takes a consumer-centered approach Adopting a new methodological approach—one that is not quantitative but instead captures the key dimensions of people's speech and perceptions of language. By focusing on how consumers perceive and evaluate sustainability in their answer as a key factor in purchasing decisions, this research adds depth to the understanding of sustainability from the viewpoint of the end-user. What sets this study apart is its integration of both qualitative and computational text analysis methods, which allows for a comprehensive exploration of consumer attitudes toward sustainability. Semi-structured interviews provide rich, in-depth qualitative data, offering direct insights into how consumers interpret and relate to sustainable practices.

The application of Sentiment Analysis, on the other hand, offers a powerful tool to analyze the emotional and cognitive dimensions of these responses at scale, uncovering hidden patterns and nuanced shifts in consumer perceptions. This methodological innovation provides a more dynamic and data-driven approach to studying sustainability, going beyond traditional survey-based techniques and offering a novel lens for understanding consumer behavior. Furthermore, the study uncovers key trends in consumer attitudes, revealing how perceptions of sustainability might influence purchasing

behavior and even become a driver for competitive advantage in the marketplace. The findings contribute to the ongoing discourse on sustainable business practices by highlighting the critical role of consumer awareness, the barriers to sustainable consumption, and the factors that shape the perceived value of sustainability. This paper, therefore, provides both theoretical and practical implications, offering actionable insights for managers seeking to leverage sustainability as a strategic differentiator. By identifying the conditions under which sustainability perception translates into a competitive advantage, the study informs companies on how they can align their sustainability efforts with consumer expectations and preferences, ultimately driving greater engagement and loyalty.

Key words: *Sustainable Business models (SBMs); Consumer behaviour; Sustainable Value Proposition; Purchasing behaviour*

Health and Healthy Eating. Retailers' Communication and Consumers' Perception in Online conversations

BEATRICE CECCOLI[1] ANNA BONCOMPAGNI[2] GUIDO CRISTINI[3] DONATA TANIA VERGURA[4] CRISTINA ZERBINI[5]

Abstract

This study explores the online communication of Italian traditional retailers and discounts in relation to nutrition marketing, using the web listening methodology. The aim is to analyze how retailers address the topics of healthy eating, health, and well-being, and how their actions in these areas are perceived by users. The analysis was based on online conversations in 2024 and focused on three main themes: health, healthy eating, and well-being. Data were collected through the Blogmeter platform. The results showed a low prevalence of online discussions related to nutrition marketing, with traditional retailers and discount stores showing different performance levels in terms of engagement and sentiment. Furthermore, a discrepancy emerges between the official communication of retailers and consumers' perceptions, suggesting that transparency and attention to nutritional quality are important factors in improving retailers' online reputation, particularly for discount stores. This study provides useful insights for optimizing nutrition marketing strategies and enhancing the interaction between retailers and consumers. The limitations and implications are also discussed.

Framing of the research. *In recent years, the increase in diseases related to poor dietary habits, such as obesity, diabetes, and cardiovascular diseases, has driven consumers to become more aware of the importance of making informed and responsible food choices (Archundia Herrera et al., 2017; Chen et al., 2023). This has led to a progressive increase in the adoption of healthier eating habits (Steinhauser & Hamm, 2018). This change is part of a broader cultural and social transformation, reflecting a growing interest in individual well-being, disease prevention, and adoption of healthy lifestyles (WHO, 2022).*

The growing interest in more conscious food choices has prompted consumers to actively seek healthier options, a shift that retailers have been called upon to support (Willett et al., 2006). Retailers, through nutrition marketing initiatives, play a key role in guiding consumers' eating habits (Willett et al., 2006; Hecht et al., 2020). Retailers' marketing strategies focused on healthy nutrition have been the subject of numerous studies, which have organized them according to the "4Ps" of the marketing mix: product, price, place, and promotion (Scapin et al., 2025). Some examples of these strategies include expanding assortments to include healthier food options, modifying packaging to make it more attractive or informative, and adopting nutritional labels and claims that highlight health benefits (van't Riet, 2013; Cameron et al., 2016). Additionally, increasing the accessibility of healthy products, for instance through discounts or cashback, is a common strategy to encourage the consumption of healthier foods (Ball et al., 2015; Cameron et al., 2016). Other initiatives include changes to the physical layout of stores or product placement, aimed at promoting healthier food choices (Cameron et al., 2016). Finally, in-store campaigns, as well as TV, online, social media, and outdoor advertising, are used to raise consumer awareness and promote the consumption of healthier foods (Scapin et al., 2025; Cameron et al., 2016).

Consumer perceptions of these initiatives have also been the focus of various studies (Gaur et al., 2024; Van Kleef et al., 2012; Samoggia et al., 2019). Specifically, consumers tend to associate specific product attributes, such as clear labels, minimally processed ingredients, and attractive packaging, with the nutritional value and healthiness of food (Asioli et al., 2017). Furthermore, placing healthy food products at eye level or in more visible locations significantly increases the likelihood of purchase (Van Kleef et al., 2012). Online communication, particularly on social media, also plays a decisive role in shaping consumers' perceptions of healthy foods. Promotional activities and advertising

campaigns by retailers have a significant impact on purchase intentions (Franco-Arellano et al., 2020). Social media are particularly effective as participation in health-oriented social networks and online communities influences food choices, increasing the social desirability of healthier products and lifestyles (Kokkoris & Stavrova, 2021). Furthermore, the presence of retailers on social media is essential for engaging consumers, building trust, and positively influencing purchasing behavior towards healthy food products (Purwanto et al., 2021; Samoggia et al., 2019).

Despite the rich literature on consumer perceptions regarding nutrition marketing strategies, none of these studies have investigated retailers' communication in relation to consumer perception through direct data, such as that provided by social media. The methodology of web listening allows for a more complete and authentic understanding of public perceptions on these topics, based on user-generated content (UGC), which directly and unfiltered reflects individuals' opinions and experiences. In today's digital era, online users generate a massive amount of data, and the growing availability of user-generated content provides a vast repository of information on attitudes, motivations, and opinions. These data have been widely used in research across various sectors, such as healthcare (Marchetti et al., 2022), tourism and hospitality (Marcolin et al., 2021), politics (Wu et al., 2020), and sustainability (Bellini et al., 2024; Ceccoli & Vergura, 2024), highlighting how UGC can provide valuable insights into individuals' attitudes and emotions. Listening to online conversations represents a unique opportunity to access spontaneous debates free from research bias, thus allowing for a more genuine and direct understanding of public opinion.

Purpose of the paper. *This study uses a web listening methodology to investigate, on the one hand, the online communication strategies adopted by Italian grocery retailers to convey their actions in the field of nutrition marketing, and on the other hand, users' perception of these actions. Specifically, the research aimed to examine how retail brands (traditional retailers and discount brands) address issues related to healthy eating and compare this communication with what consumers perceive and consider relevant. Through a planned and systematic online listening activity, it was possible to identify the most discussed retail brands and explore the main topics of discussion that users associate with the concept of healthy eating. This made it possible to explore potential discrepancies between the official communication of these brands and the expectations, preferences, or perceptions of the public. The research provides valuable insights into what consumers truly value when discussing healthy eating and offers support for the communication strategies of food industry companies in the area of nutrition marketing.*

Methodology. *The research design utilized a mixed-methods approach, combining quantitative and qualitative textual analysis (Andreotta et al., 2019). The analysis was conducted using the Blogmeter Suite, a web and social intelligence platform that enables the collection and analysis of user conversations on social media and other web platforms (Facebook, Twitter, Instagram, YouTube, TikTok, Twitch, forums, blogs, news, and app review sites). The platform extracts textual data from a database of over 2 billion documents, collected both from the official application programming interfaces (APIs) of social networks and from Blogmeter's proprietary web crawlers.*

The analysis, which covers the period between January and December 2024, was preceded by two preliminary phases. The first phase involved a survey of the most grocery discussed retail brand online in the Italian context, with particular attention to traditional retail and discount brands. From this step of analysis, seven brands emerged, divided into four Italian traditional retailer and three discounts. The second phase involved the selection of the terms most commonly associated with the nutrition marketing strategies implemented by these brands. Three main themes were identified: health, healthy eating, and well-being. Once the preliminary phases were completed, the main analysis was conducted, which involved creating sub-sets of specific keywords for each theme and for the selected brands. For the well-being theme, terms such as "well-being," "wellness," and "feel good" were considered. For health, terms like "health," "healthy," "healthcare," "health," "medicinal," and "prevention" were included. Finally, for healthy eating, keywords like "healthy eating," "nutrition," "nutritionist," "dietitian," and "food pyramid" were selected. The overall dataset was then manually cleaned, retaining only occurrences of the keywords relevant to the themes under analysis.

For the quantitative analysis, the following metrics were used: total messages, mentions, engagement, and positive/negative sentiment. ***Total Messages*** *refers to the total number of posts that, within the analysised period, mention at least one of the relevant keywords (in this case, the retail brands in general). This metric includes all comments on these posts, regardless of when they were written.* ***Engagement*** *measures the total number of interactions associated with the posts, including reactions, likes, shares, and views (for platforms such as TikTok and YouTube).* ***Mentions*** *represent the total number of posts and/or comments that contain the analyzed keywords. Each mention constitutes a segment of online content that includes one of the keywords of interest. This analytical framework provides valuable insights into the digital visibility and user engagement levels of different retail brands, facilitating a comparative evaluation of their online impact. Moreover, subsets of data were extracted and subjected to a more in-depth qualitative analysis.*

Results. *The analysis of general online conversations (not only those involving the topics under attention) around the seven retail brands considered highlights how certain brands generate greater discussion and user engagement compared to others. This phenomenon was assessed using three key indicators "Total Messages", "Engagement", and "Mentions".*

According to the analysis (Figure 1), ***Discount 1*** *emerges as the most discussed brand, accounting for 27% of total messages, and demonstrates a high level of online engagement, with 50% of total interactions. This indicates that users frequently discuss this brand and that its content generates significant interest, often being shared, commented on, and accumulating a high number of likes and views. Following Discount 1,* ***Retailer 1*** *and* ***Retailer 2*** *also generate substantial discussion, although their overall centrality in conversations is lower (accounting for 26% and 16% of total messages, respectively). Notably,* ***Retailer 1*** *exhibits a strong level of engagement (17%), although it remains below the level achieved by* ***Discount 1****. Conversely,* ***Retailer 2****, despite having a significant number of mentions (28%), fails to generate*

a high level of engagement, accounting for only 3% of total interactions. This suggests that while the brand is frequently mentioned, it does not effectively capture users' interest or drive meaningful interaction.

*In contrast, **Retailer 4**, despite having a relatively low share of total messages (7%) and mentions (6%), stands out for its high engagement levels, ranking as the third most engaging brand (13%). This indicates that, although fewer posts about the brand are published, they elicit substantial interest, generating a high number of interactions per post. Lastly, **Retailer 3** ranks fourth in terms of mentions, accounting for 14% of the total, and having a low engagement level and a relatively small number of messages. This suggests that while the retailer is frequently referenced, it does not generate substantial interaction among users. Meanwhile, **Discount 2** and **Discount 3**, exhibit more consistent performance across all analyzed metrics. However, they remain at the lower end of the rankings compared to the other brands.*

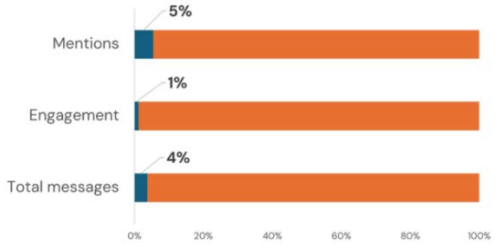

Fig. 1: "Total Messages", "Engagement" and "Mentions" KPIs of the seven retail brands

Source: our elaboration

In the preliminary stages of the analysis, health, healthy eating, and well-being have been identified as the key terms associated with the nutrition marketing strategies adopted by the brands. However, when examining online conversations about these brands more broadly, these topics occupy a relatively marginal space. The data reveal that, out of the total volume of discussions, these themes appear in only 5% of mentions, 1% of engagement, and 4% of total messages (Figure 3). These findings suggest that retail brands address nutrition marketing topics less frequently than other subjects in their online presence. As a result, users also tend to engage less with these themes in their discussions.

Fig. 3: Percentage of KPI topics over total retail KPIs

Source: our elaboration

Additionally, conversations about health, healthy eating, and well-being often overlap. In discussions on healthy eating, health is mentioned in 50% of cases, while 18% also refers to well-being. Similarly, half of the well-being discussions relate to health, with around 2K posts covering all three topics simultaneously. These findings support existing research on their interconnection (WHO, 2022; Archundia Herrera et al., 2017; Chen et al., 2023).

When analyzing the most common terms and hashtags used by Italian users regarding health, healthy eating, and well-being in relation to traditional retailers and discounters, the conversation remains broad and generic. Rather than focusing on specific products or product lines, discussions focus on high-level themes (Figure 4).

Fig. 4: Cloud per topics and retailers

Source: our elaboration

Among the most commonly used terms, the following thematic groups emerge:

- ***Inspirational terms*** *(highlighted in red) include words such as "project", "initiative", "participate", "improve", "engage", and "dedicate" that refer to campaigns and initiatives promoted by the retailers, rather than to the products they offer in their stores. Examples include "Benessere è Equilibrio", an initiative promoted by a traditional retailer in support of an oncology institute; the "Percorso dei Campioni" program promoted by another traditional brand; or the collaboration between a traditional retailer and a foundation for cancer research.*
- ***Terms related to the composition and production of products*** *(highlighted in blue). In this case, the discourse focuses on the quality and specific characteristics of the products, often analyzing their composition, supply chain, and production practices. These topics can also take on a negative connotation, as seen in cases of product recalls or potential health risks.*
- ***Terms related to price and promotion*** *(highlighted in green). Even when discussing healthy eating, consumers cannot avoid considering price and, in many cases, they associate the healthiness of a product with a higher-than-average cost. This places discount retailers at a disadvantage compared to traditional retailers. However, there is also a group of experts who argue that healthy spending can be achieved while staying mindful of the budget.*

Examining the sentiment associated with retailers provides valuable insights into some of the themes that emerged from the term cloud (Figure 4). The distribution of positive and negative opinions appears to be almost identical for all retailers, suggesting that sentiment toward retail brands is not influenced by the distinction between discount and non-discount stores. However, a more in-depth analysis of the positive sentiment associated with the examined retailers, along with a comparison of earned versus owned messages, reveals critical insights. Specifically, notable differences emerge in consumer perceptions of pricing and product healthiness, highlighting the nuanced ways in which users evaluate and engage with retail brands.

Figure 5 presents a summary of positive sentiment toward the retailer, distinguishing between general approval of the brand (light green line) and more specific expressions related to health, nutrition, and well-being (dark green line). This broader measure of positive sentiment captures not only direct appreciation for the retailer but also favorable opinions on its health-related products and services. Conversations focused on health, well-being, and nutrition significantly enhance positive sentiment, leading to an average increase of 16.8 percentage points.

The second chart on the right illustrates the distribution of messages based on their origin, distinguishing between official retailer communications shared through owned channels and externally generated content, such as user comments or reviews on third-party platforms (earned). When analyzed alongside the first chart, this distribution provides insight into how much of the observed positive sentiment originates from the retailer's direct communication versus external sources.

Fig. 5: Positive sentiment (retailers and topics) and total messages (earned and owned)

Source: our elaboration

The two graphs illustrate that positive sentiment toward brands, particularly regarding nutrition, wellness, and health, is largely driven by external (earned) sources. In other words, user-generated discussions play a key role in shaping positive perceptions, as consumers express favorable views on brands' offerings through their own content and conversations related to these topics, with the exception of a few specific cases. One notable exception is ***Discount 3****, which, despite having a relatively low volume of conversations (around 2,000), shows a remarkably high proportion of messages originating from owned sources, accounting for 51% (approximately 1,020 messages). This, combined with the fact that positive sentiment increases by 20 percentage points when nutrition-related topics are considered, suggests a strategic approach. Discount 3 appears to be investing in a marketing communication strategy centered on nutrition through its own channels, likely to enhance its reputation in areas such as health, healthy eating, and wellness. This initiative may be a deliberate response to the common perception that discount retailers offer fewer healthy product options (Völckner & Hofmann, 2007; Zielke, 2014).*

Retailer 4 *also stands out for its high volume of messages from owned sources (approximately 900), with a 29-percentage-point increase in positive sentiment when nutrition-related topics are considered. This suggests that, compared to other retailers, Retailer 4 is actively investing in nutrition marketing.*

This contrast underscores a significant opportunity for other retailers to enhance their online communication on healthy nutrition, particularly Retailer 1. ***Retailer 1*** *not only has a low positive sentiment but also shows a below-average increase of just 12 percentage points when nutrition topics are focused. Additionally, its engagement in nutrition marketing through owned channels is minimal, with only 70 messages.*

Research has shown that social influences play a key role in shaping healthier food choices (Cruwys et al., 2015; Kokkoris & Stavrova, 2021). By strengthening its online communication strategy and fostering discussions on nutrition, Retailer 1 could not only encourage healthier consumer behaviors but also generate positive word-of-mouth, ultimately enhancing its brand reputation (Schivinski & Dabrowski, 2014; Krisprimandoyo et al., 2024).

A final exception is ***Discount 1****, which, despite being widely discussed by users - in relation to health and nutrition, with 9,400 user-generated messages - sees only a 7-percentage-point increase in positive sentiment when these topics are considered. This figure is significantly below average, suggesting that Discount 1 does not have a strong reputation in the area of nutrition marketing.*

By integrating qualitative insights with quantitative data, it is possible to gain a deeper understanding of the observed results. First, although existing literature suggests that traditional retailers and discount stores are gradually converging in terms of reputation (Cardinali & Bellini, 2014; Anselmsson & Johansson, 2014), the findings do not fully support this claim. User perceptions indicate that traditional retailers are generally viewed as offering healthier products compared to discount stores. This perception of lower product healthiness in discount stores appears to be linked to price affordability - in other words, price levels are often used as a proxy for product quality and healthiness.

Despite social media testimonials from experts highlighting that a healthy diet is achievable even when shopping at discount stores - supported by their own purchase experiences - the widespread belief persists that low-cost food products may have a negative impact on health. Below are examples of expert content advocating for healthy eating while shopping at discount retailers.

Expert 1: *"Shopping with the nutritionist. What do I buy from discounters"*

Expert 2: *"WHAT do I buy and HOW MUCH do I spend per week at DISCOUNT for healthy, waste-free shopping? Find out by watching the video to the end!"*

This does not appear to have persuaded consumers, who instead demonstrate their mistrust of the quality and healthiness of cheaper products. The following online comments are illustrative of this:

User 1: *"Discount where convenience does NOT meet quality"*

User 2: *"Sorry, but you can't save on food"*

User 3: *"What you save at the discount store you use at the pharmacy later"*

User 4: *"If you go to the discount store you can't do the diet"*

In conclusion, traditional retailers appear to have a favorable reputation, as evidenced by the quantitative data (see Figure 5). However, a subsequent investigation revealed that this reputation is not uncontested, with negative comments relating to the quality and healthiness of the products that emerged when specific events occur, such as the recall of certain foods from the market.

User 5: *"Retailer 2 food warning, flagged up a product much loved by children"*

Although product recalls are rare, companies must respond transparently and promptly to preserve their reputation. In this case, recalling a popular children's product could be especially harmful due to customers' heightened sensitivity to food safety (see Figure 4). In order to prevent such incidents from undermining reputation, retailers should implement strict preventive measures and improve communication management during and after the recall in order to reassure consumers about product safety and quality. Figure 5 shows that retailers 2 handled the situation well, maintaining a good positive sentiment compared to the average of traditional and discount brands (+16 p.p.).

In the case of discount stores, such as Discount 1, there is a growing need to address topics related to health, well-being, and healthy eating in general. Focusing on the nutritional quality of the products offered could serve as a key

strategy to improve the retailer's perception, particularly if supported by clear and transparent communication about nutritional aspects. Increasing online presence and promoting healthy eating through effective communication could help enhance the overall brand image and reassure consumers about the nutritional quality of the products. However, as shown in Figure 5, Discount 1 still has significant work to do in terms of online nutritional communication through owned channels, as it remains limited (6%).

Research limitations. *While the study explores an interesting topic and enhances understanding of online communication by retailers in the areas of health and well-being, it is not without its limitations. The research is part of a larger project on nutrition marketing, representing only one phase of the overall study. Therefore, it could be further developed through the implementation of a longitudinal study to track fluctuations in reputation, as this can be influenced by transient events. Additionally, the study does not provide information on the demographic characteristics of the users, which could be an important aspect to monitor. Young people could perceive discount stores differently compared to adults due to varying economic availability (Thangavel et al., 2022) and, at the same time, they tend to be highly attentive to health and well-being issues (Becerra et al., 2023; Halicka et al., 2025).*

Managerial implications. *The study of online user conversations has provided an insightful overview of consumer perceptions regarding retailers and their image related to healthy eating and well-being. The results, on one hand, deepen the understanding of online communication in the retail sector, particularly regarding product healthiness, while, on the other hand, they offer significant managerial implications. First and foremost, there is a clear need for retailers to increase their online communication efforts on relevant topics, generating more content related to healthy eating, which is increasingly becoming a key aspect of brand recognition (Krisprimandoyo et a., 2024). This approach helps to shape user perceptions and guide conversations, directly communicating the retailer's commitment to nutrition issues, thereby improving positive sentiment. Secondly, in the case of negative comments, such as product recalls, it is crucial to act swiftly to address dissatisfaction, demonstrating transparency and care for the health and well-being of consumers. Timely interventions help prevent reputational damage, which can spread rapidly online. Finally, discount retailers, in particular, should focus on increasing their communication efforts, directing their editorial plans toward product healthiness and healthy eating. This would help challenge the widespread belief that low-cost equals unhealthy, ultimately enhancing their reputation. In conclusion, creating online content that highlights initiatives and offerings supporting healthy eating, well-being, and proper nutrition should be a priority for Italian retailers, who are still relatively passive and only partially attuned to consumer sensitivity on these issues.*

Originality of the paper. *Although the topics of proper nutrition, well-being, and the marketing of health-related products have been widely examined in the literature (e.g., Hecht et al., 2020; Scapin et al., 2025), much of the existing research relies on traditional methods such as surveys or interviews (e.g., Hwang & Chung, 2019), which may not fully capture consumers' spontaneous and authentic opinions on these on these socially relevant themes. In parallel, studies employing web listening or sentiment analysis typically focus on customer satisfaction, product features, or overall service quality (e.g., Lim et al., 2019; Radovilsky & Hegde, 2024; Falatouri et al., 2024), overlooking the broader discourse around retailers' engagement in promoting public health. This study aims to fill this gap by using web listening techniques to explore and highlight what users perceive regarding the grocery retail sector's efforts to support consumer health and well-being. The analysis of online conversations allows for a better understanding of the current alignment between the actions retailers are taking in promoting healthy eating and the perceptions of their audience. In this way, both traditional retailers and discount stores can reshape their communication strategies through their own channels, focusing more on a topic that resonates strongly with the public and contributes to shaping their reputation.*

Key words: *nutrition marketing; web listening; Italian grocery retailers; consumers' perceptions; well-being; health*

Promoting Healthy Choices at the Point of Sale: The combined effect of Space Management and In-store Communication

SUSANNA GRAZIANO[1] BENEDETTA GRANDI[2] MARIA GRAZIA CARDINALI[3] GUIDO CRISTINI[4]

Abstract

The increase in chronic diseases is an alarming phenomenon, often linked to unhealthy lifestyles and diets. The relevance of this phenomenon in the retail sector is also recognised. Information overload can compromise consumers' ability to process information and make informed food choices. The arrangement of products on shelves has been demonstrated to influence consumers' information processing. In this regard, space allocation represents a powerful in-store marketing tool, given that the quantity and quality of space allocated to a product, category, or brand exerts a substantial impact on purchasing decisions. This study explores the effectiveness of a display aggregation of the cereal category, combined with in-store communication that leverages the taste attribute, to influence consumer choices. The experiment consists of a pre-test conducted through an online questionnaire on a sample of 246 participants. The results suggest that display aggregation combined with in-store communication can increases the choice of communicated products and reinforces the message conveyed by the in-store communication initiative. The study is not without its limitations, including the simulated online experimental setting and the composition of the sample. Further research could explore the effectiveness of combined strategies in real-world settings, involving a more diverse sample, by integrating the results with sales data.

Framing of the research. *The recent increase in cases of chronic diseases is an alarming phenomenon (GBD, 2018). This trend is also fostered by unhealthy lifestyles and diets (GBD, 2019). In this context, the importance of a preventive approach to health and well-being, through diet and lifestyle interventions, becomes evident. In this regard, the World Health Organization (WHO) emphasises the need to foster healthier food choices at the population level (WHO, 2022). The relevance of this phenomenon is also recognised in the retail sector; however, the wealth of information to which consumers are subjected can compromise the effective communication of health-related messages within the point of sale. Information overload has been demonstrated to impede an individual's capacity to make effective decisions (Toffler, 1970). Indeed, in situations of stimulus overload, the capacity for rational evaluation is reduced (Toffler, 1970). Previous studies (Jacoby et al., 1974; Jacoby, 1977) have demonstrated that information overload can lead to inefficient consumption decisions. While some studies report that consumers desire more information (Russo, 1974), others (Jacoby et al., 1974; Jacoby, 1977; Iyengar & Lepper, 2000) find that they make decisions when the number of choices increases, leading to potentially unsatisfactory choices. When consumers are faced with making a food choice, they have to consider a range of information. This process not only demands effort and time to acquire, but also effort to understand and combine this information into an overall evaluation (Russo, 1981). In consideration of the temporal and cognitive limitations experienced by consumers during the purchasing process (Hoyer, 1984), the arrangement of products on shelves has been demonstrated to exert influence on consumers' information processing (Lamberton & Diehl, 2013). In this context, space management is a powerful tool (Kim & Moon, 2021), which is strategically employed to influence consumer choices in a predictable manner (Pechey et al., 2020; Arno & Thomas, 2016), and prompting impulse buying (Sorensen, 2003). Through the strategic placement of products, retailers aim to optimise sales by leveraging factors such as the number of facing, assortment, and product availability. The extant literature (Dulsrud & Jacobsen, 2009; Chandon et al., 2009; Stilley et al. 2010) agrees on the importance of this lever, suggesting that the quantity and quality of the space dedicated to a product, category or brand are determining factors in purchasing decisions. Indeed, increased visibility, achieved through adequate exposure, has been demonstrated to increase the likelihood of purchase (Bayley & Nancarrow, 1998; Inman et al., 2009; Muruganantham & Bhakat, 2013; Wilson et al., 2016; Cadario & Chandon, 2017; Grandi et al., 2021). A substantial body of research has been dedicated to investigating the efficacy of various space management strategies over time. However, the findings have been somewhat inconclusive. For instance, Liu et al. (2018)*

DOI 10.7433/SRECP.SP.2025.01

reported an increase in sales of healthy products when they were placed at the end of aisles; but when they placed less healthy and unhealthy products in the same aisles, sales of healthy products stopped increasing. In a study by Young et al. (2020), the placement of healthier breakfast cereals at eye level in three (and three control) supermarkets in New Zealand was tested, but revealed no significant difference in sales of the healthy products. Adam et al. (2017) conducted an experimental study on dairy products, managing the space in the refrigerated counters of ten Danish supermarkets; the study demonstrated that, although there was a significant effect for the individual products tested, there was no increase in overall sales of the category (Adam et al., 2017). de Wijk et al. (2016) conducted an experiment on wholemeal bread, placing it in a more "convenient" and accessible position, and found no difference in sales due to space manipulation. In contrast, in the study by Nakamura et al. (2014), the position of non-alcoholic and alcoholic beverages in the end of aisle produced an increase in sales (Nakamura et al., 2014). Baird et al. (2018) measured the quality of diet in women of childbearing age before and after a store layout intervention; this intervention consisted of increasing the availability and improving the positioning of fruit and vegetables, while removing sweets from the checkouts, giving positive results (Baird et al.,2018). In the research conducted by Trude et al. (2018), the strategic exploitation of space was achieved through the augmentation of access to sugar-free beverages and snacks. Concurrently, educational campaigns, promotional activities and communication initiatives were implemented, thereby culminating in the successful augmentation of sales of unsweetened beverages and the concurrent reduction in the percentage consumption of calories in snacks (Trude et al., 2018). It has been demonstrated in previous research (Van Kleef et al., 2012; Chandon & Wansink, 2007; Chapman et al., 2019; MacKenzie et al., 2019; Ayala et al., 2013) that the most effective strategy to stimulate healthier food choices is to integrate different nutritional marketing interventions and maximise their impact (Adam & Jensen, 2016). Therefore, we decided to test display aggregation in combination with an in-store communication initiative. Based on the above, we posit:

H1: Display aggregation increases the choice of communicated products.

In the context of food choices, consumer expectations regarding the taste of a product have been shown to influence decision-making processes (Saba et al., 2019) and to predict levels of food consumption (Roininen et al., 1999). In light of these findings, we decided to implement a communication strategy that would emphasise the taste attribute. However, when individuals are confronted with a choice, they often assume that opting for a healthy product necessitates compromising on taste, due to the prevailing belief that unhealthy food is more savoury than healthy food (Erhard et al., 2024; Raghunathan et al., 2006; Piqueras-Fiszman & Spence, 2015; Saba et al., 2019; Teisl & Levy, 1997). This phenomenon is referred to as the Unhealthy = Tasty Intuition (UTI) hypothesis (Mai & Hoffmann, 2015; Raghunathan et al., 2006). Nevertheless, research has demonstrated that consumer judgement can be influenced by shelf labelling that is capable of evoking taste expectations in the consumer's mind (Wansink, 2017) and that messages that emphasise the taste of a healthy product has the potential to change the consumer's perception towards it (Steptoe et al., 1995). Lugli (2015) has highlighted that the perception of a food's taste is influenced not only by the consumption experience itself, but also by the representation of that food. Therefore, we posit that:

H2: The aggregation of the display reinforces the message conveyed by the in-store communication initiative.

In order to implement an experiment in a real environment, a pre-test was first carried out with an online experimental design.

Purpose of the paper. *The present study aims to explore the effectiveness of display aggregation in the context of healthy product selection in the cereal category. The underlying assumption is that an organised and consistent arrangement of products can facilitate the perception of their availability and increase the likelihood of their selection by consumers. The research focuses on an experimental pre-test aimed at simulating shopping conditions and measuring the role that display aggregation plays in the decision-making process. The study also aims to examine whether display aggregation can strengthen the message conveyed through a taste communication initiative, reducing UTI perception. This research contributes to the extant debate in the literature on how space management can influence consumer choice, examining firstly the direct relationship between display aggregation and purchasing decisions; and secondly, the influence of the display on the message conveyed by in-store communication.*

Methodology. *In order to conduct the experiment in a real-world environment, an experimental design was conducted via a self-administered questionnaire on the Microsoft Forms platform as a pre-test. Participants were recruited via social networks during the period from 17 to 31 January 2025. The total sample consist in 246 individuals (70% female, 30% male). From a demographic perspective, the 19-34 age group constitutes the majority of the sample (57.72%), with the 45-64 age group representing a significant proportion at 28.05%. In contrast, the 35-44 (9.35%) and over-65 (4.88%) age groups are less represented. Within the 19-34 age group, 30.49% of respondents report purchasing health products for their psycho-physical well-being, while 19.51% do so to maintain or improve their physical fitness. Regarding educational attainment, 87.80% of respondents have attained a high school diploma or higher, while 12.20% have only completed a middle school diploma. With respect to employment status, 46.75% of respondents are employed by private companies, 18.29% are students, and 13.82% are self-employed. Geographically, the sample is predominantly concentrated in Northern Italy, with 60.57% of respondents residing in the North-West and 26.02% in the North-East.*

The southern and insular regions are less represented, with 6.91% and 1.63% of the sample, respectively. Two stimuli were presented to participants: (1) a video of the display aggregated with the taste communication initiative, (2) the display disaggregated with the taste communication initiative. The duration of the two videos was identical, as was their shelf-scrolling speed and simulated direction of travel. The products presented in the display were the same for both stimuli and had the same number of facing. The message communicated in the end-of-aisle crowner was as follows:

"TASTE is WELLBEING. A varied and balanced diet and a healthy lifestyle are the foundation of your well-being. Discover HERE for products that, due to their ingredients and nutritional values, can contribute to your well-being without sacrificing your desire for good food."

Meanwhile, the message presented in banner, floor sticker and stoppers a simplified version of the above, namely: "TASTE is WELLBEING". The product bundling strategy was implemented with the objective of promoting a range of private label cereals, which were selected in accordance with the retailer's specified nutritional criteria.

Results. *The analysis was conducted using IBM® SPSS® Statistics software. A multivariate ANCOVA was used to test our hypotheses. In addition to product choice, we measured other variables and included them as covariates. These are purchase intention, perceived product and shelf healthiness, perceived freedom of choice and shelf realism. With regard to H1, the means between the two groups were significantly different (Mdis = .38, Magg = .40; p = .020). Therefore, we confirm H1. Regarding H2, the means were again significantly different (Mdis = 5.11, Magg = 5.14; p = <.001). Therefore, we can accept H2. In addition, purchase intention (Mdis = 4.44, Magg = 4.73; p = <.001), perceived healthiness of the products (Mdis = 4.75, Magg = 4.78; p = <.001), perceived freedom of choice (Mdis = 4.9, Magg = 5.04; p = .075) were also significant in favour of the aggregated display. Instead, the realism of the shelf (Mdis = 4.82, Magg = 4.69; p = <.001) and the perceived healthiness of the shelf (Mdis = 3.97, Magg = 3.87; p = <.001) were higher in the disaggregated display. This could be due to the fact that consumers are not used to seeing an aggregated display in reality, making it less realistic. Furthermore, by aggregating healthy products, the number of less healthy products could be higher than in a disaggregated display, thus reducing perceived healthiness. These results suggest that an aggregated display with in-store communication based on taste can have a positive impact on influencing consumers' healthy choices.*

Research limitations. *The present study is subject to certain limitations that may have influenced the results obtained and offer insights for future research. Firstly, maybe the experimental context was not conducive to the desired outcome. In fact, although the simulated experimental context allows for greater control over the variables, it may not fully reflect real consumer behaviour in a real environment. Furthermore, the choice of using a video to represent the shopping experience may have reduced the emotional and cognitive involvement of the participants compared to an actual shopping experience. In reality, factors such as time pressure, stress level (Ahlbom et al., 2023), the presence of other shoppers (Hui & Bateson, 1991) and physical interaction with products influence the decision-making process. The absence of an effect of display aggregation on taste expectations suggests that the mere grouping of products is not sufficient to significantly alter consumer perceptions. It is possible that the communicative message focused on taste did not have a strong enough impact to change pre-existing expectations. Taste perception is a multifaceted construct influenced by numerous factors, including prior experiences, eating habits, and individual preferences (Montanari, 2006), which may have led to the non-significant change in expectations observed in this study. Another aspect that must be given due consideration is the spatial location of the display aggregation in the virtual display. Previous studies (Atalay et al., 2012; Valenzuela et al., 2013) have demonstrated that consumers tend to focus more upon products placed in the centre of the shelf. In our study, the display aggregation was placed on the left side, which may have had a negative influence upon the effectiveness of handling. This aspect deserves further investigation in order to assess whether a different spatial arrangement could more strongly influence consumer perception and choice. Moreover, the composition of the sample, may have influenced the results, limiting their generalisability. Online recruitment may be subject to self-selection based on specific interests and behaviours, potentially excluding less active social media users or those with different consumption habits. Finally, although the number of participants (N = 246) is adequate for many behavioural studies, a larger sample might provide more statistical power to detect any effects on display aggregation.*

Managerial implications. *The findings of this study provide certain insights for retailers. In particular, they show that aggregating products on the base of their nutritional quality can increase purchase intention and the perception of the healthiness of the products. This could consequently lead to an improvement in the nutritional quality of consumers' purchases. Working on the levers of space management and in-store communication is therefore essential for industry and distribution players. This study confirms the power of in-store marketing levers to influence consumer choice.*

Given the global problem of poor nutrition and the rise in cardiovascular disease due to obesity, this evidence is fundamental. It means that retailers have the power to improve people's lives through proper nutrition.

Originality of the paper. *The originality of this research lies in its ability to address some of the gaps in the literature on space management and point-of-sale communication by proposing an innovative approach that integrates product layout with a taste-focused message. The existing literature has explored the concept of information overload and its impact on consumption decisions (Toffler, 1970; Jacoby et al., 1974; Jacoby, 1977), highlighting how an excess of stimuli can impair consumers' decision-making ability. However, there has been limited investigation into how display space*

management can influence not only product choice, but also the perception of product quality characteristics, such as taste. The extant literature on the subject has predominantly focused on the role of space management in enhancing the visibility and likelihood of a product being purchased, albeit with equivocal results. For instance, while some research indicates that improved placement of healthy products can boost sales (Nakamura et al., 2014; Baird et al., 2018; Trude et al., 2018), other studies report no significant impact in this regard (Young et al., 2020; de Wijk et al., 2016). The present study contributes to the ongoing debate by testing the effectiveness of a display aggregation strategy combined with targeted communication to understand whether such an intervention can influence product choice and taste perception. Moreover, this study employs the UTI paradigm, which posits that consumers often perceive healthy products as less appetising than less healthy alternatives (Raghunathan et al., 2006; Mai & Hoffmann, 2015; Piqueras-Fiszman & Spence, 2015). The present study analyses the interaction between display and taste-focused communication, contributing to an understanding of how these two variables can influence purchase decisions and consumer perceptions. The findings of this study confirm the power of visual merchandising strategies, suggesting that combining multiple levers and multiple visual, perceptual and communicative aspects, may be necessary to achieve a significant impact on purchase decisions. In this sense, the study opens up new avenues of research on the combined effectiveness of different marketing levers at the point of sale, highlighting the need for further investigation to identify optimal display and communication strategies for healthy products.

Key words: *space management; nutrition marketing; taste communication; wellbeing; health; in-store marketing*

The role of recovery strategies in online service failures: a cross-national study

GIOVANNA BAGNATO[1] VANIA VIGOLO[2] ATTIA ABDELKADER ALI[3] FELIPE RUIZ-MORENO[4]

Abstract

This study proposes an integrative framework grounded in theories of justice and attribution theory to investigate how organizations delivering digital services can effectively respond to online service failures. Drawing on empirical data collected from Egypt and Spain, the research explores the effect of recovery strategies for e-failures on customers' post-recovery perceptions and behavior in the context of online banking services using Partial Least Squares Structural Equation Modeling. Cross-cultural variations in service recovery responses will be explored through multi-group analysis. The findings are expected to contribute to the refinement of online service recovery literature and provide actionable recommendations for online banking services aiming to tailor recovery processes in alignment with cultural expectations.

Keywords. *Service failure; Service recovery; Online banking; Justice Theory; Attribution Theory*

Framing of the research. *Service recovery is a crucial aspect of service management to contain the possible adverse effects of service failure, such as customer dissatisfaction, negative word of mouth, and customer defection (Zhao et al., 2025). Designing successful service recovery strategies can restore satisfaction, strengthen word-of-mouth and increase repurchase intentions (Jose and Mathew, 2016; Chao and Cheng, 2019).*

The recent shift towards digitalization of service across many sectors, including banking and financial services (Reis et al., 2019; Formisano et al., 2020), has increased the physical distance between service providers and customers, thus making it even more important for service providers to promptly react in case of service failure (Cunningham et al., 2005). Customers of online services can experience service failures (e-failures) due to different causes, including, for example, technological inefficiencies, delays, security issues, or poor customer support. These failures can undermine trust, making effective e-service recovery crucial for maintaining customer loyalty (Chih et al., 2012; Ozuem et al., 2017; Nyagadza et al., 2022). Failure in online banking services can be particularly critical since these services are usually characterized by a certain level of perceived risk and uncertainty (Cunningham et al., 2005).

In the event of an e-service failure, customers typically assess the situation by evaluating its controllability (i.e., if it was preventable), and stability (i.e., if the failure is likely to occur again). In addition, customers judge the perceived recovery justice, that is, whether the recovery effort was just/fair in terms of compensation, transparency, and the interpersonal treatment received from the service provider. Customers' reactions to service failure and recovery could vary according to different factors, including cultural dimensions (Gi Park et al., 2014). For example, extant research suggests that customers with a more collectivistic culture versus an individualistic culture may find it disturbing to complain in case of a service failure, and they would rather have the organization initiate service recovery actions (Lee et al. 2024). In this sense, cross-national studies are crucial to determining whether the established relationships between perceived recovery justice, post-recovery satisfaction, relationship quality, word-of-mouth, and repurchase intentions hold across diverse cultures and market environments (Tsao, 2018).

Purpose of the paper. *Based on these premises, this study combines Justice Theory (Rawls, 1971) and Attribution Theory (Weiner, 1985) with the aim of exploring the effect of service recovery strategies for e-failures in banking services on customers' post-recovery perceptions and behavior. Specifically, we will assess:*

1. *the effect of service recovery strategies on perceived recovery justice*
2. *the effect of perceived recovery justice on post-recovery satisfaction*
3. *the effect of post-recovery satisfaction on relationship quality*

4. *the effect of relationship quality on attitudinal loyalty*
5. *the moderating role of service failure attribution in the relationship between perceived recovery justice and post-recovery satisfaction*

The model for the study is presented in Figure 1.

Fig. 1: The proposed model

Methodology. *This study will adopt a quantitative methodology. Two surveys will be conducted among a sample of Egyptian and Spanish customers of online banking services. The questionnaire will include items derived from previous studies that will be adapted to fit the study setting. Specifically, service recovery strategies will be measured with items from Liao (2007) and Boshoff (2005), while perceived recovery justice will be assessed through items adapted from Blodgett et al. (1997) and Maxham and Netemeyer (2002). Post-recovery satisfaction will be evaluated with items from Lin et al. (2011) and del Río-Lanza et al. (2009). Relationship quality will be measured with items adapted from Grégoire and Fisher (2008). Attitudinal loyalty will be assessed in terms of repurchase intentions (Zeithaml, 2000; Bacile et al., 2018) and word-of-mouth (Mattila, 2001; Wong and Sohal, 2002). Service failure attribution will be measured using items adapted from Hess et al. (2003). All items will be rated on a five-point Likert scale, ranging from "strongly disagree" (1) to "strongly agree" (5).*

For data collection, a web-based questionnaire will be distributed to banking customers in Egypt and Spain via social media. A purposive sampling method will be employed to ensure that participants have experienced online banking service failures and recovery, as verified through preliminary screening questions. To ensure content validity, the questionnaire will undergo expert review, will be piloted among customers from both countries, and will be translated using Brislin's (1970) method. The data will be analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM) and multigroup analysis to explore differences between countries.

Results. *The data collection is still in progress at the time of writing this short paper. Across both Spain and Egypt, we expect to find a positive and significant effect of service recovery strategies on perceived recovery justice. In addition, we anticipate perceived recovery justice to increase post-satisfaction recovery, and, in turn, we expect post-satisfaction recovery will have a positive effect on relationship quality. Also, we anticipate that relationship quality will increase attitudinal loyalty. We expect service failure attribution to have a negative moderating effect on the relationship between perceived recovery justice and post-recovery satisfaction. Particularly, we expect to find that higher levels of service failure attribution will weaken the effect of perceived recovery justice on post-recovery satisfaction. We also expect to find significant differences between the two contexts of the analysis.*

Research limitations. *This empirical research will inevitably present certain limitations, which may shape directions for future inquiry. First, the empirical investigation will be limited to two countries. Future studies could extend the analysis to a more diverse range of regions.*

Second, the research design will adopt a cross-sectional approach, capturing user perceptions at a single moment in time. Longitudinal investigations may be warranted in future work to gain a more dynamic understanding of evolving customer experiences and behavioral trajectories.

Third, while the current framework will draw upon Justice and Attribution Theories, future scholars could explore alternative theoretical perspectives, such as Expectation-Disconfirmation Theory (Oliver, 1980) or Consumer Coping Theory (Lazarus, 1984), to further unpack the cognitive and emotional mechanisms underlying consumer reactions to service recovery efforts.

Fourth, reliance on self-reported survey data may introduce bias related to memory or social desirability. Incorporating objective behavioral data - such as service usage records or complaint logs from financial institutions - could enhance the empirical rigor and external validity of forthcoming studies.

Finally, the study will focus on digital service recovery within online banking services. Future research could investigate the implications of emerging technologies, such as AI-based support systems and chatbot interventions, in shaping customer judgments of fairness, satisfaction, and loyalty.

Originality of the paper. *This study will be poised to offer novel contributions to the academic discourse by generating original insights that will deepen the understanding of service recovery in the context of digital banking services. Departing from the traditional focus on recovery strategies in conventional banking environments, the research will redirect scholarly attention toward online service failures, an increasingly relevant domain as financial institutions pursue digital innovation, business model transformation, and operational redesign.*

The study will compare service recovery constructs across culturally distinct settings by employing a cross-national perspective. These findings will serve to extend and refine established theoretical frameworks, including Justice Theory and Attribution Theory, by illustrating how context can shape the efficacy of recovery strategies in diverse markets.

The study will also advance the literature by shifting the analytical lens from traditional recovery strategies to psychological service recovery dimensions. Empathy, explanations, quick response, and effective problem-solving will be examined as core drivers of customer perceptions. Furthermore, the research will integrate attributional variables - specifically stability and controllability - as subdimensions of service failure attribution. Recovery attribution will be introduced as a moderating factor in the relationship between perceived justice and post-recovery satisfaction.

Lastly, the research will uniquely position relationship quality as a central construct in predicting post-recovery behaviors such as repurchase intention and word-of-mouth advocacy, thus offering a complete understanding of the mechanisms that underpin sustained customer loyalty in digitally mediated service environments.

Managerial implications. *From a practical standpoint, this study will propose a set of strategic, adaptable recommendations aimed at helping online banking service providers navigate the complexities of digital service e-failures while strengthening customer relationships. Drawing on empirical insights, the research will outline best practices tailored to varying socio-cultural and institutional environments, offering practical guidance for implementation across both developed and emerging market contexts.*

It is anticipated that the findings will inform decision-makers in digital banking on how to refine their recovery approaches in response to culturally influenced customer expectations. For example, in some markets characterized by individualism and low-context communication (e.g., Spain), customers may prioritize transparency, detailed explanations, and formal accountability mechanisms. In contrast, in relationship-oriented, high-context cultures (e.g., Egypt), emotional intelligence, human interaction, and responsiveness may hold greater value in service recovery efforts (Lee et al. 2024).

Furthermore, the study is expected to reinforce the importance of relationship quality as a key driver of attitudinal loyalty, such as repeat usage and positive word-of-mouth. In culturally collectivist or trust-based environments, personalized services, such as loyalty programs, referral incentives, or regular follow-up communication, could significantly enhance customer retention (Westjohn et al., 2022; Honora et al., 2023).

The research will also highlight how perceptions of fairness in recovery vary: some customers may assess justice based on controllability (i.e., whether the issue could have been avoided), while others may judge service recovery on the speed and sincerity of the resolution. Therefore, rather than adopting a one-size-fits-all model, financial institutions will be encouraged to establish flexible recovery protocols that prioritize fairness, consistency, and promptness, cornerstones of customer satisfaction and long-term brand advocacy across digital service environments.

The role of special events and AI in amusement parks to improve the customer experience and performance

ANTONELLA ANGELINI[1] MAURIZIO CRISANTI[2] MARCO TRASSINELLI[3]

Abstract

This research explores the strategic role of special events in amusement parks, highlighting their impact on visitor experience and loyalty. With the growth of experiential tourism, parks have enhanced traditional attractions with themed events and engaging activities, becoming year-round destinations. The study uses a qualitative and quantitative approach, combining secondary data analysis and expert insights with surveys in Mirabilandia and online. The data analyzed through the Kano model assesses visitor satisfaction and the role of user-generated content in promoting events. The results show that while physical attractions remain central, special events significantly enhance the experience. Events such as Halloween extend the season, while digital marketing and artificial intelligence enhance customization. In terms of managerial implications, the study recommends leveraging special events and advanced technologies to improve visitor satisfaction, positively influence repeaters' rates and improve operational efficiency. The findings offer actionable insights to guide strategic decisions on special event offerings and the adoption of emerging technologies. The paper concludes with a discussion of the limitations of the analysis and potential directions for future research.

Framing of the research. *A positive customer experience represents a differentiation factor in the competitive positioning of organizations (Pine II and Gilmore, 1998; Meira de Vasconcelos et.al, 2013) and creates opportunities to improve the image and brand awareness. Today, customers are increasingly looking for experiences (Caru & Cova, 2003). In the tourism sector, memorable tourism experience has become central for companies to achieve important results in terms of their ability to better satisfy customers, attract new ones and strengthen their competitive advantage over time (Hosany et.al. 2022). Tourism experiences have been defined as enjoyable, memorable and engaging encounters (Oh et al., 2007). A recent report published by McKinsey & Company (2024) points out that offering experiences is a crucial factor in choosing a tourist destination. For the destination, creating opportunities for memorable tourism experiences is therefore beneficial for its competitiveness (Stone et. al, 2018). The travel experience market could exceed $1 trillion in value. Paid activities for tourists, such as concerts and entertainment, account for approximately 25% of global spending on experiences, totaling $250-310 billion per year. According to the Mastercard Economic Institute, the preference for experiences over material goods is growing. In Europe, the share of spending on experiences rose to 22% in 2023 (from 19% in 2019), while spending on goods remained stable. A Mastercard survey of over 16,000 consumers reveals that 88% plan to spend the same or more on experiences in 2024, with 33% interested in family experiences, such as amusement parks. Theme parks, water parks, zoos, and aquariums are a key sector in global tourism, with over 900 million tickets expected to be sold by 2025 and visitor spending reaching $66.33 billion (according to IAAPA[4]). In Italy, 180 parks attract 20 million visitors annually, generating over €350 million. The sector faces challenges related to costs and cultural competition, shifting the focus from creating new attractions to enhancing memorable experiences through events, shows and themed activities that can encourage both loyal guests and new visitors to increase the number of days spent at the park as well as to repeat the experience many times.*

Amusement parks are complex entities that require careful management to ensure sustainability and success. While they rely on key elements, they must continuously evolve to attract and retain visitors, adapting to trends and changes in the environment. Nowadays, capturing people's attention is increasingly difficult. The multitude of stimuli and the wide availability of diverse experiences create significant challenges in reaching and engaging the target audience. That's why amusement parks are increasingly transforming into hubs of various types of experiences: relying solely on physical attractions is no longer enough. There is a need to innovate, refresh, and focus on new engaging offerings such as special events, shows, themed parties, and much more. It is important to highlight that new technologies, particularly AI (but also AR/VR), contribute, and will further help, to create increasingly personalized and memorable experiences for different types of users and visitors. The impact is already significant and will lead to exciting developments in the coming years.

DOI 10.7433/SRECP.SP.2025.01

Seasonality poses a challenge for amusement parks. As highlighted by the TEA/AECOM "Theme Index 2023" report, special events such as Halloween and Christmas help extend the season and attract new visitors. Today's parks aim is to offer unique experiences that combine existing attractions with thematic events with the aim of creating experiential and engaging opportunities for visitors even during the peak season. While events come with high costs, they are a powerful media tool for the Parks. Additionally, they improve the park's visibility through viral content on social media (often generated by visitors, also known as earned media) and collaborations with well-known external brands.

Based on these premises, the study aimed to understand the importance of special events in amusement park offerings (and strategies) as a means to build customer loyalty and spread the experience using social media by visitors. This communication tool is very effective in services, more than information spread through traditional communication channels (Hennig Thurau et al., 2010). The reason is the trust in the information shared by customers. Moreover, with social media the customers can share images and videos that can make the experience fully understood.

The research is based on theories of experiential marketing and services, with a focus on the economics of experience in tourism and amusement parks. To study the evolution of experiences in parks, market research techniques were extensively used, with a focus on guest satisfaction and an application of Kano's model to capture empirical data useful for analysis.

Purpose of the paper. *The objective of the paper is to understand how the offer is evolving within amusement parks, deep the importance of exclusive events and experiences over traditional entertainment formats, and how new technologies will create an even more disruptive impact.*

The research questions are the follows:

- *How is the experience evolving within amusement parks?*
- *How can events and exclusive experiences transform visitors into repeaters?*
- *What is the importance of events and exclusive experiences compared to traditional offering formats?*
- *How will new technologies impact the design of visitor experiences?*

Despite the growing interest of parks in organizing special events, there is a lack of detailed reports and specific analysis on the actual success of these initiatives, regarding visitor satisfaction levels and their impact on the park, in terms of e.g. economic results, visibility, notoriety, image and visitor's attraction. This information gap is the reason for this in-depth study on the evolution of the offer in amusement parks, with a specific focus on the strategic use of special events.

In this way it is possible to provide valuable insights that could be useful for professionals and operators in the sector in making strategic and operational decisions in the age of experience and digitalization and for future research. The paper concludes with some considerations about the role of AI in these entertainment venues: a highly relevant topic that impacts (and will continue to impact) every aspect of the park's value proposition.

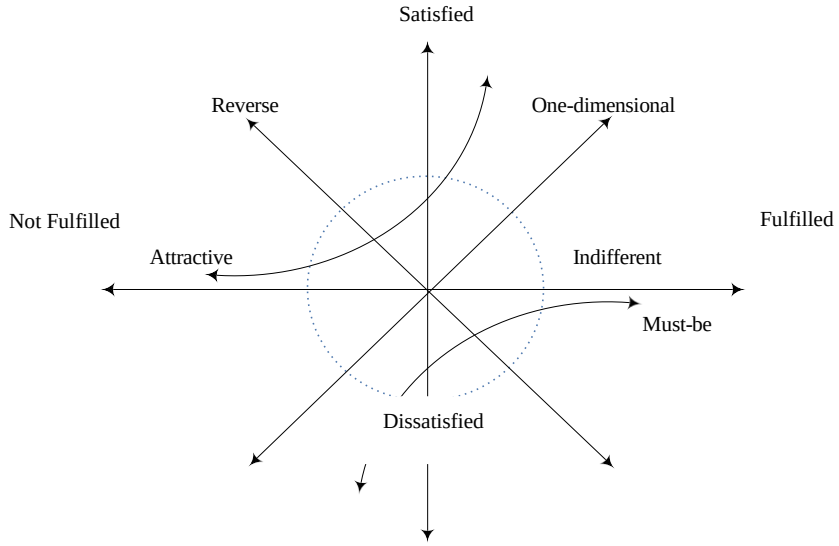
Methodology. *This research takes a qualitative and quantitative approach to explore the role of special events in amusement park offerings, focusing on behavioural insights into visitor satisfaction, the likelihood of repeat visits and the potential of visitors to act as promoters through electronic word-of-mouth (eWom).*

The study was conducted as follows:

Exploratory phase: the initial phase involved an in-depth review of secondary data, including reports, academic literature, and insights provided by industry experts. This stage aimed to identify key variables and trends to shape the subsequent phases of the research.

Descriptive phase: primary data were collected using two structured questionnaires:

- ✓ *On-site survey: administered directly at Mirabilandia during the "Best Day Ever: Spongebob's Birthday" event organized in the season 2024;*
- ✓ *Online survey: conducted using a CAWI (Computer-Assisted Web Interviewing) method, yielding over 400 responses from a diverse sample of amusement park visitors.*



The collected data were analyzed using Kano methods and Net Promoter Score (NPS).

Kano model categorizes the attributes of special events based on their impact on visitor satisfaction. Kano model is an analytical tool defined by a professor at Tokyo Rika University, Noriaki Kano, in 1984. This model suggests that customer satisfaction is achieved when a customer's needs and expectations are met, and the products and services are categorized considering the customer's perceptions and the impacts on customer satisfaction. In this way it is possible to identify problems regarding the service quality level that need to be improved in order to increase customer satisfaction. The model involves asking customers the rate of satisfaction if the product or service has a particular attribute and if the product or service does not have some attribute. The following are suggested as response alternatives: I dislike it that way, I can live with it that way, I am neutral, it must be that way, and I like it that way (Kuo, 2012). Kano et al. classified quality attributes into five categories of must-be (basic), one-dimensional (performance), attractive (motivational), indifferent, and reverse (Kano et al., 1984; Llinares and Page, 2011; Shahin et al., 2013). The following are some considerations on the impact of these attributes on customer satisfaction (see fig.1):

- *Must-be Attributes: these are basic expectations. If they are not fulfilled, customers are dissatisfied but fulfilling them does not increase satisfaction;*

- *One-dimensional Attributes: satisfaction increases as performance improves, and dissatisfaction occurs if performance is poor;*
- *Attractive Attributes: these exceed customer expectations and create satisfaction when present, but their absence does not cause dissatisfaction;*
- *Indifferent Attributes: these have no significant effect on customer satisfaction, whether fulfilled or not;*
- *Reverse Attributes: these lead to dissatisfaction if fulfilled and satisfaction if not.*

Figure 1 Kano Model

Source: Adapted from Kano et.al (1984)

In this model there are therefore three types of product/service requirements that influence customer satisfaction in different ways depending on the level of satisfaction: must-be, one-dimensional, and attractive. The Kano model highlights how customer satisfaction depends not only on fulfilling explicit demands but also on unexpected factors that can positively surprise the customer and create the opportunity to exponentially increase satisfaction levels.

The second method used is the Net Promoter Score (NPS) to measure the likelihood of visitors recommending the park to others. The NPS is calculated using data obtained from customers who are asked to answer a single question: How likely are you to refer Company X to a friend or colleague? (Reichheld F. 2002).

The answer of each customer is collected as a rating on the 0-10 scale. Then customers are categorized into three groups according to the behaviour of their answers.

The first group is made up of those customers who have given a 9 or 10 score. They are very satisfied customers that share their experience with friends or other person using also social media. For this reason, they are the best friend of the company and are classified as Promoters. The second group is formed by customers who occupy a neutral position having provided an answer of 7 or 8. They received what they expected and that is why they are classified as "Neutral". The third and final group consists of customers who declare a disappointing score between 0 and 6. These customers are the detractors or those who have not been satisfied by the experience and do say negative things about the company and/or the product/service although they vary in terms of their own personality and attitude (Angelini, 2023). The net promoter score (NPS) is calculated by subtracting the percentage of detractors from the percentage of promoters, while the percentage of neutral is not used for the calculation (Hörsch, Rudinger, 2009).

Results. *The On-site survey conducted at Mirabilandia during one of the special events planned for the 2024 season: "Best Day Ever: Spongebob's Birthday" was carried out using CAPI (Computer-Assisted Personal Interviewing), with a total of 31 respondents (thus, a non-probability, convenience sample). More than half of the respondents (57%) stated that they had visited the park specifically for the event. Of these, 67% were families with children, the park's main target audience and the focus of the event. To evaluate the experience, 5-point Likert scales were used: 71% of respondents expressed satisfaction with the event (43% said "very satisfied"); 94% appreciated that the park offers this type of experience in addition to the classic physical attractions. The analysis was completed with the calculation of the NPS (Net Promoter Score): for this event, a score of 43% was recorded, which is in line with the park's average for similar initiatives.*

These early results suggest a strong appreciation for the special events organized in the park. In order to deepen the analysis, it was conducted an online survey (using the CAWI method) gathering opinions from over 400 amusement park visitors. Nearly half of the respondents were either season pass holders or frequent visitors, making them a well-qualified audience on the topic. The data were used to apply the Kano model. The aim was to identify the key requirements of

amusement park offerings to compare them and determine which of the previous categories they fall into: how special events, shows and mechanical attractions (the classic ones) are positioned in the minds of visitors?

The results are illustrated in the following tables:

Table 1: Special Events classification

SPECIAL EVENTS						
TOT	**A**	O	M	I	R	Q
402	**240**	49	1	104	6	2
100,00%	**59,70%**	12,19%	0,25%	25,87%	1,49%	0,50%

Source: Our elaboration

Table 2: Shows classification

SHOWS						
TOT	**A**	O	M	I	R	Q
402	**218**	105	4	75	0	0
100,00%	**54,23%**	26,12%	1,00%	18,66%	0,00%	0,00%

Table 3: Mechanical attractions classification

MECHANICAL ATTRACTIONS[5]						
TOT	A	**O**	M	I	R	Q
402	183	**179**	1	37	0	2

Source: Our elaboration

The data collected and processed leads to the conclusion that events and shows are positioned as attractive elements, while physical (or mechanical) attractions are classified as one-dimensional attributes.

Having made this distinction, the next step was to calculate the satisfaction/dissatisfaction coefficients. The following equations are used to calculate the two coefficients:

- *Satisfaction coefficient:*

$$\frac{A+O}{A+O+M+I}$$

- *Dissatisfaction coefficient:*

$$\frac{O+M}{(A+O+M+I) \times (-1)}$$

The satisfaction coefficient (realization of the offering element, first formula) ranges from 0 to 1, while the dissatisfaction coefficient (failure to realize the offering element, second formula) ranges from 0 to -1.

Regarding the satisfaction level, all three requirements have relatively high values close to 1. This means that the presence of these elements in the amusement park offerings contributes to increasing the respondents' satisfaction. It is noticeable that there is a particular "affection" for physical/mechanical attractions compared to other components of the offering. Even today, amusement parks are associated with adrenaline-pumping roller coasters, dark rides, and many people visit them for that reason. Events are seen as something that, if proposed, can contribute to increasing satisfaction and the overall experience in the park. However, they are not considered fundamental and necessary by the respondents: the negative value of the coefficient, equal to -0.13, suggests that their non-implementation does not lead to significant decreases in overall satisfaction. These considerations are understandable: this type of experiential offering is recent (for

[5] The assessment of attractions appears less clear: there is a substantial "tie" between requirement A (45.52%) and O (44.53%). In this case, the choice should follow the rule dictated by the model: if the requirements of a product/service cannot be uniquely assigned to the different categories of the Kano model, it is useful to apply the evaluation rule "M > O > A > I." Consequently, the introduction of new physical/mechanical attractions (or updates/improvements to existing ones) is classified as a "One-Dimensional" requirement.

example, in the case of Mirabilandia, they were introduced in 2023), and it will take a few years for visitors to "get used to" this component of the overall offering. Still, the positive impact, although not at the level of attractions, demonstrates the value of the initiative and justifies the investment strategies pursued by Italian parks in recent years.

Other data and insights from the questionnaire analysis reinforce the previous considerations. 64.64% of respondents who participated in at least one event (in recent years) stated that this type of entertainment had a decisive impact on their visit to the park. A general preference for themed events emerges (over 60% of preferences), specifically those organized for special occasions like Halloween. Visitors enjoy seeing the changing and adapting scenery, experiencing activities aligned with the mood of the celebration, and immersing themselves in meticulously designed settings.

An interesting aspect is the evaluation of satisfaction related to the latest experience at a special event: to solidify the metrics, 5-point Likert scales (ranging from "not at all" to "very much") and the NPS (Net Promoter Score) were used. Over 80% of respondents stated they were satisfied; nearly 50% (47.5%) said they "very much" appreciated the fact that the park offers these initiatives in addition to the classic attractions. Furthermore, almost 48.8% stated they would "definitely" return to the park for similar events. The NPS is at a positive value of 30% for the amusement park sector in general.

Social media play an increasingly important role in communication and user interaction. Data collected shows that the official social media profiles of amusement parks are the primary source of information (for 71% of respondents). Parks have not only recognized the importance of communicating through these platforms but also understand that they serve as a form of "free" advertising from visitors. Earned media have become essential for reaching new potential users, making it crucial to promote these behaviors and encourage participation.

During their last event experience, 50.2% of respondents stated that they shared it on social media. Among the platforms used, Instagram dominates with 83.6%, followed by Facebook at 61.8%. Stories are the most popular format (67.3%) for sharing park visits and event experiences.

Finally, it has been considered the influence of the AI in the visitors experience. Artificial intelligence is significantly transforming every sector of society; therefore, even complex organizations like amusement parks are impacted by this. As stated on IAAPA, the benefits of integrating AI are numerous: scalable content generation, real-time personalization of guest experiences, improved operational efficiency, visitor management optimization, customized itineraries, dynamic pricing, and real-time virtual assistance. The Six Flags park chain is implementing an innovative digital strategy with virtual assistants, an interactive mobile app, smart payments, and real-time image and video capture technologies. The use of wearable devices, like Disney's MagicBands and Universal's solutions, also enables a smoother experience by simplifying access to attractions and payments.

Figure 2 Disney Magic Band

Source 1 https://disneyconnect.com/

AI not only enhances experiences with immersive technologies like AR/VR and intelligent animatronics but also improves operational efficiency, reducing wait times and increasing guest satisfaction. Data analysis can also be optimized with AI to enhance the visitor experience at every stage of the customer journey. Strategies like dynamic pricing, intelligent queue and service management, and effective digital communication are increasingly appreciated by customers. Groups like Disney and Merlin use big data to optimize flows, resources, and offers, while parks like Bobbejaanland leverage connectivity to monitor and improve services in real time. New technologies are also improving safety in amusement parks. For example, Disney uses a surveillance system with closed-circuit cameras and machine learning to analyze visitor behaviors and identify dangerous situations, thus reducing risks. Additionally, AI can monitor the operation of rides, anticipate failures, and suggest maintenance, making a significant impact on safety.

However, it is essential to balance innovation with human warmth: contact with operators and personalized assistance remain central. The challenge is to leverage technology without losing the essence of what makes amusement parks places of joy and human connection.

Managerial implications. *The insights from this study provide valuable suggestions for amusement park operators and industry professionals, highlighting key strategies to enhance visitor experiences and maintain or reinforce competitiveness.*

While physical attractions remain the cornerstone of amusement parks, the rising importance of special events underscores the need to integrate them as a central part of the offering. Operators should focus on creating synergistic experiences where events complement existing attractions to amplify visitor satisfaction. Moreover, this strategic orientation can serve as a distinctive and strategic component to increase visitation frequency and enrich the overall visitor experience. By designing immersive and thematic events, parks can create memorable experiences that visitors are eager to revisit the park and recommend the experience using electronic word of mouth (eWom).

The integration of amusement parks, artificial intelligence, and new technologies is revolutionizing the visitor experience. Data-driven marketing optimized with AI enables the creation of personalized experiences, highlighting how investment in customer analytics is more strategic than simply adding new attractions. AI enhances resource management, improves operational efficiency, while IoT devices enrich interaction and the guest experience. AR/VR will also play an important role in creating immersive experiences within the parks. Artificial Intelligence and advanced technologies offer new opportunities for growth, so it's very important to be prepared for future trends. The continued evolution of amusement parks lies in their ability to innovate. Operators should monitor emerging technologies and trends to stay ahead of industry shifts, ensuring the integration of cutting-edge solutions that enhance both the visitor experience and operational performance.

In conclusion, this research reaffirms the central role of amusement parks in leisure activities. By embracing innovation, enhancing creativity, and investing in experiential and technological advancements, parks can secure their position as key players in the entertainment, tourism, and broader leisure industries.

Originality of the paper. *This research contributes to the existing literature on amusement parks by addressing an underexplored aspect of their offering: the growing strategic importance of special events. Unlike previous studies, which have primarily focused on physical attractions as the main drivers of visitor satisfaction, this study highlights the evolving role of themed and seasonal events in enhancing the visitor experience.*

The use of a dual-method approach-on-site surveys and online questionnaires-allowed for a comprehensive analysis of visitor perceptions, combining direct feedback with broader audience insights. Additionally, the application of the Kano model to evaluate visitor satisfaction with special events represents a novel methodological contribution in this context.

Another original element lies in the exploration of artificial intelligence (AI) as a transformative tool for the amusement park industry. While existing studies have examined AI in broader tourism settings, this research specifically links AI's potential to operational efficiencies, personalized experiences, and the design of innovative event offerings in amusement parks.

By combining these elements, the study not only provides actionable insights for industry practitioners but also advances academic understanding of the interplay between traditional attractions, special events, and emerging technologies in the entertainment sector.

Research limitations. *This study acknowledges several limitations. First of all, the data were collected from a non-probabilistic sample, which limits the ability to generalize the conclusions to the entire population of amusement park visitors in Italy. Furthermore, some questionnaires included incomplete responses, particularly for optional questions. This may have contributed to discrepancies in respondent counts and minor gaps in the analysis. Moreover two optional questions regarding event-related merchandising received limited responses. As a result, this variable, while recognized as relevant and potentially significant, was not included in the final analysis. Future studies could explore this aspect further to provide a more comprehensive understanding of visitor behaviors and preferences. Finally, the influence of AI in the visitor experience needs to be appropriately deepened and complemented by conducting an ad-hoc analysis. In the paper, only a few considerations on the developments and applications of AI in the context of amusement parks have been reported, but which hint at interesting effects on the visitor experience.*

These limitations underline the need for future research with a probabilistic sampling approach, broader geographical coverage, and additional data collection on key variables like merchandising to enhance the robustness and applicability of the findings.

An empirical study on the perception of AI-generated online reviews among university students

GRAZIANO ABRATE[1] VALERIA FARALLA[2]

Framing of the research. *The use of Artificial Intelligence (AI) technologies has revolutionized and reshaped content creation practices in various sectors, transforming the way information is produced and evaluated in digital environments. More specifically, e-commerce platforms like Amazon increasingly incorporate AI-generated reviews to automate feedback, manage product recommendations, and shape consumer behavior. Other industries, including the hospitality sector, may benefit from the potential of AI-generated content to enhance marketing effectiveness.*

In the hospitality context, online reviews represent a critical decision-making feature that, when perceived as trustworthy, can serve as an influential source of information that can significantly impact booking intentions (Filieri et al., 2016). Consumers, in particular, use feedback from previous users to reduce uncertainty in the purchase decision process. Prior research has extensively documented the importance of reviews in consumer decision-making (Sparks & Browning, 2011) and the role of different types of reviews, from traditional word of mouth, typically based on oral communication, to electronic word of mouth (eWOM), its web-based evolution (Hennig-Thurau et al., 2004; Liu & Park, 2015). Nevertheless, limited attention has been paid to how consumers respond to AI-generated reviews compared to human-written ones, especially when disclosure about content origin is provided or withheld. Based on this background, the present study specifically focuses on the role of the so-called "word of machine" (Longoni & Cian, 2022), a new form of recommendation driven by AI, which serves as an alternative to traditional word of mouth and eWOM. Longoni and Cian (2022) found that AI chatbots can increase an individual's purchase intention in the context of search products, while the opposite occurs for experience products. In contrast, Lo Presti et al. (2021) suggested that AI chatbots can positively influence purchase intentions for experience products by enhancing customer engagement and satisfaction. As research in this area is still emerging, further investigation is needed to clarify these aspects and provide more definitive insights. More specifically, a deeper exploration is needed to compare human and AI-generated recommendations and their distinct effects on consumer decision-making. AI-based recommendations, along with other advanced technologies, can be used not only to simplify the decision-making process but also to enhance customer engagement, facilitate communication, and personalize the guest experience (Chauhan et al., 2022). In particular, as large language models, such as ChatGPT, continue to advance in generating high-quality text, hotels are now presented with new opportunities to leverage AI to create review content that may supplement or enhance traditional user-generated reviews. From a broader perspective, how consumers and AI interact has opened new lines of research, highlighting the need for innovative, cross-disciplinary theoretical frameworks and methodological approaches (Pentina et al., 2023).

Another important issue in research on AI-generated content concerns disclosure. Preliminary studies suggest that informing consumers about AI authorship may influence how the content is evaluated (Jakesch et al., 2019). As a result, the disclosure of AI involvement seems to play a crucial role in shaping consumer trust, acceptance, and decision-making. To date, however, examining the effects of disclosure in this framework is limited. Particularly, despite growing interest in AI applications within the hospitality sector (Abrate & Faralla, 2024), a significant research gap remains in the understanding of how consumers respond to AI-generated reviews, particularly when disclosure is provided or withheld, and how AI-generated content may influence purchase intentions about traditional user-generated content. Moreover, age may influence how consumers perceive and respond to AI-generated content, as younger and older users may differ in terms of familiarity with technology, trust in automation, and cognitive processing styles (Guerra-Tamez et al., 2004).

This study aims to address these gaps by comparing eWOM and AI-based recommendations through a survey experiment involving different treatment conditions. Specifically, the study compares AI-generated online reviews-with and without disclosure-with a condition featuring real (human) online reviews, using a sample of university students.

Purpose of the paper. *The present study, based on an experimental analysis, investigates how consumers respond to AI-generated hotel reviews compared to online human-written reviews, with particular attention to the effects of disclosing the AI-generated nature of the contents on purchase intentions.*

Using a three-treatment experimental design, we examine whether consumers' purchase intentions differ when exposed to an AI-generated review without disclosure, an AI-generated review with disclosure, or real (human) reviews.

As a preliminary finding, the study also explores how different consumer segments-particularly digital natives and non-digital natives-respond to AI-generated content.

This research aims to provide hospitality managers with evidence-based insights into the strategic value of AI-generated content as part of their digital marketing strategies. More specifically, the study aims to assess the potential benefits and best practices for integrating artificial intelligence tools, such as ChatGPT, into analysing reviews within hotel management and customer relationship practices within the hospitality industry.

Methodology. *The design of the experiment comprises three treatments. In Treatment 1 and 2, participants were displayed the image of a hypothetical hotel room (Figure 1) in which a textual review and a rating were provided.*

The textual review corresponds to a textual (summary) review generated by Artificial Intelligence, namely ChatGPT. To produce this summary, ChatGPT was provided with 10 textual reviews of a hotel from Booking.com and instructed to generate a concise summary within a 400-character limit. The selected summary was drawn from a dataset of 40 ChatGPT-generated summaries originally created for a separate study. To create that dataset, ten customer reviews and respective ratings were selected for 20 three- and 20 four-star hotels. Half of the hotels were in Rome and the other half in London. We chose Rome and London because they are prominent cities, and we wanted to evaluate ChatGPT recommendations for Italian, our mother language, and English, a global language. To ensure consistency and relevance, the selection process for these reviews incorporates a predefined set of criteria. For Rome, we selected the hotels based on top choices and focused on the most recent reviews in Italian. For London, we selected the hotels based on top choices and focused on the most recent reviews written in the English language. Given that the reviews on Booking.com include both a positive and negative textbox, we selected cases where the reviewer filled in both positive and negative comments. Hotels with insufficient reviews were excluded from the database. Among these 40 reviews, for the present experiment, we chose the one which (1) seemed to be as realistic as possible, (2) had a high rating, and (3) was in Italian since this is the mother language of the experimental subjects in this study.

As for the numerical review, we used the average rating (from 1 to 10) of the original 10 textual reviews provided by the ten customers on Booking.com. As a result, in Treatment 1 and 2, the textual review is provided by ChatGPT, whereas the numerical review is the average rating of real (human) customers.

In Treatment 2, subjects were specifically informed that the textual review was generated by ChatGPT, while in Treatment 1, we did not provide this information. This is the only difference between the two treatments.

Finally, in Treatment 3, the subjects faced the same hypothetical hotel room and numerical review as in Treatment 1 and 2; nevertheless, they were presented with the 10 real (human) customers' reviews instead of the summary review from ChatGPT.

In all treatments, at the same time as the image was presented, the participants were asked the following questions: (1) the intention to buy the hotel room (i.e., How likely are you to choose to stay overnight at this hotel?; 11-point Likert scale from 0 = not at all likely to 10 = extremely likely; Juster, 1966); (2) level of trust in the textual review associated with the hotel room (11-point Likert scale from 0 = not at all to 10 = very much); (3) the level of trust in the rating assigned with the hotel room (11-point Likert scale from 0 = not at all to 10 = very much).

Following this section, the experiment comprised two additional parts. First, subjects were asked about general attitudes towards reviews: trust and usefulness of textual and numerical reviews in hotels but also generally for goods and services (flights, restaurants, etc.; 11-point Likert scale), how much they rely on reviews in their decision to buy (11-point Likert scale), and if they also write often reviews (11-point Likert scale) and for what type of good and services (open question). They were also asked to report the means of booking a hotel among hotel websites, online booking sites, travel search engines, traditional travel agencies, telephone reservations, or others. The final section included socio-demographics (i.e., age, gender, educational level, and employment status).

A follow-up section was ultimately assigned to some participants who were available to complete it. The follow-up section was available only for Treatments 1 and 2, focusing on participants' perceptions of using AI for reviews. However, we asked subjects in Treatment 3 if they remembered the intention to buy assigned to the hotel room at the beginning of the experiment. This was for assessing the different cognitive load during the experiment, considering that in Treatment 3, they had 10 instead of one review to process. The same question was also asked in Treatment 2, as a control, to assess whether it similarly increased cognitive load compared to Treatment 3.

As for the follow-up section (Treatment 1 and 2), we asked for general impressions of using ChatGPT for processing real (human) hotel reviews and for goods and services reviews (open questions) as well as the level of trust and the perception of usefulness they have about ChatGPT-generated content (11-point Likert scale). They were also surveyed about if they ever thought or tried using ChatGPT for reviews in the past (Yes, I have thought about and tried; Yes, I have thought about, but not tried; No, neither thought nor tried).

Finally, in Treatment 1, we also disclosed that the textual review was generated using AI, particularly ChatGPT. Considering this information, we asked to answer the questions in the first section again: the intention to buy the hotel room and the level of trust in the textual and numerical review associated with the hotel room. We also asked how they feel about this information (i.e., disclosure of AI use; more positive, neutral, or negative feeling) and if they realized it was an AI-generated review (no, more no than yes, more yes than no, yes).

Before starting the questionnaire, participants in all treatments were presented with a disclaimer outlining the questionnaire and privacy policy. Once they accepted the disclaimer, they proceeded to the experiment.

The present paper focuses on purchase intention and levels of trust in the textual review and rating associated with the hotel room in the different treatments, as well as the role of disclosing that the textual review was generated using AI

and participants' socio-demographic characteristics. Therefore, we restrict our analysis to this part of the experiment in the following sections.

*For this study, we used data from an online survey conducted among the students at an Italian University in the North of Italy. The questionnaire was distributed by using Qualtrics XM (https://www.qualtrics.com). Respondents received an invitation to participate via email using the communication office newsletter. The survey remained open from October 24 to November 22, 2024. One reminder email to the survey invitation was sent approximately after two weeks. The questionnaire was completely anonymous, and participation was entirely voluntary. The total number of subjects that completed the questionnaire was 413 (68% female, mean age = 25.44 years, SD = 9.46). A priori power analysis, conducted with G*Power (Faul et al., 2007), revealed that a sample of 115 participants per group was sufficient to detect a medium effect size and a minimum of 95% statistical power for a Wilcoxon-Mann-Whitney test with the use of Bonferroni's correction.*

A detailed description of each treatment is provided in Table 1. Treatment 1 (No Initial Disclosure Provided) included 150 participants, whereas Treatment 2 (Initial Disclosure Provided) consisted of 145 participants and Treatment 3 (Human Reviews) had 118 participants. The gender composition and average age of each treatment group aligned with the overall sample characteristics.

Tab. 1: Overview of Treatment Conditions

Treatment	***Description***
Treatment 1 - No Initial Disclosure Provided	*Please consider the following hotel, for which the average rating (on a scale of 1 to 10, where 1 represents the lowest and 10 the highest) and a representative review are provided.* *[hotel room] 8.70* *The hotel offers a truly exceptional stay, thanks to its quiet location and attentive staff. The rooms are well-appointed and comfortable, though some could benefit from minor upgrades. Breakfast is varied and plentiful, served with care in a cozy setting. The only area for improvement is the Wi-Fi connection, which could be more stable and faster.*
Treatment 2 - Initial Disclosure Provided	*Please consider the following hotel, for which the average rating (on a scale of 1 to 10, where 1 represents the lowest and 10 the highest) and a representative review are provided. The textual review was processed through ChatGPT based on a summary of 10 real (human) reviews.* *[ChatGPT is an Artificial Intelligence model designed to understand and generate natural language text, answering questions, providing explanations, and performing various conversational or language processing tasks. Artificial Intelligence is a computer science discipline that develops systems and algorithms capable of performing tasks typically reserved for human intelligence, such as image recognition, language understanding, problem solving and autonomous learning].* *[hotel room] 8.70* *The hotel offers a truly exceptional stay, thanks to its quiet location and attentive staff. The rooms are well-appointed and comfortable, though some could benefit from minor upgrades. Breakfast is varied and plentiful, served with care in a cozy setting. The only area for improvement is the Wi-Fi connection, which could be more stable and faster.*
Treatment 3 - Human reviews	*Please consider the following hotel, for which the average rating (on a scale of 1 to 10, where 1 represents the lowest and 10 the highest) and a representative review are provided.* *[hotel room] 8.70*

	1. *Location surrounded by greenery and a delicious, varied breakfast. Friendly and always available staff. There were minor technical issues with the Wi-Fi, which didn't work very well, probably due to the high number of guests at the property. But nothing serious!* 2. *We stayed at this property because we were working remotely. The wonderful garden became our office for a few days. The staff, always smiling, managed to meet every request without any problem. The villa is stunning, and every detail is impeccably taken care of. The bar/reception is beautifully furnished, and we fell in love with it instantly. I would probably add mosquito screens to the rooms, as being on the ground floor near a garden makes it easy to encounter a few mosquitoes. We had the room with the whirlpool tub, but while filling it, we realized there was a boiler, as after a few minutes, the hot water ran out, and we had to wait for it to heat up again. The Wi-Fi was a bit unstable.* 3. *I liked everything: the caring and welcoming staff, the beautiful room, and the super comfortable bed, which is the most important thing. And then the breakfast-the best I've had in any hotel I've stayed at. Perhaps the lack of hot water in the shower in the morning was an issue, but it was summer, so it wasn't a big problem.* 4. *Definitely worth considering for a stay that makes visiting this beautiful city pleasant. The location is unique-very beautiful and quiet, relatively close to the centre. Unfortunately, public transportation was lacking, especially in this hot summer with the metro out of service. Consider other means of transport for easier movement. Breakfast meets every need, with the staff always available and welcoming. I was disappointed not to find the classic croissants to accompany coffee or cappuccino. But, as I mentioned, it meets all other needs.* 5. *Perfect location, excellent breakfast. Great reception, location, and room space! Breakfast is well-prepared.The breakfast service cannot start at 8:00 AM; 7:30 AM should be the minimum, and ideally 7:00 AM for those who are not on vacation.* 6. *Courteous and helpful staff, along with the meticulous environment. An annoying issue with the price at check-in. I booked at one rate, but later I was informed there was an error and that I could either pay €38 more or accept a refund.* 7. *I liked the location and the room, but there was no hot water.* 8. *Great hotel with a garden. Very abundant breakfast with high-quality products, served in a clean, elegant, and convivial setting. The room is very beautiful and recently renovated. The villa and the surrounding garden are gorgeous and allow guests to enjoy a lovely day in the greenery, with benches, tables, and chairs set up all around. The staff is very available and kind. This is not a negative comment, just a note about the breakfast time, which currently starts at 8:00 AM. Considering there could also be guests who are not necessarily tourists but workers, it should be anticipated to at least 7:30 AM to allow them to reach their destinations on time. The staff did offer to prepare a takeaway breakfast box, but generally, the pleasure of having breakfast in such a setting would be preferable to a box.* 9. *Warm welcome and very kind staff. A property with great character, tastefully decorated and with attention to the smallest details, from the courtesy set to the crockery (order tea to verify). Enchanting garden. I stayed in the room near the reception, but some hotel guests talked very loudly late into the night, making it difficult to sleep.* 10. *Beautiful location in a very quiet residential area. Spacious and nicely decorated room. It feels like being at home. Good breakfast, but above all, served with care. The Wi-Fi connection needs improvement.*

Results. *As noted earlier, the present study focuses on purchase intention and trust in the hotel room's textual review and rating, with particular attention to the impact of disclosing that the review was AI-generated and participants' socio-demographic characteristics.*

Participants' purchase intention resulted to be higher for Treatment 1 (mean = 7.45, SD = 1.68, median = 8) and Treatment 2 (mean = 7.19, SD = 1.88, median = 8) than for Treatment 3 (mean = 6.71, SD = 1.99, median = 7). As for trust in ChatGPT's textual and rating reviews, the results were the following:

- *Trust in ChatGPT's textual reviews: Treatment 1 (mean = 6.85, SD = 1.62, median = 7), Treatment 2 (mean = 6.63, SD = 2.01, median = 7), and Treatment 3 (mean = 7.14, SD = 1.75, median = 8);*
- *Trust in ChatGPT's rating reviews: Treatment 1 (mean = 7.03, SD = 1.64, median = 7), Treatment 2 (mean = 6.86, SD = 1.90, median = 8), and Treatment 3 (mean = 6.55, SD = 1.92, median = 7).*

Regarding purchase intention, the comparison between Treatment 1 and Treatment 3 was statistically significant ($p < .01$; Mann-Whitney U test with Bonferroni correction applied), whereas the other pairwise comparisons were not significant, with mean values being very similar across those conditions. Comparisons for trust in ChatGPT's textual reviews and trust in ChatGPT-generated ratings were also not significant, indicating no substantial differences in trust levels across the different treatments.

Focusing on the main variable, participants' intention to buy, the significant difference between Treatment 1 (ChatGPT-generated reviews without disclosure) and Treatment 3 (human reviews) suggests that participants responded more positively to AI-generated content when unaware of its source. At the same time, however, disclosure seems to act as a credibility signal: transparency regarding AI authorship (which is supposed to enhance credibility) partially offsets any potential intrinsic preference for human reviews, and the difference between the two treatments (i.e., Treatment 2 and 3) is not significant. In parallel, participants did not appear to significantly devalue content solely based on the knowledge that it was AI-generated (and, indeed, Treatment 1 and 2 did not significantly differ in purchase intention). As a result, AI-generated content seems more persuasive than human content, and disclosure intervenes only slightly in this advantage.

In Treatment 1, we disclosed that the textual review had been generated using ChatGPT in the follow-up questionnaire, where participants were again asked about their purchase intention and their level of trust in both the

textual and numerical reviews associated with the initially presented hotel room. All mean values decreased when participants were informed that ChatGPT generated the review. More specifically, the mean value of the intention to buy lowered from 7.45 (SD = 1.68; median = 8) to 6.13 (SD = 2.31; median = 7), trust in ChatGPT's textual reviews switched from 6.85 (SD = 1.62; median = 7) to 5.72 (SD = 2.37; median = 6), and, finally, trust in ChatGPT's rating reviews dropped from 7.03 (SD = 1.64; median = 7) to 5.87 (SD = 2.33; median = 6).

All comparisons conducted before and after the disclosure were statistically significant: $p < .001$ for purchase intention and trust in the numerical rating, and $p < .01$ for trust in the textual review (Mann-Whitney U test with Bonferroni correction applied). It is also worth noting that participants reported limited use of ChatGPT in their daily lives, with a mean score of only 3.45 on a scale from 0 to 10. Additionally, only 3 out of 150 participants reported realizing that the review was AI-generated.

As for socio-demographics, we examined the potential effects of gender and age. For gender, no statistically significant differences were found in purchase intention. To analyse age-related effects, participants were categorized as digital natives (N = 303) or digital immigrants (N = 110) to assess potential differences in responses. We classified Generation Z participants as digital natives, considering individuals born from 1997 onward, although recognizing that definitions of generational cohorts can differ across the literature. Although non-digital natives represent only one-third of the Gen Z participants, we can draw some preliminary insights from the comparison. In particular, the mean purchase intention is lower across all treatments for non-digital natives (Treatment 1: mean = 6.21, SD = 2.42, median = 7; Treatment 2: mean = 6.07, SD = 2.30, median = 7; Treatment 3: mean = 6.00, SD = 2.51, median = 7). Additionally, the differences between treatment conditions were not statistically significant for this group of participants. For the digital native group, by contrast, mean purchase intentions were: 7.81 (SD = 1.18; median = 8), in Treatment 1, 7.64 (SD = 1.46; median = 8), in Treatment 2, and 7.00 (SD = 1.67; median = 7), in Treatment 3. This group's comparisons between treatments involving ChatGPT-generated reviews and the human review condition were statistically significant ($p < .01$ for Treatment 1 vs. Treatment 2, and $p < .05$ for Treatment 2 vs. Treatment 3). However, the comparison between the two AI-generated review treatments was not significant, with mean values being very similar across those conditions. Although this finding should be further investigated with a larger sample, it seems to suggest that digital immigrants appear less sensitive to differences between review sources, showing relatively stable purchase intention across treatments.

Research limitations. *Some limitations of the present study should be acknowledged, as they offer important avenues for future research. First, the sample consisted exclusively of university students, which limits the generalizability of the findings to the broader population, particularly older age groups. Additionally, the sample was not gender-balanced, with 68% of participants identifying as female, which may have influenced the results and limited the generalizability of the findings. For instance, skepticism toward AI-generated content or emotional responses to numerical and textual reviews may vary between consumers of different genders. The distribution between digital natives and non-digital natives was also uneven, with non-digital natives representing only about one-third of the sample, making it difficult to draw robust conclusions about age-related differences in responses. We intend to replicate and extend these findings in future research using more representative and demographically balanced samples, ideally including participants across a broader range of ages, education levels, and digital literacy. This would allow for a more comprehensive understanding of how different population segments perceive and respond to AI-generated content in online review contexts. A future treatment using ChatGPT-generated content with multiple reviews, comparable to the human review condition, should be tested to examine whether review quantity affects participants' perceptions and decisions-particularly in light of the dual-system approach, which distinguishes between intuitive, heuristic processing and more deliberate, analytical reasoning. Future research should also consider potential ethical and privacy risks associated with using AI technologies in consumer contexts.*

Managerial implications. *The findings of this study offer several implications for managers in the hospitality and broader e-commerce sectors. First, AI may offer a powerful tool for hotel managers to identify trends and patterns in guest preferences, enabling data-driven decisions to enhance guest satisfaction and overall business performance. AI's real-time processing of large-scale review data is essential for timely operational adjustments. The lack of significant differences in trust across treatments suggests that participants did not perceive AI-generated reviews as substantially less trustworthy than human ones. Despite this may offer reassurance to managers aiming to incorporate AI-generated summaries or ratings into their platforms, ethical considerations around transparency must be balanced carefully with strategic goals, as full disclosure-provided in a second step rather than immediately-significantly diminished participants' purchase intention and trust. Managers should therefore carefully consider how and when to disclose the use of AI-generated content, potentially framing it in a way that emphasizes accuracy and efficiency to mitigate skepticism and increase transparency, as such disclosure may affect the overall perceived credibility.*

Additionally, the different attitudes between digital and non-digital natives highlight the importance of audience segmentation in the framework of AI-generated online reviews. Younger consumers-such as digital immigrants-seem more sensitive to AI-generated reviews, reporting lower purchase intention, which may necessitate targeted communication strategies.

From a practical perspective, these insights can help hotels refine their service offerings, respond proactively to guest feedback, and tailor marketing strategies to specific customer segments. Through AI's ability to evaluate guest sentiment in real time, hotels can identify and address negative experiences while continuously adapting their services to meet

evolving customer expectations. Moreover, managers may consider complementing average numerical ratings with concise textual summaries generated by AI through comprehensive content analysis of real (human) reviews. This approach can help clarify the distinct roles that numerical and textual elements play in shaping consumer perceptions of AI-generated reviews, with and without disclosure.

Regarding theoretical implications, the findings suggest that consumers may process AI-generated content differently from human-generated content, carrying broader implications for information processing theory. Moreover, by empirically engaging with the emerging concept of "word of machine", this study further highlights AI-generated recommendations as a distinct form of influence-one that may warrant its theoretical framework within the domains of communication and consumer behavior.

Finally, concerning the Sustainable Development Goals (SDGs), this study contributes to a better understanding of how AI technologies can be effectively integrated into service industries (SDG 9 - Industry, Innovation and Infrastructure). Moreover, the focus on disclosure and transparency in AI-generated content may align with promoting informed and ethical consumer choices (SDG 12 - Responsible Consumption and Production).

Originality of the paper. *The present study offers a contribution to the growing field of human-AI interaction by experimentally examining how AI-generated reviews generated by ChatGPT can influence consumer preferences within an online hotel booking scenario under different disclosure conditions. With regulatory bodies placing greater emphasis on transparency through the disclosure of AI-generated content, the current research provides empirical evidence about the impact of such disclosures on consumer behavior. Additionally, by incorporating the distinction between digital natives and non-digital natives, the study provides some preliminary insights into how consumers perceive and respond to AI in decision-making contexts. Furthermore, in terms of hospitality management, hotels and accommodation providers may benefit from using AI-generated review content as part of their marketing strategy, even with appropriate disclosure, suggesting that a hybrid approach-combining guest experiences with optimized AI-generated content-may yield better results in the digital marketing of the hospitality sector. Moreover, the investigation of how consumers respond to AI-generated content could be extended to other products and e-commerce platforms.*

The dimensions of the hospitality experience quality in the long-term care organizations: preliminary empirical results[1]

ANGELO BONFANTI[2] PAOLA CASTELLANI[3] NICOLA COBELLI[4] CHIARA ROSSATO[5]
FRANCESCA SIMEONI[6]

Abstract

This study explores how hospitality experience quality is created in Long-Term Care Organizations (LTCOs), where older adults seek not only clinical care but meaningful, emotionally rich experiences. Through a qualitative research method based on a survey conducted through interviews with LTCO managers of the Veneto Region in Italy, eight key dimensions emerged: clinical quality, physical environment, food quality, interaction quality, immersion, participation, fun, and surprise. These dimensions contribute to bridging the gap between healthcare and hospitality literature and align with the UN's Sustainable Development Goal 3, promoting well-being for all ages. It represents one of the first efforts to define and explore hospitality experience quality in LTCOs. Managers are encouraged to cultivate an organizational culture beyond operational efficiency, integrating experiential elements into daily care.

Framing of the research. *The growth in the older population is leading to a wider demand for specific types of healthcare service settings, such as long-term care organizations (LTCOs), namely facilities dedicated to the ongoing care of individuals with chronic healthcare or social care needs, such as assisted living residences, nursing homes, and hospices. In the LTCOs, senior customers - who are individuals 65 years old and older - do not seek only services but also experience. Offering only services is not enough to create human well-being in LTCOs, and investing in service quality is considered implicit, namely, it is mainly taken for granted.*

The first studies on service quality - which is traditionally defined as a comparison of customer perceptions with expectations of actual service performance (Lewis, 1989) - date to the late seventies of the last century (e.g., Gummesson, 1979; Grönross, 1982; Parasuraman et al., 1985). In the healthcare setting, this concept is widely investigated (e.g., Cavallone et al., 2017; Singh and Prasher, 2019; Pekkaya et al., 2019) through several models (e.g., Choi et al., 2005; Duggirala et al., 2008; Sumaedi et al., 2016) and concerning specific themes such as costs of quality management systems (Wagner et al., 2003), services organization and delivery (Riedel et al., 2016), and some aspects of the patient experience (e.g., Manary et al., 2013).

Past research ignores the elements that affect experience quality, which are becoming crucial to enhancing the appeal of the LTCOs. The initial studies conducted in the healthcare setting have distinguished "what" patients receive during healthcare services from "how" they receive the service delivery (Collier, 1994). In this regard, the technical performance of practitioners has been identified as clinical quality ("what"), while their interpersonal performance, i.e., customization of care fitted to the unique needs and values of the patient, has been named as experiential quality ("how"). Aligned with this initial concept (Donabedian, 1980) is the next research according to which experience quality results from customer's perceptions and evaluations of interactions that occur during the provision of care and treatment (Li and Benton, 1996; Chandrasekaran et al., 2012; Ponsignon et al., 2015).

Taking inspiration from other service industries connected to healthcare in terms of service quality and customer experience, such as tourism and hospitality sectors, experiential quality is deeply tied to the uniqueness of customer experiences, which are individually and subjectively constructed in each person's mind. In this sense, it is impossible to replicate it identically across individuals (Schmitt, 1999). It encompasses "not only the attributes provided by a supplier,

but also the attributes brought to the opportunity by the visitor" (Crompton and Love, 1995, p. 12). As such, experiential quality is shaped by the customer's emotional and psychological responses rather than being solely based on functional or utilitarian aspects (Chen and Chen, 2010). There are very few studies on experience quality from a healthcare management perspective (Raleigh et al., 2012; Ponsignon et al., 2015).

The models proposed in the literature are not exhaustive because they cannot catch all the dimensions of the experience quality due to their context dependency. Unlike this limitation, from the studies conducted over the past 30 years, experiential quality emerges as a multidimensional construct whose dimensions vary depending on the context of the service under investigation. The dimensions that define experiential quality across different service settings are multiple, as illustrated in Table 1, which highlights a selection of studies conducted in various service contexts.

Although patients would live their hospitalization in LTCOs that provide them with a comfortable environment such as feeling at home, hospitality emerges as one of the under-researched dimensions: hospitality involves integrating hotel-like services into care settings to address not only patients' clinical needs but also their emotional and social well-being (Suess and Mody, 2018).

Given that no studies have specifically investigated hospitality experience quality, the following question is posed: What creates hospitality experience quality within LTCOs?

Tab. 1: The dimensions of the hospitality experience quality

Interaction quality, physical environment quality, outcome quality, and access quality	*Heritage tourism*	*Wu and Li (2017) Wu et al. (2018)*

Purpose of the paper. *This study aims to answer this research question by adopting the service provider perspective. It especially identifies the dimensions of hospitality experience quality provided by LTCOs to their guests.*

Methodology. *Given the explorative nature of this research, this study adopts a qualitative method as a research design strategy. The choice of conducting an exploratory study is suitable for the purposes of this research because it enables researchers to examine a specific and complex phenomenon in its real-life context (Yin, 2017) and address emerging topics for which existing theories and frameworks may not fully explain the phenomenon under investigation (Creswell and Poth, 2016).*

A purposive sampling approach was used to select respondents who could provide an informed "insider" view. This sampling method includes carefully selecting LTCOs that meet specific criteria (e.g., number of patients, provided services, existence of instruments for satisfaction measurement). A contact list was developed precisely by considering the importance of including an adequate variety of cases. LTCOs' managers of the Veneto Region (Italy) were contacted and requested to complete an email survey. The email contained a cover letter about the purpose of this study. It aimed to gather their availability to participate in this research and indicate the relevant staff contacted to provide opinions and comments about how they contribute to delivering hospitality experience quality.

In-depth interviews were chosen because they give informants freedom and flexibility to communicate their ideas, beliefs, and experiences in their own words and use storytelling to converse relaxedly (Creswell and Creswell, 2018). The interview guide was designed based on the literature review. The two following topics constitute the interview's core: service quality and experience quality. To gather a comprehensive range of information, the general topics mentioned were formulated in an open-ended question format (Gioia et al., 2013). The interviews were conducted vis à vis or via Google Meet or Zoom between September and November 2024. Each meeting lasted approximately 40 minutes to 1 hour. Following the approach outlined by Hogg et al. (2014), Italian-language interviews were translated into English.

Only managers interested in participating in the study were considered eligible targets. Precisely, interviews with eight managers of LTCOs were undertaken. In qualitative research, a fixed number of interviews that ensure the effectiveness of the sample size does not exist. Considering that the theoretical saturation can be reached between six and eight participants (Kuzel, 1992), the sample of this study can be considered adequate to respond to the research question. The anonymity and confidentiality of their responses were guaranteed.

The interviews were analyzed using NVivo software and reported in three stages outlined by Gioia et al. (2013), i.e., the first-order categories, second-order themes, and aggregate dimensions. Precisely, the first-order categories meticulously capture the details exhibited during the interviews with LTCOs. The second-order themes aggregate similar

concepts found in the first-order categories. Finally, subsets of the second-order themes are gathered into theoretical aggregate dimensions.

The researchers adopted a blended approach, inductively identifying the themes from the data and, subsequently, deductively framing these themes within the frameworks proposed by scholars who examined the experience quality dimensions in various service contexts.

Results. *The managers of the LTCOs interviewed for this study emphasized different elements that were gathered into the eight following dimensions of hospitality experience quality: clinical quality, physical environment quality, food quality, interaction quality, immersion, participation, fun, and surprise (Figure 1), which are explicated in the following subsections. Some illustrative quotations are proposed as empirical evidence to support the research findings.*

Clinical quality

The first dimension of the hospitality experience quality that managers highlighted is the medical treatment quality, which comprises multiple service activities such as clinical accuracy with appropriate diagnoses and correct medication use, continuity of care with close coordination among doctors, nurses, therapists, and external specialists, advanced care planning with the involvement of residents and families in healthcare decisions, pain and comfort management, and individualized care. All these services impact the hospitality experience quality by increasing trust, safety, a sense of control, and humanization of care and reducing stress and anxiety for residents and families. In brief, this dimension refers not only to the medical treatment quality provided within the facilities but also to the relational approach, timeliness, and accessibility offered.

Physical environment quality

The managers of the LTCOs considered for this study outlined that their guests consider the quality of the physical environment as not merely a "background" element but an active component of the lived experience in those facilities. A well-designed space can enhance autonomy, foster relationships, evoke well-being, reduce patient stress, and provide a sense of control and familiarity. For example, wide corridors, non-slip flooring, elevator access, and assistive devices within the facilities are not just elements of the physical environment that improve accessibility and mobility. They also enhance the residents' sense of safety and autonomy. In this regard, the two following statements gathered during different interviews are significant:

> *"The possibility for residents to personalize their room with personal items reinforces their identity and allows them to create a sense of home."*
>
> *"The size of the bedroom, the available space, the bathroom, and the view from the window are all factors that significantly influence residents' perceptions of their living environment."*

Food quality

All the interviewees have reported that food quality in their LTCOs is very important for all guests. It refers to their perception of the overall quality of meals, which creates experience in sensorial (taste, smell, appearance, temperature, and texture), cognitive (biographical history and personal food culture), and behavioral/relational (conviviality and comfort) terms. This respondent outlined this aspect with these words:

> *"Most of our guests look forward to the moment of the meal because it makes them happy and carefree, offering a sense of routine, comfort, and the opportunity to connect with others in a warm and familiar setting."*

Interaction quality

Another dimension is interaction quality, which refers to the perceived quality of everyday interactions among residents, staff, family members, and volunteers. It can transform a care service into a truly emotional and human experience. For this reason, it encompasses not only courtesy and professionalism but also deep human elements such as empathy, active listening, communicative skills, the ability to build trust, and recognition of each person's uniqueness, as this respondent stated:

> *"Every gesture, word, or silence of our staff can become care and recognition."*

Immersion

The managers interviewed highlighted the importance of providing their guests with opportunities for immersion by designing meaningful activities that enable them to foster engagement, also through multiple senses such as touch, smell, taste, and hearing, evoke autobiographical memories, stimulate conversation and social interaction, reduce the perception of "empty time", and improve both cognitive and emotional well-being. In this regard, each LTCO offers different activities such as occupational therapy, parties, creative workshops, film clubs, musical moments, or guided walks, as these respondents said:

> *"We organize activities that are casual but lively. For example, on holidays, we organize parties that leave a positive feeling in our guests for days."*
>
> *"Our guests perceive time spent in various activities as full and meaningful."*

Participation

According to the interviewees, the guests of different LTCOs are actively involved in daily decisions to reduce their passivity, stimulate self-determination, and increase empowerment and respect for dignity. In this regard, they participate in meal choices, and many of them co-design the weekly schedule of different recreational activities, as this respondent explained:

> *"Regularly, we organize meetings with schools or scout groups to involve our guests in socialization moments, games, readings, or workshops, which enable them to share their skills with younger participants, favoring intergenerational knowledge transfer and stimulating their emotions."*

Fun

The interviewees declared that fun is a fundamental dimension to creating a well-being climate in their LTCOs because it takes on therapeutic value, given that the days of their guests are often characterized by medical routines, which afflict and sometimes bring suffering. Especially playful, musical, theatrical, or interactive activities stimulate positive emotions and, at the same time, reduce depression and improve mood, as the extract from this interview outlines:

> *"When we organize festive evenings involving families and staff, our guests can enjoy themselves, relive memories, share joyful moments in a playful atmosphere, strengthen relationships with fellow residents and caregivers, and reduce stress."*

Surprise

The results collected during the interviews highlighted that guests of LTCOs appreciate unexpected moments that break the routine and stimulate curiosity because they create "delight moments" that become lasting memories, strengthen episodic memory, and serve as a cognitive reactivation function, as these respondents told:

> *"When we bought two donkeys, which are housed in the large garden of our facility, our guests were amazed at the possibility of interacting with those animals. Everyday, they go to feed them and stay in their company as if it were their first time."*
>
> *"Once a week, without prior notice, an animal-assisted therapy educator arrives with dogs or cats to interact with the residents, generating unexpected emotions, sensory and emotional stimulation, and many memories."*

Fig. 1: The dimensions of the hospitality experience quality in long-term care organizations

Research limitations. *This preliminary study presents several limitations that may influence future research. First, the analysis is limited to a reduced sample of LTCOs, which may restrict the generalizability of the findings. Consequently, it would be interesting to expand the sample to other LTCOs and include more managers and staff members within each organization to offer more comprehensive insights. Collecting a more expansive and different range of perspectives could provide a broader conceptualization of the hospitality experience quality.*

Second, the LTCOs selected for the empirical research are all located in Italy, especially in only one Italian Region, namely the Veneto. Future research could incorporate more LTCOs from diverse national geographic areas to capture whether variations exist in providing hospitality experience quality. In addition, future research could replicate the study

by extending the analysis to other countries. The results could reveal interesting similarities or disparities in hospitality experience quality design, providing deeper insights into its dimensions within the LTCO setting.

Third, this study focused exclusively on the perspective of service providers. However, previous research (Voss et al., 2008) emphasizes the importance of comparing the planned experience with the realized experience perceived by customers. While this study considered only the design and delivery of the experience from the provider's side, future research should also examine the customers' perspective, which may not align with the planned experience. Understanding the customer viewpoint could offer valuable insights for improving the quality of the hospitality experience. In this context, the service recipients can be seen as a "collective customer" by incorporating not only the patients or clients themselves but also their carers, including family members and friends.

Finally, the present research adopted a qualitative approach. Future research could conduct a quantitative survey using a structured questionnaire. This would allow for the development of a managerial model to design and manage hospitality experience quality in LTCOs. Such a model should adopt an integrated perspective involving multiple stakeholders who contribute to enabling seniors to maintain a lifestyle aligned with principles of human well-being.

Managerial implications. *This study highlighted that the managers of the LTCOs interviewed are concerned not only with the technical performance of care and reduction of operational costs but also with the shape of residents' perceptions of quality and experience within their facilities.*

The findings suggest that hospitality experience quality can be effectively developed when supported by an organizational culture that values not only efficiency but also prioritizes residents' well-being. This involves embracing a more holistic, resident-centered approach, where different hospitality experience quality dimensions must be integrated into daily care practices.

The opportunity offered by this research to explore real-life examples from LTCOs enables managers to derive valuable recommendations for enhancing hospitality experience quality within their facilities and promoting overall human well-being. From a practical standpoint, the findings of this study suggest that LTCOs should prioritize investment in food quality, not only from a nutritional perspective but also as a key moment for emotional satisfaction and social interaction. In addition, they advise strengthening service quality, emphasizing clinical quality to ensure safety, personalization, and continuity of care, the quality of the physical environment, and interaction quality by fostering empathy, active listening, and meaningful human relationships between staff, residents, and families. Finally, this research recommends designing and implementing experiential activities that go beyond basic care, encouraging immersion with deep engagement in meaningful tasks, participation with active involvement and decision-making of guests, fun by offering moments of play, laughter, and levity, and surprise with unexpected, delightful experiences that break the routine. These combined elements support the transformation of LTC environments into emotionally rich, person-centered spaces where residents experience care and, simultaneously, a meaningful daily life.

Originality of the paper. *This research emphasized the importance of creating greater awareness among LTCO managers about developing hospitality experience quality and identifying the key dimensions that contribute to ensuring a great quality of life for the seniors within these facilities. In this regard, this study represents one of the first attempts to explore and define the concept of hospitality experience quality within the context of LTCOs. Traditionally, customer experience (e.g., Knutson et al., 2006; Kim et al., 2012) and experience quality (e.g., Voss et al., 2008) have been primarily examined in the tourism and hospitality sectors. Precisely, customer experience refers to the customer's responses following the interaction with the physical environment and relational elements (e.g., employees) during service delivery (e.g., Sampson, 2012) and elements that fall outside the provider's control (Verhoef et al., 2009) such as attitudes and behaviors of fellow customers. Differently, experience quality is defined as a perceived judgment about the excellence or superiority of the customer experience (Lemke et al., 2011). Therefore, experience quality is a broader concept than service quality, encapsulating a wider range of dimensions.*

This study can be fully integrated into the 17 Sustainable Development Goals proposed by the 2030 Agenda of the United Nations in 2015, especially Goal 3 (Ensure healthy lives and promote well-being for all ages). It outlined how LTCOs, which are a specific type of healthcare service setting that requires further research on hospitality experience quality, can respond to the increasing demand from the aging population by offering not only clinical care but also a hospitality dimension that supports seniors in maintaining a lifestyle aligned with human well-being.

Preliminary Findings on Knowledge Transfer in Family Firms: Insights from Family Communication Patterns Theory

FEDERICA ROMANO[1] GIORGIA MARIA D'ALLURA[2]

Abstract

Knowledge transfer is crucial for the success and innovation of family firms. This study reviews existing literature on the topic through the lens of Family Communication Patterns (FCP) Theory, an aspect that remains underexplored. It examines how different communication styles within families influence the transmission of both tacit and explicit knowledge across generations. This review contributes to the literature on family business governance and organizational learning by integrating insights from communication studies. Future research should empirically assess how FCP Theory can enhance knowledge transfer strategies, ensuring business continuity and competitive advantage in family firms.

Framing of the research. *According to several literature contributions, approximately 30% of family businesses manage to endure into the second generation (Ramadani, Bexheti, Rexhepi, Ratten, & Ibraimi, 2017), while roughly 16% persist into the third generation. Consequently, succession emerges as one of the most challenging and pivotal choices for family enterprises (Ramadani and Hoy, 2015), in fact the improper management of succession planning is the primary cause of failure for family business (De Massis et al., 2018).*

Knowledge transfer from the founder to the successor might be problematic, but it is crucial for an effective succession process and achieving family business longevity (Pham et al., 2019).

There is a significant gap in the literature regarding this topic, studies focus more on the relationship between the learning process of individual family members and the entrepreneurship orientation, rather than on the methods of transmission and its content.

According to the literature on the subject, there is no one standard definition of knowledge. This work shares the knowledge's definition of Tsoukas and Vladimirou (2001) who describes knowledge as person's ability to draw distinctions: "Knowledge is the individual ability to draw distinc-tions, within a collective domain of action, based on an appreciation of context or theory, or both."; individuals decide upon the meaning they apply to the particular context. Here comes the ability to see the difference and draw distinctions.

Language and meaning plays a crucial role in knowledge construction, language is traditionally seen as a communication tool consisting of words in order to be able to describe reality and its objects (Renzl, 2007).

The transfer of tacit or explicit knowledge, or family wisdom, through the enterprise is crucial for its survival and development for the benefit of future generations (Trevinyo-Rodríguez & Tàpies, 2010).

Differently from non-family businesses, the most important factor, influencing the process of knowledge transfer lies in the reliability of the knowledge source itself; experiments in the field of communication have shown that a reliable source can significantly influence a recipient's behavior (Szulanski et al. 2004).

Furthermore, family business owners are inclined to teach next generations members everything they know about the business, since their main dream is that their kids continue it and build on it; in fact knowledge transfer through entrepreneurship education provides important awareness relative to entrepreneurial education as well as self-efficacy. Additionally, it makes a substantial difference during the business succession process (Li & Wu, 2019; Vamvaka et al., 2020).

In this sense, empirical findings indicate that children are more likely to develop entrepreneurial behaviors if they grow up with parents who are entrepreneurs, learning from their parents' entrepreneurial experiences, and internalizing their behaviors as norms for their own (Schmitt- Rodermund 2004); however, the content of communications between parents and children has been largely ignored (Dou et al., 2020).

We cannot study the process of knowledge transfer within family firms without analyzing the concept of family. The perspective applied from this work, suggest us to define the family as a social system (Parke et al., 2006). The family is conceptualized as a social system with its own characteristics, rules, roles, communication patterns and power structures that go beyond the individual. Furthermore, in this social systems framework, a family consists of subsystems such as parent-child, sibling, marital and co-parent subsystems. Family members are considered interdependent and influence each other and other subsystems directly and indirectly (e.g., a child may indirectly influence the couple by directly

influencing the behavior of one of the parents). The interactions between family members are also considered transactional (Kuczynki, 2003). That is, the interactions between parent and child are bidirectional rather than unidirectional and causality is circular rather than linear. Furthermore, the family microsystem is seen as embedded in larger systems, and interactions take place within and between these different levels (Cox and Paley, 1997).

Purpose of the paper. *The aim of this study is to analyze knowledge transfer in family firms, in particular the role of communication between the family's members and the knowledge transfer process. To examine the phenomenon, we apply the perspective of Family Communication Patterns Theory (Fitzpatrick et al., 1994), a general theory of family communication that focuses on parent-child communication to create a shared social reality. It identifies basic processes of establishing a shared agreement that affect not only concurrent communication behavior but also long-term information processing and psychosocial and behavioral outcomes. It claims to describe what family communication is and how it works, rather than how it might be interpreted in a particular context or what it should be based on a particular ideological perspective (Braithwaite et al., 2017).*

The issue of the communication process between family members plays a strategic role, in fact it would be possible to define an effective model of knowledge transmission, thus increasing not only the absorptive capacity of successors, but contributing to a definition of tacit and explicit knowledge.

Family Communication Patterns Theory, describes specific ways in which family members interact and communicate. According to the theory, family communication varies across two dimensions: conversation and conformity.

1. *Conversation dimension: this dimension reflects the extent to which family members engage in open and frequent communication. Families with high conversation orientation encourage open dialogue, while those with low conversation orientation may prioritize privacy.*
2. *Conformity dimension: this dimension pertains to the degree of conformity and adherence to family norms and values. Families with high conformity orientation emphasize uniformity and compliance, whereas those with low conformity orientation allow for individual expression (Koerner & Fitzpatrick, 1997).*

Based on the combination of conversation and conformity orientations, the theory identifies four family types:

1. *Consensual Families: High conversation and high conformity. These families encourage open communication while maintaining strong norms.*
2. *Pluralistic Families: High conversation and low conformity. They value individual expression and open dialogue.*
3. *Protective Families: Low conversation and high conformity. Privacy and adherence to norms are emphasized.*
4. *Laissez-Faire Families: Low conversation and low conformity. These families have minimal communication and few norms.*

Different types of family communication patterns have also been linked to different parenting styles, such as authoritarian, permissive, or authoritative. It has been discovered that authoritative parenting and discourse, and positive communication in particular, are related. This approach is being strict and setting boundaries while still being kind and encouraging to kids.

Conversely, the conformity orientation, which is frequently seen negatively, has been connected to both authoritarian parenting (being exigent with affection) and permissive parenting (being warm and not strict). (Hamon & Schrodt, 2012).

Management scholars concur that proficient communication plays a crucial role in various work- related behaviors and results, including team efficiency, conflict resolution, and company success. However, there is still limited understanding related to the influences that shape the communication styles of employees, managers, and business owners in the work environment.

The communication style that leaders bring to boards of directors and top management teams were imprinted from their families during youth, this topic should be explored in order to understand how and how much these communication processes impact on the company's performance and on the real skills of entrepreneurs.

Several studies suggest that a climate of supportiveness and open communication in the family helps cultivate some important personality characteristics, such as self-esteem and sociability, that individuals use to cope with different and difficult circumstances. Although the impact of family communication styles on the development of personality traits may not appear as obvious as the behavioral effects, the influence process is long-term and subtle. More importantly, the outcome of this development process has the potential to affect various aspects of our lives, including our social satisfaction, health, and careers (Huang, 1999).

Methodology. *Literature reviews identify important knowledge gaps and motivate researchers to fill them (Webster & Watson, 2002). In this paper, we aim to conduct a systematic literature review (Cook, Mulrow, & Haynes, 1997) of relevant studies examining the Knowledge Transfer in Family firms. In this sense, according to Tranfield, Denyer, and Smart, (2003), to more clearly establish the conceptual boundaries, we first examined pertinent findings that were published in management publications (select studies that applied Tranfield et al. (2003) approach are: Hoskisson, Chirico, Zyung, & Gambeta, 2017; Terjesen, Hessels, & Li, 2016). Then, we used Scopus database and ISI Web of Science to search for all articles published from all years to present (January 2025) using the search terms, ["Know* Trans*" AND "famil*"]. Manually tracking citations for additional relevant articles in highly ranked journals is an important part of the literature review (Rashman, Withers, & Hartley, 2009); however, the manual search did not produce any additional contribution on the topic.*

We searched using the phrases ["Know Trans*" AND "famil*"] using the quotations marks and the boolean operator "AND" to delimit the research on these specific terms, in [Article title, abstract keywords], and obtained 2.025 works.*

We then limited the research to Subject Area (1) [Business, Management and Accounting], (2) Psychology, (3) Social Sciences using the command [LIMIT TO].

Considering their internal criteria, the suggestion is to use the command [LIMIT TO] to filter the [SUBJECT AREA] because it is a more inclusive command. In this step, we obtained 530 documents.

The Scopus Database includes different types of documents, including articles, book chapters, articles in press, books, and reviews. According to our research protocol, the systematic review included only articles and reviews published in English. We therefore excluded the other documents. We used both commands and determined that in this case, use of either of the commands, [LIMIT TO (selected items)] or [EXCLUDE (selected items)], with 417 articles.

Second, according to our protocol, we read the entire abstract and the entire article when additional clarity was needed, to exclude: [Articles that primarily focused on knowledge transfer, but not on family firm context] and [Articles that primarily focused on family firms, but not on knowledge transfer.].

The final sample included 60 articles for further analysis.

Then on WOS Database, we searched for the phrases ["Know trans*" and "famil*"] in [Topic] and obtained 1,827 results. Then, according to the exclusion criteria, we first considered if the article was in our area of interest. The Web of Science Categories have two commands, [REFINE] and [EXCLUDE]. We used the command [REFINE] to filter the articles to include those in the following categories: (1) Business, (2) Management, (3) Business Finance, (4) Psychology, and (5) Sociology. We obtained 172 works. Thus, we set the first criterion because it included the higher number of works. Second, we applied [REFINE] to the search to filter by Document types and Language. In the Web of Science database, the Document types available include articles, proceeding papers, reviews, and editorial material. We applied [REFINE] to the results to include only articles and reviews and obtained 149 articles. Then, using the Language filter (set to English), we obtained 147 works.*

The first step was manually verified to determine how many papers were in common with the Scopus research. 53 papers were included in both database search results. Thus, according to our protocol we are reading the entire abstract (and the entire article if additional clarity was needed) of the 94 remaining articles and excluded those that were: [Articles that primarily focused on family firms, but not on knowledge transfer] and [Articles that primarily focused on knowledge transfer, but not on family firms.]. The final sample included 8 articles for further analysis.

Results. *Our systematic literature review on knowledge transfer among family members shows a significant gap: studies focus more on the relationship between the learning process of individual family members and the entrepreneurship orientation, rather than on the methods of transmission and its content.*

Following the selection of literature to be investigated, we manually compared the two data collections and finalized the dataset, which consisted of 68 articles for final analysis.

The works are spread over a period of 20 years, from 2004 to 2024, most of the papers focus on 2024, this demonstrates an increased interest for the topic of the knowledge transfer process within family businesses.

The qualitative research method is often employed in studies due to the novelty of the research topic, allowing for exploratory insights and theory building through inductive reasoning (Letonja et al. 2016), Case study methodology is widely used in research, particularly for understanding complex phenomena within family businesses. This approach allows for in-depth exploration of specific cases, enhancing the richness of the data collected (Wynn et al. 2018).

The iterative process of data collection and analysis is crucial in qualitative research, enabling researchers to adapt their methods based on emerging themes and insights, and this flexibility is essential for capturing the dynamic nature of family business interactions

Trevinyo-Rodriguez et al. (2010) used a methodological triangulation, making use of multiple data sources such as interviews and company documents, enhances the reliability and validity of findings. This approach provides a comprehensive understanding of the knowledge transfer processes within family businesses (Wynn et al. 2018)

We can notice that the selection of cases for study can vary, with no consensus on the ideal number of cases. However, a multiple-case study approach is often preferred to strengthen the robustness of the findings through cross-case analysis.

There is a lack of longitudinal studies that capture the dynamic process of knowledge transfer during succession in family businesses, which is essential for understanding the multistage nature of this phenomenon, and research often relies on a limited selection of databases, such as the Web of Science, which may restrict the span of research topics and findings related to family firms and sustainability.

Furthermore, many studies focus exclusively on specific geographic areas or types of family businesses, leading to potential biases and limiting the generalizability of findings to broader contexts.

Despite the diversity of theories used, with different purposes and significant contributions, many of which focus on the individual learning capacity of individuals (family members) and on the problems related to the issue of succession, we can find important gaps:

- *There is a lack of comprehensive studies examining how generational gaps affect communication processes in family businesses, particularly regarding the transfer of tacit knowledge between older and younger generations.*
- *Existing research often overlooks the impact of emotional dynamics on communication effectiveness within family firms, which can either facilitate or obstruct knowledge sharing.*
- *The role of structured communication methods, such as regular meetings and feedback systems, in bridging generational divides is underexplored, despite their potential to create a common language.*

- *Many studies focus on physical proximity as a barrier to communication, neglecting the effectiveness of virtual communication tools in facilitating knowledge flow across distances.*
- *The influence of family roles and relationships on communication styles and knowledge transfer is not sufficiently addressed, leading to a gap in understanding how these dynamics affect overall business performance.*

Research limitations. *Through the analysis of existing literature, it is possible to identify knowledge gaps or areas where research is limited. This offers opportunities to contribute to such areas through new explorations.*

Family businesses are highly diverse, and communication dynamics may vary significantly across different sectors, business sizes, or geographical locations. The research tends to focus on a limited area of interest, that restricts the ability to generalize findings to the broader population of family businesses (Astrachan & Shanker, 2003).

A significant portion of research on family business communication comes from Western contexts, where family business dynamics may differ from those in other cultures, this cultural bias limits the external validity of the findings in non-Western settings; in collectivist societies, family and business distinctions may not be as clearly drawn, which can affect communication strategies (Chua, Chrisman, & Sharma, 2003).

The research focuses primarily on internal family dynamics, with limited attention given to how communication with external stakeholders (e.g., customers, suppliers, investors) could e affects the businesses, however, studies often neglect how external relationships shape or are influenced by family dynamics, especially during leadership transitions, conflicts, or decisions about business strategy (Tàpies & Fernández, 2011).

Managerial implications. *The unique dynamics of family businesses, such as the connection between personal and professional spheres, generational conflicts, and emotional attachment, require tailored communication strategies to promote business success while maintaining family serenity.*

Clear and transparent communication between family members can reduce misunderstandings and conflicts, especially in decision-making processes (Ward, 1987).

Moreover develop open and structured succession planning processes, with clear communication regarding expectations, roles, and the selection of future leaders can minimize misunderstandings and helps prepare the next generation for leadership (Sharma, Chrisman, & Chua, 2003).

Finally, encourage open communication about innovation and change, ensuring that all family members are on the same way regarding the business's evolution. It's important to consider tradition with the need for innovation (Dyer, 2006).

Originality of the paper. *The innovative aspect of our research is the application of the Family Communication Patterns Theory (FCPT) to analyze these processes. By using FCPT, this study offers a unique perspective on how family communication dynamics shapes the transfer of entrepreneurial knowledge and intentions. The theory helps to identify the communication styles that are most effective in fostering an environment conducive to knowledge sharing and entrepreneurial growth. Understanding these patterns can aid family businesses in creating strategies that enhance open, supportive, and constructive communication, ultimately facilitating smoother transitions and sustained business success.*

In summary, the study highlights the critical nature of leadership and ownership transfer challenges in family businesses, underscores the importance of targeted surveys on intergenerational knowledge transfer, and introduces an innovative approach by applying the Family Communication Patterns Theory to this domain. These conclusions provide a comprehensive framework for future research and practical applications aimed at ensuring the longevity and prosperity of family firms through effective knowledge transfer and succession planning

Key words: *Knowledge transfer, Family, Entrepreneurship, Communication dynamics, Family Patterns Theory*

Track 10
Strategic Communication

Municipalities Facebook Pages and sustainability challenges

MAFALDA EIRÓ-GOMES[1] IARA GRAÇA[2] SARA SANTOS[3]

Abstract

All questions concerning sustainability and climate change are public and political issues. They belong to the realm of local, regional and national governments worries. How did municipalities in Portugal, in 2024, use their Facebook Pages to inform, share or negotiate these themes with their citizens? Which were the major concerns while communicating on the referred social network about these issues? These are some of the questions that shaped the research being presented here. Content analysis was the research method used to organize and understand the data.

Framing of the research. *In recent decades, environmental issues have become a matter of global concern. The careless way in which humanity has treated the environment and ecology, in a period of escalating growth, has led to the point of no return at which we find ourselves. From the early 1960s with Silent Spring (1962), through Roger Dajoz's major work of 1969, Prècis d'Ecologie (General Ecology in the Brazilian translation), to the early 1970s with the "United Nations Conference on the Human Environment" (1972), or the masterful report The Limits to Growth (1972), up to our contemporary times, the discourse on environmental issues has not only given rise to a series of transformations, from warnings about the dangers of a distant future; to the discourse on urgent changes that need to be implemented, to the use of the notion of "crisis" and its positioning as "crisis communication", now well into the 21st century. When The Limits to Growth (1972) was published, commissioned by the Club of Rome and coordinated by Dennis Meadows, it began with a quote from U Than, the then Secretary-General of the United Nations, in which he urged States to join together in the pursuit of a more equitable, inclusive and sustainable world. In the work that revisits this first report, the authors state unequivocally and using their own words that the global economy was already (at the beginning of this millennium) far beyond the levels of sustainability for the "fantasy of an unlimited globe" to be maintained, but that U Than's call remained unanswered (Meadows, Randers and Meadows, 2004).*

The discourse on sustainability / climate change has thus, in recent years, by necessity, entered the discourse of ordinary citizens. The big question, however, is what sources of information and communication, what sources of empowerment do citizens have at their disposal to make the right decisions about their behavior and the behaviors to demand from their political representatives. We will refrain here from addressing the issues of information, misinformation and disinformation in detail, but simply remember that it is the obligation of governments, at all levels, to be reliable sources of information and communication and active actors with their citizens in the co-creation of public policies (Morris, 2021; Pasquier, 2012).

Much has been theorized about the difficulty in defining the concept of "Public Communication", with its field and activity not being fully stabilized (Bessières, 2009). It often appears associated with administrative information, communication to citizens, communication of general interest, institutional communication (Campillo-Alhama, 2016). It is understood as a component of public institutions and their functioning (Bessières, 2009) and defines the communicative and relational interaction between the administration and citizens (Campillo-Alhama, 2016; Ládron de Guevara, 2023). Public Communication is in itself an instituting category of social practices, of the development of the state's own institutions, and as is evident from its various government bodies, state schools and universities or agencies and other public bodies. While the aim of this article is not to discuss the concept of "Public Communication", it is important to note that often in the context of public administrations, and especially local governments, there is confusion between what is the domain of the political, in the sense of political party, which are not public entities, but so many times interferes in the domain of public communication. Several authors (Bessières, 2009; Pasquier, 2012; Campillo-Alhama, 2016, Ládron de Guevara, 2023) have made it explicit in one way or another, many defending the separation and complete definition of concepts, others realizing the difficulty of this same distinction.

Public Communication constitutes a fundamental link between the State and the citizen. It is a duty that the Portuguese State needs to guarantee, and which, in fact, has long been reflected in article 19 of the Universal Declaration of Human Rights, that of providing objective and timely information to citizens, which allows them to make their own decisions (Ládron de Guevara, 2023). It has been argued that "Public Communication" should be understood as activating citizen

participation, promoting the co-creation of public policies with the contribution of the community and this is precisely the interpretation being promoted in this paper.

The exponential increase in available data, the speed with which these are processed and transformed, or not, into information, in this century, alongside technological evolution and the digitalization of society, are aspects that have increased the capacity for interaction while making communication processes much more complex and challenging (Pasquier, 2017). Reinforcing the legitimization of the role of Public Communication in the connection between the State and citizens is fundamental to distinguish it from political communication, responsible for the production and dissemination of information focused on the interests of political parties and/or political figures. A complete public service that encourages the expression of citizenship, participation in democratic debate and the promotion of actions that promote the involvement of citizens in managing their daily lives seems a way to go in order to achieve the goals of sustainability and fight against climatic changes. How are the municipalities using their social media to promote a new way of life? As Yann Arthus Bertrand (2021) has put it better than anyone else "Ce n'est pas la Terre que nous devons faire mourir, c'est notre vision du progrès".

Purpose of the paper. *This work is part of a larger research project where the main purpose is to understand how municipalities in Portugal, in 2024, fulfilled their public communication desiderata using the major online social media in Portugal for the local governments: Facebook. In reality the great majority of local governments do not have any other social media network. Due to reasons that we are not going to develop here, X, for instance, has never had great expression in Portugal and the same can be said about other platforms. Instagram is starting to be used but, in general, replicates the Facebook posts. In the research being presented here authors had a double folded purpose:to understand what are the main concerns of the municipalities, as expressed in their Facebook pages, concerning the 13th goal (understood broadly) of the Agenda 2030 for Sustainable Development and how these themes were presented. In Public Communication it is quite common to try to figure out if the municipalities use a more administrative tone, a more informative one or, to use the word loosely, a real communication, a way that promotes engagement, participation and change among the citizens. Wolton (2022) called it communication as negotiation. So it was also the purpose of this research to understand the type of information/communication presented by local governments while mentioning these issues. Where they essentially promoting or reporting on events that dealt in general with these questions, what could be understood as a top-down informative way, or to promote - at least in a certain sense the municipality government the a social changes implemented at the local level, or are municipalities in a level that we may consider as awareness communication for the behaviour and social change, that is, some communication campaigns, processes that actively implicate citizens in their ways of life.*

Methodology. *Reflection on qualitative and quantitative research consists of a distinction between explanation and understanding of the object of investigation; between the personal and impersonal role of the researcher in the process; and also, a distinction between discovered knowledge and constructed knowledge (Stake, 2009). The differentiation between the two types of research mentioned can also be defined depending on the type of knowledge they aim at. Quantitative research privileges explanation and control, while qualitative research seeks to understand the complex interrelationships between everything that exists. If, on the other hand, quantitative research wants to create explanations, in a cause-effect logic, with a view to reaching generalizations, and thinks of singularity as an error (Patton and Appelbaum, 2003); on the other hand, qualitative research seeks to promote understanding, treating the uniqueness of cases and contexts as essential for research (Stake, 2009). In reality the content analysis method emerged as a quantitative method, that is, a process that enabled the transformation of narrative data into numeric data.*

Content analysis allows researchers to work on longer or shorter corpuses of verbal communication. This research method is based on the idea that in general terms these "texts" express forms of human behavior. In the context of this investigation, we aimed to understand how the official pages of the 308 Portuguese municipalities expressed their concerns, actions or motivations on environmental issues throughout 2024 on their Facebook Pages as this is the only social network where all the municipalities are present. Content analysis as a method of document analysis is a discreet, unobtrusive, relatively cheap method, adaptable to the most varied topics and which allows good data confinement for subsequent analysis and interpretation. The following research used both analysis: quantitative and qualitative.

We started with quantitative analysis, using the platform Fanpage Karma. This analysis was constructed on the time period between January 1st and December 29th of 2024, and used a total of 111 479 posts, the sum of all municipalities posts. The municipalities were divided into groups based on their number of inhabitants, resulting in 7 groups: 30-40 thousand inhabitants; 40-50 thousand inhabitants; 50-100 thousand inhabitants; 100-200 thousand inhabitants; 200-300 thousand inhabitants; 300-500 thousand inhabitants; and >500 thousand inhabitants. We didn't consider municipalities with less than 30 thousand inhabitants because it wouldn't be possible to have a relevant analysis due to the large number of municipalities and the programme being used for the quantitative analysis. As such the corpus was reduced to the 111479 posts of 88 municipalities.

In each group we identified the presence and frequency of concepts defined based on the Agenda 2030 goals and the GreenItaly 2022 report. A quantitative and qualitative content analysis was used to understand the concepts that were highlighted in both documents. If Agenda 2030 is the standard document GreenItaly offers an international approach to our theme. In order to minimise false negatives we´ve chosen a broader wrench of concepts and all the posts that mentioned at least one of the words (or phrases), using a keyword process with the full key word list being: sustainable development; climate change; decarbonization; circular economy; sustainable economy; green management; resource management; energetic transition; Agenda 2030; sustainable development goals and, its respective acronym, SDG. It is

important to note that the words were translated into Portuguese, as the analysis focus is the local governments of Portugal. As you can notice as Boydstun (2023) has put it, validity, reliability and transparency were objectively taken into account as described here.

In order to check for the validation of the code, we used Google Sheets to conduct a manual verification on a random sample of facebook pages, to ensure that the number of posts about the concepts was approximately the same as the given by the Fanpage Karma platform.

For the qualitative part of the research, understanding the worries with validity and reliability, the codebook was developed and tested before the coding process on a sample of the municipalities facebook pages that were not taken into account for this project (those of under 30 thousand inhabitants). This enabled researchers to minimize discordance and to converge on a consensus, for a better coding process. This analysis was conducted using human coding. The two human coders (two undergraduate students) have been previously trained, and had taken part in the codebook construction under the supervision of a senior researcher. To enable intercoders coherence and beyond the already mentioned exercise, some posts were randomly analysed also by all the junior and senior coders and the differences discussed among them all along the process.

In the qualitative part of analysis, we proceeded to categorize the posts in three groups as highlighted in the purpose of the paper:

a) events - under this category are considered all the posts that in their texts had reference to events related to sustainability issues/matters/affairs, including those that are not strictly about sustainability but mention that they follow Sustainable Development Goals (SDG), and/or have initiatives to achieve them.

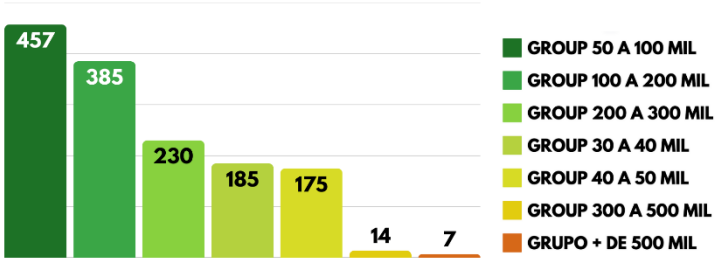
b) report - this category includes/comprehends all the posts that in their texts had mentions of local government sustainability projects; communication campaigns promoted by the municipalities (including those from other entities); municipality sustainability honors or awards; and local government budget reserved for environmental initiatives.

c) awareness - for this category were selected all the posts that in their texts promote practical sustainable actions within the community; involve the citizens in the process of deciding environmental policies; calls to action for the community to participate in initiatives that fund new local sustainable projects.

As Berger (2014, 2017) has put it,t content analyses enable researchers to figure out what other humans expressed while using - in this case - verbal communication. As it may be understandable in this analysis only manifest content was under investigation. The "post" (the text) has been considered our unity of analysis.

Results. *Before proceeding to the counting and transformation of narrative data into numeric data, that is the quantification of keyword occurrences, we used the Fanpage Karma platform to gather data about the followers, activity and posts of the local government facebook pages, in the same time period of analysis (between January 1st and December 29th of 2024).*

First, we created dashboards for each group of municipalities, and then proceeded to create graphics using facebook metrics, in this case "followers"; "average posts per day";"interaction rate" and "number of posts". From this data we were able to conclude that the municipalities with less inhabitants had more followers than to be expected, though not exceeding the number of inhabitants, in most cases. In some more populated municipalities, like Loures Municipality (200-300 thousand inhabitants) there were much less followers than inhabitants, 49k respectively. Overall, the interaction rate on local governments facebook pages is not high, never going above 1% of post interaction. Though, the amount of posts on local government facebook pages is high, posting almost everyday, and in most municipalities, more than once per day.



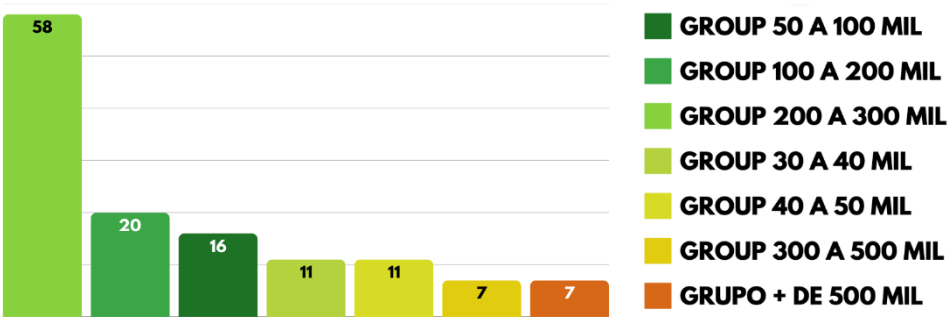
All the 308 municipalities have facebook pages, making the counting of keywords possible in all of them, except for the ones not considered in this research (those with less than 30 thousand inhabitants). The number of municipalities that make up the selected groups are represented in table 1.

Table 1. Nº of municipalities in each group

TIME GAP OF ANALYSIS	GROUP	Nº OF MUNICIPALITIES	TOTAL POSTS
from January 1st, 2024 to December 29th, 2024	30 to 40k	17	20 394
	40 to 50k	16	19 633
	50 to 100k	29	34 848
	100 to 200k	19	24 804
	200 to 300k	4	8 112
	300 to 500k	2	2 188
	more than 500k	1	1 500
	TOTA	88	111 479

The amount of posts mentioning the chosen words/phrases, in each group of municipalities, is depicted in Figure 1.

Figure 1. Number of posts about the "environment" in the different groups of portuguese municipalities

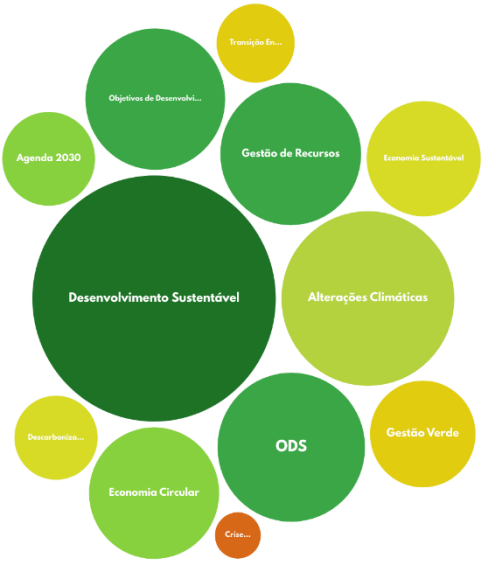


In fig.1 we can conclude that overall the municipalities with 50-100 thousand inhabitants have the most posts about environment and sustainability, counting with 457 posts, and that the one with >500 thousand inhabitants has the least posts about the topics, respectively 7 posts. These results have a relation to the number of municipalities included in each group, as there are more posts for analysis in groups with more municipalities, which makes the number of posts related to the themes biased.

Figure 2. Nº of posts related to the environment in total number of posts in each group of portuguese municipalities

In fig. 2 we can see the amount of total posts (various posts) in the different groups in relation to the posts about sustainability. This graph shows that the higher the total number of posts in the group, the higher the number of posts on the topics. Except in the case of the municipalities with 200-300 thousand inhabitants, which have 230 posts on the topics, 2,84% of all posts of this group (8112 posts, respectively). This group has a higher number when compared to the groups with 30-40 thousand inhabitants, with 185 posts, which is equivalent to 0,91% of all posts (20 209), and 40-50 thousand inhabitants, with 175 posts (0,89% of all posts), respectively.

Figure 3. The average number of posts about the sustainability per municipality in each group



We were able to see that the fact that each group is made up of different numbers of municipalities affects the results we can obtain from figure 1. In this way, we can see in fig.3 that, in contrast to what we were able to analyze in figure 1, the group of 50 to 100 thousand inhabitants is not the group where municipalities are most active in terms of communicating about sustainability, due to the number of municipalities it encompasses (29 municipalities).

Through these results it is possible to conclude that, on average, the group that emerged with the most posts about sustainability, per municipality, over the year 2024 was the "200 to 300 thousand" inhabitants group, with an average of 58 posts related to sustainability per municipality.

Also as we can see above, the groups of 300 to 500 thousand and > 500 thousand inhabitants are the groups with the fewest environment-related posts per municipality, like we have seen in figure 1, even though that number is influenced by the total number of municipalities.

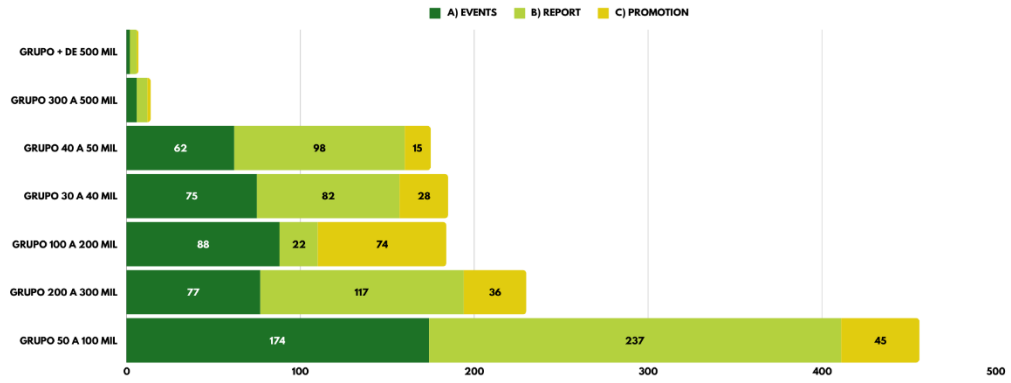
Figure 4. Environment-related words most used by portuguese municipalities

In addition to this data, as you can see in fig.4, we also analyzed the most frequent sustainability-related words in the posts of the portuguese municipalities. As seen above, the searched words were 12, already identified in the methodology used for this paper.

We were able to conclude that the most mentioned word in a global overview, in the year of 2024, of all Portuguese municipalities was "Desenvolvimento Sustentável" (Sustainable Development), with 847 mentions, and that "Crise Climática" (Climate Crisis) was the least used word, with 30 mentions respectively. These numbers are related to a total of 111 479 post texts.

Through this line of thought, it became relevant to analyze which words were most used in the posts texts by each group of portuguese municipalities. As we can see, in fig. 5, "Desenvolvimento Sustentável" (Sustainable Development) was the word most mentioned in each group of portuguese municipalities.

Figure 5. Related words with sustainability most used in each group of portuguese municipalities



In fig. 05, we can see the words most and least mentioned by each group of municipalities, in the texts of the posts, which is not equivalent to the posts themselves (that have at least 1 mention of the word) as in one text the word might repeat itself various times.

We are able to show that the 50 to 100 thousand inhabitants group is the one that mentions most the words related to sustainability and sustainability goals mentioned in the Agenda 2030 goals and GreenItaly 2022 Report, specifically with 1013 words overall. The top three words most mentioned by this group were "Desenvolvimento Sustentável" (Sustainable Development) with 268 words, "Objetivos de Desenvolvimento Sustentável" (Sustainable Development Goals) with 136 words and the acronym "ODS" (SDGs) with 125 words.

Beyond that we can verify that the word "Alterações Climáticas" (Climate Changes) is also an important word in the communication of the portuguese municipalities, since it has been revealed to be, more than once, a word in the top 3 of the most mentioned words by municipalities related to sustainability, in particular on the groups between 100 to 200 thousand inhabitants (156 mentions); 200 to 300 thousand inhabitants (64 mentions); and in the group 40 to 50 thousand inhabitants (46 mentions).

The word least mentioned in the texts of municipalities, besides "crise climática", was "gestão verde" which doesn't appear in posts of the groups with 300 to 500 thousand inhabitants and +500 thousand inhabitants. This may be related to the fact that these are the groups with the least municipalities.

Figure 6. Qualitative Analysis: Type of posts related to the environment in 3 categories: A) Events; B) Report; C) Awareness

As for the qualitative analysis, we can see in figure 6 that the majority of posts fall under the category "Reports" in all groups, except for the "100-200 thousand" inhabitants group, which has mostly posts under the category "Events" (88 posts). Most of "Report" posts are about plans and initiatives of the local governments relating to sustainability/environment, the other portion of posts in this category are mainly about local government budget reserved for environmental initiatives and awards/honors (related to these matters) received by the municipalities. This post quote emphasizes the top-down communication approach used by municipalities: "Câmara de Lagos vai investir maioritariamente em Habitação, Abastecimento de Água e Ensino" (the Lagos city council is going to invest majorly in housing, water suppliance and education).

The posts under the category "Events" also make up a significant amount of the total posts with keyword occurrences. Most of these are about workshops; local events and initiatives; and events from all other entities except the local government, regarding sustainability/environment. It is also clear in figure 6, that the category with fewer posts is "Awareness", which shows few interest of the local municipalities to inform and to involve the community in sustainable practices and new ways of life. Except for the "100-200 thousand" inhabitants group, which has 74 posts that fall under this category, a considerable amount in comparison to the other groups. The augment of "Report" or "Event" posts can be an issue that explains the low interaction on posts related to sustainability matters, as we were able to analyse , with Fanpage Karma, previously, to complement the analysis, when comparing posts about quotidian topics (events, photos of municipal landmarks, special commemorations). Perhaps, if there was more of a call-to-action approach, the results of the analysis would be different and communities would feel more involved and eager to engage, or change their ways of life. But this is just, what it is, an hypothesis.

If the 13th goal of the Agenda 2030 themes are in the agenda of the municipalities as the above graphics may show, the consistency of the sustainability/environment discourse is not a reality at all. Moreover, it is not at all clear whether the capacity to get the citizens involved or to listen to their worries and explicitly address those ideas and plans, at least, in the Facebook pages has been achieved. The lack of engagement and involvement with citizens on social platforms has been also noted by researchers in other european countries (Mabillard, Zumofen, Keuffer, 2021; Mabillard, Zumofen, Pasquier, 2022; Zumofen, Mabillard, Pasquier, 2023; Mabillard, Zumofen, 2024). As Pasquier (2017) has put it, there seems to be still a very conservative approach to the way local governments first understand Public Communication, and secondly use Facebook; a top-down channel of information.

If dealing with issues of misinformation, lapses, and essentially desinformation strategies, seems to be an increasing concern of contemporary democracies, a new look at the reality of Public Communication is probably urgent. We believe that the areas that many authors tend to consider as complementary - in the theoretical framework of this discipline (public engagement) - cannot continue to be understood in this way, if we really want to promote a change in the way we

face issues of citizenship, active participation and democracy in the midst of "post-truth contexts" (Tiercelin, 2023) or "metamorphosis of our democracies" (Diamanti and Lazar, 2018).

To conclude, as Innerarity so elegantly puts it : "changes only happen when structures, processes and collective rules are altered. The knowledge of a society is something more than the mere accumulation of existing knowledge, such as an intelligent organization, it is, through the synergy produced between rules, institutions and procedures, and not by the mere addition of one or more intelligences in personal terms" (2021, pp.22 and 23).

Research limitations. *The main research limitation is the lack of analysis at all the social networks where some municipalities are present. Concerning specifically the research being developed here some questions as those of validity and reliability might have needed to be better developed, even if authors have tried to make the research using content analysis as robust as possible. The question of having not analysed the municipalities under 30 thousand inhabitants might also be seen as a limitation as we don't have managed to be able to offer an analysis of all the pages. It must be said however that not only a random sample of pages were analysed as a training exercise as well as a recent research had been done in the frame of a larger project in what concerns the 20 to 20 thousand inhabitants municipalities. Even if not concerning the environmental themes (Eiró-Gomes, Rodrigues, 2023) it showed that the way pages are treated in these smaller municipalities is even less focused on the discussion of these kind of themes.*

Managerial implications. *Questions concerning sustainability, the environment and specifically those regarding "climate change" are seen, almost 75 years after the first warns, as a public issue, "public" in the sense of impacting all of us, but also as being a theme of discussion in the public space, or in different public spheres, as well as an important issue for governments at all levels, from the local to national, or even to international platforms. "Climate inaction is not only a political problem but fundamentally an ethical and communicative issue" (Almiron, Xifra, 2020, p.2). It's precisely to promote action, in a pragmatist theoretical approach to research, that authors will construct a short report on the global results of the research being presented here, as well as a proposal to construct a general campaign for all the municipalities to be used in the meta pages concerning the major changes to be negotiated with citizens in what concerns livelihoods and lifestyles. To offer ideas for a more involved and immersive Public Communication, is the ultimate goal of a more general research project from which the data being presented here are only those directly connected with sustainability and climatic changes. We hope that this paper might help local governments to value communication professionals, and as online community managers too, and the need for a new digitized Public Communication on social media. Even if the smaller municipalities were not expressed here, the paper might also be important for those, as they are the ones that struggle with greater lack of funds for communication and social media.*

Originality of the paper. *All the problems concerning environmental issues, and climate change, are, as we all know, wicked problems. A wicked problem is a problem that is "unclear, interdependent, multi-causal, unstable, uncertain, nonlinear, multi-centered and dynamic" (Aballi, 2020, 233). All of these issues are often conflicting realities where different interests come into play, both political and economic, as well as conflicts of values, not to mention scientific data that are often the subject of major disinformation campaigns. To document the lack of use of Facebook pages to inform, share and negotiate (Wolton, 2022) knowledge on the needs of behavioral and social change in accordance to science (Morris, 2021) and as an instrument of public communication to create awareness and mobilize citizens to co-create change (Norton, Grecu, 2020; Akin and Rice, 2013), might be seen as a call to action for the role local governments could (should) play in empowering citizens. It might be noted that it is local governments responsibility to act as reliable sources in a world where and to quote Tiercelin (2023) there seems to be a disgust with truth.*

Key words: *municipalities, sustainability, communication, public communication, empowerment*

Corporate Social Responsibility: How can businesses implement their efforts?

ANNA PIERGALLINO[1] ANTONELLA CAMMAROTA[2]

Abstract

Corporate social responsibility (CSR) communication increasingly relies on social reports as transparent, authoritative tools that attract investor and policymaker attention. This study analyzes social reports from Italy's 50 top-performing companies to identify priority CSR domains and concrete implementation actions. Using a mixed-method approach combining manual coding and Python-assisted content analysis, we identify six key macro-areas where companies concentrate their socio-environmental efforts. Within each area, we catalogue specific actions companies implement, from renewable energy educational institutions to supplier sustainability certification programs. Our findings reveal an evolutionary trajectory as organizations transition from standardized approaches toward context-specific interventions leveraging their distinctive competencies. This research contributes to CSR literature by providing different insights for practitioners and scholars. An empirically-derived classification framework based on actual corporate practices; an innovative structure integrating six distinct intervention domains; a bridge between Triple Bottom Line theory and operational implementation; and cross-sectoral insights transcending industry-specific limitations. The resulting framework serves as both a scholarly contribution advancing CSR theory and a practical guide for organizations to strategically prioritize socio-environmental investments aligned with their core competencies.

Framing of the research. *How corporations function within communities has transformed substantially beyond simply focusing on financial and regulatory obligations, as organizations progressively take on important community-focused duties and commitments (De Villiers et al., 2021; Weber et al., 2023). This evolution has made social communication essential through various channels, encompassing both institutional and informal approaches (Manetti & Bellucci, 2016; Tuan et al., 2024). While companies leverage these platforms to demonstrate their commitment to addressing social challenges, they often encounter skepticism regarding the authenticity of their initiatives, frequently facing accusations of greenwashing (Pizzetti & Seele, 2021). Successful societal engagement requires careful strategic consideration, particularly in selecting issues where companies possess relevant expertise and can generate an impact (McPhail et al., 2024). In this regard, the social report has emerged as an instrument for demonstrating transparency and commitment in sustainable actions (Alhumud et al., 2025; Cho & Patten, 2007). This type of communication allows companies to detail and quantify their commitments more precisely and clearly (Troshani & Rowbottom, 2024). However, studies on CSR communication through social reports exhibit some gaps. For instance, previous researches adopt a sector-specific analysis, focusing on industries such as banking (Avrampou et al., 2019; Ferraro & Veltri, 2024) or energy (Arena et al., 2023). Moreover, another research stream focuses on consumer perceptions of socially responsible actions communicated in social reports (Afzali et al., 2021; Boccia & Sarno, 2012; Parray et al., 2024). Finally, some scholars have investigated how the communication of CSR initiatives impacts corporate financial performance (Ahsan, 2024; Awaysheh et al., 2020; Ma & Yasir, 2023). Consequently, it emerges that the literature lacks studies examining the specific types of actions companies undertake to contribute to social and environmental society's issues. Based on this, we suggest that analysing social reports to identify the key issues businesses are currently prioritizing and the actions they are implementing could be highly valuable. These insights could not only enhance the direction of future research but also provide companies with practical and concrete insights into which socio-environmental challenges should be addressed and which types of actions may be most effective.*

Purpose of the paper. *This research has two main goals. Firstly, it aims to identify the most frequently addressed social and environmental issues by companies. Then, it seeks to determine specific actions undertaken to address these socio-environmental challenges. To accomplish these objectives, business sustainability disclosures have served as the principal materials for examination and investigation. Specifically, social reports were selected because they represent the most credible and comprehensive documents for analyzing corporate social communication, receiving significant attention from policymakers (as evidenced by recent directives), and providing more detailed information compared to alternative social communication formats (Cardamone & Giunta, 2012; Du & Yu, 2021).*

Methodology. *This study uses a qualitative methodology to examine the complexity and nuanced aspects of the subject matter (Tuckerman et al., 2023), employing a methodical and structured approach to textual examination that maintains replicability through standardized computational techniques (Kitto et al., 2023). Through content analysis and thematic interpretation, we were able to identify patterns and trends across corporate sustainability practices. For data collection, we utilized a targeted sampling strategy (Obilor, 2023). We analyzed the 2023 social reports of the fifty top-performing Italian companies, identified through the Mediobanca Annual Report 2023. The selection focused on high-revenue organizations based on the assumption that companies with greater financial resources and market position would typically develop more comprehensive, specific, and structured sustainability programs than their smaller counterparts.*

Given the substantial volume of data, with some reports exceeding 500 pages, we employed an exploratory Content Analysis approach (Mayring, 2021). This integrated methodological framework combined manual analysis with Python-assisted techniques in an iterative process, allowing us to systematically process and analyze the extensive textual information. This methodological integration enhanced analytical rigor, comprehensiveness, accuracy, and replicability throughout the examination process (Lewis et al., 2013). Moreover, our approach aligns with established protocols in textual document analysis and content summarization techniques (Raman et al., 2022; McKinney, 2022), providing a robust framework for systematic data organization and analytical processing.

The methodological approach comprised two distinct phases. In the initial stage, we conducted a manual content analysis to identify significant thematic patterns within the data. In this phase, the main SDGs in which companies are committed have also been extracted. This process yielded six distinct macro-categories of intervention within the social reports, which subsequently informed the development of our analytical framework (see Figure 1).

The secondary phase employed computational methods through Python programming to validate the findings derived from the initial manual analysis. For each identified macro-category established in the preceding phase, we selected representative lexical indicators. The implemented algorithmic approach facilitated the systematic association of each keyword with its corresponding thematic domain, enabling the calculation of thematic prevalence within the analyzed social reports.

Results. *The frequency analysis of the social reports from fifty Italian companies reveals a clear hierarchical structure in corporate CSR priorities, directly answering our primary research question (RQ1): "Which social and environmental issues do Italian companies prioritize in their CSR strategies. Results identified six fundamental macro-areas where corporate sustainability efforts are concentrated. These macro-areas represent the key domains in which Italian companies allocate resources and attention, providing a comprehensive mapping of the current CSR landscape in Italy.*

Companies demonstrate a differentiated distribution of commitment across these six macro-areas, with some domains receiving significantly more attention than others. Human Resource Management emerges as the top priority, reflecting a strong focus on human capital development and organizational well-being. This emphasis on human dimensions is accompanied by substantial investment in Sustainable Innovation, encompassing initiatives related to renewable energy and digital transformation. Social Responsibility constitutes another significant area of intervention, characterized by initiatives that connect companies with their surrounding communities, while Resource Efficiency reflects corporate commitment to circular and less impactful operational models. The framework is completed by Collaborative Development, which focuses on creating sustainable stakeholder ecosystems, and Inclusive Growth, aimed at fostering a fairer and more accessible economy. This distribution pattern reveals interesting sectoral variations, with manufacturing firms demonstrating greater emphasis on innovation and resource management, while service-oriented businesses typically allocate more resources toward human capital and community engagement initiatives. The prioritization also appears to correlate with regulatory pressures and stakeholder expectations specific to each industry.

The quantitative analysis results provide an organizational framework that enables a meaningful comparison of corporate initiatives across different industries and priorities. Inclusive Growth encompasses all corporate initiatives aimed at promoting more equitable and accessible economic development. Quantitative analysis reveals that Italian companies dedicate approximately 6% of their total CSR efforts to this dimension, with a particular emphasis on reducing economic disparities. Companies tend to favour large-scale economic impact interventions over more localized development initiatives. Then, Sustainable Innovation represents one of the most significant domains of intervention, accounting for 23% of total CSR engagement. This macro-area includes all initiatives aimed at developing more sustainable technologies, processes, and products. Italian companies show a clear preference for projects related to renewable energy, which constitute most of the initiatives in this domain, alongside investments in digitalization and sustainable automation. Additionally, Resource Efficiency, with 11% of total CSR efforts allocated, highlights corporate commitment to more circular and less impactful production models. Initiatives in this domain focus on optimizing the use of natural resources and minimizing waste, with a predominant emphasis on waste reduction and management over sustainable water resource management. After that, Social Responsibility absorbs approximately 21% of CSR initiatives and represents the direct interface between the company and its surrounding community. It includes educational, healthcare, social integration programs, and philanthropic activities. Italian companies are evolving from a purely philanthropic approach toward a more structured and strategic social engagement, particularly emphasizing educational and inclusion initiatives. Finally, Human Resource Management emerges as the dominant macro-area, accounting for 29% of total CSR engagement. The prominence of this area highlights the increasing recognition among Italian companies of the strategic value of human capital for organizational sustainability. Initiatives include training programs, workplace safety policies, and diversity and inclusion measures. Lastly Collaborative Development represents 8% of CSR efforts and focuses on sustainable stakeholder relationship management, including strategic partnerships and initiatives

promoting sustainability throughout the supply chain. Despite its smaller quantitative representation, this dimension is critical for the effective implementation of systemic sustainability strategies.

The distribution of engagement across these six macro-areas offers a comprehensive overview of how Italian companies are interpreting and operationalizing sustainability. Beyond identifying priority macro-areas, it can be essential to understand some specific actions implemented by companies in each domain

Our findings reveal a diverse spectrum of concrete interventions through which companies operationalize their socio-environmental commitments across the six identified macro-areas. Within the Inclusive Growth domain, initiatives may include enhanced accessibility to energy services for vulnerable populations, targeted nutritional support programs, internal wage disparity analysis, localized employment generation, and community infrastructure enhancement projects. Instead, sustainable Innovation is manifested through specialized renewable energy educational institutions, development of photovoltaic and alternative energy infrastructure, digital literacy programs, environmentally optimized automation implementation, and strategic R&D investments in green technology development. Then, Resource Efficiency is pursued via water conservation educational initiatives, waste reduction and circular economy programs, and standardized procedural frameworks for comprehensive waste management. By contrast, Social Responsibility cluster encompasses technological enhancement of educational access, cultural engagement sponsorships, psychological support services for at-risk populations, and social integration frameworks for marginalized communities. Additionally, Human Resource Management strategies include continuous professional development programs, gender diversity initiatives in STEM fields, work flexibility policies promoting life-balance optimization, and comprehensive anti-discrimination frameworks and inclusive career pathways. Finally, Collaborative Development is achieved through strategic inter-organizational partnerships, supplier sustainability certification and capacity building, and integrated sustainable supply chain management.

The documented initiatives reflect varying degrees of implementation maturity across sectors, with financial services and energy companies typically demonstrating more sophisticated approaches to measurement and impact assessment. Notably, these interventions increasingly involve multi-stakeholder collaboration, suggesting recognition that complex sustainability challenges require coordinated ecosystem responses rather than isolated corporate actions. Our analysis further indicates that companies with more advanced sustainability practices tend to integrate complementary initiatives across multiple macro-areas, creating synergistic effects that amplify their overall social and environmental impact.

Our findings document a significant evolutionary trajectory: organizations are progressively abandoning standardized approaches in favour of context-specific interventions that strategically leverage their distinctive organizational competencies. This transition from generic to tailored implementation represents a maturation in organizational conceptualization and operationalization of social and environmental responsibilities. The evidence suggests companies are increasingly aligning sustainability initiatives with core business strategies, creating integrated approaches that generate both social impact and competitive advantage. This strategic integration reflects a deeper understanding that effective CSR requires authenticity, organizational alignment, and the application of unique corporate capabilities rather than merely adopting universal best practices or following industry trends.

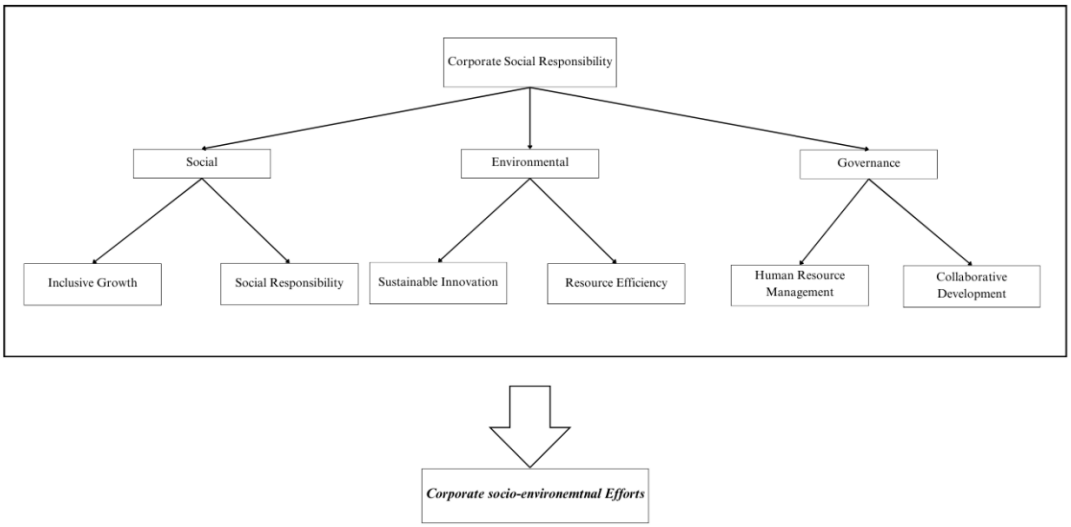
The study's results are summarized in Figure 1, which provides a practical guide for companies to understand and implement societal actions and for scholar to identify future research avenues. The proposed model synthesizes our empirical findings into an organizational structure that serves as a reference point for understanding and implementing effective CSR strategies. Grounded in Elkington's Triple Bottom Line theory (1997), our framework advances theoretical understanding by identifying six distinct macro-areas of intervention that have never been systematically structured together to create a practical implementation guide. This multi-level approach overcomes the limitations of traditional CSR classifications, providing a more granular and operational mapping of sustainability dimensions. The framework is organically structured to illustrate how the sustainability initiatives of leading Italian companies are distributed across three fundamental dimensions. The Social Dimension includes two key macro-areas: Social Responsibility, which focuses on the relationship between the company and the external community, and Human Resource Management, which is centred on employee well-being and development. The Environmental Dimension consists of Resource Efficiency, aimed at optimizing the use of natural resources, and Sustainable Innovation, which is dedicated to the development of eco-compatible technologies and processes. Finally, the Governance Dimension is manifested through Inclusive Growth, which seeks to ensure an equitable distribution of economic benefits, and Collaborative Development, which is focused on the creation of sustainable stakeholder networks. This tripartite structure aligns with the Triple Bottom Line framework and seems to reflect the 'new' modern understanding of CSR. A distinctive feature of our framework is its empirical foundation. Rather than being a theoretical abstraction, it represents a real-world benchmark of the actual practices of leading Italian companies, providing a practical reference for the organizational implementation of CSR. The framework highlights that effective CSR requires moving beyond general commitments within the three overarching dimensions, social, environmental, and governance, toward the precise identification of intervention areas with specific strategic actions. The concreteness of initiatives, the careful selection of which issues to address, and the strategic definition of intervention areas emerge as key factors in drafting a clear, impactful, and effective social report. This approach can be essential for enhancing stakeholder engagement and increasing transparency.

Research limitations. *This study has also some limitations that represent an opportunity for future research. First, it is based exclusively on the textual analysis of social reports, without considering visual elements that can be crucial in this type of analysis. Then, the 24% of the analyzed companies belong to the energy sector, potentially introducing*

sectoral bias in the results. Consequently, future studies should consider other sectors or analyze a greater sample. Moreover, this research focuses exclusively on the Italian market, thus, scholars should employ a cross-cultural studies. Finally,, the communication of a practice in social reports does not necessarily guarantee its actual implementation or positive outcomes, consequently further studies are required based on other methods such as field experiments.). Lastly, the cross-sectional nature of the study provides a static snapshot of CSR practices at a given moment, without capturing their temporal evolution. A longitudinal approach could offer valuable insights into how CSR strategies mature over time and how emerging trends shape corporate sustainability efforts, allowing for a more dynamic understanding of the phenomenon.

Managerial implications. *This research provides relevant insights that may help organizations to prioritize and strategically plan their social and environmental investments.*

Our framework - reported in Figure 1 - can be a useful guide for practitioners. Specifically, it can facilitate the strategic selection of intervention areas, allowing managers to use the six macro-areas as a strategic map to determine where to focus their company's CSR efforts.



For instance, a manufacturing company traditionally focused on Resource Efficiency might discover unexplored opportunities in Inclusive Growth, broadening its impact and engagement strategies and potentially addressing less prioritized SDGs associated with society's wicked problems (Maione et al., 2024).

Second, the framework highlights the relevance of the alignment with core competencies, enabling companies to identify CSR domains that align with their existing capabilities and resources. This may improve the authenticity and effectiveness of their initiatives. Another key managerial implication is strategic differentiation. Companies seeking to stand out from their competitors can use this study to identify less frequently addressed areas, creating opportunities for differentiation in the market.

Furthermore, another critical aspect of the framework is its capacity to balance CSR portfolios. The quantitative data on resource allocations across macro-areas enable managers to assess whether their CSR portfolio is balanced or excessively concentrated in specific areas at the expense of others. The framework further promotes the strategic integration of CSR by encouraging companies to reframe CSR as a core business function rather than a peripheral activity. Each of the six macro-areas is closely connected to fundamental business functions, facilitating the incorporation of sustainability principles into daily operations and decision-making processes. This integration reflects recent developments in workplace safety (Oyewole et al., 2024), gender inclusion (Chalermchaikit et al., 2024), and circular economy practices (Elroi et al., 2023; Shah et al., 2023).

Specifically, companies can utilize this framework in multiple ways: as a diagnostic tool for assessing current CSR initiatives, a resource allocation guide for planning new sustainability programs, a structuring framework for corporate social reports, a mapping tool to identify potential gaps in CSR strategy, and a benchmarking tool for comparing practices with industry leaders, ultimately enhancing stakeholder engagement, transparency, and accountability (Macca et al., 2024; Troshani & Rowbottom, 2024).

Figure 1: Practical framework for businesses

Originality of the paper. *This study contributes to the literature on CSR communication by identifying corporate priority intervention areas and some concrete implementation actions.*

Our research offers four distinctive contributions: First, it presents an empirically derived CSR classification framework based on systematic analysis of fifty leading companies' practices, ensuring the model reflects operational realities rather than theoretical abstractions. Second, it provides an innovative structure articulating six distinct CSR intervention domains previously not integrated into a cohesive framework. Third, it bridges theory and practice by translating Triple Bottom Line concepts into concrete intervention areas. Fourth, it offers cross-sectoral insights that

transcend the industry-specific limitations of previous research (Avrampou et al., 2019; Ferraro & Veltri, 2024; Arena et al., 2023).

Our practical framework developed distinguishes itself through its action orientation, directly applicable to corporate contexts and derived from actual sustainability effort distribution. This study responds to calls for explanatory frameworks to evaluate CSR reporting (Mishra & Kumar, 2023) by proposing an empirically grounded, multi-level model offering a structured and replicable assessment method.

Key words: *Corporate social responsibility; Social report; Practical framework; Content Analysis.*

Sustainability Communication in Corporate Strategy: The Case of Valmex S.p.A.

ALESSIO TRAVASI[1] EMANUELA CONTI[2] FABIO MUSSO[3] GIORGIA CUCCHIARINI[4]

Abstract

The concept of sustainability has evolved into a pivotal element of corporate strategy, necessitating businesses to integrate sustainable practices into their operations and to communicate them effectively. As environmental, social, and governance (ESG) considerations gain increasing prominence in global markets, organizations face mounting pressure from stakeholders - including consumers, investors, and regulatory bodies - to demonstrate transparency and accountability in their sustainability commitments. While major companies have widely adopted sustainability strategies, sustainability communication (SC) - a key component of sustainability management - has only recently gained attention in both academia and practice. Despite the absence of a universally accepted definition, there is a broad consensus that SC plays a vital role in enhancing understanding and engagement with corporate sustainability initiatives. The primary objective of sustainability communication (SC) is to inform and engage customers and stakeholders, rather than to persuade. The company's overarching objective is to establish a robust connection between its stakeholders and the organisation itself. This is achieved by highlighting the company's sustainability initiatives and ensuring that these align with the expectations of its stakeholders. The capacity of SC to exert influence over corporate reputation is well-documented, with the potential to serve as a primary catalyst for competitive advantage in a market characterised by increasing complexity. In contradistinction to conventional corporate communication, SC is distinguished by its emphasis on transparency, authenticity, and active stakeholder engagement. However, inadequate or poorly executed sustainability communication can lead to reputational risks, stakeholder disengagement, and accusations of greenwashing, ultimately undermining corporate credibility and trust. Companies that fail to convey their sustainability efforts effectively may struggle to differentiate themselves in competitive markets and risk missing opportunities to strengthen brand loyalty and investor confidence. This paper explores the challenges and opportunities associated with sustainability communication within corporate contexts by examining the case of Valmex S.p.A., an Italian manufacturer of heat exchangers. The study employs a single case study approach, supported by a focus group with key company stakeholders, to analyse how sustainability communication is structured within Valmex and how effectively it engages external audiences. The manufacturing sector is characterised by its own distinctive sustainability challenges, including high energy consumption, complex supply chains and stringent regulatory compliance requirements. This research offers valuable insights into how industrial firms can develop more impactful communication strategies. The findings indicate that, despite Valmex's strong commitment to sustainability, its current communication strategies are beset by significant challenges, including limited stakeholder engagement and underutilisation of digital platforms. The absence of a cohesive and interactive communication strategy has resulted in limited visibility of the company's sustainability initiatives among key stakeholders, potentially hindering its ability to build a strong reputation in ESG performance.

Framing of the research. *Recent years have seen a shift in the integration of sustainability into corporate strategy, transitioning from a voluntary initiative to a critical business imperative. A recent study (Raza & Woxenius, 2023) posits that what was once considered an optional ethical commitment has now become a core business requirement, driven by a combination of increasing environmental challenges, heightened stakeholder expectations, and stringent regulatory demands. The traditional focus on financial performance has been superseded by a new paradigm in which businesses are now evaluated based on their ability to demonstrate responsible operation, minimise environmental impact, and contribute positively to society. This paradigm shift has been precipitated by a confluence of factors, including climate change, the depletion of natural resources, rising social inequalities, and consumer activism. These factors collectively demand corporate accountability and action (Taylor, 2024).*

One of the foundational frameworks that encapsulates corporate sustainability is the triple bottom line (TBL), as initially proposed by Elkington (1994). In contrast to conventional business models that prioritize profit maximization, the TBL approach asserts that companies must balance three dimensions: environmental stewardship, social responsibility, and economic viability. This perspective emphasises the notion that sustainable businesses must create long-term value for both shareholders and society. The concept of environmental stewardship encompasses the reduction of carbon footprints, the optimisation of resource utilisation, and the mitigation of pollution. Social responsibility entails the implementation of fair labour practices, engagement with communities, and the undertaking of diversity and inclusion initiatives. Finally, economic viability is imperative to ensure the continued profitability of a business whilst adhering to these principles. The successful integration of these three pillars enables companies to enhance their competitiveness and future-proof their operations against evolving market demands.

However, it should be noted that the mere implementation of sustainable practices alone is insufficient; effective communication of sustainability initiatives is of paramount importance. In the absence of clear, transparent and strategic communication, even the most robust sustainability efforts may remain unnoticed or, worse still, misinterpreted. Conversely, organisations that effectively communicate their sustainability commitments can enhance their corporate reputation, strengthen stakeholder trust, and gain a competitive advantage in the marketplace (Salam & Jahed, 2023). In contrast, companies that fail to communicate transparently risk undermining their credibility and facing public scepticism. Investors, customers, and regulatory bodies increasingly rely on corporate sustainability reports, ESG disclosures, and public statements to assess a company's commitment to sustainability (Eccles & Serafeim, 2013). In instances where this information is absent, unclear, or inconsistent, it has the potential to engender doubt and thereby diminish stakeholder confidence.

An even greater risk emerges when companies engage in misleading sustainability communication, commonly referred to as greenwashing. This occurs when organisations exaggerate or falsely claim to be environmentally friendly without substantive actions to support these claims (Delmas & Burbano, 2011). This deceptive practice can manifest in various forms, including the use of vague or misleading language, the selective disclosure of positive information while omitting negative aspects, or the employment of sustainability claims for marketing purposes without any tangible impact. When stakeholders identify greenwashing, the consequences can be severe, ranging from reputational damage and consumer backlash to regulatory penalties and loss of investor trust (Lin et al., 2025). To circumvent these repercussions, companies are obliged to prioritise the communication of sustainability in a manner that is both honest and verifiable, underpinned by empirical data, and substantiated by third-party certifications (Kandpal et al., 2024).

It is evident that regulatory bodies have recognised the significance of corporate transparency and have thus introduced stringent reporting standards. In the European Union, initiatives such as the Non-Financial Reporting Directive (NFRD) and its successor, the Corporate Sustainability Reporting Directive (CSRD), have been designed to standardise sustainability disclosures and ensure that large companies report on their environmental, social, and governance (ESG) performance (European Commission, 2022). These regulations mandate the publication of detailed sustainability reports, delineating the firms' impact on climate change, social policies, diversity, and ethical governance. Adherence to these frameworks fosters stakeholder trust and comparability, as investors and consumers increasingly demand access to standardised ESG data when making financial and purchasing decisions (European Commission, 2022).

Beyond regulatory requirements, voluntary reporting initiatives such as the Global Reporting Initiative (GRI) provide additional guidance for organisations seeking to enhance their sustainability disclosures (GRI, 2021). The GRI framework and more recent encourages companies to report on material sustainability issues, measure their progress using key performance indicators (KPIs), and align their disclosures with global sustainability goals such as the United Nations Sustainable Development Goals (SDGs). The adoption of these frameworks is indicative of a broader industry-wide shift towards greater corporate responsibility and accountability, reinforcing the expectation that sustainability communication must be both rigorous and transparent. Sustainability communication has gained growing academic interest over the past decade. Key themes such as sustainability reporting, green advertising, and consumer responses offer insights into communication strategies and their effects on consumer engagement. Braga et al. (2024) call for further research into both strategic and operational aspects of SC, emphasizing the need for a more balanced approach that includes social and economic, as well as environmental, dimensions.

Notwithstanding the aforementioned advancements, a considerable number of companies continue to encounter difficulties in effectively communicating their sustainability efforts. A salient emerging challenge is that of greenhushing, a phenomenon where businesses deliberately underreport or withhold sustainability information with a view to avoiding public scrutiny or accusations of greenwashing (Lyon & Montgomery, 2015). This phenomenon often originates from concerns regarding criticism for inadequate efforts, legal liabilities, or a deficiency in the reliability of sustainability metrics (Tao, 2024). Whilst greenhushing can offer companies a degree of protection against potential negative reactions, it can also result in missed opportunities to build brand credibility and stakeholder engagement. In the contemporary business environment, characterised by an emphasis on Environmental, Social and Governance (ESG) factors, organisations that fail to disclose their sustainability progress risk diminishing their visibility. Stakeholders in such a context anticipate transparency and the ability to measure the impact of sustainability efforts.

In this evolving landscape, corporate leadership plays a pivotal role in shaping sustainability communication strategies. Executives must navigate the complexities of sustainability reporting, achieving a balance between authenticity and strategic messaging. Organisations with purpose-driven leadership, where sustainability is integral to the corporate

vision as opposed to being an afterthought, have been shown to excel in the integration of sustainability into their core business strategy (George et al., 2016), employee culture (Taylor, 2025), and stakeholder relationships. It is evident that leaders who prioritise long-term sustainability objectives over short-term financial gains foster resilience, ensuring that businesses remain adaptable and competitive in the face of climate risks, evolving regulations, and shifting consumer expectations (Jones et al., 2021).

In light of the aforementioned challenges and opportunities, it is imperative to explore real-world examples of sustainability communication in action. This study examines the case of Valmex S.p.A., an Italian manufacturer of heat exchangers, to analyse how sustainability is communicated within the manufacturing sector. Manufacturing industries are characterised by unique communication challenges, stemming from the technical nature of their sustainability initiatives. These initiatives frequently encompass complex supply chains, resource-intensive production processes, and stringent compliance requirements. This ongoing study presents a case study of Valmex aimed at identifying strengths and weaknesses of communication activities as well as key recommendations for improving SC effectiveness.

Purpose of the paper. *The primary objective of this study is to evaluate the implementation of sustainability communication (SC) in a real-world corporate setting and to identify barriers that hinder effective stakeholder engagement. Through the analysis of Valmex S.p.A., the scope of this research is to understand the extent to which sustainability initiatives are communicated and perceived by stakeholders, from the perspective of managers and key personnel interviewed, and what improvements can be made to enhance communication effectiveness.*

The present study aims to establish a link between theoretical frameworks on sustainability communication and practical corporate applications. While extant literature has extensively discussed the importance of sustainability in corporate strategy (Dyllick & Muff, 2016), there remains a need for empirical research that explores how sustainability communication functions in specific industries and organisational structures. The present study focuses on Valmex, a manufacturing firm in the heat exchanger industry, and it provides sector-specific insights that can inform communication strategies in similar business contexts.

Methodology. *This study is an ongoing exploratory qualitative research project. In order to conduct an exploration of sustainability communication in a B2B company, this study employs a single case study approach, a methodology that is particularly suitable for examining complex organisational phenomena within their real-world contexts (Yin, 2018). Case study method enables researchers to conduct a detailed analysis of specific companies, thereby generating insights that can be employed to develop broader theoretical and practical implications.*

The selection of Valmex as a case study is justified by its strong commitment to environmental and social sustainability, combined with the company's recognised challenges in effectively communicating these efforts. Furtnermore, it is the first company in the Marche Region to obtain gender gap certification. Starting in 2025, it will be subject to mandatory sustainability reporting, as required for companies with more than 250 employees and an annual turnover exceeding 40 million euros. As a manufacturer in the industrial sector, Valmex provides a valuable perspective on the subject, particularly in light of the fact that sustainability communication in B2B contexts is often less developed compared to B2C contexts (Bocken et al., 2014).

The study gathered primary data through a focus group conducted with four key stakeholders at Valmex, including senior managers, employees involved in sustainability initiatives, and marketing personnel. The focus group method was selected for its capacity to engender interactive discussions, reveal diverse perspectives, and yield qualitative insights into internal sustainability communication challenges (Krueger & Casey, 2015).

The focus group discussion explored four key themes: i) The current communication strategies employed to convey sustainability efforts; ii) The perceived effectiveness of these strategies in engaging stakeholders; iii) The challenges faced in sustainability messaging; and iv) Potential improvements that could enhance communication clarity and impact. The session was transcribed and analysed using thematic coding, allowing for the identification of recurring patterns and key concerns raised by participants.

Results

Strengths of Valmex's Sustainability Strategy. *Valmex exhibits a robust and methodical dedication to sustainability, as evidenced by its comprehensive array of initiatives aimed at enhancing environmental efficiency, cultivating community involvement, and adhering to international sustainability standards. Over the past five years, the company has implemented eco-friendly manufacturing processes, which have resulted in a 25% reduction in CO2 emissions, demonstrating its capacity to integrate energy-efficient technologies into its production cycle. This is particularly significant in the manufacturing industry, where operational emissions are a major contributor to environmental degradation. The company's strategic investments in low-impact materials, energy recovery systems, and waste reduction technologies are indicative of a holistic approach to sustainability, prioritising both environmental responsibility and operational efficiency.*

Beyond its environmental efforts, Valmex is also committed to regulatory compliance and sustainability certifications, thereby reinforcing its credibility and adherence to internationally recognised best practices. The company holds the ISO 14001 certification, which sets out the criteria for an effective environmental management system (EMS). Adherence to this standard is indicative of Valmex's proactive approach to monitoring, evaluating, and reducing its ecological footprint, ensuring that its operations align with global environmental regulations. Adherence to the Corporate Sustainability Reporting Directive (CSRD), a European Union regulatory framework, is also demonstrated through the

disclosure of detailed information on environmental, social, and governance (ESG) factors (European Commission, 2022). By aligning its reporting structure with CSRD guidelines, Valmex enhances transparency, providing stakeholders with quantifiable and comparable sustainability data.

Internally, Valmex fosters a robust corporate sustainability culture, a practice that has garnered recognition and endorsement from employees across diverse departments. Focus group discussions revealed that employees place a high value on the company's commitment to sustainability, particularly in areas related to energy efficiency, ethical labour practices, and responsible sourcing of raw materials. The company's commitment to sustainability is embedded within its corporate culture, ensuring that these values are not merely directives from the top-down, but are actively embraced at all levels of the organisation. Employee involvement in sustainability initiatives has been demonstrated to enhance internal engagement, motivation, and the long-term adoption of environmentally responsible practices.

The focus group discussions revealed that the participants take pride in Valmex being the first company in the Marche Region to obtain gender equality certification (UNI EN ISO 125:2022). Furthermore, the company's commitment to socially sustainable initiatives, which are designed to enhance employee well-being, was emphasised. One such initiative, entitled "Mi Prendo Cura", provides complimentary preventive health screenings, encompassing melanoma and thyroid cancer screenings, in addition to breast examinations for women under the age of 45, in conjunction with ANT (Associazione Nazionale Tumori).

Furthermore, respondents emphasised other awards that recognise the company's commitment to social sustainability and stressed that Valmex engages proactively with local communities. This is achieved through collaboration with secondary schools and sponsorship of cultural events. One such event is the "Passaggi Festival" in Fano, a renowned cultural event in the region. At this event, the company promotes a dedicated section on gender equality.

However, despite these advantages, Valmex is confronted with several challenges in successfully conveying its sustainability endeavours to external stakeholders.

Challenges in Sustainability Communication. *Although Valmex communicates its sustainability initiatives with passion and dedication, its efforts could be more effective in engaging internal, local, and external stakeholders if supported by a sustainability communication plan. The current approach may not fully reach or resonate with key audiences, limiting the potential impact of its sustainability practices. As a result, Valmex risks missing opportunities to leverage its achievements as a competitive advantage, which could weaken the perceived value of its environmental and social initiatives and affect stakeholder perceptions and brand positioning.*

Another challenge for Valmex is strengthening the use of digital platforms to communicate its sustainability efforts more effectively. In contrast, many leading companies have shifted towards more dynamic, multi-channel communication strategies, utilising digital platforms, interactive content, and social media engagement to disseminate sustainability messages more effectively (Kaplan & Haenlein, 2010). The absence of a strong digital presence in Valmex's sustainability communication strategy limits its ability to connect with diverse stakeholder groups, particularly younger consumers and ESG-conscious investors, who increasingly rely on online platforms for corporate sustainability information.

Another significant challenge is the risk of greenwashing perceptions, a problem that was highlighted during the focus group discussions. Some respondents explained that the first annual sustainability report was not published on the website. The risk of greenwashing can erode stakeholder trust and diminish the credibility of a company's sustainability initiatives (Delmas & Burbano, 2011). To address this issue, Valmex must strengthen its sustainability reporting mechanisms by publishing this report and providing clear, verifiable, and data-backed evidence of its environmental and social impact.

Opportunities for Improvement. *In light of the challenges identified, the focus group discussions identified several key areas where Valmex could enhance its sustainability communication strategy in a significant manner.*

Implementing a well-structured communication plan is one of the most effective ways to enhance credibility and transparency. By leveraging a mix of communication channels that present data authentically and transparently, Valmex can strengthen stakeholder trust in its sustainability performance and reduce the risk of greenwashing concerns.

Another key area for improvement is the adoption of interactive sustainability communication through digital platforms, particularly social media. Research shows that investors, customers, and employees increasingly prefer digital, interactive formats that offer real-time updates on corporate sustainability efforts (Lamberton & Stephen, 2016). Valmex could leverage digital storytelling techniques to make its sustainability achievements more accessible and engaging, presenting milestones in a visually compelling and easily understandable way. The involvement of customers, suppliers, and local communities in a company's sustainability strategies has been demonstrated to enhance trust and to build long-term relationships based on shared responsibility (Pedersen et al., 2018). Furthermore, Valmex could develop an open sustainability forum where stakeholders can provide input, share feedback, and participate in decision-making processes related to environmental and social initiatives. This engagement would serve to reinforce the company's authenticity and commitment to meaningful sustainability efforts.

Finally, publishing annual sustainability reports is essential for fostering transparency and encouraging active stakeholder engagement and co-creation in sustainability communication. To address these challenges effectively, it is recommended that Valmex establish a cross-functional sustainability task force, including representatives from marketing, operations, human resources, and corporate social responsibility. This initiative would help ensure that sustainability messaging is cohesive, well-integrated, and strategically aligned with the company's overall goals.

Research limitations. *The present study is a work in progress and relies on a single case study, which is susceptible to inherent limitations concerning the generalizability of its findings. While the analysis of Valmex S.p.A. offers valuable insights into sustainability communication within the manufacturing sector, it is important to note that these insights may not be universally applicable across different industries or organisational contexts. The distinct characteristics of Valmex, including its corporate culture, market positioning, and stakeholder dynamics, may influence the applicability of the results to other settings.*

Moreover, while the focus group methodology is effective in eliciting detailed qualitative data, the number of participants in this study was limited. The limited sample size may not encompass the entire range of perspectives within the organisation, potentially overlooking divergent views or internal challenges related to sustainability communication. Furthermore, the composition of the focus group, which was primarily comprised of internal stakeholders, may introduce a bias, as the participants might be inclined to present the company's practices in a favourable light. The study also acknowledges the rapidly evolving nature of sustainability standards and stakeholder expectations. As the global emphasis on environmental, social, and governance (ESG) criteria intensifies, companies face increasing pressure to enhance transparency and accountability in their sustainability practices (Freeman et al., 2018). This dynamic landscape necessitates continuous adaptation and may affect the relevance of the study's findings over time. It is recommended that future research in this domain be informed by longitudinal studies that track changes in sustainability communication practices and stakeholder perceptions. Such studies would provide a more comprehensive understanding of trends and challenges in this area.

Managerial implications. *The findings from this study offer several preliminary critical implications for managers aiming to enhance their organisation's sustainability communication strategies. Firstly, there is a pressing need to integrate SC into the core business strategy, ensuring that it aligns with the company's overall mission and values. This integration fosters authenticity and strengthens stakeholder trust, as stakeholders are more likely to engage with organisations that demonstrate genuine commitment to sustainable practices (George et al., 2016).*

Secondly, it is incumbent upon managers to prioritise the development of a comprehensive SC strategy, including stakeholder engagement plans. Effective stakeholder engagement, as defined by Lane & Devin (2018), involves the dissemination of information in addition to the active involvement of stakeholders in decision-making processes. This, in turn, enhances the credibility and effectiveness of sustainability initiatives.

Thirdly, it is imperative to strengthen the utilisation of social media, interactive websites, and other digital tools that have the potential to augment the reach and impact of sustainability messages, making them more accessible and engaging for a diverse range of stakeholder groups. However, it is crucial to ensure that digital communications are not merely superficial but provide clear and verifiable information to avoid perceptions of greenwashing (Delmas & Burbano, 2011).

In conclusion, managers should foster a culture of continuous improvement and learning within their organizations. Encouraging feedback from stakeholders and being responsive to their concerns can lead to more effective and adaptive sustainability practices. This approach not only enhances the organization's reputation but also contributes to more sustainable business operations and long-term success.

Originality of the paper. *This paper contributes to the existing literature by examining sustainability communication within a manufacturing context - an area that has received relatively less attention in sustainability research. Through a case study of Valmex S.p.A-, it provides unique insights into the challenges and opportunities manufacturing firms face in communicating their sustainability efforts, particularly from the perspective of internal personnel. The study explores both the strategic and operational levels of sustainability communication, as well as both environmental and social dimensions of sustainability. It also explores the alignment between internal and external sustainability communications, highlighting the importance of consistency and coherence. This comprehensive approach addresses gaps in the literature, where most studies tend to focus either on strategic or operational levels or primarily on environmental sustainability (Braga et al., 2024).*

The employment of a single case dimensions study approach facilitates a detailed exploration of the specific organisational dynamics and stakeholder interactions that influence sustainability communication practices.

Furthermore, the integration of recent advancements in the domain of sustainability reporting, including the implementation of the Corporate Sustainability Reporting Directive (CSRD) by the European Union, situates the present study within the prevailing regulatory framework (European Commission, 2022). This contextualisation enhances the relevance of the findings for organisations navigating similar regulatory environments. The study also explores emerging challenges in sustainability communication, such as the phenomenon of greenhushing, where companies deliberately underreport their sustainability initiatives to avoid scrutiny, adding a contemporary dimension to the discussion (Lyon & Montgomery, 2015).

Moreover, the study emphasises the significance of aligning sustainability communication with corporate purpose and values, particularly in the context of external pressures and evolving political landscapes. This standpoint emphasises the necessity for companies to sustain their commitments to sustainability, even in the face of adversity, to ensure long-term resilience and success (George et al., 2016).

Key words: *sustainability communication (SC); environmental dimension; social dimension; B2B market; single case-study*

From Loss to Gain: Rethinking Value Co-Destruction in Strategic Communication. Insights From the Banking Sector

FRANCESCA SAMMARTINO[1] DOMENICO SARDANELLI[2] FRANCESCA CONTE[3]
MADDALENA DELLA VOLPE[4] ALFONSO SIANO[5]

Abstract

This research reinterprets value co-destruction (VCD) as the effect of a strategic response by top managers to the urgency of digital transformation in the bank industry, viewing it as a temporary phase to overcome customers' innovation resistance and enabling long-term value co-creation (VCC). The study examines strategic VCD through the case of Intesa Sanpaolo's transfer of a business unit to its digital-only subsidiary, Isybank, without explicit customer consent. To assess the impact of this transition, a sentiment analysis of online reactions was conducted, tracking the evolution of negative sentiment from the transition phase to the post-transfer period as an indicator of VCD.

Findings suggest that Intesa Sanpaolo's possibly intentional VCD did not significantly threaten the banking group and ultimately led to positive outcomes for Isybank, including il successful transfer of many customers and the acquisition of new ones. Challenging the prevailing view of VCD as a negative outcome, this study offers new insights to the literature, demonstrating that, through the lens of strategic communication, VCD can be intentionally leveraged to change consumer habits, enabling them to adapt to technological advances and fully exploit the benefits of innovation, ultimately achieving VCC, especially when gradual innovation may be less effective. However, such strategies must be carefully implemented to mitigate reputational risks. Given its deductive approach, this research cannot confirm whether Intesa Sanpaolo's top management deliberately triggered VCD. Furthermore, the limited number of posts and comments may not fully capture customer perspectives on the transfer.

Framing of the research. *The digitalization process has caused significant disruption across all industries, introducing innovations that have profoundly transformed traditional business models and led to substantial shifts in consumer behavior (Zaman et al., 2023; Son et al., 2019), while also creating new opportunities for VCC (Hauke-Lopes et al., 2022).*

Within the financial sector, one of the most significant developments is the rise of digital-only banks (or Internet-only banks), which operate without physical branches and provide banking services exclusively through digital channels, such as online banking and mobile applications (Nel and Boshoff, 2021a). This innovation, which has experienced unexpectedly rapid growth-particularly due to the COVID-19 pandemic (Van Zeeland and Pierson, 2024)-has profoundly reshaped the operations of traditional banks (Haghighinasab et al., 2025) and altered conventional face-to-face interactions that have long defined VCC between consumers and firms (Lumivalo et al., 2024) fostering new forms of interaction through alternative, non-face-to-face virtual environments (Martovoy and Dos Santos, 2012).

This new business model provides customers with a broader range of services, often more efficiently than traditional offline banks (Bhatnagr et al., 2024), since they are accessible anytime and anywhere (Ahn and Lee, 2019; Park et al., 2024) at lower costs (Shin et al., 2020), while also reducing the time and effort previously required for in-person banking transactions (Park et al., 2024). From the banks' perspective, digital-only banks enable greater cost optimization by eliminating expenses of physical branches and offering more competitive services, while also expanding the breadth and depth of customer interactions, thus enhancing the VCC process (Lenka et al. 2017). As a result, digital-only banks can achieve a stronger competitive advantage over traditional banking competitors (Lee and Kim, 2020).

This makes the digital-only model attractive to traditional banks facing increasing pressure to stay competitive in a rapidly evolving industry shaped by new technologies and changing consumer expectations (Zao et al., 2022; Loureiro

and Sarmento, 2018). Additionally, digital-only banks offer the advantage of significantly reducing operational costs, making them an appealing strategic shift for traditional financial institutions.

However, a key challenge to the widespread adoption and long-term success of digital-only banks is consumer resistance to innovation (Nel and Boshoff, 2021b) that may slow its diffusion, hinder acceptance, and ultimately threaten its long-term sustainability (Lee and Kim, 2020).

The literature has mainly focused on why consumers struggle to transition from traditional to digital-only banks. Nel and Boshoff (2021a, 2021b) identified key barriers such as (1) the perceived inferior quality of digital-only bank services compared to traditional banks and (2) the unfamiliar behavioral patterns required, which may conflict with customers' existing banking habits. Others noted that satisfaction with traditional banks creates resistance to change, hindering the shift to digital-only banks, even if they offer greater benefits (Nel and Boshoff, 2023; 2021b).

However, another critical issue concerns how firms introduce such innovations to the market. According to Hauke-Lopes et al. (2022) and Malar et al. (2019), not all digital disruptions lead to positive outcomes and VCC. In some cases, they may result in VCD, particularly when trust is lacking, communication with customers is unclear, or when firms fail to effectively convey the benefits of the innovation.

The successful introduction of innovations requires companies to focus not only on their promotion but also on ensuring their understanding, implementation, and acceptance, which are managed through strategic communication. Zerfass and Huck (2007) emphasize that this is a key function of strategic communication. This omnidirectional, diachronic process (Van Ruler, 2020) integrates business functions and engages stakeholders to support the development, execution, and evaluation of corporate strategies, ensuring alignment with organizational goals (Hallahan et al., 2007). A key element is structured listening to identify societal changes and shifting stakeholder expectations, which inform executive decision-making and strategy (Siano et al., 2015; Invernizzi and Romenti, 2011). In the case of traditional banks introducing fully digital services, reflective communication plays a crucial role in determining whether the innovation leads to VCC orVCD, directly influencing the success or failure of the strategy (Hauke-Lopes et al., 2022).

Therefore, the way traditional banks introduce fully digital banking services is through reflective communication, where the outcome-whether it fosters VCC or leads to VCD-ultimately shapes the success or failure of the innovation introduction strategy (Hauke-Lopes et al., 2022). However, in the current context, traditional banks are at the center of a complex interplay of forces. While the digital-only model can improve performance, enhance customer satisfaction, expand opportunities for VCC, and help banks navigate growing competitive pressures driven by digitalization, it also requires them to address consumer resistance to innovation and the risk that a fully digital transition could lead to VCD. Despite the relevance of this issue, recent literature has paid little attention to the strategies firms can adopt to mitigate these challenges while simultaneously leveraging supportive factors from a strategic communication perspective.

Purpose of the paper. *The urgency to remain competitive, to keep pace with technological advancements, and the consumers' resistance make it challenging to quickly implement a strategy that ensures VCC and enhances the well-being of all stakeholder systems involved. However, we argue that framing the transition solely in terms of co-creation or co-destruction oversimplifies the complexity of introducing a digital-only bank in today's banking landscape.*

According to several authors, VCC arises from a resource integration process that aligns with actors' expectations, enhancing their well-being (Plé, 2016; Vargo and Lusch, 2008). Conversely, VCD arises from factors such as resource misuse (Plé and Chumpitaz Cáceres, 2010), conflictual resource integration (Echeverri and Skålén, 2011), or resource loss (Smith, 2013), all of which result in a reduction in the well-being of at least one of the interacting parties. Moreover, from the S-D Logic perspective on service innovations, this resource integration process is what enables the emergence of new resources or new interaction patterns, ultimately facilitating and enhancing VCC itself (Lusch and Nambisan, 2015).

Therefore, since digital-only banks adoption requires a shift in behavioral patterns related to service usage (Nel and Boshoff, 2021a), customers who face this change must integrate new resources or modify existing resource integration processes, even though the previous condition already enabled them to co-create value. As a result, we could hypothesize that in some cases, innovation-including the transition from traditional to digital-only bank-inevitably leads to a temporary decline in the well-being of the interacting parties. However, this decline could be interpreted as a necessary phase, allowing new resources and new integration methods to be internalized by the interacting systems. In the long term, this adaptation could enable a higher level of well-being compared to the pre-innovation stage, ultimately fostering greater VCC. If VCD could be a possible consequence of introducing innovation, the real challenge lies in overcoming the barriers that hinder its adoption, which, from a strategic communication perspective, depends on organized listening activities and reflective communication. In highly dynamic contexts where a gradual transition may be less profitable, due to increasing competitive pressures coupled with barriers that prevent consumers from embracing change, reflective communication activities may force traditional banks to a more disruptive approach to breaking down these barriers, intentionally inducing VCD to facilitate greater co-creation in the long run.

Therefore, this study aims to explore how strategic communication can lead top management to choose to implement the forced transition of consumers from traditional banking services to a digital-only model in order to accelerate the acceptance of digital innovations in the banking sector that while could result in a short-term increase in VCD, it may ultimately be a necessary step to unlock the long-term co-creation opportunities offered by digital-only banks.

To this end, we use the Italian case of Intesa Sanpaolo's transfer of predominantly digital customers to its digital-only bank (Isybank) without explicit customer consent. The transition was made using a communication strategy that neither clearly communicated the transfer nor provided customers with an easily accessible opportunity to oppose it. The

case sparked considerable controversy among consumers, but Isybank itself framed the operation as a success, despite the reputational damage suffered. In this context, the VCD for transferred customers can be attributed to the absence or inadequacy of communication from the banking group (Smith, 2013; Järvi et al., 2018) that may have been a deliberate strategic choice. By limiting customer awareness of the implications of the transfer, the bank potentially overcame resistance to innovation, ensuring the adoption of a digital-only model that is considered essential for the sector's long-term development (Lee and Kim, 2020). For the purpose of this paper, we assume that the voluntary VCD by Intesa Sanpaolo may have been driven by the top management's organized listening activities: noticing the rapid growth of digital-only banks in Europe and the need to remain competitive (Statista, 2025; European Central Bank, 2021), and considering Italy's low digitalization rate (ISTAT, 2023), the company likely decided to leverage, even if it required a more forced approach, the segment of Italian users already familiar with digital platforms to innovate and stay competitive in the sector.

Thus, to determine whether this forced transition resulted in short-term VCD to enable long-term VCC, we will employ a sentiment analysis using negative sentiment as a proxy for a decline in well-being-and thus an indicator of VCD. This will allow us to examine whether, over time, negative sentiment decreases while positive sentiment increases, signaling a shift toward the acceptance of digital-only banking.

Methodology.

The Intesa Sanpaolo-Isybank case

As part of its digital transformation strategy, Intesa Sanpaolo, a leading Italian banking group, launched Isybank, its digital-only bank, in June 2023. It involved the automatic transfer of over 2 million Intesa Sanpaolo customers to Isybank in two phases: 300,000 customers were transferred in October, while the remaining ones moved in March, without their explicit consent, generating significant dissatisfaction. A critical aspect concerned Intesa Sanpaolo's communication strategy regarding the transition. Customers reported that the information was disseminated solely through the bank's online platform and mobile app, with minimal emphasis and during the summer holiday period, failing to effectively convey the significance of the change. As a result, many customers remained unaware of the transfer and only discovered it after the deadline to oppose it had passed, often finding that their contractual terms and services had changed (Forbes, 2024). In November 2023, the Italian Antitrust Authority ruled that this communication strategy was misleading and aggressive, allowing the first tranche to revert to their original contract and requiring explicit consent for the second. Another key aspect is that the bank strategically selected a segment of customers for the transfer. Those affected were classified as "predominantly digital customers", meaning they were under 65, had never visited a physical branch or did so occasionally, held assets below €100,000, and did not own complex financial products or insurance policies. By targeting customers who already relied on digital banking, Intesa Sanpaolo aimed to optimize costs and increase profitability, assuming minimal friction in transitioning to a fully digital service. This strategic selection may explain why complaints focused on the transition process rather than on Isybank services.
