Tertiarization & sustainability. New challenges for management in the digital era

12-13 June 2025

Conference Proceedings

Short Papers

edited by

Arabella Mocciaro Li Destri, Marta Ugolini and Lara Penco

Conference chairs

GUIDO CRISTINI	*University of Parma*
BEATRICE LUCERI	*University of Parma*
ARABELLA MOCCIARO LI DESTRI	*University of Palermo - SIMA*
MARTA UGOLINI	*University of Verona - Sinergie Italian Journal of Management*

Coordinators and co-coordinators of Conference track and SIMA thematic groups

GUIDO BORTOLUZZI	*University of Trieste*
ANNA PAOLA CODINI	*University of Brescia*
MARIA COLURCIO	*Magna Graecia University of Catanzaro*
ELISA CONZ	*University of Pavia*
ALESSANDRA COZZOLINO	*Sapienza University of Roma*
GIOVANNI BATTISTA DAGNINO	*LUMSA University*
ALFREDO D'ANGELO	*Cattolica del Sacro Cuore University*
PATRIZIA DE LUCA	*University of Trieste*
MARIA DELLA LUCIA	*University of Trento*
NADIA DI PAOLA	*Federico II University of Naples*
ROSANGELA FEOLA	*University of Salerno*
MARCO FREY	*Scuola Superiore Sant'Anna of Pisa*
EMANUELE INVERNIZZI	*IULM University*
ELISA MARTINELLI	*University of Modena and Reggio Emilia*
DIEGO MATRICANO	*Vanvitelli University of Campania*
ANNA MENOZZI	*University of Piemonte Orientale*
ANDREA PICCALUGA	*Scuola Superiore Sant'Anna of Pisa*
MASSIMO PICONE	*University of Palermo*
SIMONE POLEDRINI	*University of Genova*
ANGELO PRESENZA	*University of Molise*
ANDREA RUNFOLA	*University of Perugia*
ANGELOANTONIO RUSSO	*LUM University*
IVAN RUSSO	*University of Verona*
ALFONSO SIANO	*University of Salerno*
RICCARDO SPINELLI	*University of Genova*
MARIA VERNUCCIO	*Sapienza University of Rome*
MASSIMILIANO VESCI	*University of Salerno*
CRISTINA ZERBINI	*University of Parma*
ANTONELLA ZUCCHELLA	*University of Pavia*

Organizing committee

MICHELE BADOLATO	*University of Genova*
CLARA BENEVOLO	*University of Genova*
NICOLETTA BURATTI	*University of Genova*
ANDREA CIACCI	*University of Genova*
ALICE MANTOVANI	*University of Genova*
SIMONE POLEDRINI	*University of Genova*
GIORGIA PROFUMO	*University of Genova*
ROBERTA SCARSI	*University of Genova*

To the reader,

this volume contains the short papers of the Sinergie-SIMA 2025 Management Conference, hosted by the University of Genova on June 12th and 13th 2025.

Tertiarization is one of the most salient profiles of the structural change and economic development that have characterized the recent decades (Jorgenson & Timmer, 2011). The growth of the service industry affects multiple sectors, e.g. wholesaling/retailing, tourism/hospitality, transport and logistics, health services, public administration, education, communication, banking and financial services, and B2B services (Baines *et al.*, 2017; Barrett *et al.*, 2015).
This growing relevance of services in the economy and the society has stimulated a broader interdisciplinary debate, e.g., the impact of tertiarization on the performance of the entire economic system, the innovation and digitalization of services, and the applicability of service management issues for the transformation of product-based business models.
Based on these premises, the 2025 Sinergie-SIMA Conference aims to explore the role of services as part of the evolution of society in terms of relevance, growth, competitiveness, innovation, but also sustainability and well-being. The lens of analysis used to explore this phenomenon will be digitalization, as it is shaping service innovation in more traditional sectors (e.g., social and sanitary services, tourism, retailing, etc.) and it is boosting knowledge-intensive business services (KIBS). Thus, digitalization is a key driver of the business model transformation, facilitating the transition of manufacturing firms towards digital servitization, enabling a new automation frontier (Frank *et al.*, 2019; Kastalli & Van Looy, 2013; Liu *et al.*, 2024), and paving the way for new opportunities for value creation within the global economy (Ostrom *et al.*, 2015).
The application of digital technologies to services (e.g., Artificial Intelligence, Big Data Analytics, Internet of Things, Machine Learning, Additive Manufacturing, Virtual Reality, Augmented Reality, Metaverse) also facilitates the pursuit of relevant environmental and social issues, for example contributing significantly to the achievement of greater systemic efficiency that help attain the Sustainable Development Goals (SDGs) and circular economy (Xing & Liu, 2023). Leveraging advanced technologies enables the extraction of valuable insights from vast amounts of information, facilitating informed decision-making, personalized service offerings, optimizing service delivery processes, and enhanced customer experiences (Chauhan *et al.*, 2022). Big data plays a strategic role in developing novel solutions that address evolving societal challenges, while driving sustainable growth and innovativeness in the digital era (Cappa *et al.*, 2022; Ciampi *et al.*, 2021; Mikalef *et al.*, 2019). Therefore, the real challenge today is to harness the application of digitalization to enhance the service-oriented approach and empower companies' economic, social, and environmental performances, generating and consolidating greater trust and loyalty among their employees, customers, and suppliers for a more sustainable, inclusive, and better society (Shaukat *et al.*, 2016).
AIDEA devoted a Conference to the tertiarization and new challenges for management and governance 25 years ago in Genoa, and many scholars focused on these topics from multiple perspectives and with original approaches.
The 2025 Sinergie-SIMA Genoa Conference, in continuity with the past, is an excellent opportunity to discuss our community's research efforts in the service economy and management, in order to identify new effective solutions suitable to face the current digital era. Different theories, methodological approaches, and units of analysis are required to generate scientific research impacting theories but also outlining wide-ranging strategies that can offer valuable insights to business leaders, companies, and institutions. More precisely, the Conference was a great occasion to discuss the research efforts of our research community within tracks related to the:

- Conference theme (Tertiarization & sustainability. New challenges for management in the digital era),
- SIMA thematic groups (Artificial intelligence in management, Entrepreneurship, Innovation & Technology Management, International Business, Marketing, Purpose-driven Businesses,

Retailing & Service Management, Small & Family Business, Strategic Communication, Strategy & Governance, Supply Chain Management, Logistics & Operations, Sustainability, and Tourism & Culture Management),
- Management Case Studies.

The Conference call for papers gave the opportunity to submit either short and long papers. Overall, the editorial staff received 311 submissions of which 263 short papers and 49 long papers.

For the *short and long papers*, the evaluation followed the peer review process, with a double-blind review performed by, respectively, one and two referees - university lecturers and experts about the topic - selected among SIMA and the community of Sinergie members.

In detail, the referees applied the following criteria to evaluate the submissions:
- clarity of the research aims,
- accuracy of the methodological approach,
- contribution in terms of originality/innovativeness,
- theoretical and practical contribution,
- clarity of communication,
- significance of the bibliographical basis.

The *peer review* process resulted in full acceptance or rejection of the submissions. In the case of disagreement among reviewers' evaluations, the decision was taken by the Chairs of the SIMA thematic groups or conference track. Each work was then sent back to the Authors together with the referees' reports. The suggestions received by the referees were used by the Authors during the presentation of their research works at the Conference.

The evaluation process ended with the acceptance of 293 papers (249 short papers and 44 long papers). This volume proposes the short papers whose Authors have authorized their publication.

All the short papers published in this volume were presented and discussed during the Conference and published online on the web portal of Sinergie-SIMA Management Conference (**https://www.sijmsima.it/**).

While thanking all the Authors, Chairs, and participants, we hope that this volume will contribute to advancing knowledge about tertiarization and sustainability in management.

The Conference Chairs

Lara Penco, Arabella Mocciaro Li Destri, and Marta Ugolini

SUMMARY

Track 1 - Artificial Intelligence in Management

AI adoption in the workplace: Cognitive and Emotional Appraisals
GIULIA GOGIALI, FABIOLA SFODERA, ANDREA LAUDADIO, LUCA DEZI PAG. 3

How self-verification experiences and self-concept clarity jointly shape job applicants' responses to AI
VALERIO DERIU, MARTINA DI CIOCCIO, ANDREA MONTEFUSCO " 9

Data Discrimination and Algorithmic Challenges in AI copilots. A systematic literature review
CARMELA ELITA SCHILLACI, FEDERICO MERTOLI, LUIGI PIPER, LUCREZIA MARIA DE COSMO, GIANLUIGI GUIDO " 15

Lights and Shadows in the Governance of Generative AI Firms: a preliminary approach
FRANCESCO LAVIOLA, ROBERTO ARGIOLAS, CARMELA DI GUIDA " 21

Il Web3 incontra l'AI. Verso nuovi modelli di business decentralizzati e generativi
FRANCESCO FASANO, CHIARA BARTOLI, FRANCESCO CAPPA, ENZO PERUFFO, PAOLO BOCCARDELLI " 29

The Future of Education: reframing skills and learning in the age of artificial intelligence
CHIARA BARTOLI, FEDERICO CESCHEL, LORENZA GERARDI, LUCIA MARCHEGIANI, ENZO PERUFFO " 37

Leveraging AI for Internationalization: The Role of Artificial Intelligence in the Global Expansion of Italian Startups
NOHAILA KARTTI, CHIARA CANNAVALE " 43

The Role of International Knowledge in China's Artificial Intelligence Ecosystems
JACOPO CRICCHIO, SAVERIO BARABUFFI, ALBERTO DI MININ " 49

Generative Artificial Intelligence in the healthcare ecosystem: a game-changer for performance measurement
ANNA BASTONE, FRANCESCO SCHIAVONE, DANIELE LEONE, ANDREA GARGIULO " 55

Human-Based vs. AI-Based Diagnosis for Anamnesis Tertiarization: The Roles of Patients' Psychological Adaptation and e-healthcare Ethical Concern
ANDREA SESTINO, SIMONE GUERCINI " 61

L'impresa del post-umano: il lato oscuro della transizione digitale nelle dinamiche aziendali
PAOLO BARILE, GERARDO BOSCO, RAFFAELE D'AMORE " 67

The Intelligence Gap: Merging Explainable AI with Managerial Perception for Proactive Crisis Strategy
DAVIDE LIBERATO LO CONTE, GIUSEPPE SANCETTA, RAFFAELE D'AMORE " 75

Stakeholder Engagement and Social Sustainability Practices in Innovative Italian SMEs: The Mediating Role of Artificial Intelligence
LORENZO TURRIZIANI, VINCENZO DELL'ANNO, CRISTINA CERVINO, VALERIO MUTO " 83

Using Artificial Intelligence for Improving Sustainability in Smart City
ANGELO RIVA " 91

The Circular Revolution Is Served: AI Strategies for Sustainable Competitive Advantage
MAURO SCIARELLI, ANNA PRISCO, MARTINA PERCUOCO, VINCENZO DELL'ANNO " 95

Donor preferences between search engines and Large Language Models (LLMs): Transforming donor decision-process in non- profit fundraising
ALESSANDRO SIGNORINI, ALESSANDRO FERI " 101

AI tra impatti di (post) management e decisioni verso trans-disciplinarietà e algoretica
LUCIANO PILOTTI " 107

The Trade-off Between Data Privacy and Personalization in the Financial Sector: Can Generative AI be a moderator in Gen Z's Investment Decisions?
MARCO VALERIO ROSSI, IRENE FULCO, FRANCESCA FAGGIONI, BARBARA AQUILANI PAG. 115

Unveiling the Dark Side of Technological Innovation: Navigating the Sustainability Challenges of Generative Artificial Intelligence– A Preliminary Exploration

Track 1 –
Artificial Intelligence in Management

AI adoption in the workplace: Cognitive and Emotional Appraisals

GIULIA GOGIALI [1] FABIOLA SFODERA [2] ANDREA LAUDADIO [3] LUCA DEZI [4]

Abstract

The introduction of Artificial Intelligence (AI) technologies in the workplace is reshaping organizational dynamics and employee experiences. This study explores the role of primary and secondary appraisals in shaping employees' reactions to AI adoption, specifically focusing on the introduction of AI tools in a large organization. Data from a survey of 507 employees were analyzed using multiple linear regression and descriptive statistics, revealing significant relationships between dimensions of personal well-being, including positive emotions and economic security in the PERMA+ model, and employees' overall secondary evaluations, which include assessment of available resources, emerging through workplace wellbeing, life wellbeing, psychological wellbeing, and resulting emotions as reactions. The findings revealed that dimensions of the PERMA+ had a significant impact on employees' life and workplace wellbeing. The analysis showed that employees who perceived the AI adoption positively, particularly in terms of emotional engagement and financial stability, reported higher levels of wellbeing. Additionally, emotions like Happiness, Anger, and Sadness significantly influenced both life and psychological wellbeing, highlighting the importance of emotional regulation in shaping coping strategies and employees' overall adaptation to AI integration. The results underscore the importance of both cognitive evaluations and emotional responses in shaping employees' ability to cope with AI. These findings provide valuable insights for managers, highlighting the need to address employees' emotional needs and wellbeing during AI transitions to facilitate smoother adoption and promote long-term organizational success.

Framing of the research. *The integration of Artificial Intelligence (AI) into workplaces is accelerating globally, significantly impacting organizational dynamics and employee experiences (Zhang, 2024). In Italy, AI adoption has experienced remarkable growth, with the percentage of enterprises with at least ten employees using AI technologies increasing from 5.0% to 8.2% within a year, although it remains below the EU27 average (ISTAT, 2025). Numerous studies have highlighted the significant advantages AI offers to businesses, including enhanced operational efficiency and cost reduction (Wamba-Taguimdje et al., 2020; Tariq et al., 2021; Huang & Rust, 2020). The growing presence of AI in corporate management is reshaping decision-making processes, leadership approaches, and human resource strategies. AI-driven analytics enable organizations to optimize workforce planning, automate routine tasks, and enhance predictive decision-making, leading to more data-driven and strategic management practices (Leyer & Schneider, 2021; Trunk et al., 2020). However, while AI adoption provides efficiency gains, it also introduces new challenges for employees, including concerns over job displacement, shifting skill requirements, and increased performance monitoring (Malik et al., 2021; Koo et al., 2020; Braganza et al., 2020; Kong et al., 2021). These transformations require employees to adapt continuously, influencing their levels of workplace stress, motivation, and overall job satisfaction (Cheng et al., 2022; Kong et al., 2021).*

In response to the challenges arising from the introduction of AI in the workplace, employees adopt various coping strategies to manage the psychological and emotional impact. Workplace stress has been associated with increased turnover and decreased productivity (Bridger et al., 2013), which can negatively affect management. The severity and specific outcomes of the stress process largely depend on how individuals cope with potentially threatening events, such as the pressures arising from AI adoption. These events are also known as "stressors" (Carver et al., 1989; Aspinwall & Taylor, 1997; Skinner et al., 2003; Inzlicht & Kang, 2010). Coping, in this context, refers to the dynamic process of adjusting one's thoughts and behaviors to handle specific internal or external pressures that are perceived as challenging or surpassing an individual's available resources (Lazarus & Folkman, 1984). It helps to explain how stressors affect individuals, as well as when and why some people experience more or less detrimental consequences in terms of health and well-being (Skinner et al., 2003). It is important to highlight that there is both theoretical and empirical evidence that some types of coping strategies are more effective than others in mitigating the effects of stressors (Skinner et al., 2003; Britt et al., 2016).

Based on the Cognitive Appraisal Theory (CAT), this study examines the three phases of the appraisal process: (1) primary appraisal, employees evaluate whether the adoption of AI is relevant and whether it represents a challenge or threat; (2) emotional response, employees experience emotions based on their goals, values and evaluate the situation; (3) coping strategies, in which employees develop mechanisms to manage their emotions and adapt to technological change. However, there is a significant gap in the existing literature, as much of the research focuses mainly on stressors and coping responses (Caraver, 1997; McWilliams et al., 2003; Zhao et al., 2022), marginally neglecting specific factors related to primary and secondary appraisals (Lazarus & Folkman, 1984).

A crucial aspect of primary appraisal involves evaluating the goal relevance and goal congruence of AI adoption (Kornes et al., 2019). Goal relevance appraisal refers to the degree to which a given situation influences an individual's current goals, broadly encompassing personal concerns, values, and needs (Sander et al., 2019). In contrast, goal congruence appraisal evaluates whether the situation supports or hinders these goals (Moors et al., 2013; Sander et al., 2005). When a situation facilitates goal achievement it is perceived as goal-congruent. Conversely, if it obstructs goal attainment, it is considered goal-incongruent (Kornes et al., 2019). Beyond primary appraisal, employees also engage in secondary appraisal, where they evaluate their available resources to cope with AI-related changes (Lazarus & Folkman, 1984). The interaction between these two appraisal phases is crucial for understanding individual differences in how employees react to AI and the effectiveness of their coping strategies. Ultimately, the introduction of AI does not merely alter work tasks and organizational efficiency but also redefines employees' perceptions of their roles, professional security, and long-term career trajectories (Malik et al., 2021). Understanding how individuals cognitively and emotionally respond to AI integration is essential to assessing its broader implications for employee well-being. As AI adoption progresses, organizations must consider not only its functional benefits but also the psychological impact on employees, fostering a work environment that supports positive adaptation and long-term engagement.

Purpose of the paper. *This study aims to investigate how employees perceive and react to the introduction of AI in the workplace, analyzing their behavioral and emotional responses in relation to workplace well-being. While existing studies have primarily examined stressors and coping strategies, limited attention has been given to the secondary appraisal process through which employees interpret AI-related changes and determine their ability to manage them effectively (Lazarus & Folkman, 1984). Guided by the framework of positive organizational behaviour (Luthans, 2002), this study seeks to understand how employees' subjective evaluations of AI implementation shape their emotional reactions, and overall well-being. The research will address the following key question:*

RQ: How do employees' cognitive appraisals and emotional responses influence their adaptation to AI integration in the workplace?

By investigating the cognitive and emotional appraisal process, this study aims to provide a more nuanced understanding of employees' psychological responses to AI-driven transformations. The findings will contribute to both theory and managerial practice by offering insights into how organizations can effectively support employees in navigating AI transitions, fostering adaptability, well-being, and performance in the workplace.

Methodology. *This study employs a survey-based research design to investigate employees' perceptions, behaviors, and emotional responses to AI integration in the workplace. The survey was conducted within a large organization in the Telecommunication services that recently implemented the AI tool Copilot, allowing for an in-depth analysis of how employees across different roles and expertise levels experience this technological transition. The current sample includes 507 employees, providing a broad and diverse sample that captures variations in competencies, professional backgrounds, and exposure to AI-driven processes. However, data collection is still ongoing, and the results presented in this study represent an initial phase of the analysis. At present, approximately 60% of the target sample has been collected.*

Primary appraisals were assessed using the PERMA+ model (Donaldson et al., 2022), which explores employee well-being through dimensions such as engagement, meaning, accomplishment, and physical health. These emotions reflect the overall perception of AI in the workplace context, without delving into the specifics of how employees assess their personal resources to cope with technological changes. In contrast, emotional responses related to the evaluation of available resources in the secondary appraisal phase were measured using the Emotion Scale (Schmidt et al., 2010). This scale captures a broad spectrum of affective reactions to workplace experiences, such as frustration, anger, fear, anxiety, as well as hope, challenge, and other emotions tied to personal resource assessment in response to AI adoption. This distinction between primary and secondary appraisals helps mitigate methodological overlap, treating workplace wellbeing separately from the emotional responses related to coping resources in the face of technological change.

Therefore, coping resources were measured with the Employee Wellbeing Scale (Zheng et al., 2015), designed to capture employees' perceptions of their available resources in different areas: Phsycological, Life and Work wellbeing. The evaluation of available resources in this scale is measured through several dimensions including responsibilities, satisfaction, self-esteem, and time management. The collected survey data have been analyzed using SPSS, applying multiple linear regression analyses and descriptive statistics to examine the relationships between employees' appraisals of AI, their emotional responses, and employee wellbeing.

Results. *The overall model was found to be highly significant ($p < 0.001$), suggesting that the dimensions of the PERMA+ model have a significant impact on employees' Life Wellbeing. Dimensions from PERMA+, such as Positive Emotions, Engagement, Relationships, Accomplishment, Physical Health, and Economic Security emerged as significant factors with the greatest impact, indicating that employees' life satisfaction is closely linked to their wellbeing and success, both in emotional dimensions and work practices. Among these, Positive Emotions and Economic Security were found to be particularly decisive, highlighting that emotional wellbeing and financial security are crucial for a fulfilling life. Regarding wellbeing in the workplace, the regression analysis revealed that Positive Emotions had a particularly strong effect, followed by Work Meaning and Mindset, demonstrating that employees who perceive greater emotional engagement and have a strong mindset in their work, particularly following the introduction of Copilot, experience higher wellbeing at work. Additionally, the employees' roles within the organization showed that those in relational positions or with greater alignment to Mindset report higher levels of workplace wellbeing.*

Therefore, these preliminary results indicated a strong correlation ($R = 0.755$), explaining 57% of the variance in Psychological Wellbeing in the secondary appraisals. The significant factors in this case were Economic Security, Accomplishment, Relationships, and Physical Health, all of which had a positive effect on psychological wellbeing. This suggests that employees who perceive positive impacts on economic factors, a sense of accomplishment, and their interpersonal relationships experience significant improvements in their psychological wellbeing.

Moreover, these preliminary results on emotions revealed that emotions such as Anger, Happiness, and Sadness significantly influence Psychological Wellbeing, Life Wellbeing, and Workplace Wellbeing dimensions, suggesting that the management and balancing of emotions in relation to daily challenges play a crucial role in overall wellbeing. Emotions, therefore, are not only indicators of psychological health but also key predictive factors in determining employees' responses to the introduction of technologies like AI. These emotional responses not only serve as indicators of psychological health but also appear to be key factors in shaping employees' coping mechanisms and, ultimately, their overall wellbeing (Lazarus & Folkman, 1984).

The perception of AI adoption as a challenge or threat played a crucial role in determining the coping strategies employed by employees. Those who perceived AI integration as a challenge were more likely to adopt problem-focused coping strategies, such as acquiring new skills, integrating AI into their workflows, and leveraging technology to enhance performance. This aligns with existing research, which suggests that individuals who view a situation as challenging are more likely to engage in proactive coping mechanisms, such as learning and problem-solving (Carver et al., 1989; Lazarus & Folkman, 1984). Conversely, employees who viewed AI adoption as a threat were more likely to rely on emotion-focused coping strategies, such as avoidance or stress-reduction techniques. When employees perceive AI as a threat to job security or autonomy, higher levels of anxiety, frustration, and other negative emotions are often experienced, leading to the use of emotion-regulation strategies (Aspinwall & Taylor, 1997). These findings underscore how emotional reactions to AI adoption can shape coping mechanisms and ultimately influence overall wellbeing.

In summary, the preliminary results suggest that the introduction of Copilot as an AI tool has a significant impact on employees' wellbeing, primarily influenced by the emotional and relational dimensions of the PERMA+ model. Positive Emotions, Accomplishment, and Economic Security were key determinants in shaping employees' wellbeing in this context. Additionally, emotions such as Happiness, Anger, and Sadness demonstrated correlations with overall wellbeing, highlighting the importance of emotional responses in shaping employee coping strategies and wellbeing.

Research limitations. *A primary limitation of this study is that it is still in the preliminary stages, with data collection ongoing. As such, the findings presented are based on an incomplete dataset, which may restrict the generalizability of the results. Additionally, the sample consists exclusively of employees from a single organization, which may introduce sampling bias and limit the extent to which the findings can be generalized to other organizations or industries. Furthermore, the study examines the introduction of a single AI technology, Copilot, which may not fully capture the range of employee responses to different AI tools or technologies. These factors may constrain the external validity of the study, indicating the need for further research to corroborate the findings and assess their broader applicability across different contexts and technological implementations.*

Managerial implications. *The findings of this study offer significant managerial implications for organizations seeking to effectively manage the introduction of AI technologies, such as Copilot, and to support employees through these transitions. A key insight is that emotional responses are integral to employees' overall wellbeing and their ability to adapt to technological innovations. Understanding the emotional dynamics associated with AI adoption is essential for managers, as emotions can substantially influence both the acceptance of new technologies and the long-term success of their integration within the organization. Organizations must recognize the pivotal role emotions play in shaping employees' experiences and outcomes during technological transitions. By addressing and actively managing these emotional responses, managers can foster an environment conducive to resilience and adaptability. Specifically, cultivating positive emotional experiences and ensuring employees perceive meaning and accomplishment in their work can enhance their capacity to embrace technological change. Additionally, considering the potential emotional barriers posed by employees' prior experiences with technology, organizations may benefit from implementing targeted interventions, such as comprehensive training programs and proactive emotional support. These initiatives should aim to alleviate negative emotions, such as anxiety or resistance, by providing clarity and transparency about the AI introduction and ensuring that employees feel supported throughout the transition.*

In conclusion, the results suggest that organizations must adopt a holistic approach when introducing AI technologies, one that considers not only the technical and operational aspects but also the emotional and psychological dimensions of the change process. By prioritizing the management of emotional responses and supporting employee well-being, organizations can facilitate a smoother integration of AI, thereby enhancing overall employee satisfaction, productivity, and organizational performance in the long term.

Originality of the paper. *This paper offers a distinctive and valuable contribution to the existing body of literature by investigating the emotional and psychological responses of employees to the introduction of AI technologies in the workplace. While much of the current literature primarily focuses on stressors and coping mechanisms, this study shifts the emphasis towards the cognitive appraisal process, particularly primary and secondary appraisals, which are fundamental in shaping employees' emotional reactions and overall wellbeing. By integrating well-established frameworks such as the PERMA+ model and the Employee Wellbeing Scale, the research provides a novel perspective on how employees assess AI-induced changes and the subsequent impact on their emotional and behavioral outcomes.*

Additionally, this study uniquely concentrates on the introduction of a specific AI tool, Copilot, and its effects on employee emotions, an aspect rarely addressed in the literature. This focus on the affective dimensions of AI adoption offers important insights into the psychological impacts of technology integration, particularly in relation to emotional responses such as positive and negative affect. The study enhances the understanding of how cognitive and emotional processes influence employees' adaptation to technological transformations in organizational contexts. Therefore, the originality of this study lies in its innovative approach to examining the interplay between cognitive evaluations, emotional responses, and AI adoption, thus advancing the understanding of the human experience in the face of technological change within the workplace.

How self-verification experiences and self-concept clarity jointly shape job applicants' responses to AI

VALERIO DERIU[1] MARTINA DI CIOCCIO[2] ANDREA MONTEFUSCO[3]

Abstract

Despite the growing use of artificial intelligence in hiring practices, job applicants remain hesitant about this technological solution. What factors contribute to the low acceptance rate, and are all job applicants equally impacted? Across three controlled experiments, we demonstrate that job applicants perceive lower self-verification (i.e., the degree to which individuals feel that others understand them based on their own self-perceptions) when evaluated by an AI (vs. a human) agent, which reduces their job acceptance intentions (Study 1). Study 2 demonstrates that the low perceived self-verification with AI evaluation agents decreases applicants' perceived person-organization fit (P-O fit) (i.e., the extent to which a person's core values and beliefs align with those of the hiring organization), thereby decreasing applicants' job acceptance intentions. Using a serial moderated mediation model, we show that these effects are stronger among job applicants who score high on self-concept clarity (Study 3). These findings enhance our understanding of the factors influencing applicants' job acceptance intentions regarding AI and offer practical insights for effectively integrating AI into hiring practices.

Framing of the research. *In recent years, advancements in artificial intelligence (AI) are transforming organizational culture and work processes (Volpentesta et al., 2023; Urbani et al., 2024); hiring practices are no exception (Deriu et al., 2024; Meijerink & Bondarouk, 2023). One such advancement is the implementation of AI evaluation agents to assess job applicants in a selection process (van Esch & Black, 2019; Mirowska et al., 2020). These AI-driven systems are increasingly utilized to automate key recruitment functions, including reviewing application documents, screening candidates, and analyzing job interview data (Cheng & Hackett, 2021). By streamlining these tasks, organizations can achieve greater efficiency, reducing travel costs and shortening time-to-hire (Brenner et al., 2016; Malik et al., 2023). This efficiency gain, alongside the broader digital transformation of workplaces, has fueled the rapid adoption of AI in recruitment and growing academic interest in its implications for hiring practices (Pan & Froese, 2021).*

Despite its rising popularity, AI-based selection processes remain controversial. Emerging evidence suggests that job applicants often react negatively to AI-driven hiring, with 71% of Americans opposing the use of AI in assessing job candidates (Rainie et al., 2023; Gonzalez et al., 2022). Indeed, efficiency alone does not necessarily determine the success of AI-driven selection processes, as individuals may prefer engaging with entities that they perceive as more relatable (Di Cioccio et al., 2024). As a result, organizations should consider not only the functional benefits of AI in hiring but also the psychological factors that influence candidate acceptance of this new technological solution.

Purpose of the paper. *This research enhances our understanding of the factors that influence job applicants' reactions to AI by providing a new explanation for why some applicants may respond negatively to AI usage in hiring and examining whether this response is consistent among different types of job applicants.*

We base our investigation on self-verification theory (Swann, 1987), which suggests that individuals strive to express their self-concept through their actions and adjust their behaviors to receive accurate social feedback. Self-verifiers prefer certainty and tend to avoid risks, seeing inaccurate interpretations from others as a threat (Cowan & Dai, 2014). Self-verification theory suggests that experiences related to self-verification can influence individuals' attitudes and behaviors (Booth et al., 2019; Gardner & Prasad, 2021). For example, Booth et al. (2019) found that employees' reactions to social undermining by supervisors-where a supervisor deliberately tries to obstruct employees' successes-can be predicted by their perceptions of self-verification and their feelings of being understood. However, despite the significance of self-verification in various organizational contexts, the effect of self-verification on job applicants' reactions to the use of AI in hiring has not yet been explored.

We propose that the subjective experience of self-verification may explain why job applicants tend to respond negatively to AI agents compared to human evaluators in terms of job acceptance intentions, which is a crucial hiring outcome that demonstrates an organization's capability to fulfill its labor needs (Harold et al., 2016). Specifically, we expect job applicants to feel less self-verified when assessed by an AI agent, as they may view it as less capable than

DOI 10.7433/SRECP.SP.2025.01

humans in understanding their true selves, experiences, or personalities. Further, we believe that applicants' self-verification experiences will influence their behavioral intentions, such as job acceptance, by shaping their perception of how well they would fit with the hiring organization. This perception, known as Person-Organization (P-O) fit (Bretz & Judge, 1994), refers to the alignment between individuals' values, beliefs, and personalities and the organizational culture, norms, and values (Kristof, 1996). In particular, we expect job applicants to feel less understood and receive less accurate social feedback (i.e., lower self-verification) when evaluated by AI rather than a human evaluator. As a result, they might experience a decreased alignment between their values, goals, and personality and those of the organization. This misalignment could reduce the sense of Person-Organization (P-O) fit.

Furthermore, previous research indicates that individuals differ in their self-verification perceptions (Booth et al., 2019). Thus, individual differences may further influence how applicants' perceptions (e.g., self-verification) and behavioral intentions develop during the job selection process. One such difference might be self-concept clarity, which refers to the extent to which people have a clear and coherent sense of who they are-whether they perceive that the traits, goals, preferences, and beliefs, that make up their self-concept are internally consistent and remain stable over time (Anseel & Lievens, 2006; Emery et al., 2018). Drawing on self-verification theory, we propose that self-concept clarity can predict various perceptions in a selection process, particularly self-verification perceptions, depending on whether the evaluator is human or AI (Nash, 2023; Wang & Yu, 2022), subsequently influencing job applicants' responses to the selection process.

We conducted three experimental studies focused on employment interviews to test our hypotheses. In these studies, we developed scenarios in which applicants were evaluated by either human decision-makers or AI-based tools. Specifically, we focused on asynchronous video interviews, which are becoming an increasingly popular job interview in which applicants record videos of themselves answering a set of predetermined questions on camera (Deriu et al., 2024).

Figure 1. The full conceptual model with the associated studies.

Methodology. *The sample for Study 1 included 150 U.S. respondents (86 females, Mage = 36.95, SD = 11.80). Study 2 also involved 150 participants from the U.S. (79 females, Mage = 36.71, SD = 12.11). Data for Study 3 were collected from 241 U.S. respondents (180 females, Mage = 38.24, SD = 12.98).*

Participants were recruited through Prolific, with screening criteria ensuring they were actively seeking employment. Each study employed a 2 (evaluation agent: AI vs. human) × 1 between-subjects experimental design. Respondents were randomly assigned to one of two conditions. In the "Human Hiring Manager" condition, participants were told that a human hiring manager with over 10 years of experience would analyze and score their interview responses. In the "AI Evaluation Agent" condition, participants were informed that the company's AI algorithms, trained on 10 years of hiring

data, would assess their responses. Three manipulation checks confirmed that participants accurately perceived the evaluation condition to which they were assigned in each study.

All three studies used pre-validated Likert-scale items to measure self-verification (Amarnani et al., 2022) and job acceptance intentions (Highhouse et al., 2003). Additionally, Study 2 included a measure of perceived person-organization fit (Cable et al., 2012), while Study 3 incorporated self-concept clarity as a moderating variable (with higher scores indicating lower clarity), using items from Campbell et al. (1996). Mediation and moderation analyses were conducted using PROCESS macro models (Hayes, 2017)..

Results. *Study 1 revealed that the use of AI evaluation agents lead to lower job acceptance intentions compared to the human hiring manager (M_{AI} = 4.25 vs. M_{human} = 4.99, t (148) = 3.39, p < .001, d=0.55). Mediation analysis confirmed that AI negatively affected self-verification (b = -0.95, SE = 0.25, t = -3.79, p < .001), which in turn reduced job acceptance intentions (b = 0.46, SE = 0.06, t = -7.42, p < .001). The resulting 95% CI indicated the presence of a "full" mediation given the significant indirect effect (b = -0.43, 95% CI = -0.72, -0.19) and with the direct effect being not significant (b =- 0.31, 95% CI = -0.70, 0.08). As for covariates, we found no statistically significant effects of gender and age.*

Study 2 corroborated that AI evaluations lower job acceptance intentions (M_{AI} = 4.67 vs. M_{human} = 5.45, t (148) = 3.42, p < .001, d=0.56). Serial mediation analysis confirmed that AI negatively influenced self-verification (b = -1.01, SE = 0.24, t = -4.26, p < .001), which reduced perceived person-organization fit (b = 0.56, SE = 0.06, t = 9.42, p < .001), ultimately decreasing job acceptance intentions (b = 0.54, SE = 0.08, t = 6.50, p < .001). Moreover, the indirect effect (b = -0.31, 95% CI = -0.52, -0.15) led the direct effect to become not significant (b = -0.31, 95% CI = -0.68, 0.06), indicating the presence of a "full" mediation. Results remain unchanged even after controlling participants' gender and age.

Study 3 confirmed that the AI evaluation agent generated lower job acceptance intentions compared to the human hiring manager (MAI = 4.86 vs. Mhuman = 5.41, t (239) = 3.18, p = .002, d=0.41). In addition, results revealed that the negative effect of the AI evaluation agent on candidates' self-verification was characterized by the significant and positive interaction with candidates' self-concept clarity (b = 0.35, SE = 0.14, t = 2.52, p = 0.013). Candidates with a clear self-concept preferred human evaluations. However, this difference disappears for candidates with lower self-concept clarity, who show no significant preference between being evaluated by the AI or a human. Specifically, individuals with self-concept clarity below 2 (i.e., very clear self-concept) perceived AI as significantly less capable than human evaluators (b = -1.15, SE = 0.29, t = -3.94, p < .001), whereas those above 5 (i.e., very unclear self-concept) perceived no difference (b = -0.11, SE = 0.27, t = -0.39, p = 0.695). Moreover, we found a significant moderated mediation on job acceptance intentions (index of moderated mediation = 0.08, 95% CI = 0.009, 0.178). The effect was sequentially driven by the impact of self-verification on perceived person-organization fit (b = 0.66, SE = 0.04, t = 15.48, p < .001), which finally affected job acceptance intentions (b = 0.36, SE = 0.07, t = 5.23, p < .001). As for the previous studies, age and gender had no significant impact.

Research limitations. *Our work has limitations that can provide guidance for future research. To make the information about the two evaluation agents comparable, we provided a straightforward description of the AI agent, specifically focusing on evaluating job interview performance. However, companies can consider additional features of AI. For instance, recent advancements in AI allow for assessing job applicants' personalities. Therefore, future research could conduct a more detailed investigation into how different AI features influence job applicants' responses.*

Second, our studies converged in showing that self-concept clarity affects job applicants' responses to AI. Future research should explore the influence of additional factors, such as how individuals manage their emotions in interpersonal contexts (Burley et al., 2020) and cultural factors, such as collectivism (Ma et al., 2024). Job applicants who are high in collectivism may have lower job acceptance intentions in AI-based selection processes compared to human-based ones, as they value human interaction more than interactions with machines.

Third, we recommend future research to investigate applicants' behavioral intentions toward AI evaluation agents while considering the role of contextual factors, such as the type of company they are applying to (e.g., international vs. domestic) (Galli & Majocchi, 2023; Mirowska & Mesnet, 2021).

Managerial implications. *The growing integration of AI in recruitment brings both advantages and challenges for organizations. While AI-powered hiring tools can improve efficiency and reduce costs (Malik et al., 2023), our research highlights key psychological factors that shape job applicants' acceptance of AI-driven selection processes.*

First, our findings emphasize the importance of integrating mechanisms that enhance self-verification in AI-driven hiring. Because AI lacks the interpersonal engagement of human-led evaluations, applicants may feel that their true selves are overlooked. Organizations should consider implementing AI systems that provide personalized and detailed feedback to counter this, reinforcing candidates' self-verification experiences. For example, AI-generated evaluations could offer tailored explanations of how applicants' skills and experiences align with job requirements, rather than presenting generic assessment results. For instance, Amazon has already started enhancing its recruitment process by leveraging conversational AI to deliver real-time, adaptive candidate feedback (Pant, 2024).

Second, this study highlights the moderating effect of self-concept clarity (SCC), suggesting that organizations could adopt more flexible recruitment strategies that allow candidates to choose their preferred evaluation method based on their SCC levels. A practical example of this approach is Unilever's AI-driven hiring process, where candidates can decide whether they want to be assessed by an automated system (AI) or a talent adviser (human recruiter) (The Guardian,

2019). This strategy aligns with our findings, enabling self-selection based on candidates' psychological traits, such as SCC. By offering this choice, Unilever effectively implements a candidate-driven segmentation approach, balancing efficiency with individual differences in self-verification needs. Alternatively, organizations could assess SCC levels early in recruitment to determine the most suitable evaluation method for each candidate. This could be achieved through brief pre-assessment questionnaires using validated SCC measurement scales (e.g., Campbell et al., 1996). While implementing these assessments may require additional resources, the long-term benefits, such as improved hiring decisions, lower turnover, and reduced organizational costs, may outweigh the initial investment. Research suggests that early-stage psychological assessments enhance candidate selection, ultimately leading to better hiring outcomes (Laurano, 2015; Mathews & Redman, 2001). Similarly, Roulin and Levashina (2019) found that personality and psychometric assessments provide valuable insights into candidates' traits, improving the selection process and leading to more successful recruitment. Organizations may ultimately increase job acceptance rates by tailoring hiring methods to align with candidates' psychological traits, a strategy consistent with prior research showing that identity-related factors play a crucial role in shaping attitudes and decision-making processes (e.g., Donato et al., 2024).

Originality of the paper. *Our research makes several contributions to the literature on the factors influencing AI acceptance in hiring practices (Mirowska, 2020). As AI becomes more prevalent in evaluating job applicants, it is essential for managers to understand the psychological factors that influence job applicants' reactions to AI-based versus human-based selection processes. While previous research on AI in hiring has explored various factors influencing AI acceptance, such as fairness (Noble et al., 2021) and trust (Deriu et al., 2024), the concept of self-verification has been overlooked. Self-verification theory (Swann, 1987) suggests that individuals need to express their self-concept through their actions to receive accurate social feedback. This need is critical in understanding people's responses in organizational settings (Booth et al., 2019; Smith et al., 2021). Accordingly, we built upon the self-verification theory (Swann, 1987) and contributed to the AI recruitment literature by demonstrating that self-verification experiences significantly influences applicants' job acceptance intention with AI (vs. human) evaluation agents. By doing so, we expanded the theoretical lens of research (Gilliland et al., 1993; Oostrom et al., 2023) on job applicants' responses to AI usage in hiring practices by introducing a new theoretical framework to this emerging technological selection context.*

Second, building on previous research that indicates individual differences can influence how applicants' perceptions (such as self-verification) and behavioral intentions evolve during the selection process (McCarthy et al., 2017), we drew on self-verification theory (Swann, 1987) to show that the negative impact of using AI to evaluate applicants in job interviews depended on their self-concept clarity. In doing so, this also contributes to the literature on the role of individual differences in hiring practices (McCarthy et al., 2017). Specifically, job applicants who scored high in self-concept clarity reported experiencing less self-verification when evaluated by an AI agent, which resulted in a lower likelihood of accepting a potential job offer. One possible explanation for this phenomenon is that individuals with a clear and consistent understanding of themselves may believe that an AI evaluation cannot provide personal feedback that aligns with their self-image. As a result, they might feel that the AI's assessment does not accurately reflect or validate their self-perception. Consequently, they may be more inclined to value a human's judgment over that of an AI.

Third, we enriched our knowledge of the factors influencing job acceptance intentions (Harold et al., 2016). Our findings reveal that job applicants perceive a lower alignment-specifically, Person-Organization (P-O) Fit-between their values, beliefs, and personality and those of the hiring organization when being evaluated by an AI agent instead of a human agent. This misalignment contributes to a decrease in their intentions to accept a job offer.

Finally, by examining both job applicants' perceptions and individual differences (McCarthy et al., 2017), our research model facilitates theoretical advancements that can improve hiring managers' understanding of the factors influencing applicants' acceptance of AI. This, in turn, offers practical insights for hiring managers seeking to integrate AI into their selection processes and aims to reduce candidates' resistance to this increasingly common technology.

Keywords: *recruitment; artificial intelligence; self-verification; self-concept clarity; job acceptance*

Data Discrimination and Algorithmic Challenges in AI copilots. A systematic literature review

CARMELA ELITA SCHILLACI[1] FEDERICO MERTOLI[2] LUIGI PIPER[3]
LUCREZIA MARIA DE COSMO[4] GIANLUIGI GUIDO[5]

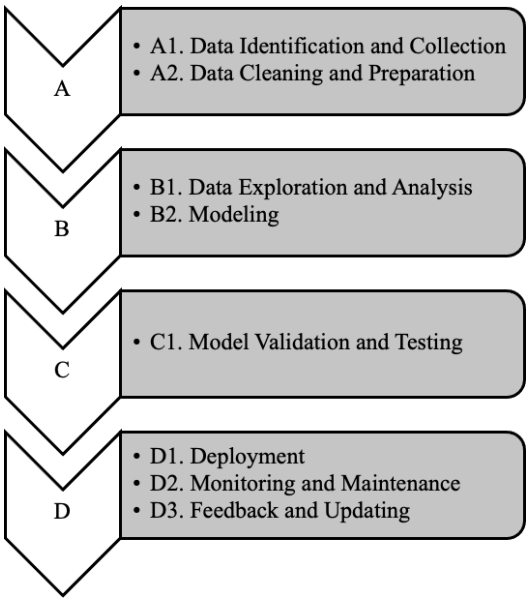
Abstract. *The rapid evolution of Artificial Intelligence (AI) has significantly impacted various sectors, including business, healthcare, and education. While AI offers enhanced efficiency and decision-making capabilities, it also raises critical ethical concerns, particularly regarding embedded biases. AI copilots, which function as virtual assistants in managerial decision-making, exemplify these challenges by integrating algorithmic biases influenced by societal norms, which can restrict open discussions on sensitive issues. This study seeks to systematically examine the presence of biases in AI copilots within managerial contexts, differentiating between biases originating from data and those stemming from algorithmic structures. Furthermore, it aims to develop effective mitigation strategies to deepen the understanding of bias propagation within AI systems. Utilizing a qualitative approach based on a systematic literature review, the research analyzes data extracted from selected academic sources to organize and synthesize key findings. The study identifies biases occurring across all phases of both the data lifecycle and the AI system lifecycle, highlighting their potential impact on managerial decision-making. Through a structured mapping and analysis, the research pinpoints the specific stages where biases are most prevalent and explores the factors contributing to their persistence. By offering a comprehensive perspective on bias formation and its consequences, this research provides valuable insights into AI ethics and its implications for organizational governance.*

Framing of the research. *Generative Artificial Intelligence (AI) has become increasingly relevant in managerial entrepreneurship due to its advanced learning and language processing capabilities (Gupta, 2024). It has been recently incorporated into Business Intelligence (BI) systems, enhancing data collection, analysis, and decision-making processes (Al-Eisawi et al., 2020). By leveraging these capabilities, generative AI is transforming business decision-making processes, positioning itself as an essential support tool, often referred to as a "copilot" for managers (Lim et al., 2023). AI copilots, acting as intelligent virtual assistants, assist managers in automating tasks, analyzing data, and improving operational efficiency (Dakhel et al., 2023).*

Despite these advantages, AI copilots also introduce ethical and operational concerns. Studies indicate that biases in training datasets can lead to discriminatory outcomes, particularly in hiring, where AI copilots have been found to favor male candidates based on historical hiring trends (Obermeyer et al., 2019; Varsha, 2023). In addition to biases derived from training data, AI copilots may also exhibit algorithmic vulnerabilities. Studies have shown that, through specific interactions, algorithms can be manipulated to bypass security measures, leading to unintended and potentially harmful responses, such as the disclosure of sensitive or illicit information (Jiang et al., 2024).

Biases in AI copilots can stem from both data and algorithmic structures, yet existing research does not always clearly distinguish between these sources. To bridge this gap, the present study aims to classify biases systematically. With reference to those originating from training data, we follow the framework proposed by Ashmore et al. (2021) to examine the key stages of dataset construction.

The framework consists of four primary stages (Figure 1): A. Data Management, B. Model Learning, C. Model Verification, and D. Model Deployment. Each of these stages is further broken down into specific phases to provide a more detailed and practical understanding of the AI copilot lifecycle.



Stage A focuses on Data Identification and Collection (A1) as well as Data Cleaning and Preparation (A2), underscoring the necessity of establishing a precise and dependable data foundation for AI copilots. Following this, Stage B covers Data Exploration and Analysis (B1) along with Modeling (B2), emphasizing the iterative nature of model

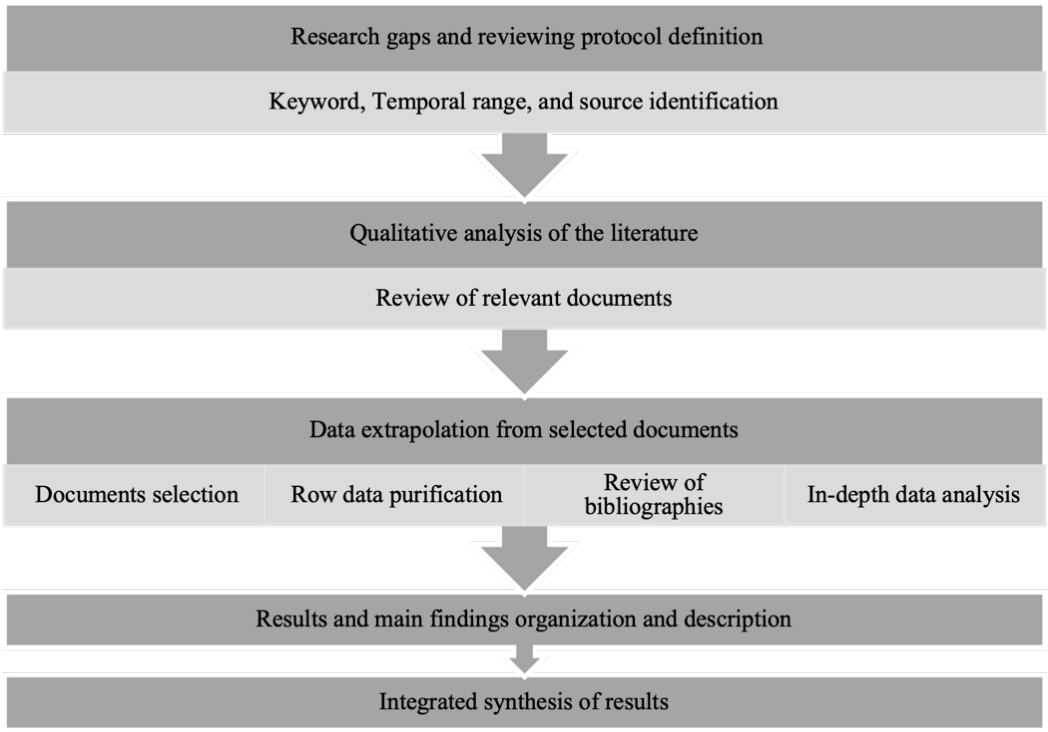
development, which progresses from an initial data assessment to the model's construction. Stage C integrates the Model Validation and Testing phase (C1), ensuring that the models perform effectively and fairly across diverse operational scenarios by evaluating their robustness and reliability. Finally, Stage D comprises Deployment (D1), Monitoring and Maintenance (D2), and Feedback and Updating (D3), forming an ongoing cycle aimed at continuously refining and optimizing the model's performance in real-world applications.

Fig. 1: Data Lifecycle

Biases stemming from algorithms tend to emerge when AI copilots do not comply with established ethical standards and frameworks for AI governance (Thiebes et al., 2020). The European Union's ethical framework for trustworthy AI mandates that AI copilots adhere to three core principles: compliance with existing legal regulations, including privacy, data protection, and anti-discrimination laws (Lawful); alignment with ethical norms that reflect the moral values upheld by society (Ethical); and effective functionality that minimizes errors and mitigates failure risks (Robust) (European Commission, 2019). Regarding algorithmic biases, various models have been proposed in the literature to outline the AI system lifecycle. For this study, the model developed by Li et al. (2023) (Figure 2) has been adopted, which comprises five fundamental stages: A. Data Preparation, B. Algorithm Design, C. Development, D. Deployment, and E. Management.

Fig. 2: AI system lifecycle

Purpose of the paper. *By conducting a systematic review of existing literature, this study aims to categorize and analyze the biases that emerge in AI copilots, differentiating between those stemming from data and those originating*



from the algorithm. Additionally, it seeks to determine the specific stages within the AI copilot lifecycle where these biases appear, investigate the factors contributing to their persistence, and propose strategies for their mitigation. This approach not only enhances the understanding of bias formation and evolution but also contributes to the broader academic discussion on bias dynamics within AI copilots. As a result, this research is structured around the following central research question:

RQ: What biases affect AI copilots, and what are their sources?

Methodology. *To investigate the research question, a systematic literature review was conducted following the qualitative methodology outlined by Tranfield et al. (2003). The study was developed through a structured process that began with the identification of gaps in the existing literature and the formulation of a research protocol. This phase involved recognizing the necessity of a review, defining the scope of analysis, preparing a detailed research proposal, and establishing a methodological framework for conducting the literature review.*

Following this initial phase, a qualitative analysis of relevant academic contributions was undertaken. This step focused on examining previous studies related to biases in the data lifecycle, ensuring that the selected literature aligned with the research objectives. Once the key documents were identified, data extraction and synthesis were carried out, allowing for the collection of relevant insights from the selected studies. Finally, the findings derived from the review process were systematically organized into a comprehensive report, ensuring that the results were effectively structured and communicated. Figure 3 provides a visual representation of this structured approach, outlining the main phases and their corresponding sub-phases.

Fig. 3: Flow Chart of the literature review process

In the first phase of the study, both the research problem and the methodological strategy were defined. This involved gathering information relevant to biases in the data lifecycle and establishing precise criteria for selecting and excluding studies. The search strategy was developed based on established guidelines for systematic reviews, particularly those proposed by Davies and Crombie (1998). To determine the most frequently used terminology in scholarly research on data lifecycle and biases, a focus group was conducted. Eight experts participated, with equal representation from the fields of marketing and management, as well as informatics. These specialists were first asked to compile a list of at least ten terms associated with the study of aging and technology.

To ensure a thorough review of academic research, only peer-reviewed journal articles published in English within the fields of economics and business were considered. The literature search was conducted using Scopus, a widely recognized indexing and abstract database that provides access to a comprehensive collection of academic sources. The decision to utilize Scopus was based on its ability to offer an extensive selection of research articles while also enabling advanced filtering and analytical tools (Franceschet, 2010). Once the relevant studies were retrieved, the selection process continued with a review of documents that contributed meaningfully to the conceptual framework. The selection

approach followed the methodology proposed by Tranfield et al. (2013), prioritizing studies that specifically addressed bias in the data lifecycle.

Following this selection process, data analysis was conducted through a systematic extrapolation of key findings. A structured research framework was applied to examine specific elements of each study, including its central theme, the methodology used for data collection and analysis, and the nature of the research, whether qualitative, quantitative, or review-based. In refining the dataset, overlapping studies were analyzed, and a data purification process was applied to remove redundancy and ensure the relevance of the selected documents. As a result of this filtering process, a final dataset of documents published between 2014 and 2023 was obtained.

In the final phase of the literature review, each selected study was carefully examined to verify its alignment with the research objectives. Additionally, the bibliographies of these articles were manually reviewed to identify further relevant sources. During this phase, articles that did not meet the established content criteria were excluded from the analysis. The remaining studies were systematically reviewed following the methodology proposed by Bal & Nijkamp (2001), ensuring a structured synthesis of findings. This analytical process resulted in a final selection of contributions, providing valuable insights into the presence of biases across various stages of both the data lifecycle and the broader AI system lifecycle.

Results. *The presence of biases has been observed at various stages of the data lifecycle, influencing the development and performance of AI copilots. Within the Data Management phase, particularly in the Data Identification and Collection (A1) phase, biases begin to emerge early in the process, shaping both the training and overall effectiveness of AI models. Flawed sampling methods can distort datasets, leading to inaccurate AI copilots (Adomavicius & Yang, 2022). Similarly, Chhillar & Aguilera (2022) argue that decisions made during dataset design can introduce biases, reducing transparency and reinforcing systemic prejudices within AI copilot applications.*

In the data cleaning and preparation (A2) phase, removing anomalies may inadvertently eliminate crucial information, exacerbating Data Distribution Bias (Adarsh et al., 2023). Normalization and standardization processes, if not carefully managed, can obscure underrepresented groups, amplifying structural inequalities (McDonald & Pan, 2020). During phase of Data Exploration and analyses (B1), analytical techniques can introduce biases that distort AI copilot interpretations. Chu et al. (2023) identify Aggregation Bias, where visualization tools like histograms and heat maps oversimplify data, masking differences between groups. This generalization can lead AI copilots to misrepresent diverse populations, reducing model accuracy and fairness. During the phase of modeling (B2), methodological challenges arise. Errors such as conflating correlation with causation or excessive generalization can lead to Method Bias, where the chosen approach fails to distinguish influences within the dataset (Akter et al., 2021). Additionally, Model Bias occurs when machine learning models do not adequately reflect real-world complexity, leading to misrepresentations (Akter et al., 2023). Despite extensive research, a comprehensive understanding of how biases evolve within AI modeling remains lacking.

In the model validation and testing (C1) phase, Algorithmic Bias can emerge, reflecting societal stereotypes embedded in AI development. These biases often result from the perspectives of developers, leading to unfair outcomes for specific groups (Bhavani & Thuraisingam, 2022; Sanclemente, 2021). If validation datasets do not adequately represent diverse populations, models risk perpetuating systemic inequalities. Once AI copilots are deployed (D1), biases can become more pronounced due to interactions between technology, society, and data. Societal Bias emerges when models trained on historical data with cultural and demographic prejudices reinforce existing discrimination (Akter et al., 2021). AI copilots may generalize based on past patterns, overlooking marginalized groups and intensifying disparities. The Monitoring and Maintenance (D2) phase plays a crucial role in preserving the effectiveness and reliability of AI copilots over time, yet there is limited research on how biases evolve at this stage. Scholars generally agree that biases appearing at this stage are influenced by multiple factors, including the evolving nature of operational environments and continuous updates to data sources (Sanclemente, 2021). The reliance on outdated, incomplete, or biased data further complicates the challenge, making it necessary to implement ongoing oversight to detect and correct distortions (Akter et al., 2023). In the Feedback and Updating (D3) phase of the data lifecycle, AI copilots are refined based on user interactions and real-world feedback. However, Biases can persist and even be reinforced through user interactions and feedback loops. Feedback Bias occurs when AI models reinforce existing prejudices instead of correcting them (Van Giffen et al., 2022). Effective mitigation strategies should integrate feedback as a core component of evaluation and refinement. Other scholars highlight this issue as User Interaction Bias, emphasizing the risks of unintentional bias reinforcement through iterative AI learning (Pagano et al., 2023).

Furthermore, Biases have been identified even throughout the various phases of the AI system lifecycle, influencing the development and application of AI copilots. In the initial phase of Data Preparation (A), when AI copilots process data to generate responses, there is an inherent risk of producing unfair, discriminatory, or ineffective decisions, which can ultimately compromise the robustness and reliability of the system (Richardson, 2022). As demographic misrepresentations, particularly regarding gender, can reinforce stereotypes and systemic discrimination (Edwards & Rodriguez, 2019). During the subsequent phase of Algorithm Design (B) of the AI system lifecycle, there is a considerable risk that designers and developers may inadvertently introduce their own biases into, AI copilots further amplifying discrimination based on gender, race, or disability (Bhavani & Thuraisingam, 2022; Chen, 2023). For example, AI assistants with female voices often reflect societal stereotypes, reinforcing subservient roles (Schillaci et al., 2024). Social Bias has also been identified in AI visual labeling, where women are disproportionately linked to domestic tasks, necessitating dataset adjustments to achieve balance (Zhao et al., 2017). Lack of human oversight in algorithm selection

can also contribute to Algorithmic Bias (Adomavicius & Yang, 2022). As AI systems progress to the next phase of Development (C), additional biases emerge that can undermine their reliability and overall performance. Overfitting occurs when AI models become overly dependent on specific training data, reducing their ability to generalize to new scenarios (Domínguez Figaredo, 2020; Schwartz et al., 2022). Furthermore, training in controlled environments often fails to reflect real-world conditions, leading to inconsistent and discriminatory outputs (Gao et al., 2022). Human interactions also introduce distortions, as operators may influence AI behavior through biased inputs or limited test scenarios (Bartlett & Li, 2019; Chen, 2023; Chhillar & Aguilera, 2022). Ensuring the explainability of AI copilots becomes particularly crucial in the deployment (D) phase. Stakeholders need to comprehend the reasoning behind AI-generated decisions, particularly in high-stakes applications such as medical diagnostics. When AI copilots are used to assess patient symptoms and physical characteristics, their inferential processes must be entirely transparent to guarantee diagnostic accuracy and reliability (Morley et al., 2020). In the final phase of Mangement (E), bias risks persist, particularly Automation Bias, where users overly trust AI-generated decisions without critical evaluation (Adomavicius & Yang, 2022). Another major issue is Feedback Loop Bias, where AI models continuously learn from their own biased recommendations, reinforcing errors over time (Van Giffen et al., 2022).

Research limitations. *A key limitation of this study arises from the diverse range of literature analyzed, which spans multiple industries rather than concentrating on a single sector. While this broad approach enables the identification of common patterns across different domains, it also presents the risk of drawing generalized conclusions based on specific contexts. Additionally, the presence of overlapping biases presents another challenge. Different researchers may refer to the same type of bias using varying terminology, leading to potential duplications.*

Managerial implications. *The findings clearly indicate that AI copilots are susceptible to generating multiple forms of bias throughout their system lifecycle and during the dataset creation process. These biases can take on various forms, including territorial (Weissglass, 2022), gender-based (Scheuerman et al., 2019), cultural (Murphy et al., 2021), ethnic (Chouldechova et al., 2018), demographic (Fountain, 2022), and historical biases (Gerdon et al., 2022). Despite substantial documentation on these issues, managers who integrate AI copilots into decision-making processes frequently fail to recognize these biases, inadvertently embedding them into organizational operations, which can lead to significant negative consequences (Brendel et al., 2021). One of the primary reasons managers struggle to detect these biases is their lack of personal experience with the discrimination certain groups face. This highlights the necessity of fostering diverse teams in the workplace, which can enhance awareness of bias-related issues and contribute to a more equitable and inclusive environment. To mitigate the risk of discrimination, managers must also develop an understanding of the technical constraints of AI copilots and implement governance strategies that balance operational efficiency with principles of organizational and social justice. This requires consideration of ethical, legal, and societal factors in AI adoption (Brendel et al., 2021). The responsible and ethical deployment of AI copilots demands a comprehensive strategy that integrates proactive measures across different levels of an organization. Companies should establish stringent monitoring frameworks, implement rigorous oversight mechanisms, and ensure that all AI-driven decision-making processes are transparent (Nah et al., 2023; Heinrichs, 2022).*

Originality of the paper. *Although the literature on AI biases is vast, few studies systematically differentiate biases by their origin. This study introduces a clear distinction between data-derived biases and algorithm-intrinsic biases, filling a methodological gap in the classification and analysis of these distortions. Furthermore, we propose original frameworks that allow for the classification of biases along the entire lifecycle of data and AI systems, thus providing an analytical basis to more precisely identify at which stages biases manifest themselves and how they can be mitigated.*

Lights and Shadows in the Governance of Generative AI Firms: a preliminary approach

FRANCESCO LAVIOLA[1] ROBERTO ARGIOLAS[2] CARMELA DI GUIDA[3]

Abstract

The emergence of Generative Artificial Intelligence (AI) has accelerated the growth of the AI sector, transforming business processes and redefining corporate decision-making. This paper examines the complex relationship between AI and governance through a multidimensional lens, emphasizing its non-linear nature. We identify three principal dimensions that form a triangular framework: Governance with AI, referring to the integration of AI into corporate decision-making; AI governance, encompassing regulatory frameworks that shape AI development; and Governance of AI firms, which examines internal governance models balancing innovation, profitability, and ethical concerns.

Our analysis focuses specifically on the governance of AI firms, highlighting the factors that influence their structural choices. Through a qualitative investigation, this study identifies key governance models, including profit-distributing nonprofits (e.g., OpenAI), trust-controlled corporations (e.g., Anthropic), and open-source oriented organizations (e.g., Mistral). The findings suggest that governance structures are shaped by company size, geographic location, regulatory environment, and software distribution models (open-source vs. proprietary).

This research offers valuable implications for AI stakeholders, suggesting that organizations should develop governance frameworks that balance innovation with ethical considerations while adapting to their specific market contexts. Larger companies, particularly those with proprietary models, should prioritize robust oversight mechanisms to build stakeholder trust.

This study introduces an innovative tripartite analytical framework to examine the governance structures of generative artificial intelligence providers. This analysis, conducted in a research area that is still relatively under-investigated, aims to fill existing gaps in the scientific literature. Through this original approach, the study offers new perspectives on the governance dynamics that shape the generative AI industry, providing a significant contribution to the understanding of this rapidly evolving sector.

Key words: *Generative AI, Corporate Governance, Artificial Intelligence Ethics, AI Regulation, Open-Source AI.*

Framing of the research. *Artificial Intelligence (AI) is transforming the anthropic world, driving innovation in science, economies and society itself. AI in the economy is changing the way corporations make decisions and manage processes. Corporations use AI to automate their processes and improve their decision-making process.*

To clearly explain the key concepts covered in the present paper, it is necessary to provide a definition of AI. Russell and Norvig define it as "the study of [intelligent] agents that receive precepts from the environment and take action. Each such agent is implemented by a function that maps percepts to actions, and we cover different ways to represent these functions, such as production systems, reactive agents, logical planners, neural networks, and decision-theoretic systems" (Russell and Norvig 2010, p. viii). Generative AI is defined by Ramdurai and Adhithya as "an artificial intelligence field that concentrates on generating new and original information by machine learning on massive databases of experiences" (Ramdurai and Adhithya, 2023, p. 1). This definition highlights the core function of generative AI, which relies on extensive datasets to produce novel outputs through machine learning techniques.

The introduction of advanced Generative AI tools, such as ChatGPT in 2022, has made AI more accessible to a broader audience, including employees, managers, and entrepreneurs with limited technical expertise. However, the widespread adoption of these tools is hindered by a lack of adequate digital skills, limiting the effectiveness of AI integration within businesses and reducing its transformative impact.

This lack of competence is also evident in the decision-making process, particularly in the field of Corporate Governance. As AI enables more data-driven decision-making, the limited expertise of Top Management and the Board constrain its full potential, hindering the effective integration of AI into corporate strategies (Agnese et al., 2025).

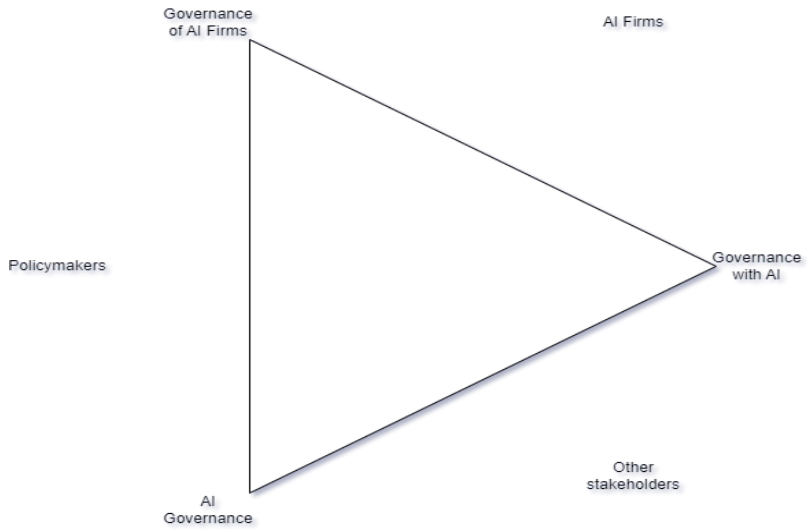
The relationship between AI and governance is neither linear nor one-dimensional; rather, it is shaped by multiple actors and forces pushing in divergent and sometimes conflicting directions. This relationship can be understood as a triangle (see Figure 1), with the three key dimensions positioned at its vertices.



First, Governance with AI refers to the integration of AI solutions into Corporate Governance. In this vein, AI is primarily employed for financial tasks, such as data analysis and report generation to support investment decisions, as well as risk identification to anticipate financial stress or bankruptcy (Bae, 2012). It plays a crucial role in fraud detection (Xu et al., 2023), helping to combat money laundering, terrorism financing, and ensuring compliance among employees and management. In the Environmental, Social, and Governance (ESG) domain, AI provides recommendations on sustainability strategies (Raza et al., 2022). Finally, it enhances board performance by automating repetitive processes, managing board activities, assisting in director selection and improving board diversity (Eroğlu and Karatepe Kaya, 2022) and generating reports and insights (Ahdadou, 2024).

Second, AI Governance represents the efforts of policymakers to regulate AI-related phenomena-often under the influence of major tech corporations-despite an incomplete understanding of the technology's full implications. While the United States is characterized by a more flexible and less restrictive regulatory approach to AI, the European Union has adopted a more interventionist legislative framework. The U.S. introduced multiple regulatory initiatives to govern AI development and use. Among the most significant federal measures are the National AI Initiative Act (2020), the Blueprint for an AI Bill of Rights (2021), and, most recently, the Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (2023). In contrast, the European Union has pursued a more stringent regulatory path. Key legislative measures include the Ethics Guidelines for Trustworthy AI (2019) and the AI Act, approved in 2024, which represents the most comprehensive legal framework on AI globally. One key difference between these approaches is that U.S. regulations do not appear to hinder AI market growth, whereas the EU's regulatory framework raises concerns about its effectiveness and potential negative impact on the European AI sector. The primary risk associated with this new regulatory structure is that it may slow down AI development, creating a competitive disadvantage for the European market compared to China and, most notably, the United States (Musch et al., 2023).

Third, Governance of AI Firms focuses on the internal governance structures, mechanisms, and processes within AI companies themselves. This dimension examines how AI firms balance innovation, profitability, and ethical considerations, as well as the ways in which their governance frameworks shape the broader AI ecosystem.

By analyzing these three interconnected dimensions, it appears evident that AI and governance are engaged in a dynamic and reciprocal interplay, where regulatory pressures, technological advancements, and corporate governance models continuously influence and reshape one another.

Fig. 1: The three interconnected dimensions that drive AI and Governance relationship

Source: Authors' elaboration

Artificial Intelligence companies have developed various governance structures to balance profit motives with their stated missions of developing safe, beneficial AI.

Oudin and Groza (2024) outline five different governance models for AI companies.

The first identified model is the "Profit-Distributing Nonprofit". OpenAI, the creator and the owner of the generative AI solution ChatGPT, adopts this model. From a governance perspective, OpenAI exemplifies a hybrid structure: it was, in fact, initially founded as a nonprofit but later adopting a mixed model to attract private investment while maintaining a public-benefit mission. Its governance is split between OpenAI Nonprofit, which oversees its mission, and OpenAI Global LLC, a for-profit entity with a capped profit model (Weiss, 2024) to balance financial sustainability and ethical

commitments. However, governance challenges, such as the dismissal and reinstatement of CEO Sam Altman (O'Brien and Hadero, 2024), have raised concerns about the board's independence and the influence of major investors like Microsoft. Critics argue that OpenAI's governance model lacks transparency and may struggle to uphold its public-interest objectives amid market pressures, highlighting the need for stronger oversight mechanisms.

The second identified model is the "Bounded For-Profit Controlled by a Trust". Anthropic adopts this model and emerges in this vein as one of the primary alternatives to OpenAI, implementing a distinctive governance structure centered around a Long-Term Benefit Trust (LTBT) to ensure that AI development remains aligned with the public interest (Ayana and Thompson, 2024). Unlike traditional corporate models, Anthropic is structured as a Public Benefit Corporation (PBC), a legal framework that enables the company to balance profit generation with broader societal objectives. At the core of its governance model, the Long-Term Benefit Trust (LTBT) holds Class T shares, which do not carry financial rights but grant governance authority (Schuett et al., 2024). Over time, the trust will gain a majority on the board of directors, ensuring that corporate decisions prioritize AI safety over short-term financial gains. While major investors such as Google and Amazon have provided funding, the LTBT structure prevents them from exerting direct control over the company's governance. This governance model is designed to establish a stronger accountability mechanism compared to OpenAI, safeguarding Anthropic's mission from commercial pressures while maintaining its commitment to ethical AI development.

The third case concerns Benefit Corporations. For example, Inflection AI and xAI have registered under this legal structure, which allows companies to pursue a public-benefit mission while remaining for-profit entities.

The fourth identified model is that of European AI companies, which have not implemented any governance structures to ensure the ethical and safe development of AI, despite expressing their intention to operate in this direction. Aleph Alpha claims to uphold ethical AI practices but does not specify any corporate safeguards ensuring their implementation. NXAI, an Austrian AI firm, is structured as a joint venture with significant founder influence. While it commits to European ethics and values, it has not disclosed specific governance mechanisms to uphold them (Oudin and Groza, 2024).

Finally, some companies do not believe that AI can evolve in harmful or dangerous ways. As a result, having no concerns regarding its ethics or safety, they have chosen not to modify their governance structure in any way. Mistral, a French AI startup, takes a distinctly different approach to AI development compared to companies like OpenAI. Rather than emphasizing ethical considerations or safety in its mission statement, Mistral focuses primarily on creating open and customizable AI technologies. The company has positioned itself as a provider of open-weight models intended for business and developer use, deliberately avoiding the direct-to-consumer application market.

This business model reflects a philosophy where Mistral appears to distance itself from responsibility for how its technology is ultimately deployed, as it provides tools that others can freely modify and implement. This stance has sparked debate in the AI governance community: some advocate that companies offering open-source AI solutions should be granted exemptions from liability, while critics question whether this approach adequately addresses the potential risks associated with AI deployment.

When examining AI service provider governance structures, understanding the key factors driving their development is crucial. The fundamental choice between open-source and proprietary approaches significantly shapes these structures. Open-source systems are "software for which the source code is open and available" (Comino and Manenti, 2003, p. 2). The term "open" refers to the capability for everybody to read and modify the source code, while "available" implies that anyone can use it for free or at a nominal price. Closed-source software, on the other hand, refers to software that is not made publicly available, with the source code remaining the intellectual property of the company or individual that developed it. Mistral illustrates this dynamic clearly: its decision to embrace an open system model reflects a business philosophy that appears to place less emphasis on controlling the security and ethical implications of its technology after release. This approach contrasts sharply with companies that maintain proprietary systems, allowing them to exercise greater ongoing control over how their AI technologies are implemented and used.

Purpose of the paper. *The purpose of the present working paper is to undertake a comprehensive analysis of the governance structures of companies that provide Generative AI solutions, with a particular focus on the differing models of governance utilized by these organizations. This study will explore key areas that influence how these companies operate and develop their technologies while aiming to balance profit motives with ethical obligations. Specifically, the research will focus on four main objectives.*

First, it will examine the different governance models adopted by AI provider companies, like OpenAI and Anthropic, highlighting best practices that ensure operational efficiency while adhering to ethical standards. This is particularly relevant given that recent developments, such as generative AI tools like ChatGPT, have democratized access to AI, equipping even those with limited technical expertise. Second, the paper will analyze the implications of choosing open-source software versus closed-source software and how such choices impact governance frameworks, transparency, and stakeholder trust (Schuett, 2023). Third, the importance of ethical governance practices will be assessed through critical evaluations of existing ethical guidelines and how they are integrated into operational frameworks (Greene et al., 2019). Finally, the study will explore how robust governance structures can foster an innovative environment, allowing these companies to adapt to technological advancements and market demands while ensuring their AI initiatives are aligned with broader business strategies (Ghani et al., 2022).

Methodology. *The research is in its seminal phase of development. The present working paper employs a qualitative approach to explore and analyze the governance structures of companies providing Generative AI solutions. The methodology consists of several key components.*

Regarding data collection, a representative sample of 10 companies specializing in generative AI was selected based on rigorous methodological criteria designed to ensure both homogeneity and comparability. The selection process incorporated several key principles:

- *Balanced geographical distribution: companies were chosen from the three main AI hubs-United States, European Union, and China-to capture the unique regulatory and market contexts inherent to each region.*
- *Dimensional homogeneity: to ensure that the comparison was not influenced by structural disparities between the subjects analyzed.*
- *Consistency of the operational scope: only entities with a core focus on developing and commercializing generative AI solutions were considered.*

The sample includes leading generative AI providers such as OpenAI, Anthropic, DeepMind, and emerging firms in the field. Companies are selected based on their market presence, the significance of their AI solutions, and their commitment to ethical practices. This includes both established firms and emerging companies to ensure a holistic view of the governance landscape. This approach allows for a diverse examination of governance structures across different organizational contexts, offering insights into various models and their implications for ethical AI development.

The primary data collected and analyzed consists of a variety of corporate documents. Initially, annual reports, merger and acquisition announcements, and press releases are examined. Annual reports provide insights into the governance structures, financial performance, and ethical commitments of AI companies. The analysis of merger and acquisition announcements aids in understanding how governance frameworks adapt to corporate strategies, specifically highlighting the expansion of the generative AI market. Finally, press releases and news articles assist in capturing public perceptions and the discourse surrounding governance practices.

Subsequently, the collected data undergoes thematic analysis to identify governance models, ethical practices, and choices between open-source and closed-source software. A comparative analysis will focus on the leading generative AI provider companies, such as OpenAI and Anthropic. This comparison will provide a deeper understanding of how various governance models influence ethical decision-making, risk management, and stakeholder engagement.

Results. *The analysis of the structured sample highlights how various factors influence a company's decision to modify its governance structure in order to ensure the ethical and safe development of AI models. The main dimensions that emerge are geographic location, company size, the corporate policy adopted, and the choice of AI model distribution (open-source or proprietary). Additionally, the rapid development of the AI market contributes to the continuous evolution of governance structures, which change in response to market dynamics.*

Geographic location is the first dimension. Identifying a single representative model, both in USA and EU, is not trivial. USA based companies, operating in a less restrictive regulatory environment, tend to adopt an autonomous approach, developing internal mechanisms to ensure the ethical and safe development of AI. In this context, self-regulation is encouraged by public debate and growing media attention on the issue. However, despite the trend among most American companies, companies like xAI do not place significant emphasis on security and ethical principles.

In contrast, European companies primarily rely on regulatory frameworks, hoping that ethical principles will be safeguarded through legislative interventions at the EU or national levels. However, their response is not uniform. European companies developing open-source models tend not to express significant concerns regarding the security and ethics of AI, considering the inherent transparency of their models sufficient to avoid changes to their internal governance. An example of this is the French start-up Mistral, which, operating with open-source systems, does not see the need to adopt specific mechanisms to address the transparency gaps typical of proprietary models. On the other hand, other European companies recognize the risks associated with AI development and are concerned about its implications, but do not always take concrete actions regarding Corporate Governance, suggesting a more cautious approach compared to their American counterparts.

Another factor to consider in this context is company size. European startups, for instance, appear less inclined to adjust their governance structures to ensure the ethical and safe development of AI, partly due to their limited resources. The lack of financial and organizational means could make it more challenging for these companies to implement advanced oversight and control mechanisms compared to larger firms in the sector. After all, the European Union (EU) follows a bank-based model, where corporate financing primarily depends on bank loans and credit. In contrast, the United States (USA) operates under a market-based model, where companies raise capital through financial markets, issuing stocks and bonds rather than relying on banks. While this system fosters liquidity, investment, and financial innovation, it also increases market volatility. Such differences in liquidity access may also influence the development and governance structures of generative AI companies. U.S. firms, relying on market funding, may prioritize aligning their governance structures with investor expectations to build trust and attract capital. Conversely, in the bank-based European model, financial stability is the primary concern, making governance adjustments to meet market expectations less urgent.

Another notable trend in the AI sector is the relationship between the choice of software model and the evolution of Corporate Governance. Specifically, many companies that adopt open-source software tend not to significantly modify their governance structure, whereas companies that develop proprietary software often implement structural changes in their governance. The underlying assumption that could explain this behaviour is that companies with proprietary models

are incentivized to adjust their governance to compensate for the benefits they miss out on by not adopting an open-source system. Open-source software not only provides greater product customization but also enhances stakeholder trust due to its increased transparency and accessibility (Hou and Jansen, 2022). As a result, companies developing proprietary models may feel the need to reinforce stakeholder trust by adapting their governance structures. A clear example of this dynamic is Mistral, which adopts an open-source model and has not implemented significant modifications in its governance model. Conversely, OpenAI, which develops proprietary software, has adjusted its governance structure to inspire greater stakeholder confidence, compensating for the lower transparency associated with its closed model.

For companies outside the U.S. and the EU, such as Chinese companies, governance structures are further complicated by political factors. In China, government control in strategic sectors like AI can strongly influence business decisions, raising doubts about the independence of these companies and the transparency of their decision-making processes. This scenery makes it difficult to determine whether governance changes are driven by the need to ensure security and ethics, or if they are the result of political and economic control imposed by the government.

Establishing a unified governance model and formulating universally applicable principles is challenging, not only due to the diversity of approaches but also because of the constant evolution of the market, which drives companies like OpenAI to modify their governance structures. Initially founded as a non-profit organization, it underwent a radical transformation following Microsoft's partial acquisition, shifting towards a more profit-oriented model. This change illustrates how market dynamics and internal developments can shape governance decisions and how companies adapt to new circumstances to balance innovation, financial sustainability, and strategic objectives.

In conclusion, the governance structures of companies operating in the field of Generative AI are shaped by a complex interaction of geographic factors, company size, internal policies, and the choice between open-source or proprietary models. These factors determine varied approaches to managing the ethical and security challenges of AI, and corporate responses can differ significantly depending on the context in which they operate.

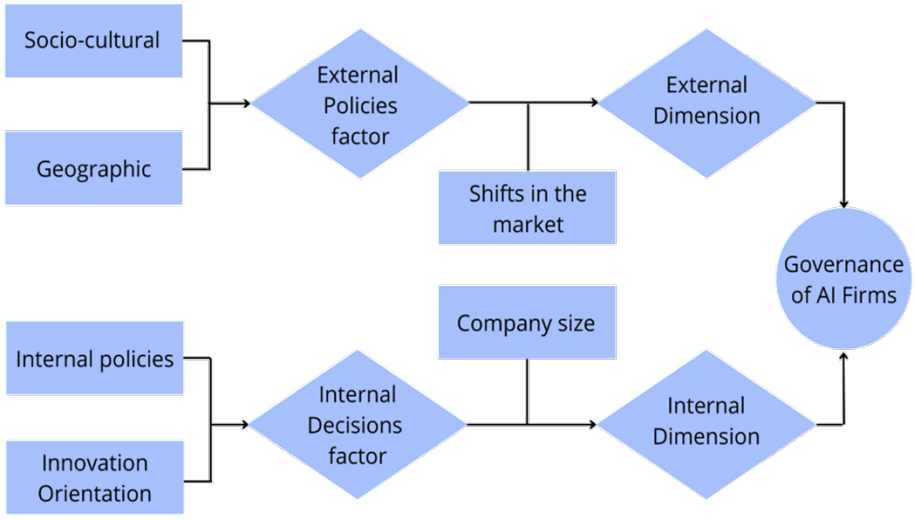
Research limitations. *The study presents several limitations that deserve to be carefully considered. First, the non-quantitative methodological approach that has been adopted in the research could constitute a major obstacle in the ability to derive conclusions that are statistically generalizable to the entire sector. This type of approach, while offering valuable qualitative insights, does not allow for establishing robust statistical correlations or determining the prevalence of specific phenomena with numerical precision.*

Second, the sample that has been analyzed presents evident limits in terms of overall representativeness, as the investigation focuses exclusively on generative AI providers, excluding other relevant actors in the sector. Moreover, the relatively limited number of companies included in the study further reduces the possibility of capturing the full range of variations in governance structures present in the field.

To significantly improve the scientific validity and representativeness of the obtained results, future research in this field should consider a substantial expansion of the examined sample, including companies operating in different segments of the artificial intelligence ecosystem, beyond providers of generative solutions. This broader and more inclusive perspective would allow for a remarkably more complete and multi-faceted analysis of existing governance structures across the entire artificial intelligence sector. Consequently, this more comprehensive approach would lead to the development of results characterized by greater scientific solidity and a higher degree of generalizability, thus offering a deeper and more reliable understanding of the studied phenomenon.

Managerial implications. *The findings of this research will have important implications for policymakers, platform owners, and entrepreneurs. By understanding the interplay of various factors, organizations can strategically align their governance practices with ethical standards and stakeholder expectations. The following examines the main managerial implications: i) governance structures should be revised to prioritize trust-building within the organization and with external stakeholders. This is particularly vital for companies using proprietary models, as they may face skepticism regarding transparency and ethical considerations. Implementing robust oversight functions can help mitigate these concerns while reinforcing stakeholder trust. Research supports that incorporating trust into AI governance frameworks can lead to more successful implementations. (Frey et al., 2018); ii) organizations must adapt their governance structures based on their geographic location and corresponding regulatory environments. For example, U.S.-based companies might implement self-regulatory mechanisms, while European firms may need to align their policies with EU regulations. These regional differences highlight the necessity for adaptable governance frameworks that can respond to local contexts and legal requirements (Khlystova et al., 2022); iii) corporate governance should integrate ethical considerations that address stakeholder concerns over AI development. Establishing ethical review boards or committees to monitor AI projects and ensure alignment with ethical standards is crucial. Anticipated regulatory frameworks, such as the EU's proposed AI Act, can serve as a guide for businesses in defining these ethical requirements (European Commission, 2021); iv) differences between bank-based capital markets (e.g., the U.S.) and market-based systems (e.g., the EU) necessitate distinct governance strategies. U.S. firms may benefit from a focus on innovation and risk management, while European companies should emphasize stakeholder engagement and social responsibility. Understanding these differences is essential for aligning governance practices with both financial objectives and ethical responsibilities (IMD, 2024); v) companies that adopt open-source models often benefit from greater transparency and collaborative innovation, which can strengthen governance practices. Such companies may not feel the need for extensive governance modifications. Conversely, those developing proprietary models must enhance governance structures to build stakeholder trust and compensate for perceived opacity; vi) company size significantly influences its ability to adjust*

governance structures. Smaller startups may lack the resources necessary to implement comprehensive governance frameworks, which could affect their ability to ensure ethical AI development while larger firms should lead by example, establishing best practices that smaller companies can emulate; vii) finally, our research suggests that an effective AI governance framework should not only ensure compliance and ethical integrity but also foster innovation and entrepreneurship. Platform owners need to implement robust governance mechanisms that promote both regulatory alignment and technological advancement. Transparent policies and collaborative ecosystems can enhance accountability while supporting dynamic business models. For entrepreneurs, understanding the evolving regulatory landscape is critical for mitigating compliance risks and effectively advocating for their interests. Collective action and industry networks can provide valuable support in navigating governance challenges and fostering responsible AI innovation. Moreover, governance structures should reinforce the social pillar of ESG by aligning AI development with broader societal and environmental goals. Initiatives that integrate AI with community engagement and social welfare programs can enhance stakeholder trust and demonstrate corporate commitment to responsible innovation.



Originality of the paper. *The originality of this paper lies in several innovative elements introduced throughout the study. First, it examines the governance structures of AI companies, a topic still relatively unexplored by the literature, also due to the rapid evolution of AI landscape. In the same vein, while the study's narrow focus on generative AI providers may be seen as a limitation, it also represents a novel contribution by delving into a field that is still underdeveloped and rarely addressed in academic discourse.*

Furthermore, as depicted in Figure 1, we introduced a tripartite analytical framework to critically analyze AI's impact on governance. This conceptual model provides a structured approach to understanding the complex interplay between AI and corporate governance, further enriching the academic discussion on the subject.

Finally, we introduce Figure 2 as an additional originality feature of the present study. The upper block, consisting of the geographical and socio-cultural dimensions, represents the key factors influencing policymakers' decisions. Political choices, combined with market changes, constitute the external dimensions that impact the governance strategies adopted by AI companies.

The second block, on the other hand, focuses on internal decisions. The choice of software model (open-source or proprietary), along with the business strategy - oriented towards value creation or profit maximization - represent the main internal decision-making factors. These, in turn, combined with the company dimension, contribute to defining the internal variables that influence the structural governance choices of AI firms. This flow representation, organized into blocks, synthesizes the dynamics that determine the governance choices of a company operating in the Artificial Intelligence sector, highlighting the interaction between external and internal factors in shaping governance structures.

Fig. 2: The Multidimensionality of Decision-Making Processes in the Governance of AI Firms.

Il Web3 incontra l'AI. Verso nuovi modelli di business decentralizzati e generativi

FRANCESCO FASANO[1] CHIARA BARTOLI[2] FRANCESCO CAPPA[3] ENZO PERUFFO[4]
PAOLO BOCCARDELLI[5]

Abstract

Lo studio presenta i primi risultati relativi all'analisi dell'impatto dell'IA nel modello piattaforma del Web3, abilitata dalle distributed ledger technologies (DLT). Il lavoro adotta un approccio qualitativo multilivello all'indagine, mediante il ricorso al metodo adduttivo applicato a dati raccolti attraverso il coinvolgimento di oltre 100 manager ed esperti nella gestione di progetti con tecnologia blockchain. Dal lavoro emerge che l'IA riveste un ruolo chiave nei modelli piattaforma Web3, nelle dimensioni rilevanti dei modelli di business piattaforma: creazione del valore, delivery del valore e cattura del valore. In particolare, i primi risultati mostrano come l'IA migliora l'efficienza operativa, la governance strategica e i processi decisionali nelle piattaforme decentralizzate Inoltre, l'IA consente di personalizzare, ottimizzare i processi di matching e le interazioni all'interno delle piattaforme del Web3. Viene evidenziato il ruolo dell'IA nel promuovere, i processi di knowledge transfer, l'innovazione e la formazione delle risorse umane, potenziando la possibilità di attingere a figure qualificate per gestire il complesso ecosistema Web3. Lo studio mostra come l'IA migliori le prestazioni delle piattaforme basate sulle DLT accrescendo la conoscenza rispetto al funzionamento dei modelli piattaforma decentralizzati e offrendo rilevanti implicazioni manageriali e di policy per fare leva sulle peculiarità dell'IA per massimizzare il valore dei modelli di business piattaforma.

Keywords. *Intelligenza Artificiale, Generative AI, Distributed Ledger Technologie, Web3, blockchain, business model innovation, Web3*

Introduzione. *Con l'evoluzione delle tecnologie digitali il modello piattaforma si sta affermando come business model prevalente rispetto ai modelli tradizionali (Rohn et al., 2021; Täuscher and Laudien, 2018), consentendo alle organizzazioni di creare e catturare valore facendo leva sugli effetti di rete e le interazioni digitali (Mcintyre and Srinivasan, 2017). Le piattaforme rappresentano interfacce che facilitano lo scambio tra una rete di utenti che agiscono come acquirenti e venditori (Mcintyre e Srinivasan, 2017). L'avvento del Web3, riconfigura il modello piattaforma (Lage et al., 2022; Trabucchi et al., 2020). Il mercato del Web3 raggiungerà i 22,57 miliardi di dollari entro il 2029 a un tasso di crescita annuo del 38,4% (The Business Research Company, 2025). Centrale nell'evoluzione dei modelli piattaforma Web3 è la tecnologia blockchain, definita come un database distribuito basato sulla crittografia e governato da meccanismi di consenso (Beck et al., 2017). Le caratteristiche della blockchain implicano un cambiamento di paradigma nei modelli piattaforma, perché decentralizzano la governance, migliorando la trasparenza ed eliminando gli intermediari (Trabucchi et al., 2020). Studi manageriali hanno evidenziato infatti come le piattaforme basate su blockchain siano caratterizzate da maggiore apertura e trasparenza delle transazioni rispetto alle piattaforme tradizionali, e dalla disintermediazione, che consente un maggiore controllo sui dati ed una accresciuta simmetria delle informazioni, che accresce a sua volta la fiducia dei partecipanti al network (Schmück et al., 2025). Tuttavia, nell'ambito dei nuovi paradigmi delle piattaforme abilitate da blockchain, sono ancora ridotti gli studi relativi all'impatto potenziale di altre tecnologie emergente, come l'intelligenza artificiale (AI). I recenti sviluppi dell'IA offrono infatti nuove opportunità di creazione di valore per le imprese (Patrucco et al., 2024). L'IA si dimostra capace di innovare i Modelli di Business (BM) tradizionali, automatizzando i processi, influendo sui processi decisionali, e migliorano le capacità predittive delle imprese (Burström et al., 2021). Le peculiarità dell'IA ne suggeriscono il potenziale nell'innovare i modelli piattaforma, anche quelli basati su blockchain, tuttavia si tratta di aspetti che non sono stati ancora esplorati*

nella letteratura manageriale. Infatti, nonostante si riconosca la capacità sia dell'IA che della blockchain di innovare i BM (Ghosh, 2025; Paiola et al., 2024), tuttavia mancano studi che esplorino il loro effetto integrato sui BM piattaforma (Brewer et al., 2024). Si tratta di aspetti rilevanti alla luce della convergenza delle due tecnologie nelle piattaforme Web3, e che crea nuove opportunità e sfide per le organizzazioni che cercano di adattare i loro BM a un'economia sempre più digitalizzata (Lage et al., 2022; Trabucchi et al., 2020). Il presente studio ha l'obiettivo di colmare questo gap, accogliendo una prospettiva manageriale all'analisi degli impatti dell'IA sulle piattaforme basate su blockchain, per indagare come l'integrazione dell'IA influenzi i BM piattaforma abilitata con blockchain nelle dimensioni chiave di creazione di valore, value delivery e cattura di valore (Osterwalder et al., 2005; Rohn et al., 2021).

I modelli piattaforma abilitati da blockchain. *A differenza dei BM tradizionali il modello piattaforma presenta meccanismi peculiari di creazione di valore che dipendono dalla centralità del network (Rohn et al., 2021). La letteratura sottolinea infatti come nel modello piattaforma la struttura peculiare della rete influisce sui meccanismi di creazione del valore, influenzando le attività chiave - che si basano sull'incontro tra acquirenti e venditori- la proposta di valore - legata alla capacità dei partecipanti di accedere a una più ampia varietà di prodotti offerti dalla rete- e alle caratteristiche della piattaforma (Afhuan, 2013; Mcintyre and Srinivasan, 2017) Rispetto ai modelli piattaforma tradizionali, le piattaforme abilitate da tecnologia blockchain presentano caratteristiche peculiari: le esternalità di rete sono basate sulla decentralizzazione (Trabucchi et al., 2020); ciò significa che le transazioni tra gli utenti non dipendono da un entità centrale che ne regola lo svolgimento, in tal modo consentendo a ciascun partecipante di beneficiare pienamente degli effetti di rete (Murray et al., 2023). Inoltre, il potere assegnato agli utenti, attraverso la tokenizzazione e la capacità di catturare direttamente il valore generato, accresce la partecipazione nella piattaforma, potenziando le esternalità di rete (Trabucchi et al., 2020). Peraltro, le risorse chiave che caratterizzano il modello piattaforma blockchain derivano dalle caratteristiche peculiari delle digital ledger technologies, ed includono la trasparenza delle transazioni, l'esecuzione automatica in conseguenza del verificarsi di una determinata condizione, le verifica delle transazioni da parte di tutti i nodi con un contenimento dei costi delle transazioni, e ridotto rischio di alternazione dei dati. Poiché le transazioni sono accessibili a tutti i membri della rete, questo aumenta la simmetria delle informazioni nella rete (Schmück et al., 2025). Inoltre, le piattaforme blockchain consentono la tokenizzazione dei dati, permettendo lo scambio di oggetti fisici digitalizzati anche attraverso le criptovalute (Schmück et al., 2025). Il modello piattaforma abilitata con blockchain aumenta inoltre il controllo degli utenti sulle loro attività e sui loro dati (Lage et al., 2022; Trabucchi et al., 2020), offrendo anche la possibilità ai partecipanti di ricevere un compenso diretto per il valore creato attraverso le attività creative (Murray et al., 2023). Infine, attraverso la tokenizzazione, il modello di piattaforma blockchain consente di accrescere il valore della condivisione (Schmück et al., 2025; Trabucchi et al., 2020), che viene riconosciuta come un'esternalità di rete rilevante nei modelli piattaforma (Murray et al., 2023; Trabucchi et al., 2020*

Modelli piattaforma e Intelligenza Artificiale. *L'IA è stata definita da McCarthy (2007) come "la scienza e l'ingegneria della creazione di macchine intelligenti, in particolare di programmi informatici intelligenti" (McCarthy; J., 2007). La caratteristica principale dell'IA è quella di imitare l'intelligenza umana, accrescendo le capacità predittive e di soluzione problemi complessi attraverso la leva dei dati (Heimberger et al., 2024). Oltre l'automazione dei processi, l'IA agisce come tecnologia capace accelerare i processi di innovazione e di creazione del valore (Burström et al., 2021; Mishra and Tripathi, 2021; Teece, 2018), aumentando la capacità creativa e progettuale delle imprese (Davenport and Mittal, 2022) che consente di attivare processi dinamici di innovazione continua nelle organizzazioni (Jorzik et al., 2024; Mithas et al., 2022).*

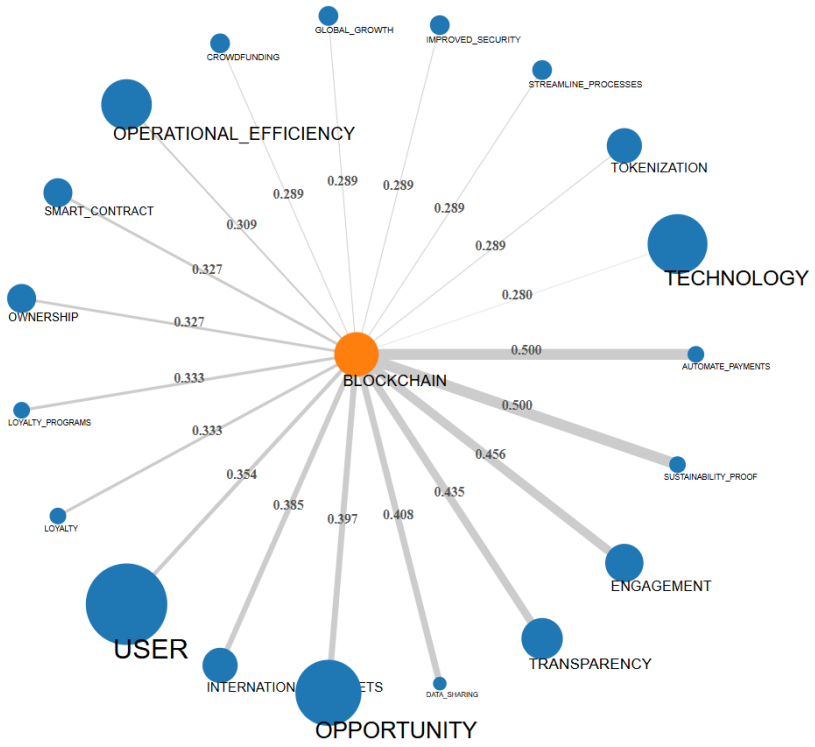
L'IA è anche considerata come abilitatore della trasformazione dei BM tradizionali verso modelli piattaforma, in quanto favorisce l'intelligenza dei dati e l'interoperabilità, e migliora le capacità delle altre tecnologie (Mishra and Tripathi, 2021).

Nell'ambito dell'integrazione dell'IA nei BM abilitati alla blockchain, studi recenti hanno suggerito la complementarità delle due tecnologie: l'IA può infatti migliorare l'efficacia dei sistemi blockchain facilitando la prevenzione dei fallimenti sistemici che rappresentano uno dei maggiori rischi dei modelli blockchain (Brewer et al., 2024). Nonostante la rilevanza dei processi di interazione tra blockchain e AI, mancano studi che sistematizzino il ruolo dell'IA nell'ambito dei modelli piattaforma basati sulle DLT, come blockchain ed in particolare nell'ambito del Web3.

Metodologia d'indagine. *Per raggiungere gli obiettivi di ricerca, lo studio ha previsto l'impiego di un approccio mixed - method multilivello basato sulla somministrazione di un questionario articolato su domande chiuse ed aperte a top manager appartenenti a diversi settori. Lo studio è stato integrato con lo svolgimento di un focus group che ha coinvolto un panel di manager attivi in progetti nel Web3.Le risposte aperte al questionario sono state sottoposte ad analisi testuale mediante il software T-LAB, al fine di identificare le relazioni tra le principali parole chiave (Lemmi) nel corpus e approfondire significato del punto di vista dei manager circa il ruolo dell'IA nel Web3. Le unità lessicali chiave sono state poi sottoposte ad analisi secondo il modello dell'ego-network, con un focus alle parole "blockchain" e "Intelligenza Artificiale" con le sue variazioni lessicali (Machine Learning e Generative AI). I risultati sono stati successivamente sottoposti ad un processo di generazione teorica mediante il ricorso all'approccio adduttivo, mutuato dalla grounded theory (Glaser and Strauss, 1967) secondo una prospettiva interpretativista (Charmaz, 2001) al fine di generare nuove ipotesi esplicative e apportare innovazioni teoriche a un corpus di conoscenze esistente (Timmermans and Tavory, 2012; Vila-Henninger et al., 2022) rispetto al ruolo dell'IA nel business model piattaforma abilitata da blockchain.*

Primi risultati. *Il work cloud che è stato realizzato attraverso l'elaborazione delle risposte aperte al questionario con il software TLab offre una prima panoramica delle principali parole chiave presenti nel discorso dei manager*

Fig. 1: Word cloud delle parole dominanti il discorso degli intervistati



Fonte: elaborazione propria attraverso software T-Lab

Le parole chiave enfatizzano gli aspetti di valore del modello di piattaforma basata su blockchain, in particolare la gestione dei dati, la decentralizzazione ("piattaforma decentralizzata") e l'automazione ("automazione dei processi"). Inoltre, le keyword: "sperimentazione", "efficienza operativa", "automazione dei processi" sottolineano le potenzialità del Web3 nell'innovare il BM. La presenza di parole chiave come "modello di business", "intelligenza artificiale" e "Web3" indicano il focus degli intervistati sull'interazione tra tecnologie del Web3 e l'IA nell'innovare il BM del Web3.

Ego network e associazioni di parole. Le prime analisi delle relazioni tra concetti chiave nel discorso dei manager, attraverso il software T-Lab, rispetto ai lemmi chiave legati a blockchain a "Intelligenza Artificiale" (parola al centro dell'ego. Network) rafforzano la rilevanza di alcune delle peculiarità che caratterizzano le formule di articolazione del valore dei modelli *piattaforma decentralizzati, tra cui l'automazione delle transazioni, ("smart contract"; "automatizzare i pagamenti") e la trasparenza delle transazioni ("trasparenza"). Nell'ambito della value proposition, sono rilevanti anche i concetti di "ownership" e "tokenization", oltre che di "engagement" e "loyalty program" da cui si inferisce il ruolo della blockchain nella costruzione di value proposition basate sulla proprietà di asset digitali e sulla condivisione, capaci di rafforzare gli effetti di rete. Un ulteriore aspetto è la riduzione degli intermediari e l'estensione dello scope della piattaforma, attraverso l'accrescimento del target e della global reach, che può essere inferita dai termini "crescita globale" e "mercato internazionale".*

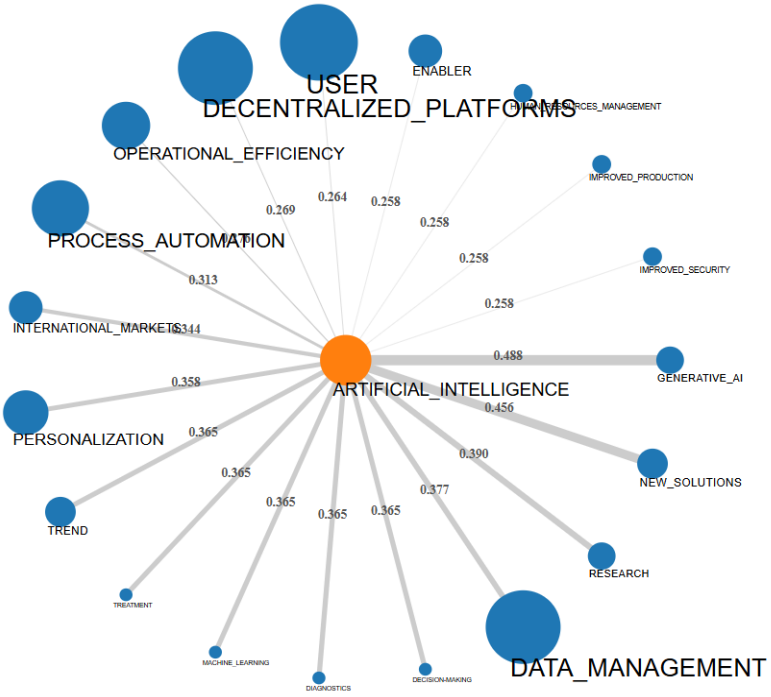


Fig. 2: Ego Network per le parola chiave "Blockchain", I valori indicano l'intensità dell'associazione della keyword centrale con la keyword nel radiale dove 0= associazione minima e 1 = associazione massima

Fonte: elaborazione propria attraverso software T-Lab

L'analisi rivela anche che l'IA facilita la connessione tra i partecipanti ('connect') accrescendo il valore che viene generato nelle piattaforme e creando nuovi servizi ("new solutions") in tal mondo accelerando l'acquisizione di capacità dinamiche di gestione delle risorse delle piattaforme del Web3.

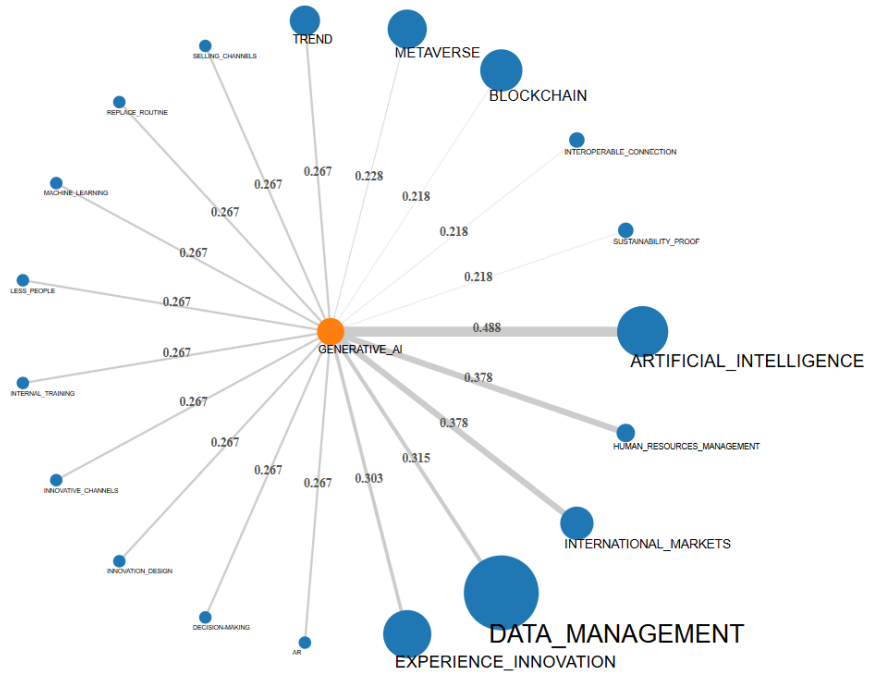

Fig. 3: *Ego Network per la parola chiave "Intelligenza artificiale", I valori indicano l'intensità dell'associazione della keyword centrale con la keyword nel radiale dove 0= associazione minima e 1 = associazione massima*

Fonte: elaborazione propria attraverso software T-Lab

Inoltre, le parole chiave "data management" e "efficienza operativa", suggeriscono che l'IA agisce migliorando i meccanismi che regolano gli scambi mediante una gestione ottimale del dato. Un altro concetto rilevante è "esperienza" che, collegato al lemma "IA generativa" e "Machine Learning", e ai termini legati a innovazione, suggerisce la capacità dei modelli generativi di migliorare l'esperienza dell'utente nelle piattaforme decentralizzate. Il miglioramento dell'esperienza è legato anche al concetto di "personalizzazione", che suggerisce che l'IA può aggiungere nuovo valore ai modelli delle piattaforme abilitate alla blockchain, migliorando la capacità offrire agli utenti esperienze personalizzate.

Fig. 4: Ego Network per la parola chiave "Generative AI", I valori indicano l'intensità dell'associazione della keyword centrale con la keyword nel radiale dove 0= associazione minima e 1 = associazione massima

Fonte: elaborazione propria attraverso software T-Lab

Un ulteriore aspetto riguarda le risorse chiave. Infatti, le parole chiave "gestione delle risorse umane", "formazione interna" e "processo decisionale", associate al lemma "Intelligenza artificiale", suggeriscono che l'IA facilita la generazione di nuove competenze e l'accrescimento delle capacità di presa delle decisioni. Rilevante è anche il concetto "miglioramento della sicurezza", che insieme a "efficienza operativa" e '"automazione" consente di inferire che l'IA aumenta l'efficienza del matching nelle piattaforme web, sia in termini di velocità che di efficienza delle transazioni. Questo aspetto rafforza potenzialmente i meccanismi di governance decentralizzata delle piattaforme abilitate dalla blockchain, soprattutto nell'ambito della value delivery.

Discussioni e Conclusioni. *Il lavoro investiga le sinergie tra AI e blockchain nel contesto delle piattaforme, secondo la prospettiva dei manager che operano in diversi settori e coinvolti in progetti di implementazione di queste nuove tecnologie. Applicando un approccio adduttivo all'indagine, il lavoro fa emergere risultati rilevanti rispetto all'impatto dell'IA nei modelli piattaforma abilitate da blockchain. L'IA migliora il funzionamento dei sistemi Web3, potenziando i driver che caratterizzano i modelli piattaforma blockchain-based e che sono già stati evidenziati nella letteratura esistente (ad esempio Schmück et al., 2025). Nell'ambito delle attività di creazione di valore, l'analisi fa emergere la centralità dell'IA come abilitatore di connessione e di interoperabilità. Infatti l'IA, attraverso la leva dei dati consente di collegare più piattaforme abilitate dalla blockchain, ampliando le possibilità di matching tra diversi standard di blockchain, massimizzando in tal modo il potenziale delle informazioni accessibili sulla piattaforma, con un potenziamento degli effetti di rete. I risultati mostrano che da un lato blockchain facilita l'interazione diretta tra parti commerciali e il rispetto dei contratti, eliminando al contempo gli intermediari, dall'altro l'IA apporta alla piattaforma efficienza operativa, ottimizzando il flusso delle interazioni tra le parti. Inoltre l'IA può abilitare nei modelli piattaforma decentralizzati "nuove soluzioni" o "soluzioni migliorate" che consentano condizioni di scambio ottimizzate e soprattutto più sicure. Rispetto alle "risorse chiave" i risultati rivelano inoltre che l'IA, accresce le connessioni ottimizzando il matching e lo scope delle imprese, e modellando nuove strategie sulla tokenizzazione del valore generato, massimizzando la reach della piattaforma decentralizzata. Inoltre, l'IA può supportare i processi di decisione strategica delle piattaforme, accrescendo la capacità di ricorrere ai dati per formulare previsioni, ed ottimizzare le scelte strategiche. Un ulteriore aspetto riguarda la gestione delle risorse umane, ed in particolare dei creativi e degli sviluppatori. Le piattaforme open-source basate su blockchain consentono infatti agli sviluppatori di innovare*

liberamente, contribuendo al miglioramento delle piattaforme. In questo l'IA svolge un ruolo cruciale, in quanto i manager ne sottolineano l'importanza nella "gestione delle risorse umane" e nella "formazione interna", verso lo sviluppo di comunità di talenti altamente qualificate all'interno dell'ecosistema Web3. Infine nella dimensione del value delivery, l'IA svolge un ruolo cruciale nella automazione e ottimizzazione dei processi che regolano la "value proposition", agendo direttamente nella gestione dei "consumatori" e dei "canali di vendita". Infatti, l'IA accresce le capacità di uso dei dati storici degli utenti e le transazioni sulla blockchain per mappare la clientela e creare automaticamente offerte personalizzate in base al comportamento e alle preferenze dei clienti. Le analisi evidenziano anche come l'IA possa fornire "canali innovativi", costruiti su misura per il cliente. Nella dimensione della cattura del valore, e in particolare nell'ambito dei meccanismi di prezzo, se la blockchain garantisce la certezza delle transazioni, l'IA può consentire l'implementazione di strategie di prezzo basate sulle caratteristiche del cliente. Il lavoro fa emergere che l'IA e la blockchain, nell'ambito dei modelli piattaforma del Web3, possono creare non solo complementarietà tecnologica ma anche complementarietà di innovazione, aumentando la produttività e il valore generato. Tale sinergia rappresenta un aspetto rilevante per le imprese per mantenere un vantaggio competitivo duraturo in contesti di mercato caratterizzati da elevata complessità. Si tratta di un aspetto importante anche nell'ottica della diffusione del modello piattaforma (Trabucchi et al., 2023), infatti l'IA e la sua interconnessione con la blockchain potrebbe rappresentare una leva importante di accrescimento della competitività dei modelli piattaforma. Tuttavia, l'orchestrazione delle interconnessioni tra AI e blockchain loro orchestrazione richiede una visione chiara e una pianificazione strategica da parte dei manager, affinchè i benefici derivanti dall'interazione tra le due tecnologie possano essere sfruttati appieno, limitandone i possibili rischi, e che sono legati principalmente alla natura delle infrastrutture ed alla governance dei dati.

Ringraziamenti: *Il presente studio è stato condotto nell'ambito dell'Osservatorio sul Web3 di Luiss con EY e in collaborazione con il Centro di Ricerca in Strategic Change "Franco Fontana" Luiss e che si ringrazia per il prezioso supporto.*

The Future of Education: reframing skills and learning in the age of artificial intelligence

CHIARA BARTOLI[1] FEDERICO CESCHEL[2] LORENZA GERARDI[3]
LUCIA MARCHEGIANI[4] ENZO PERUFFO[5]

Abstract

The introduction of artificial intelligence (AI) into education is fundamentally transforming learning models, skill requirements, and labor market dynamics. This study explores how AI adoption is reshaping education, focusing on the skills needed to address AI-driven changes. Through interviews with CEOs and educational experts, the research highlights the challenges and opportunities in both educational and professional contexts, emphasizing the importance of balancing hard and soft skills and promoting continuous learning. Using co-occurrence analysis with T-Lab software, the study uncovers how AI is altering learning models, data management, professional training, and cross-sector partnerships. The findings provide practical insights for educational institutions and businesses to better align curricula and learning approaches with emerging market demands, thereby supporting the workforce's adaptive capacities.

Introduction and background. *In an increasingly digitalized world, technology has moved beyond being merely a support tool or enhancer, becoming an infrastructural layer that permeates society and profoundly influences both the labor market and education. Digital technologies have established themselves as enabling factors across various sectors, including education, leading to a growing reliance on their applications by both users and institutions (Rahmatullah et al., 2022). Today, with digital technologies integrated into living spaces, students are digital natives and have grown accustomed to engaging with active and interactive learning methods, which they find more effective than traditional, passive approaches (Kozanitis & Nenciovici, 2023). On the other hand, the workforce is increasingly composed of an aging population, which necessitates ongoing training and the development of new educational models that cater to the need for lifelong learning. These combined pressures have led to a shift in the role of technology in education, making it not just an optional enhancement but a critical element for addressing the diverse needs and expectations of both younger and older generations in today's workforce (Hashim, 2018).*

In this evolving landscape, artificial intelligence has emerged as a key driver of transformation, with recent technological advancements and the growing proliferation of AI pushing the discussion beyond theoretical speculation toward empirical research focused on its tangible impact on learning processes and teaching methodologies (Kaplan & Haenlein, 2019; Labadze et al., 2023). This shift is already visible in concrete applications that are reshaping learning models and the overall educational experience, making it more adaptive, interactive, and tailored to students' needs.

According to a recent Microsoft report (2024), in school settings, 95% of institutional leaders, 68% of educators, and 62% of students report engaging with AI-powered tools in some capacity, highlighting the growing integration of these technologies into everyday teaching and learning practices. Institutional leaders primarily leverage AI to enhance the efficiency of operational and administrative processes (37%) and to improve equitable access to educational knowledge and resources (34%) (source). Educators integrate AI into their lesson planning workflows and the management of supporting materials and assignments (24%), while also utilizing it to simplify complex topics for students (20%). Meanwhile, students report using AI for summarizing information (35%) and for brainstorming and generating initial ideas for assignments (32%).

These trends show how AI is being seamlessly incorporated at multiple levels of the educational ecosystem: rather than serving as a mere tool for automation, AI functions as a support mechanism that augments human capabilities, streamlining routine tasks while enabling educators and students to focus on more cognitively demanding and creative aspects of learning and teaching.

Research shows that a key application of AI in education is the use of chatbots, which engage students in dynamic interactions, fostering sustained dialogue and enhancing engagement with the subject matter (Perez et al., 2020). Likewise, expert systems are increasingly employed for pedagogical planning, supporting educators in the development of more efficient and personalized curricula (Huang et al., 2021). AI also plays a critical role in shaping the relational dimensions of education-for instance, Learning Management Systems (LMS) optimize interactions between students and instructors, facilitating a more collaborative and continuous learning experience (Dias et al., 2015). More broadly, AI-driven predictive models enable proactive and adaptive learning strategies, fostering a more equitable educational framework by dynamically adjusting to individual learning needs and cognitive styles.

At the same time, AI is reshaping how educational institutions approach learning and management. It goes beyond automating tasks and streamlining processes, driving a fundamental change in how people learn, collaborate, and make decisions. Through AI integration, organizations are not just improving existing methods but are fundamentally transforming how knowledge is created, shared, and applied. For instance, AI enhances organizational learning by facilitating iterative co-creation, where knowledge is continuously assimilated and reused (Massa et al., 2023). Building on Simon's (1991) concept of bounded rationality, AI helps overcome human limitations in decision-making, offering predictive models and decision-support tools. One of AI's most powerful contributions is to experiential learning, where individuals engage with smart tools, access new information, and receive immediate feedback, all while learning through simulation and modeling. This approach fosters proactive learning by allowing students to explore different solutions in virtual scenarios before applying them in the real world. AI also nurtures incremental learning, enhancing processes and improving efficiency over time by providing real-time feedback and allowing continuous refinement of skills and knowledge.

The impact of AI influences not only educational frameworks (Xue et al., 2022) but also leads to a shift in the skills required by employers and, consequently, in those that educational institutions must develop to address this mismatch (An et al., 2024).

In the context of AI, the balance between hard and soft skills is particularly significant. While effective use of AI requires hard skills such as data analysis, prompt engineering, and overall data literacy, soft skills play an equally critical role. Competencies such as curiosity, problem-solving, lateral thinking, and adaptability enable individuals to respond to market changes and adopt a continuous learning approach (Pustalova & Vahter, 2025). Useful in this regard is the concept of complementarity between human and artificial intelligences, based on the idea that, although artificial intelligence (AI) can take on specific tasks with efficiency and precision, human qualities such as creativity, empathy, and critical thinking remain indispensable in many contexts. With this in mind, a vision of learning models is developing in which AI does not merely replace human work but enhances it by promoting synergistic collaboration between humans and machines (Brynjolfsson & McAfee, 2017).

The adoption of AI in education presents challenges, particularly the risk of reducing critical and creative thinking. Ethical concerns, such as data protection, require clear regulatory frameworks and ethical guidelines. A "Human by Design" approach is essential, ensuring individuals remain central to technological development. Educational institutions, especially universities, must guide innovation and support the transition to hybrid roles involving AI. AI integration should also involve humanities subjects to foster a critical approach, addressing both technological and ethical issues, ensuring equitable access to learning, and maintaining academic integrity.

Purpose of the paper. *Despite the growing body of literature on AI in education, there is limited empirical research on how educational institutions and businesses perceive the changing skill requirements. This study addresses this gap by comparing insights from CEOs and education experts on the evolving interplay between AI, skills development, and professional training. In light of these transformations, it is essential to understand how education is evolving to meet the skill needs that arise from the rapid integration of disruptive technologies in business.*

Hence, our research, currently in progress, aims to deepen the understanding of how artificial intelligence is reshaping the skills required by the labor market and how educational institutions, businesses, and governments are responding to these needs in the world of work.

Methodology. *The research is based on 19 in-depth interviews conducted between October 2024 and March 2025 with 15 CEOs and Presidents from Italian companies across sectors such as IT, consultancy, fashion, finance, shipbuilding, steel, and aviation, alongside 4 education experts. The sample, selected through a key informant approach (Robson & Foster, 1989), included both public and private organizations and aimed to capture strategic perspectives on the intersection between AI, education, and work transformation. Interviews followed a loosely structured protocol exploring AI's impact at macro (society and economy), meso (organizational models), and micro (skills and learning needs) levels. Each conversation lasted about an hour and was recorded, transcribed with AI tools, and anonymized. Data analysis combined text mining with qualitative interpretation. Using T-LAB software (Lancia, 2012), we examined keyword frequencies and co-occurrences, producing ego networks and word clouds to highlight emerging themes. This was integrated with cognitive mapping (Eden, 2004), which traced cause-effect links among concepts in each interview, later merged into a collective map of shared perceptions, visualized via Mural*

Results. *The following section presents the findings of our study, structured to first illustrate the perspectives of the two panels: Education Experts and CEOs. This division allows for a clearer understanding of how AI is perceived in terms of its impact on skills development and education from both a corporate and an academic standpoint.*

After presenting these viewpoints separately, the analysis highlights areas of convergence and divergence between the two groups. This comparative approach helps to identify common ground in addressing the challenges posed by AI, as well as the differing priorities and concerns that emerge within each professional domain.

a) Education Panel

The interviews reveal a strong focus on developing the skills necessary to face the challenges of AI in the labor market. In particular, the keyword analysis suggests the extent of change resulting from AI integration in education, affecting both higher and continuing education as well as labor market dynamics.

The most recurrent terms include "artificial intelligence", alongside "individual", "skills" (including "soft skills"), "university", "young people", "work", and "training paths." This highlights the central role of AI as a technological phenomenon with a profound impact on competencies, the pivotal function of universities, and the future of educational pathways in relation to ongoing technological advancements.

Additionally, the prominence of terms such as "learning processes" and "proper use" underlines the interviewees' focus on how AI is integrated into educational programs. This suggests that experts are not only concerned with the methodological aspects of AI-driven learning but also with the ethical implications of using AI in education.

The topic of skills also emerges as highly relevant. A strong emphasis is placed on the development of soft skills, particularly analytical thinking in relation to AI (comprehension skills). This suggests that, beyond technical knowledge, interviewees consider transversal skills to be crucial, necessitating the development of new hybrid approaches to skills training in the context of AI.

At the same time, the high recurrence of terms such as "enterprise", "European alliances", and "university" highlights the importance of adopting a shared vision and fostering cooperative approaches among various stakeholders. These collaborations are not limited to academia but also involve the corporate sector. Accordingly, priority is given to creating collaborative models between universities and businesses that transcend national boundaries. This aims to address the challenges related to designing learning models in the new scenarios shaped by AI adoption in educational contexts, following open and multilateral approaches.

Furthermore, the network analysis enabled the classification of interview narratives into five main semantic categories:

1. *Technology and human-machine interaction. This category centers on the interaction between machines and individuals, with a particular focus on the responsible use of technology. Education and institutional roles serve as key levers of change. The "individual" node introduces the theme of multidisciplinary education, which is essential for managing the human-machine relationship. Keywords such as "philosophical subjects" and "digital skills" further indicate the need to bridge the gap between humanities and STEM disciplines, fostering synergies across fields to equip individuals with the skills required for effective AI interaction.*
2. *AI as a global and local phenomenon. This category positions AI as a transformative technological force in education, capable of reshaping the role of universities within society and learning environments. The analysis underscores the need to strengthen connections between universities and schools, as well as between the educational and economic sectors. Universities emerge as the primary drivers of skills development among young people, with a strong emphasis on aligning academic degrees with the requirements of new professions.*
3. *Training models. This category focuses on educational models, particularly the structuring of study programs and the modularity and flexibility of their design (e.g., elective courses offered in a modular format). AI is perceived as a challenge, as indicated by the strong association between the terms "training models" and "challenge." This challenge encompasses both learning processes and skill development, particularly soft skills.*
4. *Skills development. This category revolves around the concepts of competencies and professions, highlighting keywords such as "skills acquisition", "learning processes", and their connection to the labor market. The analysis suggests that continuous training is a crucial tool for updating skills and aligning professional profiles with market needs.*
5. *International collaborations. Another key category relates to international partnerships, emphasizing the importance of European alliances and the globalization of training institutions. Education experts consider these collaborations to be critical for tackling AI-related challenges, both in terms of educational practices and the evolution of professional roles.*

b) CEOs Panel

The CEOs' narratives revolve around four key terms-technology, work, data management, and corporate organization-in addition to the overarching theme of artificial intelligence.

The term "technology" suggests the role of AI as a central driver of transformation, affecting data management, corporate structures, and innovation processes within both economic and societal frameworks. AI is perceived not only as an economic tool but also as a social phenomenon, as indicated by the prominence of keywords like "culture" and "human being."

The systematic analysis of these terms reveals a strong emphasis on the need for a responsible and conscious adoption of AI. This perspective highlights the importance of fostering trust and an open corporate culture, promoting ethical AI use, and ensuring that technological advancements are fully integrated into human-centered business environments.

Additionally, the frequent mention of "work", "skills", "individual", and "training" underscores CEOs' recognition of AI's impact on labor dynamics. This transformation extends beyond automation, encompassing skill development, workforce adaptation, and the creation of new professional roles.

The CEOs' discourse is structured around three focal areas, each analyzed through ego network mapping: business models, competencies, and processes. These clusters reflect how AI is shaping corporate strategy, workforce skills, and organizational decision-making.

1. *Business Models. AI is seen as a transformative force reshaping business models by redefining value creation mechanisms. Key areas of impact include resources, data, and core activities, which drive the development of AI-powered products and services. A particularly strong association emerges between business models and data management, highlighting how AI enhances strategic decision-making through predictive analytics and competitive insights. This data-driven approach strengthens companies' adaptability in dynamic markets, fostering flexibility, innovation, and business growth.*
2. *Competencies. AI is fundamentally altering the landscape of required workforce competencies, expanding beyond technical expertise to encompass managerial and strategic skills.*
   While AI-related technical skills (e.g., machine learning, information technology, and language models) remain crucial, CEOs emphasize the growing importance of strategic thinking and competitive analysis. Additionally, soft skills such as adaptability and continuous learning emerge as key factors in navigating AI-driven transformation.
   The strong link between competencies, training, and work in the ego network underscores the urgency of upskilling and reskilling initiatives. AI is accelerating the need for educational programs that align with evolving job market demands, reinforcing the creation of new professional roles.
3. *Processes. AI is redefining corporate processes, particularly in decision-making and data-driven management. The CEOs' discourse highlights how AI-powered predictive analytics and data management support more informed, agile, and proactive decision-making models. This shift reflects AI's role as a strategic enabler, not merely an automation tool, enhancing organizational responsiveness and efficiency. The increasing reliance on AI for adaptive decision-making further underscores its integration into the core functions of modern enterprises.*

Comparative analysis: alignments and tensions in AI-driven transformation

The interviews with CEOs and education experts provide valuable insights into the AI-driven transformation of education and its spillover effects on skills and the labor market. The findings presented highlight both areas of alignment and divergence in how AI is reshaping competencies, learning models, and the workforce.

A key point of convergence is the recognition of AI not merely as a support tool but as a transformative force influencing both business strategy and education systems. Both panels emphasize the need for continuous skills development to adapt to AI-driven shifts in the labor market. While both groups acknowledge the importance of lifelong learning as a response to these changes, CEOs focus on AI's role in enhancing strategic decision-making and business efficiency, particularly in terms of skill demands and emerging professional roles. In contrast, training experts stress the need for educational programs that integrate technical, managerial, and transversal skills to adequately prepare individuals for these evolving roles. Similarly, both groups recognize the central role of universities in bridging the gap between academia and industry. There is a shared emphasis on strengthening the dialogue between educational institutions and businesses to improve the alignment between labor supply and demand, fostering new opportunities in an AI-transformed job market.

Among the areas of divergence, on the contrary, significant dissonances in priorities and approaches emerge. While CEOs focus on AI as a driver of competitiveness and productivity, mostly viewing its impact through the lens of business models, operational efficiency and decision-making processes, and prioritizing data-driven strategies, predictive analytics and automation as key enablers of business growth, on the contrary, education experts take a broader and more systemic view, emphasizing the ethical, cognitive and social dimensions of AI adoption. Their more holistic vision reflects concerns about the responsible use of AI, human-centered learning models and the integration of multidisciplinary approaches, especially the need to balance STEM and humanities education.

These differences reveal an underlying tension between short-term efficiency and long-term adaptability, two contrasting but parallel needs. Short-term efficiency is mostly sought by CEOs in immediate AI-driven benefits for organizational performance, while long-term benefits are preferred by the panel of education experts through a sustainable and inclusive learning framework that fosters critical thinking and ethical awareness along with technological expertise. To address this gap and seize both short-term and long-term opportunities, coordinated efforts are needed to align business needs with education policies, ensuring that AI adoption leads to both economic innovation and social responsibility.

This comparative analysis therefore highlights the keystone to resolve such tensions in cross-sectoral dialogue and strategic cooperation between business and education, to manage AI-driven transformation with both technical and human-centric skills.

Research limitations. *The study, still in progress, presents the preliminary results of the first 20 interviews. This limited sample size imposes obvious constraints on the generalizability of the findings, which may not fully represent the views and experiences of a broader population. Additionally, the sample was selected using a non-probability sampling method, which could introduce bias in terms of representativeness. The inclusion of CEOs from large companies and experts in higher education may limit the diversity of perspectives. Further development of this study could address this limitation by employing a quota sampling approach to ensure a more balanced representation across different sectors and organizational levels.*

Managerial implications. *This research provides managerial implications for both businesses and educational institutions. For companies, it emphasizes the importance of designing continuous training programs focused on micro-competencies to bridge the skill gaps emerging from the disconnect between traditional, linear training programs and the rapidly evolving technological landscape.*

Companies investing in AI integration can achieve significant benefits in operational efficiency, productivity, and revenue growth. However, these results depend not only on the technology itself but on how it is adopted-by fostering collaboration between human and artificial intelligence and creating a culture of learning, collaboration, and innovation. Businesses should integrate both hard and soft skills development, ensuring that employees are equipped not only with technical knowledge but also with critical thinking, creativity, and adaptability, which are essential in today's rapidly changing environment.

For educational institutions, the recommendation is to adapt curricula to be more dynamic and aligned with industry demands, encouraging lifelong learning practices that reflect the ongoing need for skills updating. Educators will play a key role as learning designers, helping students develop personalized, interdisciplinary competencies connected to real-world challenges. AI can assist in innovating curricula, automating routine tasks, and creating learning resources, enabling educators to focus on high-value activities such as mentorship and designing engaging, interactive learning experiences. Both sectors are urged to enhance collaboration to address the challenges posed by disruptive technologies, ensuring that education and training evolve in tandem with these changes.

Originality of the paper. *Our work stands out by offering a unique perspective that compares both managerial and academic viewpoints. This dual approach provides a comprehensive and systemic understanding of the impacts of AI on education and workforce development. By proposing a comparative framework that bridges the emerging skill gaps in both corporate and academic environments, our research offers a practical solution for adapting education and training to today's dynamic technological landscape, distinguishing our work as an innovative contribution to the field. The paper contributes to current debates in the fields of innovation management and education strategy by framing AI not only as a technological shift but as a socio-organizational transformation that requires rethinking the design of learning systems, both within firms and educational institutions. AI's transformative potential in education necessitates a balanced approach to skills development, integrating technical, managerial, and soft skills. This multidimensional focus enhances the existing literature on workforce reskilling and lifelong learning in AI-driven contexts.*

By fostering dialogue between academia and industry, educational institutions can better align curricula with evolving market needs. In doing so, the study addresses a gap in the literature by offering empirical insights into how different actors, managers and educators, are interpreting and reacting to AI, and what this means for the future of human capital development. The study's comparative analysis highlights the importance of integrating ethical considerations with technical advancements, promoting a holistic and adaptive educational paradigm.

Key words: *artificial intelligence; education; AIed; skills; lifelong learning; educational reform*

Leveraging AI for Internationalization: The Role of Artificial Intelligence in the Global Expansion of Italian Startups

NOHAILA KARTTI[1] CHIARA CANNAVALE[2]

Abstract

This study aims to investigate how Italian startups strategically integrate and implement AI technologies within their international strategies. The objective is to understand how these technologies impact various critical stages of internationalization process, including market identification, opportunity assessment, risk management, customer adaptation, and operational efficiency in international activities. This study employs a qualitative case study approach, which is well-suited for exploring complex and context-specific phenomena, such as the relationship between AI adoption and the internationalization processes of early-stage firms. Both primary and secondary data sources will be utilized to achieve methodological triangulation, which enhances the credibility and reliability of the findings. The thematic approach will be used to analyze the collected data. This will be combined with process tracing techniques to reconstruct the sequence of decisions, actions, and adaptations through which AI tools were implemented to support internationalization objectives. The implementation of AI brings new dynamics that challenge, enhance, and, in some instances, completely transform these processes. This research offers several managerial insights for startup founders, executives, and ecosystem stakeholders, providing practical perspectives on how AI-driven decision-making can improve international expansion. This study makes a unique contribution to the fields of international entrepreneurship, digital transformation, and the growing role of artificial intelligence (AI) in global business strategy. A key conceptual innovation of this paper is its argument that AI adoption does not merely enhance existing internationalization pathways, but rather reconfigures the logic through which startups identify, evaluate, and pursue international opportunities.

Framing of the research. *In the continuously evolving global business landscape, adopting digital technologies within corporate strategies has become a fundamental factor, redefining the mechanisms of market expansion and competitive dynamics. (Di Vaio et al., 2020; Wei & Pardo, 2022).*

Digital technologies can facilitate the international growth of firms (Jean et al., 2010; Sinkovics et al., 2013), equipping smaller enterprises with innovative tools and strategies to access and engage global markets. Additionally, they offer new methods for structuring economic activities and managing business operations (Falahat et al., 2020). These aspects have recently attracted increasing scholarly interest (Bettiol et al., 2020; Cassetta et al., 2019; Hannibal and Knight, 2018; Laplume et al., 2016; Strange and Zucchella, 2017).

Beyond studies examining internet-facilitated internationalization and the impact of e-commerce on global expansion (Bell and Loane, 2010; Hamill, 1997; Nummela, 2010; Reuber and Fischer, 2011; Sheth and Sharma, 2005), limited research has explored how digitalization enables or constrains the international growth of startups (Neubert, 2018). Existing literature mostly emphasizes digitalization as a communication and sales channel, highlighting its role in accelerating early-stage global expansion. However, digitalization is an extensive concept that includes various aspects of both business and daily life (Hagberg et al., 2016). It incorporates a wide range of technologies and applications, including, for example, Artificial Intelligence, cybersecurity, cloud computing, and smart robotics. Due to its broad scope and complexity, digitalization can sometimes seem both all-encompassing and unclear. To better understand its specific aspects, more research should focus on particular types of digitalization. (Denicolai et al., 2021)

Building on this perspective, we focus on Artificial intelligence (AI) as a key digital technology since it stands out as a major trend in digital innovation, significantly transforming global business and internationalization process (Burström et al., 2021; Denicolai et al., 2021; Ghauri et al., 2021). In today's globally connected environment, where international trade and cooperation have become standard practices, AI plays a key role in facilitating and enhancing the process of internationalization (Gölzer and Fritzsche, 2017; Li et al., 2018).

This research refers to AI in its broadest sense, encompassing the wide range of smart process automation, intelligent systems, and the algorithmic economy. (Azkan et al., 2019; Martinez-Lopez and Casillas, 2013). Moreover, AI can also be described as a cognitive technology, referring to computer-based systems that assist in decision-making (Watson,

DOI 10.7433/SRECP.SP.2025.01

2017; Montes and Goertzel, 2019). It represents one of the most unique and impactful applications of AI, where decisions supported by cognitive technologies range from everyday tasks to high-level strategic decisions (Denicolai et al., 2021).

In this paper, we specifically focus on startups, since within the startup ecosystem, the constraints of limited size and early-stage development often create challenges for international expansion. AI provides a strategic advantage and a practical tool to help navigate global growth more effectively (Neubert, 2018).

Although research on international entrepreneurship has extensively examined the influence of entrepreneurial orientation, innovation capability, and networks in facilitating early internationalization, the specific role of AI as a catalyst, accelerator, and shaper of global expansion remains underexplored (Denicolai et al., .2021).

This study aims to investigate how Italian startups strategically integrate and implement AI technologies within their international strategies. The objective is to understand how these technologies impact various critical stages of internationalization process, including market identification, opportunity assessment, risk management, customer adaptation, and operational efficiency in international activities.

The theoretical framework of this study draws on three key perspectives. First, international entrepreneurship theory (Oviatt & McDougall, 1994) offers a valuable lens for exploring the proactive, innovative, and risk-taking behaviors that define startups pursuing early internationalization. In this context, AI is considered as a crucial enabler of entrepreneurial agility, allowing startups to quickly identify, assess, and seize opportunities across distant markets.

On the other hand, dynamic capabilities theory (Teece, 2007) provides a process-focused view of how firms identify opportunities, mobilize resources to capitalize on them, and continuously shape their internal processes to maintain a competitive edge in fast-changing environments. In this context, AI is seen as a tool that enhances capabilities, particularly through its ability to identify international opportunities via real-time data analysis, support market entry with flexible, tailored strategies, and optimize internal operations to meet the unique demands of each foreign market

Third, the expanding literature on digital internationalization (Autio et al., 2018) and technology-driven globalization emphasizes the critical role of digital tools, such as AI, in lowering the resource barriers to internationalization. This enables even the smallest firms to pursue global expansion without needing significant upfront investments in physical assets (Denicolai et al., 2021).

Purpose of the paper. *This study aims to explore, conceptualize, and empirically examine the role of AI as a transformative force in the internationalization of Italian startups. It investigates how AI-driven capabilities shape key aspects of the international expansion process, including opportunity recognition, market selection, strategic adaptation, and the overall trajectory of international growth.*

The internationalization processes of technology startups have been widely studied (Cavusgil & Knight, 2015; Oviatt & McDougall, 1994), while the transformative impact of advanced technologies, particularly artificial intelligence (AI), has not yet been fully incorporated into established theoretical frameworks. Although the increasingly interest in the digital internationalization of firms (Monaghan et al., 2020; Coviello et al., 2017), existing research has mainly centered on digital platforms, e-commerce ecosystems, and online marketing capabilities.

Therefore, the main objective of this study is to examine the implications of AI integration in the internationalization of startups. This research aims to determine whether Italian AI-driven startups follow unique internationalization trajectories, adopt different knowledge frameworks and decision-making logics, and how the interaction between algorithmic and human decision-making influences critical aspects of the internationalization process, such as partner selection, market entry timing, and product/service localization strategies.

Instead of treating AI simply as a tool for enhancing efficiency, this study conceptualizes AI as both a cognitive and strategic agent within the firm. It explores how AI not only transforms existing knowledge but also redefines how international opportunities are identified, understood, and pursued.

Accordingly, the research question of this work is:

How do Italian startups leverage AI to drive their internationalization?

Methodology. *This study employs a qualitative case study approach, which is well-suited for exploring complex and context-specific phenomena (Mogaji et al., 2022; Eisenhardt, 1989; Yin, 2017), such as the relationship between AI adoption and the internationalization processes of early-stage firms.*

This interpretative phenomenological approach helps gain a deeper understanding of stakeholders' personal experiences, offering valuable insights into their perceptions, motivations, and challenges related to AI integration. The flexibility of qualitative research methods further supports this process by allowing researchers to adapt data collection strategies and identify emerging themes within a rapidly changing technological landscape (Creswell & Creswell, 2018; Patton, 2015).

Moreover, this approach facilitates the analysis of data from multiple cases through an ongoing comparison between theoretical concepts and empirical data, aiming to establish a robust alignment between the two (Creswell & Creswell, 2018; Gehman et al., 2018). Comparing similarities and differences across cases also enables the researcher to identify potential patterns, trends, or connections, thereby supporting the development of inductive theories (Eisenhardt & Graebner, 2007; Welch et al., 2020; Yin, 2017).

Based on the six criteria outlined by Miles and Huberman (1994) (i.e., alignment with the conceptual framework, ability to generate detailed insights into the phenomena of interest, credibility (real-life applicability), generalizability, ethical considerations, and feasibility), purposive sampling was identified as the most suitable approach for this study.

Specifically, the selected startups meet the following criteria:

1. *they were founded within the last ten years, ensuring they are part of the recent wave of digitally-native firms*
2. *they actively leverage AI tools in at least one core internationalization process-including market intelligence, customer adaptation, risk management, or operational efficiency- thereby ensuring theoretical relevance*
3. *they have successfully entered at least one foreign market, demonstrating a clear international footprint.*

Both primary and secondary data sources will be utilized to achieve methodological triangulation, which enhances the credibility and reliability of the findings (Gibbert & Ruigrok, 2010). Primary data collection involves semi-structured interviews with founders and managers of each startup. These interviews explore the motivations for AI adoption, the specific tools and platforms used, the decision-making processes surrounding market selection and entry, the perceived benefits and limitations of AI tools, and the role of AI in continuous adaptation and learning in foreign markets.

The data collection process also incorporates secondary sources, such as media articles, industry reports, and official documents, which help to define the broader technological environment influencing AI adoption and internationalization opportunities in each case.

This multi-source triangulation ensures that the findings do not only rely on self-reported perceptions, which can be subject to retrospective bias or strategic exaggeration, especially in highly competitive startup ecosystems (Podsakoff et al., 2003).

The thematic approach outlined by Braun and Clarke (2006) will be used to analyze the collected data. This will be combined with process tracing techniques (Langley, 1999) to reconstruct the sequence of decisions, actions, and adaptations through which AI tools were implemented to support internationalization objectives.

This methodological design supports the study's broader ambition of theory building (Birkinshaw et al., 2011; Eisenhardt & Graebner, 2007). By identifying and theorizing the mechanisms through which AI shapes internationalization processes, the study contributes to the emerging literature on digital internationalization (Autio et al., 2018), while also enriching established theories of international entrepreneurship (Oviatt & McDougall, 1994) and dynamic capabilities (Teece, 2007) with technology-sensitive insights.

Expected Results. *The Uppsala model (Johanson & Vahlne, 2009) suggests that firms expand internationally step-by-step, learning from experience. However, this may not fully apply to startups using AI. Instead, the research is likely to show that AI allows firms to bypass this gradual process, helping them enter multiple foreign markets by using data-driven insights rather than slow, incremental learning (Coviello et al., 2017).*

Another expected outcome is that AI shifts the role of entrepreneurial decision-making process in internationalization. Traditionally, entrepreneurial decision-making relied on heuristics, personal networks, and subjective assessments of foreign markets (Arenius, 2005). However, AI-driven startups are expected to rely more on algorithmic decision-making, where AI tools analyze large amounts of data reducing human bias and uncertainty (Brynjolfsson & Mitchell, 2017).

While AI-driven internationalization offers many advantages, it also comes with challenges that firms will need to navigate. The research is expected to show that although AI improves scalability and efficiency, it doesn't remove the complexities of dealing with cultural, institutional, and regulatory differences in different markets (Agrawal et al., 2022).

he findings are expected to provide a deeper understanding of how AI fits into internationalization strategies. Rather than replacing traditional entrepreneurial theories, the research is likely to show that AI should be seen as a tool to enhance strategy, combining the power of data with human insights, cultural understanding, and adaptable decision-making (Ozturk, 2024).

In summary, this research aims to challenge traditional internationalization theories, demonstrating that AI is not just a facilitator but a transformative force in how firms expand globally (Denicolai et al., 2021). Thus, instead of completely replacing traditional market-entry strategies, AI works best as an enhancement.

Research limitations. *This research wants to offer valuable insights into the role of AI in startups internationalization process. However, it is important to recognize its limitations. One of the first limitations of this study arises from its multiple case study approach. Even if a qualitative research approach was appropriate for addressing our research questions, the focus on a limited number of firms and respondents restricts the generalizability of the findings to a wider range of industry sectors (Taylor et al., 2021)*

Since this research focuses on a small number of startups (located in Italy) , the findings may not be fully applicable to all firms, especially those in different industries, business models, or institutional environments (Yin, 2017).

Additionally, case study research relies heavily on subjective interpretation, which introduces the risk of researcher bias. Even though efforts are made to ensure triangulation through multiple data sources, the interpretation of AI's role in internationalization may still be influenced by the researcher's own theoretical perspective (Dubois & Gadde, 2002). Future research could mitigate this limitation by complementing case studies with large-scale empirical analyses using quantitative techniques.

Furthermore, AI's impact on internationalization varies across industries and regions, making it difficult to ensure representativeness. This study focuses on italian startups, which may not reflect the experiences of firms in other countries and regions.

Managerial implications. *The implementation of AI into internationalization strategies marks a significant shift in how technology can affect startups' approach to global markets. Traditional theoretical models mainly focus on learning from experience, expanding through networks, and gradually adapting to foreign market conditions (Johanson & Vahlne, 2009; Coviello et al., 2017). The implementation of AI brings new dynamics that challenge, enhance, and, in some instances, completely transform these processes. This research offers several managerial insights for startup founders,*

executives, and ecosystem stakeholders, providing practical perspectives on how AI-driven decision-making can improve international expansion.

The first implication is the need to reconsider how international opportunities are identified and assessed. Traditionally, entrepreneurs have depended on network connections, personal experiences, and intuitive decision-making to choose which markets to enter (Autio et al., 2021). Nowadays, AI-driven analytics allow startups to analyze large volumes of real-time data, simulate potential market scenarios, and predict demand with a level of accuracy that was previously impossible (Agrawal et al., 2022; Ozturk, 2024). This capability not only minimizes uncertainty and cognitive biases in market selection but also enables firms to act faster and more efficiently.

AI also transforms how startups manage risk in foreign markets. International expansion is challenging due to cultural differences, regulatory complexities, and shifting competitive dynamics (Meyer & Peng, 2016). AI-powered risk models, which analyze factors such as geopolitical trends, trade flows, and consumer sentiment, offer real-time risk assessments, enabling firms to anticipate challenges and refine their strategies proactively (Ozturk, 2024).

This has several implications for internationalization strategies, as startups can dynamically reconfigure their international operations based on AI-generated insights rather than relying solely on previous experiences.

As AI becomes more integrated into internationalization strategies, startup teams will need to adapt. Companies must hire talent that understands both AI technology and international business, forming cross-disciplinary teams that connect technical skills with strategic decision-making. Additionally, the use of AI in decision-making brings up concerns about organizational flexibility and the balance between centralized and decentralized decision-making. While AI supports data-driven centralization, startups must ensure that local market managers still have the freedom to interpret AI insights and adjust strategies according to local conditions.

Originality of the paper. *This study makes a unique contribution to the fields of international entrepreneurship, digital transformation, and the growing role of artificial intelligence (AI) in global business strategy. While there is a significant body of research on the internationalization processes of startups, particularly within the established born global and international new ventures (INVs) models (Cavusgil & Knight, 2015; Oviatt & McDougall, 1994), these frameworks were developed before AI became widely integrated into entrepreneurship and internationalization. As a result, they are not fully equipped to capture the profound ways in which AI-driven startups are changing the mechanisms, sequences, and even the decision-making processes of international expansion.*

A key conceptual innovation of this paper is its argument that AI adoption does not merely enhance existing internationalization pathways, but rather reconfigures the logic through which startups identify, evaluate, and pursue international opportunities. Traditional theories emphasize gradual experiential learning and network-embedded opportunity identification (Johanson & Vahlne, 2009; Cavusgil & Knight, 2015), while the rise of AI introduces the possibility of data-driven, algorithmic learning at a scale and speed that fundamentally alters the relationship between knowledge, experience, and international strategic action (Autio et al., 2021). This reframing challenges the prevailing temporal assumptions embedded in Uppsala-type models and raises new questions about the role of managerial cognition and entrepreneurial intuition when much of the opportunity identification process is increasingly mediated by machine learning models and predictive algorithms (Brynjolfsson & Mitchell, 2017).

At the empirical level, the paper's originality lies in its focus on real-world cases of startups that are not only internationalizing but doing so with AI as an embedded, dynamic capability influencing their decision-making, operational adaptation, and competitive positioning.

Much of the current literature on digital internationalization focuses on e-commerce platforms, digital marketplaces, and the role of social media in reducing psychic distance and accelerating cross-border reach (Monaghan et al., 2020; Coviello et al., 2017). However, there remains a striking gap in research examining how AI specifically influences internationalization pathways to encompass strategic foresight, risk assessment, product localization, and even adaptive business model transformation in response to real-time international market signals (Arshi et al., 2022).

By grounding the analysis in multiple, data-rich case studies of AI-enabled startups actively navigating international markets, this research addresses this gap and offers many insights into how AI shapes not only firm-level strategies, but also the entrepreneurial cognition and organizational learning processes underpinning them.

Key words: *internationalization; Artificial intelligence; startup; international entrepreneurship; dynamic capabilities; digitalization*

The Role of International Knowledge in China's Artificial Intelligence Ecosystems

JACOPO CRICCHIO[1] SAVERIO BARABUFFI[2] ALBERTO DI MININ[3]

Abstract

Entrepreneurial ecosystems (EEs) play a pivotal role in fostering regional economic growth and innovation, especially in the context of emerging technologies like artificial intelligence (AI). This study examines the impact of international collaboration and knowledge sharing on innovation capacity within China's AI-focused EEs. Utilizing a patent-based citation analysis, we explore how cross-border knowledge flows influence AI innovation performance across a panel dataset of 1,858 Chinese AI firms from 2014 to 2019. Our findings indicate that international collaboration significantly enhances innovation capabilities, evidenced by positive correlations with AI innovation performance, and enterprise value in both static and dynamic panel models. This study contributes to the EE literature by highlighting the importance of global interconnectedness and the role of foreign knowledge in enhancing the innovation potential of EEs. The implications suggest that robust international networks are crucial for firms aiming to innovate in AI, pointing to the need for policies that support international cooperation and knowledge exchange to sustain competitive advantages in the global market.

Framing of the research. *Entrepreneurship has been recognized as a driving force for economic growth and regional development (Benneworth 2004). Local infrastructures and resources have proven essential in facilitating the development of entrepreneurial activities (Van De Ven 1993). The development of a healthy entrepreneurial ecosystem (EE) is now deemed vital for regional development (Alvedalen and Boschma 2017).*

An EE tends to be described as a set of interdependent actors and factors or as an interaction system composed of hierarchically independent but coordinated stakeholders that enable productive entrepreneurship within a particular territory (Stam and Spigel 2016; Autio et al. 2018). However, there is still debate around the precise definition of EE and how it differs from other concepts that also aim to explain the geographical concentration of entrepreneurial activities like clusters, regional innovation systems, and networks (Acs et al. 2017; Spigel and Harrison 2018).

Following the knowledge-based view of the firm (Grant 1996), prioritizing and maintaining knowledge sharing both within and outside the company's boundaries becomes crucial for innovation. With the evolution of EEs, information sharing between organizations and improvement of knowledge management capabilities become easier (Ferreira et al. 2023). Furthermore, firms with international experience and networks are more likely to engage in exploratory innovation, which can lead to the development of new products, processes, and technologies (Nambisan et al. 2019).

The concept of entrepreneurial ecosystems has evolved significantly over the past two decades, with scholars increasingly recognizing the importance of open innovation, knowledge brokerage, and cross-border collaboration in fostering technological progress (Autio et al., 2018; Stam & Spigel, 2016). Within this framework, the role of knowledge brokers has gained prominence, as firms and institutions strategically position themselves to facilitate the exchange and recombination of ideas across different innovation networks (Cricchio et al. 2025).

Recent studies have shown that the strength of global embeddedness of EEs is likely to develop sectorial orientations (Audretsch and Belitski 2021). In the Chinese context, regional governments' primary role in providing public and social services contributes significantly to the expansion of entrepreneurship within regional EEs (Wei 2022). China hosts prominent examples of vibrant EEs where iterative resource dynamics foster sustained competitiveness, leading to regional economic development (Shi and Shi 2022).

China has made significant strides in AI innovation, competing globally in terms of patent applications and scientific publications, reflecting its impressive research output and innovation capabilities (World Intellectual Property Organization 2019, 2024). These elements shape an entrepreneurial ecosystem where both indigenous and foreign knowledge play crucial roles. China is now one of the world leaders in AI adoption (Castro and McLaughlin 2021), largely due to its vast data availability (Yu et al. 2022). The country hosts the second-largest cluster of AI firms, concentrated in Beijing, Shanghai, Shenzhen, and Hangzhou. The increasing role of universities, AI entrepreneurs, digital

platforms, and government bodies at both national and local levels further accelerates innovation (Arenal et al. 2020; Jacobides et al. 2021; Yu et al. 2021).

In particular, China's Big Tech firms act as hyperscalers while simultaneously fostering smaller firms' digitalization and AI adoption. This contributes to the development of a more equitable tech ecosystem where key firms strengthen their positions by ensuring a balanced network of complementors (Cricchio et al., 2025). This strategic approach underpins China's AI ecosystem and reinforces the importance of cross-border knowledge exchange.

Purpose of the paper. *This study aims to examine the role of international knowledge and cooperation in the development of China's AI ecosystem. The EE literature lacks a comprehensive understanding of the role of knowledge circulation across EE's geographical boundaries since the majority of prior studies have mainly focused on a domestic context (Acs et al. 2017; Theodoraki and Catanzaro 2022). We aim to fill these research gaps by analyzing the EE in an international context and its connection to the role of innovation activities.*

Research on the boundaries of ecosystems, their openness, and their governance structure remains underdeveloped (Colombo et al. 2019). For innovative firms, being involved in an EE brings advantages in terms of knowledge acquisition possibilities and increases the types of collaborative activities available. In this regard, even though international cooperation can be risky, it also provides greater knowledge access and stronger relational ties (Ferreira et al. 2023).

Recently, private and public actors in China have been strongly collaborating to develop AI technology (Jacobides et al., 2021). Collaboration is encouraged at both national and regional levels through various innovation policies (Wu et al. 2020). While Chinese AI development objectives have been distinctly delineated by national and regional boundaries, with a focus on enhancing indigenous innovation, foreign knowledge has historically played a pivotal role in China's technological progress (Chen et al. 2021). AI is a general-purpose technology (GPT) that thrives on the recombination of knowledge across different disciplines and geographical boundaries. The integration of foreign expertise, intellectual property, and collaborative R&D partnerships is critical for firms aiming to sustain competitive advantages in AI innovation (Cockburn et al. 2019). Unlike traditional innovation models that emphasize closed R&D processes, AI firms increasingly rely on strategic alliances, patent-sharing mechanisms, and knowledge diffusion strategies to maintain technological leadership (Nylund and Brem 2023). Therefore, in this study, we ask: what is the role of international knowledge and international cooperation in the development of the Chinese AI ecosystem?

Despite these advancements, significant gaps remain in the literature regarding the role of foreign knowledge in China's AI entrepreneurial ecosystem. Most studies focus on national innovation policies and indigenous technological capabilities, overlooking the critical contributions of international collaborations, joint ventures, and foreign direct investments (FDIs). This study addresses these gaps by exploring the extent to which foreign knowledge flows influence AI innovation performance within China's entrepreneurial ecosystems, offering new insights into the mechanisms of cross-border knowledge exchange and its implications for ecosystem development.

We use a patent-based citation analysis from a longitudinal perspective to examine how international knowledge flows affect innovation performance in China's AI ecosystem. We formulate the following research hypothesis:

H1: International collaboration and knowledge sharing positively correlate with the EE's capacity to innovate in AI.

Methodology. *To test our hypothesis, we retrieved data from Orbis Intellectual Property Database, Orbis Database, China Statistical Yearbook, and China Statistical Yearbook on Science and Technology for 2014-2019 following. Following the approach of Liu et al. (2021), that combines keyword search with IPC and CPC codes, we identified AI-related patents and hence the Chinese AI firms. We constructed an unbalanced panel dataset of 1858 firms. The sample includes firms from various sectors, including technology, manufacturing, healthcare, finance, and transportation, reflecting the cross-industry applicability of AI technologies.*

Given AI's role in fostering innovation and technological advancements, our methodological approach involved a panel regression with firm and time-fixed effects to account for unobserved heterogeneity. This model ensures that differences in innovation performance are not solely attributed to firm-specific characteristics or time trends but rather to variations in international knowledge inflows. The equation used for the regression model is expressed as:

$$lnY_{i,t} = \alpha + \beta lnX_{i,t-1} + \varphi_i + l_t + \varepsilon_{i,t}$$

where $Y_{i,t}$ represents the dependent variables: (1) AI Innovation Performance (AI_inn), measured by the number of AI-related patents granted by Chinese National Intellectual Property Agency excluding patents with foreign backward citations; (2) Return on Equity (ROE), calculated as net income divided by shareholders' equity; and (3) Enterprise Value (EV), determined as the sum of a firm's market capitalization and its short- and long-term borrowings.

The key independent variable, Foreign Knowledge (FK), is operationalized as the number of AI patents with backward citations originating from foreign applicants. This variable captures the extent to which firms leverage external knowledge sources for innovation. Control variables include firm size (measured by the number of employees), intangible assets, tangible assets, firm age, debt levels, profit, and revenue. Independent and control variables are lagged by one year to reduce endogeneity concerns and to ensure that their effects on innovation outcomes are not confounded by simultaneous influences.

Results. *The regression analysis confirms our hypothesis that foreign knowledge flows significantly enhance indigenous AI innovation performance and enterprise value within China's AI ecosystem. The results from our static panel models reveal a positive and statistically significant correlation between Foreign Knowledge (FK) and both AI Innovation Performance (AI_inn) and Enterprise Value (EV), supporting the notion that access to international expertise strengthens firms' technological capabilities.*

Specifically, firms with higher exposure to international knowledge networks-measured through foreign backward citations-exhibited superior innovation outcomes, as indicated by an increased number of AI-related patents. This finding suggests that cross-border knowledge flows play a crucial role in enabling firms to engage in knowledge recombination, a key driver of AI advancement. Furthermore, firms with access to foreign expertise demonstrated improved enterprise valuation, indicating that international knowledge inflows contribute to firms' financial strength and long-term sustainability.

The results also indicate that AI firms operating within well-connected ecosystems benefit from greater knowledge spillovers, which, in turn, enhance their ability to develop cutting-edge AI applications. This aligns with prior studies emphasizing the role of ecosystems in facilitating productive entrepreneurship (Autio et al., 2018; Stam & Spigel, 2016). Additionally, firms that engage in global partnerships and maintain strong international linkages outperform their counterparts with domestic-only innovation strategies, reinforcing the importance of global knowledge flows (Nambisan et al. 2019).

	Indigenous AI innovation performance	Return on Equity	Enterprise Value
AI Foreign Knowledge flows t-1	**0.1320***** (0.0234)	0.0179 (0.0444)	**0.1250***** (0.0464)
Number of firms	1858	1858	792
Number of obs.	7633	7432	3524
Control variables	Yes	Yes	Yes
Time fixed effects	Yes	Yes	Yes
Firm fixed effects	Yes	Yes	Yes

Robust standard errors in parentheses. *** p<0.01, ** p<0.05, * p<0.1

Research limitations. *While this study provides valuable insights into the role of international knowledge in China's AI ecosystem, it also has certain limitations.*

First, the study relies on patent data as a primary indicator of innovation performance, which, while widely used, does not capture all dimensions of AI innovation. Many advancements in AI occur through software development, algorithmic improvements, and trade secrets, which are not always patented.

Second, the analysis focuses on backward citations in AI patents as a measure of international knowledge flows. However, collaborations, joint ventures, and foreign direct investment (FDI) also play crucial roles in knowledge transfer, which are not fully captured in this approach. Future research could integrate qualitative methods, interviews, or case studies to complement the patent-based network analysis.

Third, regional and sectoral differences within China's AI ecosystem are not deeply explored. While our dataset covers 1,858 firms across multiple regions, the specific regional policies, firm-level strategies, and localized knowledge dynamics might influence the impact of international knowledge flows differently. A more granular, region-specific analysis could further refine our understanding of China's AI ecosystem.

Finally, the study covers the period from 2014 to 2019, which does not account for more recent AI developments, particularly in light of evolving geopolitical tensions, policy shifts, and the impact of new AI regulations in China and globally. Future research could extend the time frame to capture longer-term trends and post-2020 developments in AI innovation.

Despite these limitations, our findings highlight the critical role of international knowledge flows in fostering innovation within China's AI ecosystem and provide a foundation for further research on global innovation networks.

Managerial and policy implications. *Several noteworthy implications emerge for policy and management. Businesses with robust international networks exhibit a heightened ability to innovate in AI. Amid the prevailing notion of AI as the new development catalyst, accompanied by geopolitical tensions, lies an opportunity for coordinated global collaboration in technology advancement. Policymakers are urged to foster international cooperation within the AI domain, facilitating the expansion of businesses beyond local boundaries through internationalization support.*

The findings of this study suggest important managerial and policy implications for businesses, government agencies, and international organizations engaged in AI development. From a managerial perspective, firms operating within China's AI ecosystem must recognize the strategic importance of international knowledge flows in enhancing their innovation capabilities. Companies that actively engage in cross-border collaborations, participate in international research initiatives, and form strategic alliances can gain a competitive edge by leveraging diverse knowledge sources. Given AI's role as GPT driving digital and green transitions, firms should prioritize partnerships that allow them to access cutting-edge research, specialized expertise, and novel technological applications beyond domestic boundaries.

Beyond the firm level, this study underscores the need for policy interventions that foster global knowledge exchange while balancing national innovation priorities. Governments should actively promote bilateral and multilateral agreements that facilitate AI knowledge flows by reducing barriers to international research collaboration, harmonizing IP protection frameworks, and establishing data-sharing protocols. Policies that support the internationalization of AI firms-such as targeted funding programs, tax incentives, and AI-specific incubators-can further enhance firms' ability to expand into global markets. For startups and SMEs, in particular, access to international AI hubs can provide critical opportunities for scaling and integrating into global AI supply chains.

At the same time, China's push for indigenous AI innovation must be carefully balanced with the continued inflow of foreign expertise. While national strategies increasingly emphasize self-sufficiency, the evidence suggests that international knowledge remains a key driver of technological progress. A flexible and adaptive policy framework is needed to ensure that China's AI sector remains competitive while navigating challenges such as technology transfer restrictions and evolving geopolitical tensions. Striking this balance will require regulatory approaches that encourage domestic research excellence while maintaining access to global knowledge networks.

Finally, as AI adoption accelerates, policymakers must address broader concerns related to AI governance, ethical AI development, and regulatory oversight. International knowledge sharing plays a crucial role in establishing best practices for AI transparency, accountability, and fairness, ensuring that AI ecosystems develop in a way that is both innovative and responsible. A coordinated global effort in AI governance can help mitigate biases in AI models, standardize ethical guidelines, and create more inclusive AI applications that align with broader societal objectives.

By integrating these managerial and policy considerations, firms and governments can create a more resilient, innovative, and globally connected AI ecosystem.

Originality of the paper. *This study's contributions are threefold. Firstly, it introduces an international perspective into EE literature that traditionally views EE as isolated entities. We reveal the influence of global interconnectedness on the innovation potential of EE. Secondly, we underline the importance of innovation activities for the success of EE, bridging these two realms of literature. Thirdly, we delve into the intricate interplay of China's indigenous innovation and AI as a pivotal national technology, underscoring the ongoing significance of foreign knowledge in this developmental landscape.*

This study offers a novel contribution to the literature on entrepreneurial ecosystems by introducing an explicitly international perspective in a field that has traditionally focused on domestic dynamics. While most studies examine ecosystems as self-contained, localized structures, our findings underscore the critical role of global knowledge flows in shaping the innovation potential of AI-focused ecosystems. By integrating insights from international patent data, we reveal how foreign knowledge enhances the ability of Chinese firms to innovate, reinforcing the idea that regional ecosystems cannot be fully understood in isolation from global technological and scientific networks.

In addition to extending the entrepreneurial ecosystem literature, this study contributes to the broader debate on AI-driven innovation. AI, as a GPT, is inherently reliant on cross-disciplinary knowledge recombination, making international collaboration particularly valuable. While prior research has focused on China's domestic innovation policies and indigenous AI development, our study highlights the interplay between national strategies and foreign knowledge inflows, offering a more nuanced understanding of how China's AI ecosystem is shaped by external influences.

Furthermore, this research bridges the gap between entrepreneurial ecosystem studies and innovation policy scholarship, demonstrating that the strength of global embeddedness is not merely an ancillary factor but a fundamental determinant of ecosystem performance. By empirically testing the impact of foreign knowledge on firm-level innovation outcomes, we provide robust evidence supporting the importance of international openness, even in a policy environment increasingly focused on self-sufficiency.

Our study also sheds light on the broader geopolitical and economic implications of AI innovation in China. As global AI development becomes increasingly intertwined with industrial policy, trade regulations, and strategic competition, understanding the mechanisms through which foreign knowledge contributes to China's AI sector is of growing relevance to both scholars and policymakers. By demonstrating the tangible impact of international knowledge on firm-level AI innovation, enterprise value, and economic competitiveness, this study lays the foundation for future research on the role of global networks in shaping the next phase of AI-driven economic transformation.

By integrating these insights, this paper moves beyond static, localized conceptions of entrepreneurial ecosystems, instead presenting a dynamic, multi-level perspective that accounts for global knowledge flows, regional specialization, and competitive spillovers. This approach provides a more comprehensive framework for understanding how AI-driven innovation develops in different institutional and geopolitical contexts.

Key words: *artificial intelligence; China; knowledge flows; ecosystem*

Generative Artificial Intelligence in the healthcare ecosystem: a game-changer for performance measurement

ANNA BASTONE[1] FRANCESCO SCHIAVONE[2] DANIELE LEONE[3] ANDREA GARGIULO[4]

Abstract

Healthcare systems function as interconnected ecosystems comprising several stakeholders, including hospitals, clinics, public institutions, and pharmaceutical companies. Effective inter-organizational collaboration enhances clinical outcomes, resource allocation, and knowledge sharing. However, growing complexity necessitates a shift toward an ecosystem perspective characterized by dynamic governance, interdependence, and shared value creation. In this evolving landscape, Performance Measurement Systems (PMSs) are crucial for aligning actors' interests and optimizing efficiency. Yet, traditional PMSs struggle to adapt to fast-changing digital environments, limiting their effectiveness in real-time performance evaluation. This study examines how Generative Artificial Intelligence (GenAI) influences performance measurement within healthcare ecosystems. Using an experimental approach, ChatGPT 4.0 was applied to assess healthcare performance in an Italian region, leveraging a Key Performance Indicator (KPI) dashboard focusing on care quality, resource utilization, and overall performance. ChatGPT was tested in generating performance insights, identifying patterns, and developing best practices to enhance decision-making. Preliminary findings suggest three key advantages of integrating GenAI into PMSs: (1) improved objectivity and accuracy in performance evaluation, (2) optimized decision-making through real-time data analysis, and (3) a more holistic assessment via human-AI collaboration. However, challenges remain, particularly regarding transparency, accountability, and the "black-box" effect in AI-driven decision-making. This research bridges a critical gap in AI-driven performance evaluation, contributing to both academic discourse and managerial practice. It underscores the need for institutional support and regulatory frameworks to ensure ethical and effective AI implementation. Ultimately, this study highlights the transformative potential of GenAI in shaping the future of healthcare ecosystems.

Framing of the research. *The literature has widely discussed inter-organizational networks (Haagedoorn, 1993; Hergert & Morris, 1988; Mowery, 1988). From an innovation creation standpoint, networks are characterised by their inherently temporary nature, linked to specific projects, varying from weeks to years (Keast et al., 2004; Provan & Huang, 2012). The need to coordinate care for patients with different needs (Palumbo et al., 2020) stimulated the spread of this organisational model in healthcare to 1) optimise clinical outcomes, 2) create evidence-based healthcare, 3) cost containment, 4) knowledge sharing, 5) ensure equity in access to care, and 6) resources optimising (Howard et al., 2008; Ferlie et al., 2010). The high complexity characterising the current competitive scenario has shifted toward an ecosystem perspective (Moore, 1993). Ecosystems do not have a standard definition, but the literature identified three main characteristics (Thomas & Autio, 2014): 1) a network of participants, 2) a governance system, and a shared logic. Indeed, contrary to inter-organizational networks, they have a decentralised, more fluid and dynamic governance structure, with informal and formal relationships and a strong orientation towards complementarity and interdependence (Thomas & Autio, 2020). Since the actors involved collaborate to realise a "central value proposition" (Adner, 2017), an ecosystem represents "an analytical lens that can be used to examine any network of actors consciously working together to create value" (Adner, 2006). Remarkably, the actors' heterogeneity in healthcare suggests considering healthcare networks as part of a broader ecosystem rather than an isolated phenomenon with only direct connections between nodes (Denicolai & Previtali, 2020). This is consistent with the value-based approach (Porter, 2006), where interaction and information exchange are key elements in value co-creation for patients and stakeholders.*

Despite the benefits of ecosystems, the interdependence of multiple actors can lead to a high risk of failure. This translates into the need to map and monitor ecosystems to improve efficiency and maximise value (Adner, 2006; Vainieri et al., 2020). Therefore, developing performance measurement systems (PMSs) is crucial to aligning employee behaviour with corporate goals (Yin & Qin, 2019; Nijp et al., 2016). This is especially relevant in healthcare ecosystems, where

coordination and collaboration between actors driven by heterogeneous goals is crucial (Nuti et al., 2018). Evaluating performance within the healthcare ecosystem is challenging due to its multidimensional nature, stemming from the collaboration of different organisations and professionals (Barbazza et al., 2021). In the digital age, it is imperative to re-evaluate conventional performance measurement systems to align them with the dynamic nature of an environment characterised by constant technological advancements, organisational shifts, and process updates (Sahlin & Angelis, 2019; Yin & Qin, 2019; Kamble et al., 2020; Schiavone et al., 2022). In this context, digital technologies such as Artificial Intelligence (AI) further support performance evaluation by speeding up operations, identifying faster bottlenecks and improving overall efficiency (Akter et al., 2020). Thus, integrating AI in PMSs could represent a game-changer. It allows for a vast amount of real-time information and insights, enhancing the quality of decision-making (Lindebaum et al., 2020; Araujo et al., 2020; Buçinca et al., 2021; Kumar et al., 2022; Yu et al., 2018). Indeed, AI's ability to generate decision-support models from unstructured data can potentially improve our understanding of management and market dynamics (Martins et al., 2020).

Recent advances in AI opened the way to the development of Generative Artificial Intelligence (GenAI or GAI), a particular type of Artificial Intelligence system able to autonomously generate new, original content (Clune, 2019). Thus, "generative" refers to AI's ability to produce relevant content without explicit programming for each possible output (Cao et al., 2023). This revolutionary technology can boost progress, providing solutions and capabilities unimaginable (Dwivedi et al., 2023). From a performance measurement perspective, GenAI is a powerful tool. By leveraging large datasets and sophisticated algorithms, it analyses several data while minimising bias in evaluation processes (Rathnayake & Gunawardana, 2023). However, within the Industry 5.0 paradigm, it cannot replace human activities. The near-total automation of operations raises ethical and social concerns, including job displacement (Huang & Rust, 2018). Industry 5.0 instead promotes a resilient, human-centred approach, looking at digital technologies as a tool to foster human-machine synergy (Leng et al., 2022) and enable more personalised and sustainable processes (Rani et al., 2024).

Purpose of the paper. *GenAI can transform performance evaluation in healthcare by supporting clinical decision-making, streamlining administrative processes, and facilitating early diagnosis and treatment planning. However, GenAI is an augmentation tool that enhances professionals' capabilities rather than replacing human beings. Despite progress on this topic, the management literature still does not address the relationship between GenAI-driven performance measurement and healthcare ecosystem dynamics. Some authors define the antecedents of such performance (Floetgen et al., 2022), weights, metrics, and indicators (Acs et al., 2021; Guntupalli et al., 2021) or the relationship between the development of the digital ecosystem and its performance (Fernández-Portillo et al., 2024).*

Additionally, from a technological perspective, many authors addressed the technical characteristics of GenAI (Clune, 2019; Cao et al., 2023; Rathnayake & Gunawardana, 2023; Dwivedi et al., 2023), not focusing on its integration into business operations - e.g. performance evaluation. This research seeks to bridge this gap by investigating the effects of GenAI on performance measurement within healthcare ecosystems and answering the following research question: How does Generative AI influence performance measurement in the healthcare ecosystem?. To address this, the paper explores how GenAI tools can enhance the evaluation of healthcare by providing more accurate, real-time data that supports decision-making. The study further examines how these tools improve healthcare efficiency, optimise resource allocation, elevate care quality, and potentially reduce operational costs.

Methodology. *To tackle the research question, the authors practiced an experimental methodology using ChatGPT 4.0 as the main diffused GenAI tool to generate content. In doing so, the authors decided to simulate a case study of a research project on performance evaluation in an Italian healthcare ecosystem. Particularly, the project is focused on the development of a Key Performance Indicators (KPIs) dashboard to evaluate a healthcare ecosystem in South Italy. The dashboard is articulated in three main strategic areas: (1) Quality of care, (2) Resource utilisation and (3) Performance. To experiment and evaluate the potential of GenAI in augmenting human cognitive capabilities, one author implemented the dashboard to analyse data about the above-mentioned healthcare ecosystem. Simultaneously, a second author provided the dashboard and the dataset to ChatGPT. Considering the novelty of GenAI tools, authors followed the approach and protocol employed for similar research by Cervini et al. (2023). Particularly, the protocol suggests the different steps to be followed in dialogue with ChatGPT. To apply the protocol, the authors took the following actions:*

1. *They asked ChatGPT about the main performance measurement KPIs in healthcare.*
2. *They asked ChatGPT to measure the performance of the selected healthcare ecosystem based on a specific dataset and implement the project's dashboard.*
3. *They regenerate the questions to ChatGPT, varying the prompting with additional information, specifically considering the recommendation to improve critical KPIs of each strategic area.*
4. *They asked ChatGPT to develop best practices to improve the healthcare ecosystem's performance.*

To guarantee data triangulation (Yin, 2012), the authors identified several secondary sources of evidence, such as reports, statistical data, online documentation and archival records about the implementation of GenAI as a support for the healthcare ecosystem.

Expected Results. *The analysis will highlight the transformative power of GenAI in improving performance measurement within healthcare ecosystems. GenAI can boost how healthcare performance is measured by exploiting a vast amount of real-time data, improving the precision and efficiency of evaluation outcomes. Preliminary findings show that integrating GenAI in performance assessment systems provides three main advantages. First, it can significantly reduce bias in human data analysis, leading to more objective and reliable assessments. Second, it optimises decision-making by generating detailed, real-time insights that support the improvement of critical Key Performance Indicators*

(KPIs). Third, GenAI facilitates a holistic approach to performance measurement by fostering human-machine collaboration, ensuring a more comprehensive evaluation framework. However, preliminary findings highlight that its implementation is not without challenges. Addressing ethical concerns related to transparency, accountability, and trust in AI-driven recommendations is crucial. Indeed, there are several doubts about the quality and reliability of GenAI outputs generating potential black-box effects in healthcare decision support. Addressing these challenges is essential to fully harnessing the potential of GenAI in healthcare performance measurement.

Research limitations. *This study, while offering valuable insights, is not without its limitations. One of the key limitations is the focus on a single region in Italy, which may significantly affect the generalizability of the findings. Context-specific factors, such as the healthcare system's structure, cultural nuances, and regional policies, could lead to different outcomes in other regions or countries. As a result, these findings may not apply universally; therefore, future research should explore the application of GenAI in other geographical regions, comparing the results to identify regional differences and better understand the subtleties of applying this technology in diverse healthcare systems. Another limitation concerns the potential biases inherent in the dataset used for performance evaluation. Data-driven AI systems are susceptible to biases, which may affect the accuracy and reliability of the recommendations provided. This is particularly critical in healthcare, where the consequences of biased decisions can have significant ramifications. To improve the robustness of AI-driven performance evaluation, future research could explore methods for identifying and mitigating biases in healthcare datasets, including strategies for ensuring more representative and balanced data. Methodologically, the experimental approach used in this study may also pose limitations. The reliance on ChatGPT as the primary tool for data analysis and decision-making introduces the possibility of over-reliance on the technology's capabilities. Future research could explore more diverse methodologies, integrating human expertise alongside AI to develop a more hybrid approach to performance measurement. Additionally, external factors such as policy changes, technological advancements, and societal shifts could impact the applicability and relevance of this study's findings, making it crucial to continuously reassess the implications of these technologies in healthcare over time. Finally, the scarce availability of previous solid experiences about using GenAI to support healthcare performance evaluation could undermine the preliminary results' validity, laying the ground for future research. By acknowledging these limitations, future studies can build upon this research to provide more nuanced, scalable, and adaptable solutions for integrating GenAI into performance measurement systems across different healthcare ecosystems.*

Managerial implications. *This study provides valuable theoretical and practical implications for healthcare organizations, policymakers, and academic researchers. For healthcare managers, the findings suggest that GenAI can significantly enhance the effectiveness of performance measurement systems. By leveraging real-time data, GenAI can help optimize resource allocation, improve care quality, and reduce costs. However, its successful integration requires a shift in organizational mindset, as GenAI's potential needs to be recognized and supported by leadership. Managers will need to foster an environment that encourages technological adoption while balancing the human element in decision-making to ensure a human-centred approach is maintained. Moreover, the study highlights to policymakers the need for clear, structured guidelines to facilitate the adoption and implementation of GenAI in healthcare ecosystems. As this technology presents ethical and operational challenges, policymakers must create frameworks that address transparency, accountability, and trust issues. Additionally, they must ensure that GenAI integration aligns with broader healthcare goals, such as improving patient outcomes, equity in access, and cost-effectiveness. From a theoretical perspective, this research contributes to the academic debate on innovation management, technological change, and ecosystem dynamics in healthcare. It provides a foundation for further exploration of how GenAI influences performance measurement, offering new insights into its role in the healthcare ecosystem. The study encourages scholars to examine GenAI's impact from various angles, including its effects on inter-organizational collaboration, governance models, and decision-making processes. Future research should strive to find new and more versatile ways to adopt GenAI in healthcare organisations, as well as address the challenges regarding GenAI applications in other regions due to cultural differences.*

Originality of the paper. *The originality of this study lies in the new perspective it offers. While existing studies focused on the identification of tools for defining an adequate system for monitoring health performance, the present study aims to explore the role of GenAI in supporting and redefining performance measurement systems. Despite the digitalisation of healthcare being a prevailing reality, a significant lacuna exists within the body of knowledge. A review of several studies reveals a predominant focus on the adoption of AI as a tool for the real-time monitoring of patients' health status or as a support system in precision medicine, particularly in oncology and radiotherapy. This approach overlooks the potential for these tools to be employed for a more comprehensive monitoring purpose. The value of this research lies in the numerous managerial, theoretical and policy implications it offers. The findings of this study enable the identification of several opportunities to stimulate new theoretical investigations and to offer health managers the possibility of defining targeted and immediate strategic actions supported by the formulation of policies that facilitate their interventions. The analysis underscores the transformative role of a continuous monitoring system integrated with state-of-the-art digital tools. It is only through continuous evaluation of actions taken that healthcare that meets the needs of patients through increasingly personalised treatment can be guaranteed. Healthcare providers should perceive digitalisation and the vast control opportunities it offers as competitive levers rather than threats.*

Human-Based vs. AI-Based Diagnosis for Anamnesis Tertiarization: The Roles of Patients' Psychological Adaptation and e-healthcare Ethical Concern

ANDREA SESTINO[1] SIMONE GUERCINI[2]

Abstract

Tertiarization can reshape healthcare services e.g., by redesigning preliminary anamnesis and diagnosis before specialist referral. In this study, trough an experimental research design, we examine the effects of AI-driven diagnostic tertiarization compared to human-led consultations. Findings interestingly show that AI-based diagnosis (vs. human-based diagnosis) enhances patients' intention to follow medical initial recommendations through psychological adaptation to technology. However, ethical concerns about e-health services moderate this effect, as higher concerns reduce psychological adaptation, weakening AI's positive impact. These results highlight the need to balance technological efficiency with ethical and psychological factors to foster AI acceptance in healthcare.

Keywords: *tertiarization; medical doctors; patients; healthcare; psychological adaptation; e-healthcare ethical concern; digital literacy*

Framing of the research. *The tertiarization of healthcare services has the potential to deeply modify the delivery of medical care, particularly by outsourcing initial diagnoses before specialist referral. In this paper, terziarization is this process of shifting toward AI-based technologies of processes that in the past were only internal to human-based organizations. Traditionally, general medical doctors, have played a gatekeeping role, conducting preliminary assessments before directing patients to specialists (Hitchcock et al., 2014; Tybjerg, 2023). However, advancements in healthcare tertiarization have led to the externalization of this diagnostic phase, optimizing patient flow and resource allocation (Berry et al., 2021; Taylor et al., 2013). This shift raises questions about the role of "non-traditional" diagnostic intermediaries, including artificial intelligence (AI)-driven systems, in facilitating medical decision-making (Sauerbrei et al., 2023).*

Recent technological advancements have enabled AI to perform initial diagnostic assessments (Jussupow et al., 2021), surgical decision making (Loftus et al., 2020), often through symptom-checker platforms where patients input symptoms, select affected body areas, and answer structured questions (see Wallace et al., 2022 for a detailed review. These AI tools, trained on vast medical datasets, generate preliminary diagnostic suggestions and specialist referrals, mirroring the function traditionally performed by human general practitioners (Shen et al., 2019). The increasing reliance on AI in this phase of healthcare delivery highlights the need to understand medical doctors' reactions to this technology (e.g., as in Irgang et al., 2025), and importantly individuals' psychological adaptation to new technologies, a concept that explains how individuals develop cognitive and emotional readiness to use and trust technological tools (Ronzhes et al., 2023). Psychological adaptation fosters a renewed intention to adopt technology-driven solutions, including following AI-generated recommendations in healthcare contexts (Muhammad et al., 2020; Sestino & Nasta, 2025).

Given this premise, two important research questions emerge: When anamnesis is outsourced, are AI-based diagnostic recommendations perceived as more or less acceptable than those from a human medical doctor? And importantly, how does psychological adaptation to technology influence this preference, and to what extent does ethical concern toward e-health services moderate this effect?

Recent literature suggests that patients and consumers are increasingly - and "already" - conscious of privacy risks associated with digital healthcare services (Duckert & Barkhuus, 2022; Scarpi et al., 2022). However, rather than privacy concerns alone, together with other important aspects e.g., maintaining non-verbal, emphatic communications and emotionality in the e-healthcare setting as well (e.g., as in Raman et al., 2016; Sestino & D'Angelo, 2023), a broader and more "convergent construct", i.e. the ethical concern, especially when dealing with AI, is gaining prominence (e.g., as explained in Ashok, 2022). Coherently, a recent studies by Verma, Kumar & Sharma (2021) begun conceptualizing e-healthcare ethical concern, as a key factor influencing trust, adoption, and compliance in AI-mediated healthcare.

Understanding this construct's moderating role is essential for assessing the potential trade-offs between technological efficiency and ethical apprehensions in AI-based medical diagnostics.

Purpose of the paper. *The purpose of this paper is to investigate the effect of the Type of Tertiary Medical Diagnosis (Human-based vs. AI-based) on patients' intention to follow medical recommendations, while shedding light on two key psychological mechanisms: The mediating role of individuals' psychological adaptation to technology and the moderating role of e-healthcare ethical concern.*

Psychological adaptation to technology plays a central role in determining individuals' readiness to accept and integrate AI-driven diagnostic recommendations into their healthcare decision-making process. However, this adaptation is not uniform across individuals and can be significantly influenced by ethical concerns related to AI implementation in healthcare. E-healthcare ethical concern, which encompasses worries about transparency, fairness, accountability, and the potential erosion of human oversight, may shape how patients perceive and respond to AI-generated medical advice.

To operationalize psychological adaptation to technology, this study adopts the Technology Readiness Index 2.0 (TRI 2.0; Parasuaraman & Colby, 2015): The TRI 2.0 provides a well-established and multidimensional framework for assessing how individuals perceive and adapt to emerging technologies, particularly in contexts where technology substitutes human expertise. Importantly such as concept has been already widely employed in e-health settings (e.g., as in Kayser et al., 2019; Yosser et al., 2020). Unlike earlier iterations, TRI 2.0 integrates both technology enablers (optimism and innovativeness) and technology inhibitors (discomfort and insecurity), offering a perspective on patients' psychological responses to AI-based diagnostic tools (Parasuraman & Colby, 2015). This operationalization is particularly relevant in healthcare, where acceptance of AI-driven recommendations hinges not only on trust in technological efficiency but also on an individual's innate disposition toward technology adoption. By incorporating TRI 2.0, this study ensures a comprehensive and theoretically grounded measurement of psychological adaptation to technology in the context of AI-powered medical tertiarization (see Figure below).

Fig. 1: The proposed conceptual framework

Methodology. *Based on above, this study employs an experimental design to manipulate two conditions in a 2x2 between-subjects experiment. Participants were randomly assigned to one of two conditions, where they were exposed to a stimulus (scenario + image) describing either: 1) A consultation in which a human general practitioner (GP) conducted the initial diagnosis before specialist referral (Condition 1, coded "-1"); and 2) A consultation in which an AI-based system provided the initial diagnosis before referral to a specialist (Condition 2, coded "+1").*

Prior to exposure to the experimental condition, participants assessed their e-healthcare ethical concern, which was hypothesized as a moderator in the relationship between the type of tertiary medical diagnosis and intention to follow recommendations. The measurement items for e-healthcare ethical concern were drawn from Verma et al. (2021) (e.g., "E-health websites mention their purpose clearly", "E-health services follow ethical codes", "The interest of the consumer comes first", and so on).

After being exposed to their assigned condition, participants responded to items measuring their behavioral intention to follow the medical recommendation (Fishbein & Ajzen, 1977), followed by items assessing their psychological adaptation to technology, operationalized through the Technology Readiness Index 2.0 (TRI 2.0). The TRI 2.0 (Parasuraman & Colby, 2015) was used as it provides a comprehensive framework for capturing individuals' predisposition toward adopting technological solutions, integrating both positive (optimism, innovativeness) and negative (discomfort, insecurity; reversed for the further analysis) dimensions of technology readiness (e.g., ""New technologies contribute to a better quality of life", "Other people come to me for advice on new technologies", "Technical support lines could be helpful", "I feel confident doing business with a place that can only be reached online"). All the responses were assessed on a Likert scale ranging from 1 to 7, where 1= "Strongly disagree", and 7= "Strongly agree".

Finally, socio-demographic variables (e.g., age, gender, education, digital literacy, geographical location) were collected to account for potential covariates.

Results. *The final sample consisted in 170 participants (M_{age} = 36.34, SD_{age} = 10.15). Among the sample, 54% were male, and 46% female. As for the main analysis, confirming our predictions, results indicate that psychological adaptation plays a crucial mediating role in shaping the intention to follow AI-based recommendations, but this effect is moderated by ethical concerns. Formally the AI-based Type of Tertiaries Medical Diagnosis (vs. the human-based ones)*

positively influences the intention to follow the recommendations, because of individuals' psychological adaptation to technologies. When ethical concerns are low, AI recommendations enhance psychological adaptation, which in turn increases intention to follow recommendations. Conversely, when ethical concerns are high, AI recommendations are perceived as less psychologically adaptable, reducing their influence on intention. Precisely, the analysis was conducted using the Macro PROCESS Model 7 of SPSS (Hayes, 2009; 2018), to examine the moderated mediation effects of psychological adaptation to technology (Me) in the relationship between the Type of Tertiaries Medical Diagnosis (Human-based vs. AI-based) and individuals' intention to follow the recommendation (Y), with e-healthcare ethical concerns, acting as the moderator (Mo).

The first step of the analysis examined whether Type of Tertiaries Medical Diagnosis (Human-based vs. AI-based) influenced psychological adaptation. The model explained 42.99% of the variance in psychological adaptation (R^2 = 0.4299, $F(3,166) = 41.73$, $p < 0.001$). The direct effect of Type of Tertiaries Medical Diagnosis (Human-based vs. AI-based) on psychological adaptation was not significant ($\beta = 0.1946$, $p = 0.1082$), indicating that AI vs. human recommendations alone did not predict psychological adaptation: However, and more importantly, the interaction between Type of Tertiaries Medical Diagnosis (Human-based vs. AI-based) and e-healthcare concern, was significant ($\beta = -0.1495$, $p = 0.0194$), indicating a moderation effect.

Indeed, the conditional analysis revealed that when ethical concerns were low, AI-based recommendations were associated with higher psychological adaptation ($\beta = 0.4799$, $p = 0.0056$), indicating that individuals' with stronger psychological adaptation to new technologies (because of their readiness to new technologies) exhibit lower ethical concern toward e-healthcare. In contrast, and coherently, when ethical concerns were high, AI-based recommendations led to lower psychological adaptation ($\beta = -0.0907$, $p = 0.5955$), suggesting that users with strong ethical concerns may perceive AI-based recommendations as less reliable, continuing preferring the human ones.

Psychological adaptation had a significant positive effect on intention ($\beta = 0.4573$, $p < 0.001$), indicating that individuals who adapted well to the recommendation source were more likely to follow its advice. However, the direct effect of Type of Tertiaries Medical Diagnosis (Human-based vs. AI-based) on individuals' intentions to follow the recommendation, was not significant ($\beta = 0.1435$, $p = 0.3432$), suggesting that AI-based recommendations do not directly influence user intention, and thus, something different (i.e., psychological adaptation) explain the effect.

To examine whether the mediation effect of psychological adaptation to technology on intention to follow the recommendations, was conditional on e-healthcare ethical concerns, a moderated mediation analysis was conducted: The index of moderated mediation was significant ($\beta = -0.0684$, 95% CI [-0.1780, -0.0003]), confirming that the indirect effect of pe of Tertiaries Medical Diagnosis (Human-based vs. AI-based), on intention to follow the recommendation, through psychological adaptation varies depending on ethical concerns.

Indeed, the analysis of the conditional indirect effects showed that when ethical concerns were low, the indirect effect of the Tertiaries Medical Diagnosis (Human-based vs. AI-based) via psychological adaptation, was significant and positive ($\beta = 0.2195$, 95% CI [0.0118, 0.5454]), supporting a mediation effect. However, when ethical concerns were high, the indirect effect was not significant ($\beta = -0.0415$, 95% CI [-0.2105, 0.0834]), suggesting that the mediating role of psychological adaptation disappears in the presence of high ethical concerns.

Research limitations. *Despite its contributions, especially because it is at a preliminarily stage, this study is not exempt from limitations. First, some socio-demographic variables (e.g., the digital literacy) was treated as a covariate rather than a core explanatory variable. Since literacy levels are shaped by cultural contexts and healthcare system structures, future research should explore its moderating role in AI-based tertiarization acceptance, as patients with lower health literacy may react differently to AI-generated recommendations. Second, individual traits such as openness to innovation and technological affinity were not explicitly measured, though this was intentional, as these constructs are already embedded within TRI 2.0. Future studies could examine granular differences in technology readiness subdimensions, identifying which aspects of innovativeness or discomfort most strongly influence AI acceptance in medical tertiarization. Third, the study does not account for cross-cultural variations in ethical concerns, which may significantly shape AI adoption in healthcare. Ethical considerations surrounding privacy, algorithmic bias, and medical accountability vary across countries and regulatory environments, potentially influencing how AI tertiarization is perceived.*

Managerial implications. *On the basis of our results, from a managerial perspective, first, healthcare tertiarization strategies should integrate AI-powered diagnostic tools to enhance efficiency in patient triage and optimize specialist referrals. AI-driven anamnesis could reduce "bottlenecks" in general practice consultations, allowing medical doctors, to focus on complex cases, or to focus on a solid AI-based diagnosis for further medical analysis to be asked to the patients. Moreover, it could help manage queues in Emergency Rooms (e.g., as for in the case of First Aid), with initial screenings that are able to recognize symptoms and emergencies of different degrees and types, also making the healthcare service delivery process more efficient (with positive consequences, in reality, also at the policy level for national healthcare systems).*

Second, healthcare providers should invest in technological adaptation programs, ensuring that patients (and medical doctors) could develop a sufficient level of psychological readiness to trust AI-based recommendations. This requires structured communication strategies to reduce cognitive resistance and improve perceived reliability of AI diagnostics. Third, given the influence of ethical concerns on AI adoption, managers should develop transparency protocols and

ethical governance frameworks, ensuring that AI-based tertiarization is aligned with patient rights, regulatory compliance, and ethical medical standards, thus "alleviating" such a concern.

Nonetheless, from a marketing perspective, first, AI-driven healthcare services should be framed not as a replacement for human expertise but as an enhancement, positioning AI-based diagnostics as a supportive tool that complements medical professionals rather than competes with them. Second, marketing strategies should capitalize on psychological adaptation mechanisms, promoting familiarity through educational content, patient testimonials, and interface design that enhances usability and trust. Third, branding for AI-based healthcare solutions must explicitly address ethical concerns, emphasizing fairness, patient autonomy, and human oversight in decision-making. This would mitigate skepticism and improve adoption rates in digital healthcare ecosystems.

Originality of the paper. *This study provides a new perspective on the tertiarization of healthcare services, which has traditionally been examined through organizational outsourcing and service delegation rather than AI-driven diagnostic mediation. By empirically testing how patients psychologically adapt to AI-powered medical tertiarization (and precisely on AI-based vs. human-based prescreening and anamnesis), this research advances the understanding of how digital transformation is reshaping the patient-provider relationship. Focusing on the e-healthcare ethical concern as a moderating factor offers an original contribution, highlighting how patients' trust in AI-based diagnostics is not solely driven by technological efficiency (or as overcome, just privacy; Gutierrez et al., 2019), but mainly by broader ethical considerations especially when dealing with AI. Furthermore, by leveraging TRI 2.0 as a novel measurement model to sage individuals' psychological adaptation to new technologies, the study ensures a comprehensive and multidimensional assessment of such adaptation to AI, addressing a critical gap in digital healthcare research.*

L’impresa del post-umano: il lato oscuro della transizione digitale nelle dinamiche aziendali

PAOLO BARILE[1] GERARDO BOSCO[2] RAFFAELE D’AMORE[3]

Abstract
Il rapido progresso tecnologico degli ultimi anni ha posto le imprese di diversi settori di fronte ad un bivio: accogliere gli strumenti digitali all’interno dei propri processi operativi o rinunciare alla possibilità di essere competitive nel lungo periodo. Se da un lato la transizione digitale, in particolare con la diffusione dell’Intelligenza Artificiale, ha offerto tutta una serie di possibilità di innovazione e di sviluppo economico, dall’altro ha introdotto diversi rischi alle quali l’impresa tradizionale non era avvezza. Il presente studio ha l’obiettivo di analizzare le implicazioni di una eccessiva deresponsabilizzazione dell’essere umano ai diversi livelli aziendali, delimitando il confine tra l’impresa trans-umana - nella quale risorse umane e digitali convivono in armonia - e quella post-umana - nella quale le macchine prendono il sopravvento, escludendo l’essere umano da qualsiasi tipo di processo. Attraverso un’attenta analisi della letteratura di settore e l’utilizzo delle solide basi teoriche dell’Approccio Sistemico Vitale, il nostro studio si ripropone di offrire ai lettori diversi spunti di riflessione per il conseguimento di un modello di sviluppo aziendale socialmente sostenibile nell’era che stiamo vivendo, rimarcando il ruolo dell’essere umano come elemento di governance imprescindibile anche per le moderne imprese digitalizzate.

Inquadramento della ricerca. *Gli ultimi decenni hanno visto la società nella quale viviamo essere pervasa - in ogni suo aspetto - da uno sviluppo tecnologico progressivamente più rapido, che ha modificato radicalmente i modelli organizzativi ed operativi aziendali in qualsiasi settore (Calabrese et al., 2021). A partire dall’ambito delle telecomunicazioni, l’avvento di Internet e la diffusione del World Wide Web ha rivoluzionato il modo in cui le informazioni vengono scambiate e condivise a livello globale, segnando un cambiamento epocale anche nelle abitudini e nello stile di vita della popolazione mondiale.*

Lo sviluppo delle piattaforme digitali e dei dispositivi mobili, prima, e dell’Intelligenza Artificiale (IA), poi, hanno avuto un impatto decisivo sul settore dei servizi - con la nascita dell’e-commerce - e, soprattutto grazie ai social media, dell’intrattenimento; a seguire l’ambito sanitario, finanziario e dell’educazione hanno subito forti influssi legati alla trasformazione in atto. Nel campo industriale (Brown, 2019), infine, la transizione digitale ha portato alla diffusione della cosiddetta ‘Industria 4.0’, caratterizzata dalla ricerca di nuove strategie di gestione basate sull’automazione dei processi - principalmente attraverso l’utilizza dell’IA e dell’Internet of Things (IoT).

Lo scenario appena descritto impone a qualunque attività che ambisca ad essere competitiva dal punto di vista economico ed al passo con i tempi, un adeguamento che sia il più rapido possibile. Per questo motivo, nell’ottica di sopravvivenza delle imprese, oggi la digitalizzazione non rappresenta più un’opzione, bensì una necessità.

Volendo reinterpretare l’integrazione del digitale nei processi aziendali da un punto di vista filosofico, si potrebbe parlare dell’impresa moderna come di una ‘impresa trans-umana’. Tale concetto - riprendendo la definizione comunemente accettata di trans-umanesimo - indica una realtà nella quale la tecnologia agisce a supporto della capacità umana, migliorando la produttività attraverso l’automatizzazione dei processi operativi e supportando i decisori umani nelle scelte strategiche (Goleman, 1998), *e nella gestione delle risorse. L’impresa trans-umana così definita porta con sé un’accezione dichiaratamente positiva, legata alla visione del progresso tecnologico come un motore di crescita per le imprese. Come sottolineano Caputo e Saviano (2020), la co-evoluzione tra risorse umane e tecnologie abilitanti rappresenta un elemento cardine per favorire lo sviluppo sostenibile dei sistemi di servizio, rafforzando il ruolo dell’impresa come piattaforma relazionale orientata alla co-creazione di valore. D’altronde, l’introduzione di strumenti innovativi nelle logiche di gestione ha, storicamente, sempre portato ad un miglioramento dell’efficienza dei processi operativi - offrendo opportunità di innovazione e migliorando la competitività.*

La stessa sostenibilità, obiettivo prioritario delle aziende di ogni settore, sembrerebbe trarre grande beneficio dalla co-operazione di risorse umane e tecnologiche nell’impresa trans-umana, senza prescindere dal valore relazionale generabile all’interno delle organizzazioni (Barile et al., 2021) Se dal punto di vista della tutela ambientale, infatti, l’ottimizzazione dei processi produttivi e della logistica potrebbe ridurre considerevolmente l’impatto sul nostro pianeta,

dal punto di vista economico nuovi processi di business e di gestione delle risorse potrebbero apportare notevoli benefici. L'integrazione degli strumenti digitali nei processi operativi porterebbe, inoltre - rimanendo nella narrazione ipotetica di un'impresa trans-umana perfettamente sviluppata - a ridurre l'esposizione umana ad attività pericolose, ripetitive o usuranti ed a garantire una migliore flessibilità lavorativa ai dipendenti.
Purtroppo, come spesso accade, non è tutto oro ciò che luccica: se da un lato, IA e IoT hanno fornito strumenti innovativi in grado di ottimizzare i processi operativi attraverso l'automazione di compiti nei quali la figura umana non era indispensabile, dall'altro hanno causato una riorganizzazione radicale delle strategie d'impresa e dei modelli di gestione che vedono una parziale esclusione della matrice umana rispetto alle dinamiche aziendali (Barile S., 2008; Barile S., 2023). Da questo punto di vista, la digitalizzazione delle imprese presenta un grande limite legato alla progressiva deresponsabilizzazione delle risorse umane che rischia di generare - a lungo andare - un modello non socialmente sostenibile.

La sensazione di alienazione dovuta ad un'eccessiva intrusione della tecnologia nei processi operativi è esacerbata da un diffuso senso di diffidenza nei confronti del digitale e dall'avversione - tipica della nostra natura - al rapido cambiamento. La preoccupazione principale è che l'IA possa prendere il sopravvento, escludendo la componente umana da qualsiasi tipo di pianificazione (Bassano et al., 2024).

Il rischio concreto è che l'idilliaco modello trans-umano di impresa ceda il posto ad una configurazione di tipo post-umano, nella quale l'elemento tecnologico assume pieno potere decisionale ed operativo. La deriva post-umana porterebbe ad uno scenario critico, nel quale l'essere umano non avrebbe più alcun controllo reale sui processi aziendali - talvolta anche in maniera tristemente inconsapevole - e sarebbe relegato al ruolo di spettatore.

Scopo del lavoro. *Quale che sia la natura dell'impresa - a prescindere dal settore di interesse e/o dal livello di integrazione tecnologica - ha come obiettivo principe la creazione di valore (Barile, 2009). Laddove la connessione tra le risorse umane e la forza lavoro digitale riesca a favorire un ambiente operativo nel quale i processi possano essere semplificati da una strategia in grado di ottimizzarli, la creazione di valore diventa il risultato spontaneo di una pianificazione adeguata (Calabrese et al., 2024; Saviano et al., 2017).*

La parola chiave per il successo economico di un'azienda è, in buona sostanza, la pianificazione - ovvero la scelta di una strategia operativa in grado di sfruttare le risorse a disposizione in maniera ottimale, di adeguare i processi ai risultati attesi e di generare un vantaggio competitivo sostenibile nel tempo (Porter, 1980). La capacità di un'impresa di gestire le fasi operative in maniera coerente con gli obiettivi prefissati non può, dunque, prescindere da un organo decisionale in grado di selezionare le strategie aziendali più appropriate) a seconda delle dinamiche contestuali (Panati & Golinelli, 1991).

Se la creazione di valore non può essere perseguita in assenza di un organo decisionale in grado di orientare il corretto funzionamento dell'impresa, bisogna ragionare sulla possibilità che, con l'avvento di tecnologie 'pensanti' basate sull'IA, tale ruolo - da sempre riservato all'essere umano - possa essere acquisito dalle macchine. Il dubbio appena sollevato rappresenta la vera linea di confine tra un'impresa trans-umana, nella quale le risorse tecnologiche - adeguatamente integrate nei processi operativi aziendali - altro non sono che strumenti al servizio del decisore umano, e quella post-umana, nella quale l'impresa automatizzata ha il potere di autogestirsi (Williams & Davis, 2020) - estromettendo l'essere umano da qualsivoglia logica decisionale.

Lo scopo del nostro lavoro è, dunque, quello di entrare nel merito della questione, esaminando gli ostacoli allo sviluppo di un modello aziendale sostenibile dal punto di vista sociale ed analizzando - con spirito critico rispetto alla minaccia concreta di una eccessiva deresponsabilizzazione dell'essere umano - le ripercussioni che il superamento di tale confine possa avere sui diversi attori aziendali coinvolti nella transizione digitale.

Oltre a valutare tutte le possibili conseguenze di una digitalizzazione eccessiva e di una deresponsabilizzazione, tale per cui la figura umana diventi completamente irrilevante rispetto ai processi decisionali, il nostro lavoro vuole trasmettere anche un messaggio positivo, basato sulla ferma convinzione che l'impresa - almeno per come la intendiamo oggi e l'abbiamo concepita in passato - non possa arrendersi alle logiche del post-umanesimo. Tale pensiero, che - come verrà chiarito nella sezione successiva - deriva dall'utilizzo dell'Approccio Sistemico Vitale (aSv) per l'analisi dello scenario descritto, è legato all'impossibilità di inquadrare l'impresa in un'ottica sistemica in assenza di un elemento umano al governo dei processi. D'altronde, parafrasando Daft, la complessità che caratterizza i processi aziendali è intrinsecamente legata alla natura (umana) delle decisioni che li determinano (Daft, 2005).

In definitiva, secondo la nostra prospettiva, l'impresa trans-umana - nella quale le tecnologie digitali agiscono a supporto dei processi - consentirebbe di preservare un livello di sostenibilità che, per tutta una serie di motivi che ci riproponiamo di esporre nel prosieguo, verrebbe meno una volta oltrepassato il confine che porta al post-umano.

Approccio metodologico. *Il concetto di sopravvivenza di un'attività economica nell'era digitale - come già accennato in precedenza - è strettamente connesso alla necessità di un adattamento dinamico alle nuove esigenze introdotte dalla tecnologia. In altre parole, un'impresa che, al variare del contesto operativo di riferimento, non sia in grado di riorganizzare i propri processi per incontrare le richieste dei consumatori o gestire in modo accurato le proprie risorse rischia di veder venir meno la propria capacità di generare valore - vanificando, di fatto, la sua stessa esistenza.*

Un'affermazione di questo tipo diventa di facile interpretazione se consideriamo il pensiero di Von Bertallanfy, secondo il quale l'impresa può essere pensata alla stregua di un sistema aperto, caratterizzato da una costante e continua interazione tra le sue componenti strutturali ed il contesto esterno nel quale essa si trova ad agire (Von Bertalanffy, 1968). Adottando una prospettiva basata sull'aSv, la riflessione diventa ancora più profonda: l'impresa come 'sistema vitale' necessita di un continuo cambiamento mirato al mantenimento dell'equilibrio con gli elementi che caratterizzano

l'ambiente operativo nella ricerca di un maggior livello di consonanza con i sovrasistemi (Barile, 2008) che essa considera rilevanti (Barile S., 2024). Per questo motivo, l'introduzione di nuovi strumenti digitali varia necessariamente la configurazione complessiva dell'ambiente, modificando le priorità del sistema - imposte dai sovrasistemi rilevanti - e costringendo l'organo decisore dell'impresa a prendere provvedimenti, sia dal punto di vista strutturale che processuale.

L'inquadramento teorico dell'impresa in ottica sistemico-vitale rappresenta l'elemento chiave alla base dell'approccio metodologico scelto per il conseguimento degli obiettivi che il nostro lavoro intende portare a termine. Come già anticipato nella sezione relativa agli scopi dello studio, l'aSv rappresenta lo strumento attraverso il quale verrà analizzata l'influenza negativa della digitalizzazione spinta sulla responsabilità sociale degli stakeholders e saranno vagliate le conseguenze del rischio - oramai sempre più concreto - di un'impresa del post-umano (Barile, 2023). In linea con questa prospettiva, Caputo e Saviano (2019) ampliano il framework dell'aSv sottolineando come, nei contesti complessi e digitalizzati, la sopravvivenza dei sistemi impresa dipenda dalla capacità di armonizzare l'evoluzione tecnologica con la dimensione cognitivo-relazionale degli attori coinvolti. Tale visione sistemica consente di leggere l'impresa come un ecosistema intelligente in cui la tecnologia non può sostituire la centralità dell'essere umano, ma deve agire in sinergia con esso per garantire sostenibilità e valore nel tempo.

Lo studio affronta, dunque, la tematica della Responsabilità Sociale d'Impresa (CSR) attraverso una nuova prospettiva: a differenza di numerose pubblicazioni scientifiche di settore, nelle quali vengono analizzati casi studio o proposte strategie per l'integrazione delle nuove tecnologie informatiche nel rispetto dei principi di sostenibilità, il nostro lavoro si concentra nel mettere in evidenza le problematiche della transizione digitale, demarcando i limiti da non superare se si vogliono evitare ripercussioni.

D'altronde, una strategia di CSR all'avanguardia dovrebbe focalizzarsi sulla ricerca di pratiche volte a tutelare i lavoratori non solo da un punto di vista legale ed etico, ma anche rispetto al loro ruolo attivo all'interno dell'azienda (Paniccia, 2018) - soprattutto in una prospettiva knowledge sharing interna alle organizzazioni e di responsabilità e di diritto di partecipazione ai processi decisionali (Iandolo et al., 2021). Risulta, pertanto, impensabile considerare esclusivamente i benefici del digitale, trascurando la possibilità che una 'deumanizzazione' dei processi possa causare degli effetti negativi sul materiale umano che compone i diversi livelli dell'impresa.

All'atto pratico, il nostro studio si basa su un'attenta analisi della letteratura che consente - dopo aver esaminato scenari concreti di comunicazione tra mondo umano e mondo digitale nel contesto imprenditoriale - di concettualizzare i potenziali effetti negative (Lerner et al., 2015) della transizione digitale in ottica sistemico-vitale, esplicitando i motivi per cui un'impresa trans-umana risulti ancora perfettamente sostenibile, purché l'elemento umano mantenga il proprio ruolo di controllo sui processi decisionali.

Focalizzandosi su quelli che Freeman definisce 'stakeholder primari' (Freeman, 1984), il nostro lavoro propone, dunque, un approccio metodologico basato su un'analisi multilivello, attraverso la quale vengono valutati gli effetti della digitalizzazione su tre figure chiave:

- *Il decisore: rappresentato dagli organi di governance, responsabili dell'orientamento strategico dell'impresa, della gestione e dell'implementazione dei processi operativi.*
- *Il dipendente: colui che prende parte ai processi in maniera attiva, pur subendo le decisioni in maniera passiva.*
- *Il consumatore: colui che determina il cambiamento delle priorità aziendali, agendo direttamente sul contesto operativo esterno all'organizzazione.*

Risultati. *La minaccia del post-umanesimo rappresenta uno scenario distopico, ma al tempo stesso più vicino alla realtà di quanto comunemente percepito. In ambito scientifico, diversi studi si concentrano sui limiti etici di una digitalizzazione spinta - in relazione, soprattutto, alla problematica della privacy informatica e della condivisione dei dati - trascurando le implicazioni legate al processo di deumanizzazione delle imprese (Richards & King, 2014; Floridi, 2016). Altri lavori si ricollegano, invece, alla richiesta di nuove figure lavorative in possesso di competenze digitali avanzate, prendendo in considerazione soltanto una piccola parte del problema. Ciononostante, seppur evidenziando una cognizione del pericolo limitata ad aspetti specifici, l'analisi condotta in letteratura, ha permesso di legittimare l'ipotesi iniziale, secondo la quale alle grandi opportunità di crescita e di innovazione offerte dalla transizione digitale si contrappongono diversi rischi - in termini di alienazione e deresponsabilizzazione del capitale umano - per la sostenibilità sociale delle imprese (Vito et al., 2021).*

Una volta inquadrata la posizione della comunità scientifica - e delle aziende stesse - rispetto alla tematica in analisi, l'aSv ci ha permesso di reinterpretare l'impresa in un'ottica sistemica e di formalizzare in maniera più adeguata le problematiche che affliggono il sistema in ogni sua parte. In particolare, come esposto nella sezione precedente, lo studio si è concentrato sulle tre categorie di stakeholder - organi decisionali, dipendenti e consumatori - ritenute essere le più colpite.

I risultati emersi vengono riassunti di seguito, esponendo le implicazioni per ciascuna delle tre classi di interesse in maniera separata:

- *Impatto sui decisori: molte considerazioni sull'importanza dell'elemento decisionale all'interno di un'organizzazione aziendale sono già emerse, implicitamente, nelle sezioni precedenti. Facendo riferimento, infatti, ad uno dei cinque postulati fondamentali del pensiero sistemico - il 'principio di sopravvivenza' -, la sopravvivenza di un sistema vitale è espressa dalla sua capacità di modificare i propri processi interni in relazione alle esigenze del momento, dettate dai sovrasistemi esterni. Risulta, pertanto, molto difficile immaginare un sistema vitale - sia esso un'impresa, o*

qualsiasi altra organizzazione - in assenza di un organo decisionale in grado di assicurare la possibilità di pianificazione necessaria.

Chiarita l'imprescindibilità dell'organo decisionale rispetto all'esistenza stessa dell'impresa come sistema vitale, bisogna riflettere sulla possibilità e sulle implicazioni che tale ruolo - nella descrizione di uno scenario post-umano - venga assunto dall'IA. La domanda da porsi, dunque, è se un decisore di tipo digitale possa in qualche modo sopperire alla mancanza dell'elemento umano - e provvedere in egual misura alla sopravvivenza del sistema - oppure la completa deumanizzazione rappresenti il punto di non ritorno che porterà alla scomparsa delle imprese per come siamo abituati a concepirle.

La risposta, fornita ancora una volta dall'aSv, prende in considerazione le modalità attraverso le quali le scelte vengono effettuate; bisogna fare riferimento al 'Modello della Varietà Informativa' (Barile S., 2024), secondo il quale ogni decisione deriva dalla capacità dell'organo di governance di raccogliere le informazioni a sua disposizione e di riutilizzarle sulla base di schemi interpretativi derivanti dalle cosiddette 'categorie valoriali' - l'insieme di valori e credenze forti che descrivono, in maniera innata, la personalità del decisore. Nel framework appena descritto non va, poi, trascurato il ruolo delle emozioni, le quali - come l'esperienza comune suggerisce - facilitano o ostacolano le scelte a seconda delle situazioni (Damasio, 1994).

La complessità decisionale della gestione di impresa viene, in sintesi, a dipendere da fattori valoriali ed emozionali tipicamente umani. Ipotizzare che una macchina possa riuscire ad operare delle scelte, attraverso la modalità appena esposta, significherebbe aprirsi alla possibilità che l'IA sviluppi una propria coscienza e che dal ruolo di mero 'attuatore' assuma una capacità decisionale che - almeno per il momento - non le si addice.

- *Impatto sui dipendenti: l'introduzione massiva di strumenti digitali all'interno dei processi operativi aziendali modifica profondamente il ruolo dei dipendenti, i quali sono costretti ad aggiornarsi rapidamente onde evitare l'obsolescenza della loro funzione. Essi, per via della loro posizione strategica che risente sia delle dinamiche interne sia degli input e delle decisioni provenienti dall'alto, risultano, probabilmente, essere i soggetti tra tutti più vulnerabili alla transizione digitale.*

  Il rischio più concreto è quello di un progressivo spostamento delle competenze operative verso il mondo digitale che, oltre ad influire sugli aspetti legati alla precarietà lavorativa ed alla necessità di riqualifica delle competenze, potrebbe generare un significativo disagio psicologico - meno evidente, ma altrettanto preoccupante - legato alla riduzione dell'autonomia decisionale (già piuttosto limitata) della classe operaia. In altre parole, il benessere sociale e lavorativo di un dipendente del sistema aziendale è vincolato alla possibilità di sentirsi parte attiva dei processi, pur non potendoli determinare in maniera diretta. Diversi casi studio su aziende di successo, non a caso, mostrano l'esistenza di una relazione diretta tra il grado di coinvolgimento emotivo - e di partecipazione attiva dei dipendenti ai processi operativi - e la capacità dell'impresa di creare valore (Calabrese et al., 2024).Un concetto molto caro all'aSv, in tal senso, quello di 'appartenenza': con l'avvicinarsi allo scenario delle imprese post-umane, il rischio per i dipendenti è che - ammesso che riescano a conservare la propria posizione lavorativa all'interno dell'azienda (Goleman, 1998) - prendano sempre meno parte ai processi, finendo per perdere il proprio senso di appartenenza.
- *Impatto sui consumatori: i consumatori, pur rappresentando una stakeholder esterna e non partecipando attivamente ad alcun tipo di processo aziendale, hanno - paradossalmente - un ruolo decisionale molto maggiore rispetto a quello dei dipendenti. Questo assunto può essere meglio chiarito inquadrando il ruolo del consumatore nella descrizione del 'sistema impresa' offerta dall'aSv: dal momento che coloro che usufruiscono dei servizi sono gli utenti finali dell'intero processo produttivo, è evidente che l'interesse dell'azienda sia, in ogni momento, quello di soddisfare le esigenze del cliente. Ecco che, al variare delle richieste e delle necessità dei consumatori, si modificano anche le priorità dell'impresa; quest'ultima, in quanto sistema, vede nelle esigenze dei consumatori un sovrasistema rilevante al quale adeguarsi per legittimare la propria sopravvivenza.*

  Da un punto di vista sistemico, dunque, i consumatori influenzano le scelte aziendali attraverso l'esplicitazione dei loro bisogni - che rappresentano i sovrasistemi rilevanti ai quali la governance di impresa deve adeguare i processi. È evidente, viste le premesse, che, in un'ottica di prosperità e di sostenibilità a lungo termine di un'impresa, la comunicazione tra azienda e cliente debba essere sempre ottimale - al fine di garantire una comprensione immediata delle esigenze dei consumatori.

  Anche in questo caso, la chiave del successo è legata ad un fattore emotivo, ovvero alla capacità dell'impresa di instaurare nel consumatore un senso di fiducia, una sorta di empatia che lo porti ad affezionarsi al brand - riconoscendo in esso la capacità di comprendere le proprie esigenze. Tutto ciò rischia di venir meno - e già sta accadendo con la diffusione, sempre maggiore, delle piattaforme di online-shopping - nel momento in cui il servizio clienti viene affidato a strumenti basati sull'IA (chatbot, ad esempio) non in grado di mostrare la minima empatia nell'interfacciarsi con i consumatori.

Limiti della ricerca. *La nostra ricerca, attraverso una visione critica ed in qualche modo volutamente provocatoria, si focalizza sui lati negativi della transizione digitale nelle imprese e sui rischi - spesso improvvidamente sottovalutati - di una eccessiva automatizzazione (deumanizzazione) dei processi e delle risorse aziendali. Nonostante l'approccio utilizzato - basato sull'analisi della letteratura e sulla reinterpretazione in chiave sistemica della problematica in esame - possa essere ritenuto di per sé esaustivo per il conseguimento degli obiettivi di studio preposti, la trattazione potrebbe beneficiare di indagini quantitative o della valutazione di un set di casi studio più ampio a supporto della tesi. Quest'ultima - che ci riserviamo per studi futuri che esulano dagli obiettivi del presente lavoro - potrebbe consentire di offrire una visione più dettagliata sulla percezione della problematica del post-umano a livello aziendale e di individuare*

delle best practice che consentano di preservare la componente umana ed emozionale nella gestione d'impresa, evitando una deriva pericolosa.

I diversi spunti e le numerose implicazioni manageriali emerse dai risultati dello studio permettono di scavare a fondo tra i diversi livelli che compongono la struttura delle imprese, analizzando i diversi aspetti - legati all'incalzante progresso tecnologico - che ne minacciano l'equilibrio. Sicuramente, per quanto la nostra ricerca abbia provato ad offrire una visione d'insieme, alcuni fattori sono stati trascurati in favore di altri, considerati più centrali rispetto allo studio. Non si è approfondito in maniera adeguata, ad esempio, sulle differenze strutturali e sistemiche tra le imprese di diversi settori. Uno spunto per un prossimo lavoro potrebbe essere, in tal senso, legato ad uno studio comparativo, volto a valutare le implicazioni della transizione digitale su settori differenti.

Infine, considerato l'elevato tasso di evoluzione tecnologica, sarebbe importante - restando nell'ottica della sostenibilità sociale - considerare anche variabili di tipo etico e/o normativo e valutare se - e con quali modalità - le imprese riescono a stare al passo. Questioni legate alla privacy ed alla sicurezza dei dati, ad esempio, meriterebbero sicuramente maggiore attenzione, sebbene la letteratura di settore sia costellata di lavori che trattano di queste tematiche.

Implicazioni manageriali. *Le implicazioni manageriali della nostra ricerca sono molteplici e, in gran parte, sono emerse in maniera spontanea - coerentemente al flusso narrativo - nel corso della trattazione. Senz'altro lo spunto di riflessione più immediato è legato al confine sottile tra il progresso dell'impresa trans-umana e la deriva di quella post-umana. I risultati della ricerca, a tal proposito, evidenziano la presenza di rischi concreti per la sostenibilità sociale a lungo termine che si oppongono alle opportunità di crescita economica promesse dagli strumenti digitali.*

La necessità di bilanciare innovazione tecnologica e capitale umano rappresenta, dunque, la prima - e più importante - implicazione manageriale. Diversi studi hanno, infatti, dimostrato come la scarsa integrazione e la non adeguata comunicazione tra risorse umane e digitali siano state la principale causa di fallimento delle strategie aziendali negli ultimi anni (Brown, 2019). Lo stesso Goleman, promotore dell'intelligenza emotiva, conveniva - molti anni prima dell'era del digitale - sul fatto che la componente umana della governance fosse l'elemento decisivo per il successo di un'impresa, ancor più degli strumenti utilizzati all'atto pratico nello svolgimento dei processi (Goleman, 1998).

Altra importante implicazione palesata dal nostro lavoro è legata al concetto di sostenibilità - più in particolare di CSR. Si fa presente, a tal proposito, come la maggior parte degli studi manageriali, nell'analizzare le diverse problematiche legate alla responsabilità d'impresa, si soffermino esclusivamente sugli aspetti più evidenti - tutela economica ed ambientale, ad esempio - trascurando i fattori psicologici delle risorse umane, che influenzano le dinamiche aziendali dall'interno. Anche nel discutere di sostenibilità sociale nello specifico, le preoccupazioni principali - in relazione alla transizione digitale - restano banalmente ancorate agli evidenti rischi di alienazione lavorativa e di scarsa protezione della privacy. Come evidenziato a più riprese, sarebbe altrettanto importante sottolineare gli aspetti sociali legati al senso di appartenenza, di responsabilità decisionale e/o operativa e di benessere psicologico del personale - oberati dalla pressione imposta dal confronto con una realtà digitale (Barbagallo, 2012) che viene percepita come una minaccia dagli addetti ai lavori.

In buona sostanza, tutte le dinamiche di interazione fra le parti che compongono l'impresa continuano a basarsi su criteri di tipo emozionale. Tale asserzione è conseguenza diretta della natura delle decisioni in ambito aziendale, che - secondo il modello della varietà informativa, citato in precedenza - non possono prescindere da una matrice valoriali che tenga in considerazione i tratti tipicamente umani (inclusa la componente emozionale) degli organi di governance. Questo discorso ci conduce ad un'altra implicazione fondamentale emersa dal nostro studio: non è possibile concepire l'impresa, così come siamo abituati a conoscerla, in assenza di un decisore umano che ne gestisca i processi.

Il messaggio di speranza, in questo senso, è forte e chiaro: l'impresa del trans-umano può essere realizzata soltanto trovando un equilibrio tra le risorse operative umane e quelle digitali - tale da non ledere lo spirito di appartenenza ed il benessere psicologico dei dipendenti -, a condizione che il ruolo decisionale e di pianificazione rimanga saldamente prerogativa dell'essere umano.

Ultima, ma non per importanza, è una considerazione relativa all'influenza di ciascuna parte del 'sistema impresa' sugli altri elementi che lo compongono. Ci riferiamo, ad esempio, al fatto che la deumanizzazione dell'impresa a livello di governance - ovvero la sostituzione dei decisori umani con ipotetici strumenti di IA in grado di prendere decisioni - causerebbe indirettamente conseguenze sui dipendenti, i quali in assenza di una persona fisica con la quale dialogare ai 'piani alti' non avrebbero modo di contestare gli ordini impartiti o di avere chiarimenti in merito ad indicazioni poco chiare; allo stesso modo, la sostituzione degli addetti all'assistenza clienti con modelli di IA generativa sarebbe fonte di malcontento per la classe dei consumatori, stanchi di interfacciarsi con un interlocutore privo di empatia e incapace di comprendere le loro esigenze (Goleman, 1998) . Di conseguenza, oltre all'imprescindibilità del fattore umano a livello decisionale, è fondamentale - per evitare il tragico scenario del post-umanesimo - che le tecnologie digitali siano implementate nei processi aziendali a supporto delle risorse umane e non in loro vece.

Originalità del lavoro. *L'originalità della nostra ricerca è stata evidenziata, a più riprese, in relazione agli obiettivi prefissati ed alle modalità di indagine selezionate. Nella fattispecie, l'argomento della sostenibilità sociale delle imprese nell'era digitale è stato affrontato attraverso un punto di vista diverso, mirato all'analisi delle controindicazioni piuttosto che dei benefici. La scelta di un simile approccio è derivata dalla tendenza, osservata in altri studi di settore, a saltare direttamente alle conclusioni, proponendo delle soluzioni e delle strategie implementative senza aver prima acquisito sufficiente consapevolezza della problematica da affrontare.*

L'obiettivo del nostro studio, pertanto, è stato quello di descrivere le principali implicazioni negative di un modello aziendale digitalizzato che - seppur riconoscendone l'importanza ed il valore aggiunto rispetto alle imprese tradizionali - presenta tutta una serie di rischi legati alla perdita di centralità dell'essere umano nei processi decisionali ed operativi.

Altro aspetto distintivo del lavoro, a testimonianza della sua originalità, è il contributo offerto dall'aSv e dalla possibilità di inquadrare le dinamiche aziendali di interazione tra umano e digitale in una prospettiva sistemica (La Sala et al., (2023). L'analisi multilivello dell'impatto tecnologico sui diversi attori in gioco - decisori, dipendenti e consumatori - e la disamina sul ruolo delle emozioni nei processi decisionali forniscono implicazioni manageriali concrete e spunti di riflessione per la promozione di una cultura organizzativa responsabile e sostenibile nel lungo periodo (Barile et al., 2013). La stessa prospettiva del CSR è stata affrontata attraverso un punto di vista differente, focalizzato sul ruolo del dipendente umano come parte integrante del sistema aziendale e non come semplice esecutore dei processi stabiliti. Da qui il concetto di appartenenza e di benessere psicologico basato sull'empatia tra le parti, troppo spesso dimenticati o sottovalutati quando si parla di responsabilità sociale.

Infine, la definizione di uno scenario post-umano - in contrapposizione al modello trans-umano di azienda sostenibile - rappresenta uno stimolo a riflettere e a valutare le controindicazioni di ogni situazione, prima di lasciarsi accecare dai possibili benefici. La scelta di preferire, dunque, un approccio di tipo critico - rivolto all'esplorazione delle problematiche, piuttosto che all'individuazione di possibili soluzioni - vuole essere anche uno stimolo per la comunità scientifica, invitata a contribuire al tema attraverso una diversa prospettiva.

Key words: *sostenibilità; responsabilità sociale d'impresa; approccio sistemico vitale; transizione digitale; gestione d'impresa; processi aziendali.*

The Intelligence Gap: Merging Explainable AI with Managerial Perception for Proactive Crisis Strategy

DAVIDE LIBERATO LO CONTE[1] GIUSEPPE SANCETTA[2] RAFFAELE D'AMORE[3]

Abstract

The increasing complexity of corporate environments necessitates a shift from reactive crisis management to proactive, AI-enhanced strategic foresight. While AI-driven predictive models have demonstrated strong accuracy in identifying financial distress, their integration into executive decision-making remains a challenge. This study bridges the intelligence gap between algorithmic precision and managerial intuition by leveraging Explainable AI (XAI) to make crisis prediction models interpretable and actionable. Using a balanced dataset of 3,000 firms, the research compares multiple innovative models, demonstrating that AI can detect latent vulnerabilities often overlooked by traditional financial analysis. Furthermore, XAI enhances transparency, allowing managers to contextualize financial risks and governance inefficiencies. The findings emphasize that AI should complement, and not replace, human decision-making, determining a shift toward intelligence-driven business resilience. However, the study also highlights limitations related to managerial AI literacy and the reluctance to adopt predictive analytics as a decision-support tool. Finally, by embedding AI within strategic workflows, this study advances both academic discourse and managerial practice, positioning AI as a transformative force in crisis anticipation and long-term corporate sustainability.

Framing of the research. *Traditionally, corporate distress has been conceptualized through reactive frameworks, where financial and managerial interventions occur only after signs of distress become apparent (Beaver, 1966; Altman, 1968). However, contemporary advancements in artificial intelligence (AI) and predictive analytics have introduced the possibility of proactive crisis anticipation, allowing firms to detect financial and operational vulnerabilities before they materialize into systemic failures (Davenport & Ronanki, 2018; Zhang et al., 2021). A clear distinction must be drawn between corporate crisis and insolvency, as these concepts entail fundamentally different implications for firms, regulators, and stakeholders. A corporate crisis refers to a situation of operational or financial distress that may impair a company's efficiency, profitability, or market positioning but does not necessarily lead to legal bankruptcy proceedings (Mitroff, 2005). In contrast, insolvency is a legally defined condition in which a company is unable to meet its financial obligations, leading to restructuring or liquidation under insolvency frameworks (Altman, 1993; Ferri, 2022).*

The regulatory approach to these conditions varies significantly across jurisdictions. For instance, in the United States, Chapter 11 bankruptcy protection enables firms to undergo structured reorganization, preserving business continuity while renegotiating debt. In contrast, the European approach tends to emphasize early warning mechanisms and preventive restructuring, as seen in the EU Directive 2019/1023, which encourages firms to identify and address distress before insolvency proceedings become necessary (Eidenmüller & van Zwieten, 2015). These differences reflect a broader evolution in corporate governance and financial regulation: rather than focusing solely on post-crisis intervention, contemporary frameworks increasingly emphasize early detection, transparency, and proactive strategic planning (Bellovary et al., 2007; lo Conte et al., 2024). This shift is driven by growing recognition that financial distress affects not only the firm itself but also a broader network of stakeholders, including investors, creditors, employees, and supply chain partners (Mitroff, 2005; Floridi et al., 2018).

Predictive AI in Crisis Detection: Advancing Beyond Traditional Models

Historically, crisis prediction relied on financial ratio analysis and econometric models, beginning with Beaver's (1966) univariate analysis and evolving through Altman's (1968) Z-Score model, which introduced a multivariate approach to bankruptcy prediction. While these models have been widely used in academia and practice, their limitations are evident: they assume linear relationships among variables, rely on historical financial data, and fail to capture dynamic, nonlinear interactions between corporate performance indicators (Ferri, 2022; Aydin et al., 2022). In response, AI and machine learning (ML) techniques have emerged as superior alternatives, offering the ability to process high-dimensional datasets, detect complex patterns, and adapt to changing business environments (McKee, 1995; Vinuesa et

DOI 10.7433/SRECP.SP.2025.01

al., 2020). Recent studies have demonstrated that ensemble models such as Random Forest, Gradient Boosting, and XGBoost significantly outperform traditional econometric models in predicting financial distress (Zhang & Susheng, 2021), and these models are particularly effective for firms across different scales and sectors:

- *Multinational Corporations (MNCs): AI-powered financial distress models enable global firms to integrate cross-border risk assessments, taking into account currency fluctuations, geopolitical risks, and macroeconomic indicators (Lin et al., 2020);*
- *Mid-sized enterprises: AI models facilitate sector-specific crisis detection by incorporating industry-specific variables such as supply chain disruptions, regulatory compliance risks, and consumer sentiment analysis (Ribeiro et al., 2016);*
- *Small enterprises: For smaller firms, AI-driven early warning systems can enhance access to alternative financing mechanisms, enabling businesses to restructure proactively rather than default (Floridi et al., 2018).*

Bridging the Intelligence Gap: Explainability as a Strategic Imperative

While AI offers unparalleled predictive accuracy, a critical challenge remains: how do managers interpret and act upon AI-generated insights? Firstly, a major limitation of AI adoption in crisis management is the lack of explainability and interpretability, commonly referred to as the "black box" problem (lo Cont et al., 2024). Decision-makers, in fact, often struggle to understand why an AI model predicts financial distress, leading to skepticism and reluctance to integrate AI-driven insights into strategic decision-making. To address this, recent research has focused on explainable AI (XAI) techniques, which enhance transparency by providing human-interpretable explanations of AI outputs (Molnar, 2022). Among these techniques, SHapley Additive exPlanations (SHAP) has emerged as a leading method for AI explainability in financial analysis (Lundberg & Lee, 2017; Fasano et al., 2024). SHAP, in fact, allows managers to identify which factors most influence a firm's financial health, making AI predictions actionable and facilitating a shift from reactive problem-solving to proactive strategic foresight (Thiebes et al., 2020). Furthermore, by integrating AI-based interpretability into crisis models, businesses can move beyond raw predictions and develop a nuanced understanding of the underlying causes of distress. In fact:

- *AI can reveal operational bottlenecks, suboptimal capital structures, and governance weaknesses that may not be evident through traditional financial analysis;*
- *Unlike rigid statistical models, AI-driven crisis detection can be tailored to sector-specific financial characteristics, ensuring greater relevance and accuracy (Nguyen et al., 2019);*
- *AI-enhanced explainability enables firms to communicate financial risks effectively to stakeholders, fostering trust and collective action in crisis management (Russell & Norvig, 2021).*

The adoption of AI-driven foresight then could represent not merely a technological evolution but a fundamental shift in corporate mindset. Traditional approaches to crisis management have been reactive, with firms responding to distress only after it manifests. However, proactive crisis anticipation necessitates a paradigm shift where enterprises integrate AI not just as a diagnostic tool, but as an interactive decision-support system (Barboza et al., 2017). This study contributes to the literature by advancing an integrated AI-human decision framework that places organizations at the center of a stakeholder-driven ecosystem. By embedding understandable, transparent AI insights into strategic foresight processes, businesses, in fact, can preemptively address financial distress, optimize resource allocation, and enhance long-term stability (Addo et al., 2018). Given these considerations, the paper first outlines the research objectives, focusing on explainable AI for proactive crisis detection. It then details the research design, including dataset selection and machine learning model implementation. The empirical findings highlight model accuracy and key financial indicators, followed by a discussion of data limitations and challenges in integrating AI-driven insights. The paper then explores practical applications in decision-making during critical situations, concluding with its contribution to bridging AI precision and executive judgment for strategic foresight.

Purpose of the paper. *Recent advancements in XAI offer transformative managerial approaches, shifting crisis anticipation from post-factum intervention to predictive, evidence-based foresight (Davenport & Ronanki, 2018; Fasano et al., 2024). However, despite the growing application of AI in financial risk assessment, a significant gap persists in integrating XAI into executive decision-making, limiting its impact at the strategic level. This gap reflects a broader challenge within the academic discourse: while the literature on corporate crisis prediction is inherently interdisciplinary, drawing from fields such as finance, econometrics, artificial intelligence, and operational research, managerial perspectives remain underdeveloped. Most existing studies focus heavily on statistical performance and algorithmic refinement rather than on how executives can leverage AI-driven insights for strategic decision-making (Jiang et al., 2020; Zhang & Susheng, 2021). This has resulted in a disconnect between research and real-world business practice, where AI models, despite their predictive accuracy, often remain detached from executive decision-making processes due to lack of interpretability, transparency, and integration into managerial workflows (Russell & Norvig, 2021). This paper addresses this issue by investigating the following Research Question:*

- *RQ: How can AI-driven predictions bridge the gap between virtual data insights and executive decision-making for early crisis detection and strategic action?*

This study then contributes to the academic debate by shifting the focus from purely technical AI advancements to their strategic application in corporate foresight and crisis management. First, it extends prior research by embedding XAI within the broader domain of crisis detection and executive decision-making, demonstrating how explainability tools enhance managerial comprehension of early warning signals (Floridi et al., 2018; Fasano et al., 2024). While previous

studies have consistently shown that machine learning models such as Random Forest, XGBoost, and Gradient Boosting outperform traditional statistical methods in financial distress prediction (Jiang et al., 2020), fewer have explored how to make these models more interpretable, actionable, and trustable for corporate leaders (Ribeiro et al., 2016). Second, this paper challenges the prevailing deterministic, one-size-fits-all approach to financial distress modeling, advocating for context-sensitive AI frameworks that consider firm-specific characteristics, industry constraints, and governance structures (Nguyen et al., 2019). Unlike standardized risk models, which often reduce crisis detection to fixed financial thresholds and static variables, this study proposes an adaptive approach that customizes AI models to different organizational settings, ensuring greater alignment with real-world managerial needs (Mitroff, 2005). Third, this research underscores the growing importance of AI-human collaboration in high-stakes decision-making. Businesses do not operate in isolation but within interconnected stakeholder ecosystems, where crisis signals must be interpreted not only in financial terms but also in relation to organizational resilience, investor sentiment, and market positioning (Lin et al., 2020).

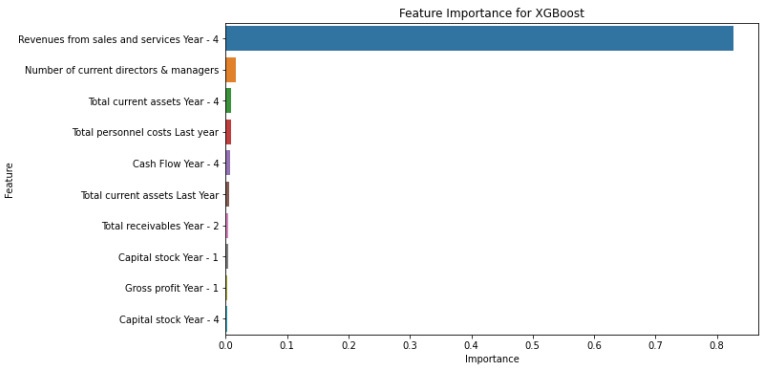
By embedding XAI into a stakeholder-inclusive crisis response model, this paper advocates for a shift from reactive crisis management to anticipatory decision-making, prioritizing transparency, shared intelligence, and collaborative problem-solving. Ultimately, this study contributes to bridging the divide between AI-driven foresight and executive judgment, demonstrating how XAI can enhance managerial confidence, facilitate strategic intervention, and redefine crisis management as an anticipatory discipline rather than a reactive necessity. So, by integrating quantitative AI modeling with qualitative insights into decision-making behavior, this paper enriches the scholarly debate on AI-human collaboration in business strategy, providing a foundation for future research in predictive analytics, digital transformation, and enterprise risk governance.

Methodology. *This paper follows an inductive research approach, allowing insights to emerge from empirical observations rather than being constrained by predefined theoretical assumptions (Tharenou et al., 2007). Given the relationship between financial performance, governance structures, and crisis anticipation, a data-driven methodology is necessary to bridge the intelligence gap between AI-driven predictions and managerial decision-making. The research is ongoing, with previous findings already published, and it continues to evolve as new insights emerge. In this context, the empirical analysis is based on a balanced dataset of 3,000 Italian firms, extracted from the AIDA database by Bureau van Dijk. The Italian business environment, in fact, provides a unique and challenging case for crisis prediction, characterized by a high concentration of SMEs, complex governance structures, and evolving regulatory frameworks for insolvency resolution (Fasano et al., 2024).*

The dataset includes both firms in financial distress, identified based on negative equity, recurring losses, high debt ratios, and formal restructuring procedures, and firms with stable financial performance and no crisis signals. The balanced nature of the dataset is fundamental, ensuring that AI models do not become biased toward distressed firms while maintaining high generalizability and real-world applicability (lo Conte et al., 2024). To develop a multi-dimensional crisis prediction model, we consider 65 key indicators spanning economic-financial metrics, governance structures, and market-related factors. The economic and financial variables include liquidity ratios, profitability metrics such as EBITDA, ROE, and ROA, leverage levels, cash flow stability, working capital efficiency, and Altman Z-Score components. Governance and structural factors account for board composition, the number of executive representatives, ownership concentration, CEO tenure, shareholder dispersion, and legal form classifications. Market and operational metrics capture industry-specific sensitivities, revenue growth trends, investment intensity, and supplier/customer concentration (Tison, 2020). The inclusion of a broad spectrum of indicators ensures a high-resolution predictive framework and enhances the early detection capabilities of AI-driven models (Jiang et al., 2020). Furthermore, the comprehensive nature of the dataset strengthens the robustness of AI models, while the diverse set of variables allows for a granular understanding of financial distress drivers.

To critically assess AI's effectiveness in corporate crisis anticipation, we implement a comparative framework that evaluates multiple algorithms in terms of predictive accuracy, interpretability, and managerial applicability (Agarwal & Tafler, 2008). Rather than treating models as isolated technical tools, they are structured as components of an AI-driven Balanced Scorecard for crisis management, designed to facilitate their practical integration into corporate decision-making processes. The machine learning models deployed include Logistic Regression, serving as a benchmark for traditional econometric approaches; Gradient Boosting Machines (GBM), refining predictive granularity through sequential optimization; and XGBoost, a high-precision boosting technique that optimizes recall for crisis prediction. Model performance is assessed using classification metrics such as F1-score, accuracy, and precision-recall AUC, ensuring a balanced evaluation of predictive capabilities and the trade-offs between false positives and false negatives (Breiman, 2001; Lundberg & Lee, 2017). To prevent overfitting and enhance model robustness, we employ 10-fold cross-validation, ensuring that predictions remain reliable across different firm profiles (Zhang & Susheng, 2021).

A fundamental component of this study is explainability, ensuring that AI models serve as decision-support systems rather than black-box predictors. The integration of explainable AI techniques addresses the intelligence gap by making predictions more interpretable and actionable for decision-makers.



SHAP provides a transparent breakdown of AI-generated crisis predictions, identifying key financial, governance, and operational drivers of distress (Fasano et al., 2024). By bridging the gap between algorithmic complexity and executive decision-making, SHAP enables firms to move beyond passive risk assessment to proactive strategic planning. Furthermore, Partial Dependence Plots (PDPs) visualize non-linear relationships between firm-specific factors and

crisis probability, offering sector-specific insights that make AI-driven forecasts more actionable. These interpretability tools ensure that predictive models are accurate but also tailored to industry-specific crisis dynamics, enhancing their real-world applicability (Tison, 2020). Moreover, counterfactual explanations contextualize crisis risk, suggesting alternative strategic scenarios to mitigate financial distress. Together, these explainability techniques transform AI from a statistical tool into an executive decision-support system, making predictions more accessible, actionable, and industry-adaptive. As AI-driven foresight advances, in fact, sector-specific explainability models will further close the gap between data insights and real-world strategic execution, reinforcing AI's role as a key enabler of corporate crisis management and business resilience.

Results. *The empirical findings confirm the dual role of AI in crisis prediction and strategic crisis management, demonstrating both its predictive accuracy and its value in early alert systems for proactive intervention. Among the machine learning models tested, XGBoost emerged as the most effective, achieving an overall accuracy of 81%, outperforming Logistic Regression (68%), and Gradient Boosting (77%). This reinforces the superiority of ensemble learning techniques in identifying firms at risk of financial distress while maintaining generalizability across different corporate structures. In particular, XGBoost model correctly identified 83% of distressed firms (recall), with a precision of 78%, ensuring a balanced approach between reducing false negatives (missed crises) and mitigating false positives (over-predictions of distress). Notably, the false negative rate remained at 17%, significantly lowering the risk of failing to detect an impending crisis. However, an analysis of false positives reveals an important insight: in many cases, firms flagged as "at risk" by the model but not currently in distress displayed early warning signs that traditional financial assessments failed to capture. These firms often exhibited subtle governance inefficiencies, declining operational margins, or unsustainable leverage ratios that may signal financial instability before it becomes critical. So, the results suggest that false positives should not be dismissed as model errors but rather examined as potential early warning signals of latent vulnerabilities (lo Conte et al., 2024). In many cases, in fact, firms flagged incorrectly as distressed later showed declining financial health in subsequent periods, confirming the model's ability to anticipate distress before conventional indicators reveal it. This underscores the importance of shifting from a reactive approach to crisis management, where intervention occurs after financial distress is evident, to a proactive approach that leverages AI for early detection and mitigation strategies.*

Figure 1 presents a SHAP summary plot for the best performing algorithm, illustrating the impact of key financial, governance, and operational variables on the AI model's crisis predictions. The horizontal axis represents the SHAP values, indicating whether a given feature increases or decreases the likelihood of financial distress. Variables positioned further from zero have a stronger influence on the prediction outcome. Notably, revenues from sales and services (Year -4) and the number of current directors & managers emerge as the most significant predictors, reinforcing the idea that early financial signals and governance structures play a crucial role in crisis detection. Additionally, leverage, production costs, and receivables management appear as critical indicators, aligning with traditional financial distress theories.

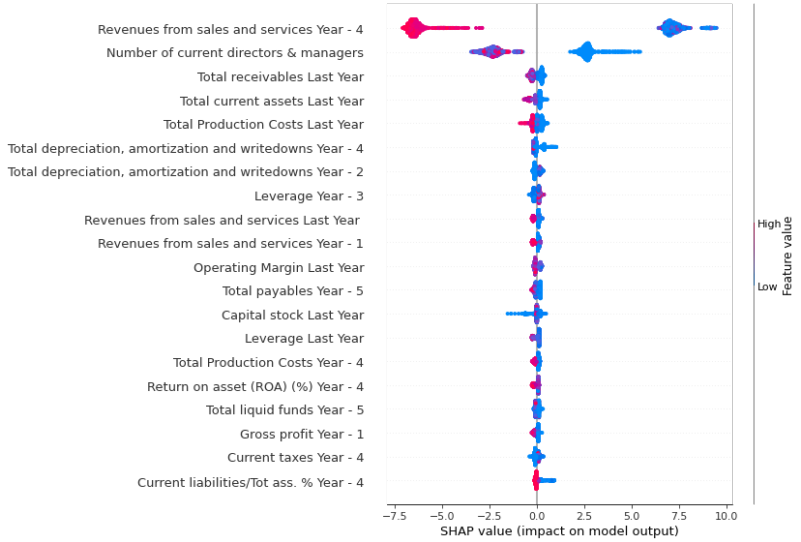


Fig. 1: Feature Importance Plot

Source: our processing

This visualization emphasizes the capacity of AI-driven models to act as early alert systems, identifying potential crisis risks in different areas of the business well before conventional financial ratios reflect distress. So, by leveraging XAI techniques, managers can interpret and act upon these insights proactively, strengthening financial resilience and decision-making processes. Figure 2, on the other side, provides a SHAP summary plot, offering a perspective on the most influential variables in predicting financial distress. This visualization bridges the intelligence gap between raw machine learning outputs and managerial intuition, making AI-driven forecasts interpretable and actionable. The horizontal axis represents the impact of each variable on the model's predictions, while the color gradient (red to blue) indicates whether higher values of a given feature increase (red) or decrease (blue) the likelihood of financial distress.

Fig. 2: SHAP Summary Plot

Source: our processing

Three key variables stand out as critical early warning signals:

- *Revenues from Sales and Services (Year -4): as expected, declining revenues over time (blue) signal financial instability, while stable or growing revenues (red) reduce the likelihood of distress. This reinforces the idea that early sales performance is a strong predictor of long-term financial health, often preceding shifts in cash flow and profitability;*
- *Number of Current Directors & Managers: a decrease in the number of directors and managers is associated with higher crisis probability. This suggests that governance inefficiencies, leadership conflicts, or excessive business structuring could be warning signs of instability. Conversely, stable governance structures indicate financial resilience;*
- *Leverage (Year -3) - The model identifies leverage as a double-edged sword: while moderate leverage (blue) supports business expansion, excessive debt accumulation (red) increases financial distress risks. This underscores the importance of balance between financial leverage and operational stability.*

This XAI-powered analysis transforms AI from a "black box" into a transparent decision-support tool, allowing businesses to not only detect crisis risks early but also understand the underlying factors driving predictions. The color contrast metaphor acts as a financial traffic light for executives, guiding them toward proactive strategic interventions rather than reactive crisis responses. In conclusion, the findings of this study emphasize that AI should be viewed as an enabler rather than a substitute for managerial decision-making. While AI-driven models, particularly XGBoost, demonstrate remarkable accuracy in predicting financial distress, their true value lies in how effectively human decision-makers can interpret and act upon these insights. Without proper contextualization, even the most sophisticated AI models remain abstract data points. The integration of AI into corporate decision-making must therefore be accompanied by a paradigm shift that incentivates AI literacy, encourages stakeholder collaboration, and embeds machine intelligence within business strategy rather than treating it as a standalone analytical tool.

A major challenge certainly remains bridging the technical gap between algorithmic outputs and managerial intuition, as AI does not replace human expertise but enhances it by providing structured, data-driven early warnings that allow firms to act before crises escalate. This is particularly relevant for SMEs, where digital fluency and AI-driven decision-making need to be cultivated to ensure that AI insights are not only available but also understood, trusted, and utilized effectively. So, to be truly effective, AI adoption must be tailored to industry-specific needs and organizational structures, much like the Balanced Scorecard framework, which aligns data-driven performance metrics with strategic goals. A hybrid approach, where AI automates routine financial monitoring while enhancing human-led interventions, could ensure that predictive insights are both actionable and adaptable to the unique dynamics of each enterprise. Furthermore, by embedding AI into corporate structures in a flexible, transparent, and explainable manner, businesses can shift from reactive crisis management to proactive strategic foresight, strengthening financial sustainability and stakeholder confidence. Ultimately, AI should not be perceived as a disruptive force but as a tool for empowerment, creating a corporate culture where data-driven insights and human expertise coexist to drive more informed, strategic, and resilient decision-making.

Research limitations *While this study provides valuable insights into AI-driven crisis prediction and strategic intervention, certain limitations must be acknowledged. The research is ongoing, meaning that some constraints will be addressed in future developments. Interestingly, the most significant challenges do not stem from AI itself but from managerial mindsets and organizational inertia: despite AI's increasing presence across industries, many firms still*

struggle to integrate it effectively into decision-making processes. The real limitation lies in the willingness to understand, trust, and apply AI-driven insights, rather than in the technology's capabilities. AI is no longer an abstract concept, it is an embedded force in modern business environments. So, the key is not resisting it but learning how to use it ethically, strategically, and efficiently. Future research will focus on expanding AI adaptability to different business contexts, refining XAI frameworks for even greater interpretability, and ensuring alignment with ethical AI principles. The goal is not just to develop more accurate models, but to help creating a managerial culture that embraces AI as a trusted, proactive tool for business sustainability and crisis prevention and management.

Managerial implications. *This study underscores the urgent necessity of embedding AI into strategic decision-making rather than treating it as an external or auxiliary tool. The real challenge is no longer whether AI can predict crises, it can, but whether businesses are prepared to adopt and integrate it meaningfully into their governance and operational frameworks. For managers, this research demonstrates that AI-driven early warning systems must transition from experimental tools to institutionalized frameworks, ensuring real-time risk assessment and proactive crisis prevention. AI literacy is no longer optional, as executives must develop the ability to interpret and leverage AI-driven insights just as they do financial reports, ensuring that data-driven decision-making becomes a cornerstone of corporate strategy rather than an isolated analytical function. Moreover, AI models must be customized and industry-specific, ensuring that their predictions align with sector-specific financial dynamics, governance structures, and risk factors, rather than being applied as one-size-fits-all solutions.*

From an academic perspective, this study bridges a crucial gap between AI precision and managerial intuition, offering a pragmatic approach that blends predictive analytics with human-centered decision-making. While AI has seen extensive application in financial modeling, many frameworks remain detached from real-world business needs, focusing excessively on statistical accuracy rather than managerial applicability. By emphasizing Explainable AI techniques and practical integration strategies, this research advances the discourse on AI adoption in corporate crisis management.

Originality of the paper. *This study redefines the role of AI in corporate crisis management, shifting the narrative from mere prediction to strategic empowerment. While existing literature largely focuses on financial distress modeling through statistical methods or black-box machine learning approaches, this research takes a bold step forward, demonstrating that AI is a catalyst for a new era of decision-making. The paper introduces a groundbreaking fusion of AI precision and managerial intuition, tackling the intelligence gap that has long hindered AI's real-world applicability. By integrating XAI methodologies, we transform AI from a distant, technical function into an intuitive, business-driven decision-support system, allowing executives to see, understand, and act on AI-driven insights rather than passively receiving abstract predictions. What sets this study apart is its focus on the intersection of AI, managerial cognition, and strategic action: it does not merely seek to enhance the accuracy of financial distress prediction models, but rather to reimagine how businesses interact with AI-driven foresight, moving from a reactive, crisis-driven approach to a proactive, intelligence-led business culture. In conclusion, by embedding AI insights seamlessly into corporate structures, much like a financial dashboard or a Balanced Scorecard, this research charts a path toward a future where AI is not feared, but embraced, where it does not replace human decision-making but enhances it. In doing so, it offers a blueprint for the future of AI in business strategy: transparent, explainable, and deeply intertwined with the human expertise that remains irreplaceable.*

Key words: *AI-driven crisis prediction; Explainable AI; early warning systems; decision-making; machine learning.*

Stakeholder Engagement and Social Sustainability Practices in Innovative Italian SMEs: The Mediating Role of Artificial Intelligence

LORENZO TURRIZIANI[1] VINCENZO DELL'ANNO[2] CRISTINA CERVINO[3] VALERIO MUTO[4]

Abstract

This study aims to examine how stakeholder engagement shapes social sustainability in innovative Italian SMEs, highlighting the mediating role of Artificial Intelligence (AI). Drawing on Ajzen's extended Theory of Planned Behavior and stakeholder theory, it proposes that higher levels of stakeholder engagement foster stronger intentions to adopt socially responsible practices, ultimately yielding more effective social outcomes. The research further posits that AI tools-encompassing chatbots, predictive analytics, and big data-reinforce the transition from intention to action by enabling proactive communication and personalized stakeholder interactions. A cross-sectional survey of 2,273 innovative SMEs identified through the Italian Chamber of Commerce will capture stakeholder engagement measures, AI capabilities, and social sustainability practices. Structural Equation Modeling (SEM) will test the proposed relationships, controlling for firm-level attributes such as size, financial performance, and age. The findings will show how AI-driven capacities and robust stakeholder engagement foster social sustainability, offering practical insights for managers and policymakers.

Key words: *social sustainability, stakeholder engagement, artificial intelligence, SEM, SMEs, TPB*

Framing of the research. *Stakeholder engagement has emerged as a cornerstone of modern organizational strategies (Hristov & Appolloni, 2022; Kujala et al., 2022), reflecting a shift from shareholder-centric models toward more inclusive approaches that prioritize dialogue with a diverse range of stakeholders (Freeman, 1984; Donaldson & Preston, 1995; Greenwood, 2007; Freeman et al., 2007; Bhandari et al., 2022; Van Buren et al., 2025).*

Stakeholder engagement is the systematic involvement of individuals, groups, or institutions affected by an organization's decisions, to foster mutual value creation (Freeman, 1984; Bridoux et al., 2022). This perspective asserts that businesses must consider the interests of all stakeholders-including employees, customers, communities, and investors-to achieve long-term success.

From this perspective, stakeholder theory-widely recognized by scholars for its inherently managerial nature-plays a crucial role when integrated with environmental (E), social (S), and governance (G) criteria (Attanasio et al., 2022). These ESG factors have become fundamental benchmarks for assessing corporate sustainability, driven by regulatory pressures, investor demands, and societal expectations (Friede et al., 2015). This paradigm underscores the importance of the relational approach between firms and their stakeholders as key determinants of the success of corporate sustainability strategies (Schaltegger et al., 2019; Kujala et al., 2022; Sady, 2023). Several recent studies have highlighted how Artificial Intelligence can enhance stakeholder engagement (Zhang & Yang, 2024), catalysing firms' ability to proactively respond to stakeholder needs and reducing information asymmetries (Rane et al., 2024). Specifically, Zhang and Yang (2024) emphasize that companies integrating Artificial Intelligence tools into managing their social sustainability practices can respond more swiftly to external pressures, positively impacting overall sustainability.

Furthermore, Artificial Intelligence's ability to identify patterns and correlations between corporate actions and stakeholder perceptions enables the development of more targeted and effective strategies. This process is recognized as a critical factor in improving the social sustainability practices of innovative Italian SMEs, with Artificial Intelligence emerging as a significant mediator in this context. As supported by various studies (Camagni & Capello, 1998; Sabatini et al., 2022; Dainelli et al., 2024) innovative small and medium-sized enterprises (SMEs) in Italy are a key resource for the Italian industrial fabric, standing out for their ability to adapt to global challenges and generate technological and innovative solutions in high-growth sectors.

DOI 10.7433/SRECP.SP.2025.01

The literature highlights that effective stakeholder engagement in innovative Italian SMEs fosters trust, aligns strategic objectives with societal needs, and drives sustainability outcomes (Winkler et al., 2019; She et al., 2023; Esposito et al., 2025).

Through active stakeholder engagement, supported by artificial intelligence's mediating role, businesses and organizations can facilitate shared knowledge creation, promote sustainable practices, and stimulate strategic innovation (Eccles et al., 2013; Eccles & Klimenko, 2019).

From this perspective, firms must manage interactions with stakeholders, which can be conducted at varying levels of engagement. Gao and Zhang (2006) highlight that this process unfolds in four stages, where the key variables are the level of commitment and the number of stakeholders involved (Figure 1):

1. Stakeholders are merely given information (passive state);

2. Stakeholders are consulted (listening state);

3. Stakeholders engage in dialogue with company (two-way process);

4. Management is driven by stakeholders (proactive state).

Figure 1 - The level of stakeholder engagement and number of direct participants

Level of engagement	Stakeholders are merely given information (passive)	Stakeholders are consulted (listening)	Stakeholders engage in dialogue with company (two-way process)	Management is driven by stakeholder (proactive)
Stakeholder engagement approach	Inform stakeholders via public media Publish reports Policy and product documents	Listen to stakeholders through formal meetings or suggestion boxes Hear stakeholders' views through questionnaires and interviews Have a complaint process	Hold focus group discussions Provide feedback to stakeholders Use stakeholder-driven performance measures and reports	Set up a stakeholder council Allow stakeholder representatives in management Ask for stakeholder verification of social report
Number of stakeholder participants	Mass stakeholders and wide society	Selected stakeholders	Limited number of key stakeholders	Very limited number of key stakeholder (e.g. stakeholder representatives)

Source: Gao and Zhang, 2006, p. 727.

In the transition from the "two-way process", where stakeholders engage in dialogue with the company-though limited to a select group of critical voices-to the "proactive state", where the number of stakeholders is highly restricted to key representatives who guide management, Artificial Intelligence can play a crucial role as a mediator in this transition process.

Purpose of the paper. *In this regard, the present study aims to explore the relationship between stakeholder engagement and social sustainability practices in innovative SMEs, focusing on the mediating role of artificial intelligence. Specifically, AI-based technologies, such as chatbots, predictive analytics, big data, and sentiment analysis, allow management to align with stakeholder expectations proactively. These tools enable the anticipation of needs, real-time feedback collection, and predicting future trends or emerging issues (Joshi, 2024). Consequently, innovative technologies facilitate more timely and effective engagement, allowing companies to fully align with stakeholders and build trust-based relationships grounded in proactivity rather than mere reactivity.*

Furthermore, artificial intelligence has the potential to personalize communication according to the specific needs and preferences of stakeholders (Bosse et al., 2023). In this perspective, organizations' digital capabilities in proactively and continuously engaging all internal and external stakeholders are essential for adequately implementing social sustainability practices (Buonincontri et al., 2024). Some studies have focused on the relationship between stakeholder management and artificial intelligence tools (Otero-Mateo et al., 2022). Prebanić & Vukomanović (2021), on the other hand, have explored the digitalization of the engagement process and its impact on manufacturing sector performance, highlighting how digital tools facilitate the adoption of creative and innovative approaches. Another stream of literature has analyzed the potential of artificial intelligence in generating financial value from a multi-stakeholder perspective (Güngör, 2020). In line with this research, Heller et al. (2021) have investigated the role of artificial intelligence in promoting external stakeholder engagement. Despite the growing attention towards stakeholder engagement, especially following the introduction of the Corporate Sustainability Reporting Directive (CSRD) (Petruzzelli & Badia, 2024), studies exploring the influence of artificial intelligence tools in the relationship between stakeholder engagement and social sustainability practices are still minimal (Kopallé et al., 2023), particularly in Italian SMEs and innovative firms

(Belas et al., 2021). To address this gap in the existing literature, based on Ajzen's extended Theory of Planned Behavior (TPB) (2019), this research aims to test the following hypotheses:

H1: Higher levels of stakeholder engagement lead to stronger intentions to adopt social sustainability practices.

According to the extended TPB, once intentions are formed under adequate perceived and actual behavioral control conditions, they should translate into concrete actions. Therefore, firms with strong intentions are more likely to implement measurable sustainability initiatives.

H2: Stronger intentions to adopt social sustainability practices result in the actual implementation of such practices.

We propose that the adoption of AI (e.g., predictive analytics, real-time monitoring) amplifies the link between intentions and behavior by enabling more efficient resource allocation, decision-making processes, and stakeholder engagement.

H3: Adopting artificial intelligence positively moderates the relationship between the intention to adopt social sustainability practices and their actual implementation, strengthening the translation of intentions into behavior.

Methodology. *This study adopts a cross-sectional survey design to investigate how stakeholder engagement influences the implementation of social sustainability practices in innovative Italian SMEs, focusing on the moderating role of Artificial Intelligence (AI). Data will be collected through an online questionnaire administered to the CEOs or sustainability managers of the entire population of 2273 active Italian innovative SMEs identified by the official Chamber of Commerce database. These respondents are well-positioned to provide comprehensive insights into stakeholder practices and sustainability initiatives.*

Stakeholder engagement will be assessed using established instruments such as the Stakeholder Engagement Maturity Model (Viglia et al., 2018; Hollebeek et al., 2022), which capture engagement breadth (e.g., the range of stakeholder groups consulted) and depth (e.g., the extent to which stakeholders are involved in decision-making). Respondents will rate their agreement with items covering proactive communication, systematic incorporation of feedback, and the maturity of their engagement processes (Freeman, 1984; Donaldson & Preston, 1995).

The adoption of AI will be measured through a scale adapted from Ajzen's extended Theory of Planned Behavior (TPB) (Ajzen, 1991; Kumar et al., 2019) to include both perceived and actual behavioral control. Items will gauge organizational attitudes, subjective norms, perceived resources and competences, and the actual availability of technical and human capabilities necessary for implementing AI-based tools-such as chatbots, predictive analytics, big data systems, and sentiment analysis-to enhance stakeholder engagement (Huang & Rust, 2021; Wetzels, 2021).

Social sustainability practices, the dependent variable, will be operationalized as a composite index capturing initiatives and outcomes related to social welfare, equitable labor practices, community engagement, and ethical supply chain management. This index is aligned with current frameworks for social sustainability practices and aims to reflect proactive and reactive engagement with diverse stakeholder groups.

The targeted population comprises innovative SMEs in Italy, identified through relevant national databases and industry registers. A pretested online questionnaire will be administered to ensure precise and reliable measures. To address firm-level heterogeneity, control variables such as firm size, financial performance, and age will be obtained from the Orbis Bureau van Dijk database, given that more prominent or more established enterprises may have more significant resources and more systematic stakeholder-engagement routines (Freeman, 1984; Donaldson & Preston, 1995).

Structural Equation Modeling (SEM) will test the hypothesized relationships. Specifically, we posit that higher levels of stakeholder engagement strengthen intentions to adopt social sustainability practices, which are more likely to be realized when supported by robust organizational control (i.e., adequate resources and capabilities). Additionally, AI adoption is hypothesized to moderate the relationship between these intentions and actual sustainability behaviors, given its capacity to facilitate real-time monitoring, data-driven feedback, and the personalization of stakeholder interactions (Huang & Rust, 2021; Wetzels, 2021). A bootstrap resampling procedure (Preacher & Hayes, 2008) will be conducted to assess the significance of indirect and interaction effects, thereby providing robust estimates of mediation and moderation.

To mitigate common method bias, respondent anonymity will be assured, and the questionnaire will be structured so that items measuring the predictor, mediator, and outcome constructs are grouped separately (Podsakoff et al., 2003). Respondents will be informed about the voluntary nature of participation and the confidentiality of their responses. The study protocol will adhere to institutional ethical guidelines, ensuring data are used strictly for research.

This methodology leverages a theoretically grounded framework (Ajzen, 1991) and rigorously validated measurement scales to offer empirical insights into how stakeholder engagement and AI adoption interact to drive social sustainability outcomes in the context of innovative SMEs. By integrating advanced quantitative methods, secondary data controls, and procedural safeguards against bias, the study seeks to provide robust evidence on the antecedents and enablers of socially sustainable practices.

Expected Results. *Anchored in Ajzen's extended Theory of Planned Behavior (Ajzen, 1991) and the longstanding scholarship on stakeholder engagement (Freeman, 1984; Donaldson & Preston, 1995; Gao & Zhang, 2006), we anticipate several interrelated outcomes. First, innovative Italian SMEs with higher levels of stakeholder engagement-evidenced by systematic stakeholder mapping, active solicitation of feedback, and inclusive decision-making processes-are expected to form stronger intentions to adopt socially sustainable practices (She et al., 2023; Esposito et al., 2025).*

By cultivating positive attitudes, robust subjective norms, and elevated perceived and actual behavioral control, such engagement strategies should lay the groundwork for embedding sustainability into the organizational ethos.

Second, these intensified intentions, in turn, are anticipated to translate into concrete social sustainability behaviors. Drawing on Ajzen's extended TPB, once an enterprise has committed-cognitively and normatively-to pursuing sustainable objectives and possesses the requisite resources and capabilities, it is more likely to enact tangible sustainability initiatives (Winkler et al., 2019; Belas et al., 2021). Empirically, we expect to observe measurable improvements in social sustainability practices indicators, including enhanced labor conditions, deeper community engagement, and ethical supply chain monitoring (Esposito et al., 2025).

Third, adopting Artificial Intelligence tools (e.g., predictive analytics, chatbots, sentiment analysis, real-time monitoring) is hypothesized to function as a significant moderator that fortifies the link between intentions and actual sustainable actions. We posit that SMEs that incorporate AI into their stakeholder management processes will benefit from timely insights into stakeholder expectations, faster detection of emerging social or ethical concerns, and more agile resource allocation (Bosse et al., 2023; Joshi, 2024). As a result, they should be better equipped to convert strong intentions into concrete, socially sustainable outcomes, surpassing the achievements of firms that rely solely on conventional engagement methods (Huang & Rust, 2021; Wetzels, 2021).

Finally, firm-specific attributes-such as size, age, financial health, and sector-are expected to nuance these relationships (Freeman, 1984; Donaldson & Preston, 1995). Larger or more established SMEs may possess superior managerial expertise and technical infrastructure to implement AI-driven stakeholder engagement, accentuating the relationship between higher stakeholder engagement and social sustainability practices (Belas et al., 2021). Conversely, younger SMEs with fewer resources might face constraints in capitalizing on AI's potential, yet could exhibit higher strategic flexibility, potentially spurring innovative applications of AI that yield notable sustainability gains.

Overall, the expected results highlight the pivotal role of stakeholder engagement in shaping sustainable intentions and behaviors and the synergistic effect of AI as a catalyst for realizing such intentions. This multifaceted relationship underscores the broader argument that social sustainability in SMEs is best achieved when human-centric engagement processes are paired with cutting-edge digital capabilities, ultimately fostering a more proactive, inclusive, and ethically grounded approach to business.

Research limitations. *While addressing a topic of increasing relevance, this research encounters several limitations warrant consideration. Firstly, the heterogeneity of innovative Italian SMEs may challenge the generalizability of the findings. Although focusing on innovative SMEs is pertinent, the diversity in sectors, sizes, and business models may necessitate a more detailed sample segmentation.*

Secondly, the territorial context, though mentioned, could benefit from greater attention. The specificities of industrial districts and technology clusters may influence corporate dynamics and AI adoption. An analysis of these influences could enrich the understanding of the phenomenon.

Finally, while a central element of the research, AI adoption may require a more thorough exploration of the different types of AI utilized and the modes of integration into business processes. Analyzing SMEs' digital competencies and change management capabilities could provide further insights.

In summary, the research presents certain limitations that, while not compromising its validity, suggest potential directions for future development. A more detailed approach to sample segmentation, the definition of innovativeness, data access, the territorial context, and AI adoption could strengthen the robustness and generalizability of the results.

Managerial implications. *The managerial implications of this research unfold across several fronts, offering concrete insights for enhancing corporate sustainability. Firstly, the need to invest in mature and structured stakeholder engagement practices emerges strongly. This means moving beyond simple communication, implementing mechanisms for active listening and integrating feedback into decision-making processes. Companies should map and prioritize their stakeholders, focusing resources on the most strategic relationships and integrating engagement into the corporate strategy.*

In parallel, the strategic adoption of AI proves crucial. Investing in AI technologies for engagement, such as chatbots and predictive analytics, allows for the personalization of interactions and anticipating stakeholder needs. However, this requires developing adequate digital skills and an ethical and transparent use of AI. Artificial Intelligence can also support the monitoring of ESG performance, improving transparency and corporate accountability.

Sustainability, therefore, must be organically integrated into decision-making processes, using the data collected through engagement and AI to inform strategic choices. Transparent and responsible communication with stakeholders becomes fundamental to build trust and credibility.

Finally, even with limited resources, innovative SMEs can benefit from AI to enhance their competitiveness. Adapting engagement strategies to available resources, leveraging AI for innovation, and collaborating with other local actors become key success factors.

In summary, this research highlights how an integrated approach, combining effective stakeholder engagement with the strategic adoption of AI, can generate sustainable value for companies, especially in the dynamic and innovative context of Italian SMEs.

Originality of the paper *The originality of this academic research is manifested in a combination of distinctive elements that situate it within a partially unexplored area of investigation, thereby offering a significant contribution to the existing literature. Unlike many studies focusing on large corporations or generic contexts, this research concentrates on innovative Italian SMEs, a crucial segment of the Italian economy (Camagni & Capello, 1998; Kedi et al., 2024;*

Iyelolu et al., 2024). These enterprises, renowned for their capacity for adaptation and innovation, represent a fertile ground for studying the intersection between technology, sustainability, and stakeholder engagement (Freeman, 1984; Ferasso and Sztando, 2022; European Commission, 2023).

The selection of this context allows for examining how AI can enhance social sustainability performance within an environment characterized by dynamism and limited resources, providing valuable insights for business practice. The analysis of AI's impact on social sustainability performance in innovative Italian SMEs offers a novel perspective, as these firms are often at the forefront of technology adoption and the implementation of sustainable practices (World Economic Forum, 2020; Belas et al., 2021; Muto et al., 2024).

The novelty of this research lies in its application of Ajzen's TPB (1991) to investigate how AI moderates the relationship between the intention and implementation of social sustainability practices, moving beyond mere correlational analysis to explore the underlying mechanisms of influence.

While previous studies have explored the impact of AI on stakeholder engagement (Mitchell et al., 1997; Heller et al., 2021; Otero-Mateo et al., 2022; Katsikeas et al., 2023), this research distinguishes itself through a detailed analysis of how AI can facilitate the transition towards proactive stakeholder engagement, employing technologies such as chatbots, predictive analytics, and sentiment analysis. Applying Gao and Zhang's (2006) framework to analyze stakeholder engagement levels and investigate how AI can facilitate the transition to proactive engagement adds an applied dimension to existing theory. This allows for the analysis of progression from passive information sharing to stakeholder-driven management, and how AI can aid in that process.

Despite the increasing emphasis on sustainability and stakeholder engagement, particularly following the introduction of the CSRD (European Commission, 2021; GRI, 2023; Glaveli et al., 2023; Staudt et al., 2023), studies exploring the impact of AI on social sustainability performance in innovative Italian SMEs remain limited (Kopallé et al., 2023). This research addresses this gap, providing valuable insights for companies needing to comply with new regulations and tackle sustainability challenges.

In summary, the originality of this research resides in its capacity to combine a specific and relevant context, an advanced theoretical approach, a detailed analysis of AI's role, and a strong connection with current regulatory trends, thereby offering a significant contribution to the understanding of the intersection between technology, sustainability, and stakeholder engagement in innovative Italian SMEs.

Using Artificial Intelligence for Improving Sustainability in Smart City

ANGELO RIVA[1]

Abstract

This review study examines the important role of Artificial Intelligence (AI) in fostering green city sustainability. As urban centers grapple with escalating environmental challenges, AI-driven solutions offer promising avenues for optimizing resource management, reducing emissions, and enhancing overall urban resilience. This paper synthesizes current research, exploring the diverse applications of AI across key urban sectors, including energy, transportation, waste management, and urban planning. Furthermore, it identifies critical research gaps and ethical considerations, paving the way for future investigations and responsible implementation of AI in urban sustainability initiatives

Framing of the research. *The process of using artificial intelligence for smart city strategy involves several key stages:*

I. *Shared Vision and Mission: Establishing a shared understanding of the city's goals among political leaders and public officials is crucial for successful implementation. A clear strategic definition is fundamental for developing a balanced scorecard*
II. *Inform and Involve: Ensure that city staff are aware of the strategic goals and receive incentives aligned with their achievement*
III. *Planning and Goal Setting: Set ambitious goals and align annual budgets with medium- and long-term plans.*
IV. *Strategic Feedback and Learning: Employ a team-based approach to problem-solving, recognizing that the strategic process is dynamic and requires continuous adaptation.*

Purpose of the paper. *By analyzing the potential benefits and limitations of AI technologies, this study provides a comprehensive overview of how AI can contribute to the development of sustainable and livable cities (see fig. 1).*

Fig. 1: AI and Sustainability

Source our elaboration

A systematic review is a type of literature review that collects and critically analyzes multiple research studies or papers. Systematic reviews are conducted to identify, appraise, and synthesize all high-quality research evidence relevant to a specific question. The importance of systematic reviews lies in their ability to provide a comprehensive and unbiased summary of the available evidence. Overall, systematic reviews are an essential tool for ensuring decisions are based on the best available evidence.
VOSviewer permits to visualization and understanding of complex relationships within research data.
I)Create relationship maps:
II) Uncover hidden connections between words
III) Spot influential publications and authors:
VOSviewer shows you which publications and authors are most cited, highlighting their influence in the field.

Results. *The results describe some distinguishing features After selecting the more relevant paper, we analyze the cluster of the main contributions to underline the main problems and new line of research.*
The network analysis is organized by Vos viewer (see fig.2 and 3).

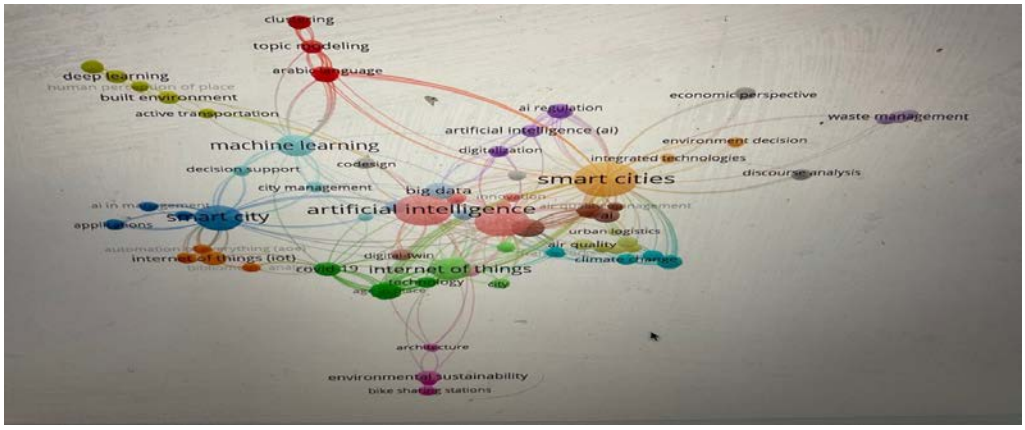

Fig. 2: Vos viewer analysis

Source our elaboration

I) Cluster 1 - AI and environmental sustainability and city by improving environmental monitoring and protection.
II) Cluster 2 - AI and other methodologies for smart city and environmental sustainability. Focus on machine learning deep learning;
III) Cluster 3 - AI and other methodology: focus on the manager of the database and big data - AI and other methodology for smart city big data, cloud);
IV) Cluster 4 AI and other methodology: focus on internet things.

Fig. 3: Network Analysis

Source our elaboration

I) Cluster 5 AI and smart city and mobility and transport and autonomous vehicles;
II) Cluster 6 AI smart city and waste management and economic prospectives.
III) Cluster 7 AI smart city and transparency and explainable city design.

There is the identification of several clusters (see tab. 2)

Tab. 2: Clusters

	CLUSTERS	GROUPS OF PUBBLICATIONS	MAIN RESEARCH AREA
1	**CLUSTER 1 AI** and ENVIRONMENTAL SUSTAINABILITY AND CITY BY IMPROVING ENVIRONMENTAL MONITORING AND PROTECTION	(Abdulkadir et al., 2024; M. Ahmad et al., 2022; Al-Habaibeh et al., 2024; Ingwersen & Serrano-López, 2018; Khlie & Benmamoun, 2024; Marston et al., 2020; Ortega-Fernández et al., 2020; Shruti et al., 2022; Strielkowski et al., 2022; Xu, 2024)	**Pollution and environmental condition control Air and Green Quality Monitoring**
2	**CLUSTER 2 -** AI and other methodology FOR SMART CITY AND ENVIRONMENTAL SUSTAINABILITY. FOCUS ON MACHINE LEARNING DEEP LEARNIG,	(Barletta et al., 2024; Gohari et al., 2022; Kruse et al., 2021; Louati et al., 2024; Park et al., 2019; Rezk et al., 2024; Skubis et al., 2024; Verdejo et al., 2022)	**Predictive ModelingOptimized Resource Allocation**
3	CLUSTER 3 AI AND OTHER METHODOLOGY: FOCUS ON MANAGER OF DATABASE AND BIG DATA - AI AND OTHER METHODOLOGY FOR SMART CITY BIG DATA, CLOUD)	(Alahmari et al., 2022; Escobedo et al., 2024; Qadir & Fatah, 2023; Rani et al., 2021; Silva et al., 204)	**Improved Accuracy and EfficiencyData Availability and Qualit**
4	**CLUSTER 4** AI AND OTHER METHODOLOGY: FOCUS ON INTERNETS THINGS	(Addas et al., 2024; Chahid et al., 2022; Gohari et al., 2022; Gouiza et al., 2024; Kuru, 2021; Lăzăroiu & Harrison, 2021; Simionescu & Strielkowski, 2024)	**Green Infrastructure PlanningReal-time Data Collection and Analysis**
5	**CLUSTER 5** AI AND SMART CITY AND MOBILITY AND TRANSPORT AND AUTONOMOUS VEHICLES.	(Jaramillo-Alcazar et al., 2023; Li et al., 2023; Mohsen, 2024; Neo et al., 2023; Qureshi et al., 2021; Reisi et al., 2020; Shulajkovska et al., 2024)	**Mobility and transport informationTransport optimization.**
6	**CLUSTER 6** AI SMART CITY AND WASTE MANAGEMENT AND ECONOMIC PROSPECTIVES.	(Akkad et al., 2022; Belsare et al., 2024; Zota et al., 2024)	**Waste Management: mage recognition and robotic sorting and AI**
7	**CLUSTER 7** AI SMART CITY AND TRANSPARENCY AND EXPLAINABLE A CITY DESIGN	(Arora et al., 2023; Camaréna, 2021; Elshapasy & Mohamed, 2024; Kuru, 2021; Singh et al., 2020; Verdejo et al., 2022; Yigitcanlar et al., 2021; Zaman & Hertweck, 2022)	**Community Involvement Ethical Considerations**

Source our elaboration

The results analyze the critical role of smart city strategies in driving sustainable urban growth. A city's strategy serves as a unifying framework, guiding decision-making and ensuring consistency Effective urban planning must prioritize the needs of all stakeholders while ensuring environmental sustainability.

Research limitations. *The research is based on a systematic review that selects a limited number of papers and cannot be completed.*

Managerial implications. To give a new practical systemic review on A.I and environmental sustainability (see tab. 3)

The results show the importance of the integration of the process: 1) Sensing; 2) Perceiving; 3). Learning,4). Visualizing, 5) Acting (see tab. 3)

Tab. 3: The Loop of 1) Sensing; 2) Perceiving; 3). Learning,4). Visualizing, 5) Acting

AREA	FOCUS
1.SENSING (computer vision):	Pollution detection: Identifying illegal dumping or industrial emissions from visual data. Disaster response: Assessing damage
2. PERCEIVING (pattern recognition)	Classification and Pattern Recognition: ML algorithms can recognize patterns in data, Analyzing satellite imagery to identify deforestation, urbanization, and other land-use changes. Automatically identifying species from images or sound recordings for biodiversity monitoring. Recognizing different types of waste for efficient recycling.
3. LEARNING (machine learning)	Predictive Modeling: Climate modeling: Pollution forecasting:
4.VISUALIZING (Deep Learning)	Image and Signal Processing: DL is particularly powerful for analyzing complex image and signal data, Extracting information from satellite and aerial imagery for environmental monitoring. Acoustic monitoring: Analyzing sound recordings to detect illegal logging, poaching, or changes in animal behavior.
5 ACTING (Robot and actions)	Robot control Control autonomous vehicles: Designing self-driving cars that minimize emissions and traffic congestion. Develop sustainable urban planning strategies: Finding optimal strategy

Source our elaboration

Originality of the paper. *The original contribution of this paper and the production of new knowledge in the field is to give a new practical framework for the strategic vision, and implementation for planning a smart city using AI-. The original contributions of this research (highlights) regarding the production of new knowledge in the field:*

I) the original description and analysis of the role of A. I (artificial intelligence) in improving green sustainability. II) a new practical framework for new areas of research in the field.

A limitation of this research is based on the method of the review study. Further research can analyze the impact of the strategy of digitalization on green sustainability.

In conclusion, the future is focused on a strong implementation of A. I for an integrated approach for improving the strategy of smart city.

Keywords: *environmental sustainability, smart city, stakeholders' management, planning, strategic vision, sustainability*

The Circular Revolution Is Served: AI Strategies for Sustainable Competitive Advantage[1]

MAURO SCIARELLI[2] ANNA PRISCO[3] MARTINA PERCUOCO[4] VINCENZO DELL'ANNO[5]

Abstract

This research analyzes how artificial intelligence (AI) can support the adoption of circular economy practices in the household appliance sector, using Porter's value chain framework. Specifically, the study, conducted through a multiple case study on three large companies, aims to understand (1) the extent to which AI influences the achievement of circular goals, and (2) which activities within the value chain are most impacted by the use of smart technologies. Data analysis, divided into two phases (secondary data collection and semi-structured interviews), will provide a comprehensive overview of AI applications along the value chain. In line with the literature, it is expected that AI can enhance logistics, production, and distribution. It can support eco-design, optimize the use of materials and packaging, aid in recycling processes, predictive maintenance, and reverse logistics, improving sustainability, efficiency, and corporate responsibility, while also contributing to the transformation of business models towards more collaborative approaches.

Key words: *circular economy; sustainable production; artificial intelligence; value chain; competitive advantage; multiple case study*

Framing of the research. *Environmental damage represents one of the major global concerns, as natural resources are irresponsibly exploited, seriously threatening the ecosystem (Yucedag et al., 2018). Global warming, environmental protection, and climate change require innovative solutions based on advanced technological skills (Al-Ghussain, 2019). In this context, the circular economy emerges as a fundamental paradigm to mitigate environmental impacts, offering a regenerative model aimed at minimising resource waste and optimising their reuse within interconnected production systems (Geissdoerfer et al., 2017). This approach represents a shift from the traditional linear production model, based on the sequence of "extract, produce, and dispose," promoting instead a more efficient and sustainable use of resources (Ness, 2008; Ghisellini et al., 2016; Sauvé et al., 2016). A key factor for the implementation of circular economy practices is digitalization (Cagno et al., 2021), which plays a fundamental role in the reconfiguration of sustainable business models (Ellen MacArthur Foundation, 2019), increasing operational efficiency, and opening new perspectives for creating sustainable value in line with Sustainable Development Goals (SDGs),*

In particular, among the technologies of Industry 4.0, Artificial Intelligence (AI) plays a crucial role in resource management, promoting sustainable practices throughout the entire supply chain (Gupta et al., 2019). AI enables the optimization of resource usage, reduces waste, and encourages sustainable behaviors (Duan et al., 2019; Tutore et al., 2024), in addition to facilitating the creation of digital platforms that encourage collaboration among companies engaged in sustainable practices (Tutore et al., 2024). Thus, the contribution of AI to the circular economy is particularly evident in improving recycling operations and waste management. For example, advanced algorithms can optimize the sorting and separation processes of materials, increasing the efficiency of recycling facilities (Tutore et al., 2024). Furthermore, AI can encourage consumer engagement in adopting more circular behaviors (Testa et al., 2020).The creation and enhancement of digital ecosystems represent another key aspect for the widespread adoption of the circular economy. In this context, AI can support the development of digital platforms that promote collaboration among companies, facilitating resource sharing and organizing supply chains based on circularity principles (Tutore et al., 2024) While recognizing the already identified benefits, it becomes essential to explore the potential challenges arising from the use of AI-based technologies. Among the main critical issues are the energy consumption of data centers, the extraction of resources required for the production of technological devices, and the ethical implications related to data management

[1] This study was funded by the European Union - NextGenerationEU, within the framework of the GRINS project – Growing, Resilient, INclusive and Sustainable (MUR Project Code: PE00000018 - CUP: E63C22002140007).

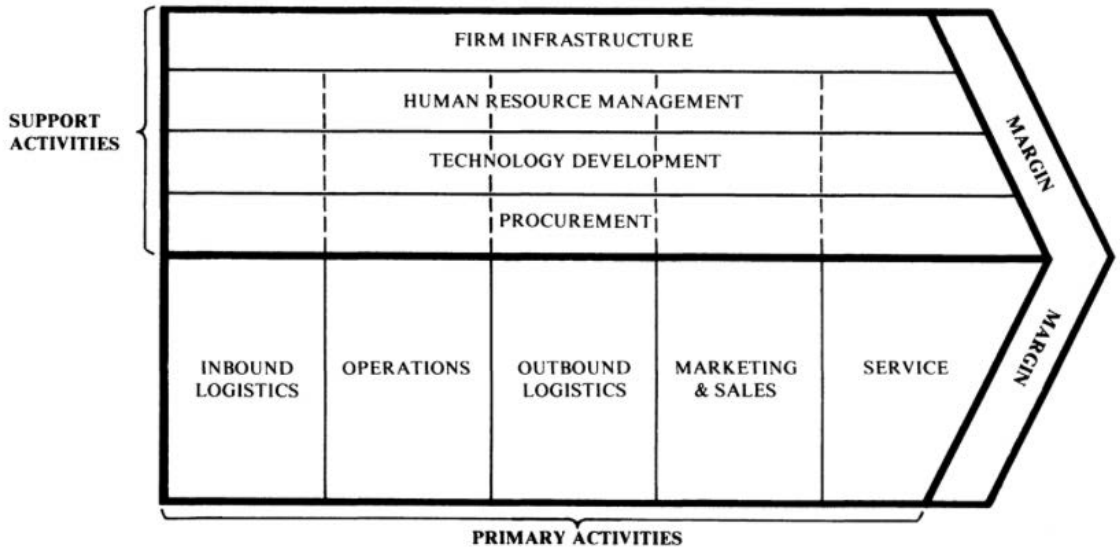
(Al-Sharafi et al., 2023). Therefore, adopting a balanced approach that considers both the opportunities and the limitations of digital technologies is crucial to ensure an effective and sustainable transition to a circular economy.

To analyze the impact of artificial intelligence on circular economy practices, the framework of Porter's value chain (Porter, 1985) was chosen.

Integrating AI within Porter's Value Chain framework provides a useful structure for analyzing its impact on circular economy practices. Porter's Value Chain framework helps businesses systematically assess how AI can enhance efficiency, reduce waste, and create value across primary and support activities. By breaking down business operations into distinct components. It becomes easier to identify opportunities where AI can optimize processes, improve resource allocation, and minimize environmental impact.

According to Porter, a company creates value for the customer through its activities, which is measured by the price the customer pays or would be willing to pay for the product (Sciarelli, 2022). The concept of the value chain helps to understand the sources from which competitive advantage can be derived for the company (Porter, 1985). Specifically, two groups of functions are identified: primary activities and support activities.

Primary activities are represented by production and sales functions, and are divided into the following areas:



- ***Inbound Logistics**: This includes the receiving, storing, and distributing raw materials or components to the production facilities. AI can optimize inventory management, predict material demand, and streamline the supply chain by integrating real-time data to reduce waste and inefficiency.*
- ***Operations**: This involves transforming raw materials into finished products. AI can play a pivotal role in automating manufacturing processes, improving production schedules, and ensuring quality control. Additionally, AI-based systems can contribute to reducing energy consumption and minimizing material waste, thus enhancing the sustainability of production practices.*
- ***Outbound Logistics**: This covers the distribution of finished products to customers. AI can optimize delivery routes, enhance warehouse management, and improve packaging processes to reduce the environmental footprint of logistics activities. Machine learning algorithms can predict demand patterns, reducing overproduction and waste in the distribution process.*
- ***Marketing and Sales**: This involves activities related to advertising, promotion, and selling products. AI technologies can help companies segment their customer base more effectively, personalize marketing campaigns, and predict customer preferences, leading to more sustainable consumer engagement. Moreover, AI can support the promotion of circular products and services, such as those with extended lifecycles or offering shared use options.*
- ***Services**: This includes post-sales activities such as customer support, maintenance, and repair services. AI can enable predictive maintenance and remote diagnostics, extending the lifespan of products and reducing the need for repairs or replacements. It also facilitates the development of services related to product reuse, remanufacturing, and recycling, further enhancing circularity.*

Support activities, on the other hand, provide the foundation for the actual realization of primary activities and are divided into the following areas:

- ***Infrastructure Activities**: These include the organizational structure, management, and planning processes. AI can optimize business processes, support decision-making through data analytics, and streamline strategic planning, aligning operations with circular economy goals.*
- ***Human Resource Management**: This involves recruiting, training, and developing employees. AI can support talent management by using predictive analytics for workforce planning, offering personalized training programs, and automating administrative tasks to free up time for more value-added activities. In the context of the circular economy, AI can help identify skill gaps related to sustainability and circular practices, fostering a more knowledgeable and efficient workforce.*
- ***Technology Development**: This refers to the design and improvement of products and processes. AI falls under this category, where its application can lead to the development of new circular products or services, such as products designed for disassembly, recycling, or remanufacturing. AI can assist in optimizing product design, material selection, and manufacturing processes to reduce environmental impact and improve the overall circularity of products.*
- ***Procurement**: This includes the sourcing of raw materials and components. AI can enable smarter procurement strategies by analyzing supplier performance, optimizing purchasing decisions, and reducing the environmental impact of supply chains. Additionally, AI can support the identification of sustainable suppliers, materials, and practices, contributing to the circular economy by promoting responsible sourcing.*

In summary, the integration of AI across both primary and support activities in Porter's value chain can contribute to enhanced sustainability by improving efficiency, reducing waste, extending product lifecycles, and fostering the circular economy. Below is the framework of the Value Chain:

Fig. 1: Value Chain

Source: Porter, 1985

Purpose of the paper. *The goal of this study is to systematically analyze the relationship between artificial intelligence (AI) and the circular economy, focusing particularly on the different primary activities of Porter's value chain (such as logistics, operations, marketing and sales, as well as post-sale service). Through an in-depth analysis of how AI can promote more sustainable production and consumption models, the research aims to identify the business areas where AI can most contribute to reducing waste, extending product life cycles, and promoting the recovery and reuse of resources, in line with circularity principles. Furthermore, it seeks to assess how technologies such as machine learning, predictive analytics, and intelligent automation can be integrated into various stages of the value chain, with the intention of providing a clear and comprehensive vision of how artificial intelligence can be used not only to create economic value but also to achieve environmental and social sustainability goals. In light of this, the study aims to answer the following research questions:*

RQ1: To what extent does artificial intelligence influence the implementation of circular economy practices within the company?
RQ2: In which activities of Porter's value chain is the impact of AI most significant?

Methodology.*The methodology adopted in this research is based on a multiple case study analysis. While presenting some limitations mainly related to issues of reliability and validity (Ginsberg and Abrahamson, 1991; Yin, 2003), this approach offers the opportunity to explore the phenomenon under study in depth, highlighting more subtle aspects. This ability to provide a detailed understanding makes case study analysis particularly suitable for the objectives of this investigation (Eisenhardt, 1989). To increase the robustness compared to a single case study, the analysis involves three companies (Yin, 1994). The selection focused on large companies operating in the household appliance sector, identified for their presence of products that utilise artificial intelligence with the aim of reducing waste and promoting circularity. The selection criteria, therefore, included the type of industry, product category, company size, and ownership structure (Silverman, 2000). As emphasized by Eisenhardt (1989), case selection plays a crucial role in theory building, as a precisely defined population allows for strategic sampling, management of external factors, and the delineation of the validity boundaries of the results.*

In line with the existing literature (Yin, 2003; Gnyawali & Park, 2011), the data collection process will be carried out in two phases, consistent with the same approach. In the first phase, secondary information will be gathered through company websites, sustainability reports, and official documentation of the companies. In a later phase, the research team will conduct semi-structured interviews to gather further information. The involvement of multiple researchers will enrich the analysis, as the diversity of perspectives will enhance the quality of the data, and the convergence of observations will strengthen its credibility (Eisenhardt, 1989).

Expected Results. *The integration of AI into Porter's Value Chain provides a structured approach to evaluating its impact on circular economy practices. By breaking down business activities into primary and support functions, this framework helps identify where AI-driven innovations can optimize processes, reduce waste, and create sustainable value. AI enables businesses to enhance operational efficiency through predictive analytics, automation, and data-driven decision-making, fostering a more circular and resource-efficient economy. From supply chain optimization to eco-friendly product design, AI can be a transformative tool for reducing environmental impact while maintaining economic*

competitiveness. The following tables outline the expected AI-driven outputs across primary and support activities in the value chain.

Primary Activity	***Expected Output with AI***
Inbound Logistics	*- Optimization of procurement with predictive algorithms.* *- - Waste reduction through advanced stock management.*
Operations	*- Reduction of production waste through real-time analysis.* *- - Predictive maintenance to extend machinery lifespan.* *- - Optimization of resource usage (energy, water, raw materials).*
Outbound Logistics	*- AI-optimized transport routes to reduce CO_2 emissions.* *- - Minimization of excess inventory through demand forecasting.*
Marketing & Sales	*- Personalization of offerings based on consumer behavior analysis.* *- - Promotion of recycled or circular products using AI insights.*
Service	*- Product lifecycle extension through predictive maintenance.* *- - Automated customer support for repairs and reuse.*
Support Activities	***Expected Output with AI***
Firm Infrastructure	*- AI-powered decision-making for sustainability strategies.* *- - Risk assessment for circular supply chains.*
Human Resource Management	*- AI-driven workforce training for sustainable practices.* *- - Talent acquisition focused on circular economy expertise.*
Technology Development	*- AI-assisted eco-friendly product design.* *- - Digital twins for process optimization and lifecycle analysis.*
Procurement	*- AI-driven supplier selection based on sustainability criteria.* *- - Smart contracts for ethical sourcing.*

Based on the evidence from the literature, it is expected that artificial intelligence can significantly contribute to waste reduction, recycling, and the reuse of materials, as well as to the design of more sustainable life cycles, with tangible impacts on costs, consumption models, and environmental impact (RQ1) (Sarc et al., 2019; Agrawal et al., 2022; Nowakowski et al., 2020; Nañez Alonso et al., 2021). One of the main expected outcomes is to demonstrate the crucial role played by AI, not only in enhancing existing processes but also in fostering broader changes, such as the evolution of business models and the development of collaborative ecosystems (Pinheiro et al., 2022; Ramakrishna et al., 2020).Regarding the specific area of primary activities in Porter's value chain (RQ2), the aim is to highlight particularly the potential of AI in the areas of Operations and Outbound Logistics, where the automated classification and treatment of waste can ensure greater process efficiency and a tangible reduction in waste (Agrawal et al., 2022; Sarc et al., 2019). Similarly, it is plausible that Marketing and Sales can also benefit from the application of AI algorithms, especially for promoting products with extended life cycles and sharing and reuse services (Mboli et al., 2023). Furthermore, the important role of Service in extending the useful life of products is evident, thanks to opportunities for predictive maintenance and constant resource monitoring (Bianchini et al., 2019; Colla et al., 2020). Overall, a positive correlation is expected to be identified between the use of AI and the ability to create a significant impact across the entire value chain, highlighting how, as the company's circular ambition level increases, both competitive advantages and environmental benefits become progressively more relevant (Velis, 2018).

Research limitations. *This research presents several points of attention that should be noted. Firstly, the analysis is limited to artificial intelligence, excluding other emerging technologies such as the Internet of Things, Big Data Analytics, or Augmented Reality. Consequently, future studies could broaden the scope by integrating these tools as well, to more thoroughly assess the factors that promote their adoption and their impact on the circular economy. Secondly, the study focuses on the positive outcomes of technological use, overlooking the potential negative effects that could emerge. Lastly, the generalizability of the results is limited by the small number of cases analyzed in the multiple case study.*

Managerial implications. *The research will provide practical recommendations and strategic insights for businesses and policymakers, with the aim of facilitating a conscious and targeted adoption of artificial intelligence (AI) to support the transition towards a circular, sustainable, and competitive economic model in the long term. In this context, the work will offer a clear and comprehensive vision of how AI can not only generate economic value but also contribute to achieving environmental sustainability goals. These elements can, in fact, stimulate the development of new business strategies and circular innovation practices, creating tangible opportunities for the responsible and profitable evolution of organizations.*

Originality of the paper. *This study enriches the existing body of knowledge by examining the intersection of artificial intelligence (AI) and circular economy (CE) through the conceptual framework of Porter's value chain. While the literature has already explored the role of digitalization in promoting circular business models, this work distinguishes itself by analyzing the specific impact of AI on primary activities within the value chain, highlighting its contribution to business transformations oriented towards sustainability.The originality of the contribution lies in its empirical investigation of AI applications in large manufacturing companies, with a particular focus on the household appliance sector. This approach allows for a deeper understanding of the mechanisms through which AI supports circular economy practices, providing a solid foundation for comprehending its strategic implications. Furthermore, the research*

contributes to the debate on sustainable digital transformation, highlighting the interconnection between AI, business strategy, and circular economy goals. This perspective allows for a more precise identification of the high-impact applications across different business functions-from logistics and operations to marketing and post-sales services-enriching the strategic discourse on integrating AI into circular economy models. Ultimately, the work makes a significant contribution to advancing knowledge on how AI can be effectively employed to enhance circular economy initiatives within the business context.

“Donor preferences between search engines and Large Language Models (LLMs): Transforming donor decision-process in non-profit fundraising”

ALESSANDRO SIGNORINI[1] ALESSANDRO FERI[2]

Abstract

This research explores the choice between traditional search engines and Large Language Models (LLMs) when donors gather information about non-profit organizations. Donors traditionally rely on search engines to find organizations that match their values and personalities, assessing factors such as mission objectives, project impact, and transparency. LLMs are set to complement or even substitute search engines as they provide user-friendly, concise, and conversational responses that simplify information retrieval. Concerns however emerge regarding the factual accuracy and reliability of the information provided by LLMs.

The study employs a sequential exploratory mixed-methods approach, starting with 30 qualitative interviews with first-time and repetitive donors in Italy, followed by a quantitative questionnaire conducted with 300 respondents.

Preliminary findings show that donors tend to mirror their general propensity to LLMs to the non-profit context. Frequent LLM users are likely to extend the inquiries to non-profit. LLMs are primarily employed for initial assessments of non-profits with the creation of lists of potential recipients based on causes of interest. More detailed information, such as project evaluations and organizational accountability, is still predominantly acquired through traditional search engines and non-profit websites. Existing donors use LLMs to monitor project progress and explore new opportunities for further engagement. LLMs complement search engines when seeking new non-profits to donate to, and can substitute them when researching organizations to which donors have already contributed. Overall, donors generally perceive information from LLMs as reliable and accessible, with a similar level of trust than search engines.

This study highlights the strategic importance for non-profits to integrate LLMs into their fundraising strategies. Non-profit organizations should actively monitor the responses to potential donors and optimize their digital content to mitigate the risks of misinformation, as LLMs may use different learning reference sources compared to search engines. Non-profit organizations should also assess the development of tailored, domain-specific LLMs to interact with individual donors.

Framing of the research. *Donors to non-profit organizations employ complex search processes to choose the non-profit organizations to donate to and consider many factors during the processes involving a prolonged search of information (Gregory, Ngo and Miller, 2019). The processes vary according to the donor”s socio-demographic and personality characteristics, their preferences, and external motivations (Bavčević, Najev Čačija and Pepur, 2022). Traditionally, the main sources of information have been digital sources, primarily, search engines (Athey et al., 2024) as well as social networks (Klafke et al., 2021; Oliveira et al., 2021), and word of mouth from existing donors, volunteers, and employers of non-profit organizations (Athey et al., 2023).*

Search engines are employed by donors to discover non-profit organizations that resonate with their own core values and match their aspirations for support specific causes (Sneddon, Evers and Lee, 2020). Donations to non-profit do not entail any exchange of benefits, hence, the evaluation exclusively concern the projects, social campaigns, and activities that are carried out by the non-profit. At first, donors use search engines to discover new organizations that contribute to a general cause, such as, healthcare, environmental concerns, education. Also, donors can find out non-profit organizations that are active in their local communities and are potentially involved in local issues. Donors are often segmented following their preferences for international causes, particularly in developing countries, and local causes (Sirisena and Shneor, 2018). Once identified a list of suitable non-profit organizations, donors can look for information through search engines on the trust and transparency of the organizations. The financial sustainability, accountability, and the ratio of administrative costs over project costs can also be used to rank the organizations to donate to. However, donors tend to prioritize nonfinancial information such as programs, projects, and missions of the non-profit over financial information. Even if donors acquire and analyze financial information, they seem to be less likely to influence

their donation choices (McDowell, Li and Smith, 2013). Search engines may also be functional to existing donors to control how projects evolve and the contributions that donations did, to learn about new activities, and confirm the overall legitimacy of the non-profit management (Athey et al., 2023). Given the relevance of the search engines in the donation process, non-profit organizations have widely engaged in Search Engine Optimization (SEO) strategies and created engaging and high-quality content in the form of blogs, reports, and testimonials (Lindfors, 2018).

Until recent days, Google played an almost monopolistic role in the search engines with an almost 90% market share worldwide in November 2024 (Statcounter, 2024), with Microsoft Bing scoring 4% while Yandex and Baidu are the main search engines used in the Russian and Chinese markets (Strzelecki, 2024). However, the emergence of Large Language Models (LLMs) have the potential to rapidly substitute the search engines because, among the emerging areas of applications, LLMs are perceived as a possible game changer in the search engine market. Given its significant investments in Open AI, Microsoft attempts to gain significant market share with ChatGPT against the market leader Google, although Google has already implemented its own AI LLM model Gemini (previously Bard) (Filippo et al., 2024; Strzelecki, 2024). Indeed, at the end of October 2024, ChatGPT has launched its specific search engine application ChatGPT Search (Kimberley Kao, 2024).

Considered this market evolution, users of search engines are likely to increasingly rely upon LLMs when looking for information and advice (Tafesse and Wien, 2024). Also, users of search engines will be gradually exposed to search engines that incorporate the AI features in the search engines (Zhou et al., 2024). The user"s experience between search engines and LLMs is however different. Search engines categorize existing web pages according to an algorithm assessing the relevance and popularity of webpage. When prompted with a direct question, search engines will provide an answer list or a featured extract with a quotation from the consulted webpage. Conversely, LLMs present verbal responses in the form of complete answers. These responses originate from schemes that the LLMs learn from the training data. The LLMs re-elaborate the information following the data scheme through a statistical model (Memon and West, 2024).

The differences are also connected with the different technological stages that the two systems face, search engines are at their maturity peak while LLMs have to consolidate their functions for users. Search engines started as simple catalogs and evolved as complex platforms with many different features, such personalized suggestions, sponsored results, and voice control (Strzelecki, 2024). The evolution of LLMs as search engines is to still to be determined among users, particularly if search engines will incorporate the LLM capabilities.

In terms of user experience, search engines may be favored because of their interface, which presents an effective combination of text, images, and videos associated to a specific query. Users are directly connected with the typology of information that they need with the associated web link. Search engines feature stable and immediate responses and offer a constant access to real-time data (Strzelecki, 2024). LLMs are conversely preferred because of the convenience of their responses (Shen et al., 2024). As LLMs generate responses in paragraph form and prose, they are more accessible and closer to the current way users communicate in their everyday interactions (Shen et al., 2024). LLMs are capable of extracting and summarizing meaningful information for users and minimize the burden of browsing countless web links (Zhou et al., 2024). According to a recent study (Xu, Feng and Chen, 2023) using a randomized online experiment, LLMs users spend less time on retrieving information tasks as compared to search engine users, although no significant difference in the task performance was observed. In addition, LLM users perceive that they obtain higher quality and immediate information as compared to search engines.

The main issue with LLMs comparing with search engine is however the reliability of the retrieved information (Labrague, 2024). LLMs produced in numerous occasions plausible but inaccurate information, such as false biographical details, made-up references, falsified financial data. Erroneous information has already generated negative real-world consequences (Arcila, 2023). Indeed, LLMs are frequently affected by the so-called "hallucinations" that are defined as factual inconsistencies or factual inventions in the content generated. LLMs prompt sequences of words from probabilistic statistical models from the training data without a proper sense of the overall meaning. This process is inherently conditioned by a level of unpredictability, as LLMs can make up information to fill gaps in their knowledge in the attempt to generate a complete sentence (Zhao et al., 2023). Additionally, the probabilistic models can naturally favor certain typologies of sources over others and can arbitrarily select certain data limiting the depth and diversity of the sources and increasing the probability for erroneous information. If vast amount of data contains stereotypes, clichés, and distorted societal images, LLMs can inadvertently absorb and mirror these biases in their responses (Memon and West, 2024). This process may intensify over time because with the growing use of LLMs, LLMs will probably index the generated content from other AI, amplifying the biases and spreading false information. A recent research (Liu, Zhang and Liang, 2023) on the reliability of four popular LLMs point out that only 51.5% of generated sentences are supported by citations and 74.5% of citations support their associated sentence. Another research (Shen et al., 2023) on ChatGPT"s reliability through a set of 5,695 questions across ten databases and eight domains poses significant doubts on the ChatGPT responses as the reliability greatly varies across different domains with a worrying underperformance in scientific responses. ChatGPT is shown to be particularly sensitive to adversarial examples, meaning designed training data to cause the platform to produce false and misleading responses. This raises significant concerns on sensitive domains, such as politics, commercial offers, social campaigns. Nonetheless, in specific and well-studied applications, comparisons between LLMs and search engines have shown more favorable results for LLMs in terms of reliability and credibility of the sources. In the medical field, for example, LLMs appear to offer strong potential in patient treatment and communication. Dubin et al. (2024) prompted a variety of possible patient inquiries to ChatGPT and Google Search and found out that ChatGPT primarily employed academic (38% vs 15%) sources contrary to Google Search that counted

on commercial sources (32% vs 11%). Notably, 39% of the patient inquiries delivered divergent answers between the two platforms. Further, Russell et al. (2024) accomplished on Alcohol Use Disorder (AUD) and the accessibility of treatments online through LLMs by potential patients. ChatGPT effectively answered to AUD treatments with 92% (59/64) of responses based on scientific evidence and only 12.5% (8/64) encompassed referrals to external sources. (Sun et al., 2023)explored the capabilities of ChatGPT vs. Google Search as a diagnostic support tool for urological pathologies in a sample of 60 clinical cases. ChatGPT showed a more reliable diagnostic accuracy than Google Search, although its capability in detecting rare conditions is still delimited.

To summarize, LLMs appear to be very promising as search engines because of their user-friendly and concise responses and have a strong potential to substitute the traditional search engines or at least to be integrated in their existing platforms (Sun et al., 2023). Users show a similar if not stronger trust in LLMs than traditional search engines and, since they offer a persuading and authorative style, users perceive the statements as more credible (Xu, Feng and Chen, 2023).

Companies and organizations can take advantage of LLMs as search engines and enable their key consumers and stakeholders to access meaningful information in a rapid and comprehensible way. Nevertheless, lack of factual accuracy associated to hallucinations and missing or made-up sources (Shen et al., 2024) remains a critical challenge, which AI developers need to address (Arcila, 2023). Factual accuracy is a serious concern for companies and organizations that depend on user decisions driven by search information from LLMs (Zhao et al., 2023). Companies and organizations can jeopardize their reputation and credibility with core customers and stakeholders if LLM deliver false and misleading information. Among other solutions, numerous small domain-specific search engines are likely to emerge where training data can be more readily controlled and a pool of experts can be employed to check the responses (Memon and West, 2024).

Purpose of the paper. *This research aims to explore the potential transition of donors to non-profit organizations from using search engines to LLMs when they seek information. In this context, the other sources of information for donors are excluded, primarily, social networks and word of mouth from non-profit stakeholders. Search engines play a significant role in the donor decision making process and LLMs are expected to substitute and integrate search engines in the foreseeable future. Therefore, this study is important to understand if and how the donor decision-making process of donors will adjust to these changes in the search engine setting. It is also relevant to appreciate how donors perceive the information originating from LLMs as their interfaces are more direct and user-friendly, although, the probabilistic analysis of data in LLMs expose the responses to false and misleading information. In this investigation, first-time donors are examined who try to find a non-profit organization whose cause and mission is compatible with their values and personality characteristics. In addition, existing donors can review other non-profit organizations working on similar or different causes. Non-profit organizations engaged in local causes can be discovered as well as non-profit organizations involved in international projects. Existing donors can also evaluate their selected non-profit organizations by monitoring the progress of sponsored projects and social campaigns, financial accountability and transparency, and commitment to the mission, with the possibility to increase their contributions or become monthly givers.*

Based on the literature review and the research context, the following grand-tour questions are proposed:

1) *Will donors seeking non-profit organizations to support partially or completely replace search engines with LLMs? If so, what types of information will they prefer to search for using LLMs instead?*
2) *Will donors researching the non-profit organizations they have already supported partially or completely replace search engines to LLMs for their inquiries? If so, what types of information will they prefer to search for using LLMs instead?*
3) *How will donors perceive information from LLMs compared to search engines? Will donors regard it as more reliable and trustworthy?*

Methodology. *Given the objectives of this study, a sequential exploratory mixed methods approach is selected. This research design comprises both qualitative and quantitative methods in a specific sequence, normally, starting with the collection and analysis of qualitative data followed by quantitative data (Bowen, Rose and Pilkington, 2017). This approach is chosen when the research questions are complex and subjective motives and intentions of participants are relevant in understanding the reality, while still relating to objective facts (Gill and Johnson, 2002). In addition, this method can be useful when the study evolves in a dynamic social construct, where variables can develop in uncertain directions and the framework can change within the period of the examination (Ivankova, Creswell and Stick, 2006). This study focuses on how donors subjectively evaluate information from two alternative digital sources, while the advancements in LLM technology can unpredictably modify the nature of user interactions. The first qualitative phase of a sequential exploratory approach focuses on obtaining a deep understanding of the phenomenon under investigation. In this phase, the data will be collected through in-depth interviews, meaning individual, face-to-face interviews where the list of questions is unstructured. Unstructured interviews are appropriate for evaluating subjective issues and opinions of respondents in contexts that are not influenced by theoretical assumptions. Moreover, open-ended interviews allow analyzing beliefs and values that respondents use to process information (Gubrium and Holstein, 2002). Other sources of qualitative data will be excluded as the focus is on the donor behavior. The collected qualitative data will be analyzed using thematic analysis with the identification of recurring themes and patterns (Almeida, 2018). The key goal of the qualitative data is to generate insights into participants" perceptions and attitudes and develop a theoretical framework*

and hypotheses to direct the next quantitative phase. The quantitative phase comprises of collecting quantitative data to generalize the findings from the qualitative phase. A questionnaire will be designed based on the insights generated in the qualitative phase and will include questions that test the hypotheses set in that phase. This phase will encompass a representative sample to allow for generalizability of results (Wadongo, 2014). The quantitative data will be analyzed employing statistical methods, in detail, descriptive statistics, inferential statistics, and factor analysis. After completing the quantitative phase, the results will be integrated to indentify potential inconsistencies and outline definitive research conclusions. Interpretive integration will be used to fully understand how the qualitative insights explain and provide a framework for the quantitative results The combination of qualitative exploration and quantitative testing enables to obtain deep, detailed insights and the ability to generalize findings (Ivankova, Creswell and Stick, 2006).

The participants to the study will include first-time donors and repetitive donors to one or more non-profit organizations, and have used search engines to gather information about these organizations. These will be donors to three existing non-profit organizations that raise funds in the Italian market, though their operations can extend internationally, within or outside the European Union. To ensure a broad research scope, the three non-profit organizations represent three different causes, in detail, healthcare in developing countries, environmental sustainability, and support to agricultural production in developing countries. Participants will be over 18 years old and proficient in Italian, as the data will be collected in Italian. Donations will be classified as small, ranging from 10 euro to 250 euro (Brockner et al., 1984). Big and corporate donors will be excluded from the study.

The round of in-depth interview will be conducted with 30 participants meeting the aforementioned criteria, with the condition that only 10 of them will be first-time donors. This ensures a more tailored appreciation of the second grand-tour question while still including a significant representation of first donors. The in-depth interviews will last between 30 to 45 minutes. Once the interviews will be concluded and the data analyzed, the questionnaire will be designed to test the hypotheses generated. A sample of 300 participants is predicted with a sample of 100 first donors.

Results. *At the moment of writing, 19 in-depth interviews were conducted as part of the initial qualitative phase. This paragraph offers a summary of the preliminary findings before the completion of all 30 in-depth interviews.*

The general propensity to use LLMs is the main factor influencing their use when looking for information about non-profit organizations. If participants frequently rely on LLMs for different tasks, such as research assistance and quick answers to specific questions, whether on computers or smartphones, they are likely to inquiry about potential donation recipients, without a specific preference for non-profit.

As participants search for a non-profit organization associated to a cause (Grand Tour Question 1), they often turn to LLMs as an initial source of information to generate an initial list of potential recipients. Subsequently, they use search engines to deepen and enrich the information and focus on the non-profit website, external media coverage, independent reviews, and specific projects. Specific financial details are rarely checked at this initial stage. First-time donors are more inclined to rely on LLMs for generating the initial list, particularly if they get interested in a cause that has recently caught their attention on the news. In contrast, repetitive donors looking for a non-profit in a different cause rely less heavily on LLMs. LLMs were employed to identify non-profit organizations addressing local issues, while search engines were favoured to explore involvement in international operations. No significant differences were noticed across different types of causes. Hence, during the initial stages of the donation decision-making process, LLMs tend to complement search engines rather than substitute them and are employed for preliminary screening.

As existing donors conduct additional research on the supported organizations they support (Grand Tour Question 2), they tend to mirror their general propensity on LLMs, meaning that participants that frequently use LLMs tend to to use it more extensively for non-profit organizations. They show a particular interest in the progress of the projects that the organization is accomplishing as well as in additional projects that the organization is involved in. They also monitor events that the organization sets, in one case, the non-profit organization regularly hosts civil gatherings and local inverventions where, inviting donors to participate. Financial details are rarely reviewed, although, LLMs are consulted to check project expenses when assessing additional donations. In particular, participants were interested in the costs of a complex international project where the outcomes were difficult to evaluate. When employed, LLMs tend to completely substitute search engines and play a significant role in the decision-making process for additional donations.

Regarding the perception of information from LLMs (Grand Tour Question 3), participants show significant trust on the information provided and view it as reliable and well-grounded. Overall, their attitudes toward LMMs and search engines are similar in terms of information quality and authenticity. They only occasionally check the sources and references provided by LLMs, and when they do, they demonstrate full confidence in the list of sources. When asked about potential hallucinations in LLMs, participants appear to be mostly unaware of this issue and attribute any misleading information to the unreliability of the Internet. In any case, they seem to confide more on LLMs than social networks, in particular TikTok. To conclude, partecipants appreciate the type of responses and interface that LLMs provide and they believe that the information is easier to access and understand.

Research limitations. *The main limitation of this research is the uncertainty in predicting how the LLM technology will evolve in the foreseeable future and how users will interact with it. LLMs are at the early stages of their technological life cycle and the competitive market is still to consolidate. During in-depth interviews, almost all participants referred to LLMs as OpenAI's ChatGPT, but it is difficult to predict if new players and platforms will emerge. Also, LLMs are likely to be integrated into search engines, making the distinction and the alternative for donors proposed in this study obsolete in case of a total integration. However, it remains unclear whether traditional search engines will still be available and whether certain user segments will continue using them despite the forthcoming integration.*

The second limitation is that all participants in this study are Italian speakers and all-non-profit organizations accomplish their fundraising strategies in the Italian market. Hence, the findings cannot be extended to other national cultural contexts. Different cultural paradigms can influence how participants interact with technology and perceive information. Also, the donation process can inadvertently reflect the specific cultural norms, for example, concerning the accountability and transparency of non-profit organizations. The study also covered three causes to broaden its scope, nonetheless, other relevant causes were excluded, where donor behavior and preferences can differ completely. Some non-profit organizations can stand out for their adversary and controversial approach to companies and governments, which can influence the types of donors and their personality characteristics.

In conclusion, the limitations for the sequential exploratory mixed method apply in this research, where the integration of qualitative findings into the quantitative stage can be difficult, particularly when qualitative themes are complex to translate into quantitative variables. Obviously, the small number of participants in the in-depth interviews and questionnaire restricts the generalizability of the research outcomes.

Managerial implications. *This research demonstrates that donors employ LLMs in their donation decision-making process. As a result, non-profit organizations should include LLMs in their digital promotion fundraising strategies to engage both first and repetitive donors in close combination with search engines. Donors tend to look for non-profit organizations that operate in causes that interest them and match their personal values. Also, donors explore ongoing and new projects through LLMs, and in some cases, review project expenses.*

Consequently, non-profit organizations are advised to test LLMs with a wide range of inquiries and closely review the responses offered to potential donors. It is important that documents produced by the non-profit align with certain causes and that LLMs include the non-profit in the suggested list, otherwise, fundraising strategies can miss significant donation opportunities. Also, projects must be clearly described and consistent across all sources, since LLMs can use different learning mechanisms and reference sources that were overlooked by search engines.

Non-profit organizations must exercise caution to adversarial examples. As mentioned by Shen et al. (2023), LLMs are significantly sensitive to designed training data to cause the platform to produce false and misleading responses (Shen et al., 2023). Controversial or adversarial non-profit organizations can be significantly exposed to adversarial examples because LLM prompts can be manipulated by interested parties and can be sourced to external media and social networks as LLM credible material. To mitigate the risks, non-profit organizations need to be constantly alerted and prepare alternative material from LLMs to counteract potential negative arguments.

Given the relevance of LLMs and the associated issues, non-profit organizations should consider creating small-domain LLMs that are specifically trained by a pool of non-profit employees and stakeholders and are specifically designed to interact with individual donors. Potentially, these small-domain LLMs can be extended to facilitate interaction with corporate donors.

Originality of the paper. *This research is an original attempt to analyze the user choice between traditional search engines and LLMs within the unique context of humanitarian organizations. Specifically, it investigates the crucial role that LLMs will have in shaping the digital promotion strategies that non-profit employ to obtain individual donations. While previous studies have concentrated on the donor decision-making process through traditional digital tools such as search engines and social media, this research investigates the consequences of the adoption of LLMs when donors look for information on non-profit organizations. LLMs will gradually substitute and integrate with traditional search engines, hence, non-profit fundraisers need to understand to which extent donors will adopt these tools and how they will influence their preferences and attitudes. This research investigates first-time and repetitive donors, thus, it attempts to appreciate how LLMs reshape the choices of diverse donor segments with varied approaches to humanitarian issues. As different causes are covered, it introduces original contextual dimensions to the investigation. This research is among the first to consider how users perceive the reliability of information provided by LLMs compared to traditional search engines and highlights the risks associated with a wide use of LLMs. In conclusion, as the study addresses the potential evolution of digital search methods and their implications for in the donation process, it provides relevant insights for academic literature and interesting suggestions for practitioners in the field of non-profit fundraising.*

AI tra impatti di (post) management e decisioni verso trans-disciplinarietà e algoretica

LUCIANO PILOTTI[1]

1 - Applicazioni dell'AI e dimensioni tecno-organizzativa e decisionale: verso una razionalità sostenibile e trans-disciplinare dal linguaggio naturale?

Le applicazioni dell'intelligenza artificiale sono estremamente varie e ricoprono un'ampia gamma di campi, rendendo quindi difficile un elenco completo ed esaustivo e definitivo ma certo gli impatti tecno-organizzativi e decisionali sono quelli che possono meglio indicarci il loro grado (atteso/inatteso) di desiderabilità sociale e umana (oltre che ambientale) e dunque anche - potremmo dire - il loro grado di razionalità strumentale e/o di obiettivo sia questa di tipo convenzionale, intuitiva o inventiva.

Attualmente la concezione predominante nello sviluppo di AI si concentra su sistemi che ci aspettiamo agiscano razionalmente che vanno tuttavia compresi. L'agire razionale implica una visione dell'intelligenza che non solo si limita alle capacità intellettuali, ma che è anche estesa ad una interazione efficace con l'ambiente circostante nella sostenibilità. Nel contesto presente, sembra di poter dire che l'attenzione è maggiormente posta sull'efficacia e sulla precisione dei risultati prodotti dai sistemi di AI piuttosto che sulla loro versatilità, adattabilità e sostenibilità. Tanto che ci si concentra prevalentemente sullo sviluppo di sistemi altamente specializzati per applicazioni specifiche "inseguendo l'esistente" per esplorarne la "sostituzione", piuttosto che sistemi di intelligenza generale che possono operare in contesti più ampi e integrati secondo logiche di versatilità, adattabilità e sostenibilità. Infatti, una possibile categorizzazione delle aree applicative dell'AI include diversi ambiti specifici dei quali possiamo riprendere alcuni casi esemplificativi.

Per esempio possiamo partire dalla pianificazione autonoma di attività e operazioni, particolarmente importante in settori come la produzione industriale e la logistica, ma anche in alcuni contesti più avanzati come l'esplorazione dello spazio. I sistemi di AI che vengono sviluppati in questo campo sono in grado di avere un focus definito come obiettivo generale, per generare poi un piano costituito da una sequenza di operazioni-processi per raggiungere l'obiettivo, ed infine di monitorare l'esecuzione di tale piano e i risultati raggiunti per eventuali aggiustamenti successivi in un circolo virtuoso di affinamento.

Nel campo dei giochi, gli studi effettuati hanno avuto un impatto significativo, con l'uso di tecniche per la ricerca nello spazio degli stati. Un caso emblematico - citato diffusamente in letteratura - riguarda la vittoria del supercomputer Deep Blue di IBM[2] sul campione mondiale di scacchi Garry Kasparov nel 1997, dimostrando quanto l'AI possa essere potente in ambiti competitivi.

Con riferimento al controllo autonomo, vi sono invece risultati promettenti nell'ambito del controllo di sistemi complessi, come nel caso della guida autonoma di veicoli e nel controllo delle sonde spaziali che necessitano di capacità autonome di adattamento rispetto alle prime macchine spaziali (navicelle e stazioni orbitanti o satelliti geo-stazionari) degli anni 60 e 70 del secolo scorso.

La dimostrazione automatica di teoremi matematici e la programmazione automatica rappresentano altre aree tradizionalmente influenzate dall'AI, nelle quali ci si occupa di complessi problemi teorici e metodologici. Più di recente, la ricerca si è soffermata sullo sviluppo di tecniche inferenziali che consentano di dedurre nuovi fatti da un insieme di dati attuali, influenzando così la progettazione dei sistemi esperti e dei sistemi di domanda e risposta capaci di costruire catene auto-regolate di adattamento e ricerca dell'equilibrio in condizioni instabili e variabili.

Se guardassimo alla robotica e alla visione artificiale scopriremmo che sono settori immersi in mondi multidisciplinari e che utilizzando strumenti di AI possono integrare molteplici altre discipline in modo trasversale, come la meccanica, l'elettronica e l'ingegneria dei sistemi e ormai anche la bio-chimica. Campi che spingono verso la trans-disciplinarietà e ibridandosi mirano a creare macchine autonome in grado di svolgere compiti integrati che fino a pochi anni fa richiedevano l'intervento o la mediazione dell'uomo. Un esempio significativo è il veicolo autonomo Stanley, che nel 2005 ha completato con successo una gara nel deserto del Mohave, dimostrando il potenziale della robotica intelligente in condizioni estreme come quelle che potremmo trovare su altri pianeti ad esempio sulla Luna, o su Marte o Venere.

Una ulteriore applicazione dell'AI dai sorprendenti sviluppi è l'elaborazione del linguaggio naturale; un'area estremamente complessa, che si occupa di problemi legati alla comprensione e alla generazione di espressioni

linguistiche da parte delle macchine simulando il linguaggio naturale e umano e che già ritroviamo in parte nei chatbot come Alexa o Siri. Nonostante in questo campo siano stati fatti numerosi progressi, rimangono ancora molti punti interrogativi. Tuttavia, se il potenziale applicativo di queste ricerche è molto promettente per ora si pensa solo a miglioramenti incrementali e in un futuro prossimo a salti più robusti di stato e di potenza tenendo conto delle enormi esigenze energetiche di questi strumenti come primo limite di fondo da "superare" che dovrà accompagnarsi ad un salto ancora più forte in relazione alla trans-disciplinarietà di cui necessita per potere esprimere tutto il suo potenziale.

Infatti, i sistemi esperti e le ontologie rappresentano una parte fondamentale dell'ingegneria della conoscenza e per tale motivo hanno un impatto significativo nella modellazione della conoscenza per l'AI, particolarmente nell'ambito del web e delle applicazioni nell'organizzazione industriale , organizzativa e/o dei servizi da remoto[3].

E' dunque evidente anche da questo pur limitato richiamo ai mondi delle applicazioni che l'intelligenza artificiale rappresenta un enorme potenziale ancora del tutto da esplorare in profondità essendoci per ora mossi sulla sua superficie, ma avendone colta la sua forza trasformativa per le organizzazioni sostenibili moderne tra limiti, opportunità e grandi sfide epocali. L'AI sta rivoluzionando il modo in cui le aziende operano, producono, decidono e cambiano richiedendo un completo ridisegno delle loro strutture organizzative, dei processi decisionali e della cultura aziendale e di interazione con l'utente finale e/o intermedio. Il primo salto è quello dell'integrazione dell'AI nei modelli operativi e che porta con sé numerosi cambiamenti, tra cui un ripensamento delle catene di approvvigionamento, l'automazione di processi complessi e la necessità di sviluppare nuove competenze e infrastrutture, soprattutto in chiave trans-disciplinare e a partire dalla doppia transizione digitale e di sostenibilità. E' Accenture[4] a segnalare che - differentemente da quanto si riteneva solo pochi anni fa - l'AI consente di automatizzare non solo i processi ripetitivi, ma anche attività più complesse, sia riducendo i costi delle operazioni e sia migliorandone l'efficienza. Tuttavia, per far si che il potenziale dell'AI sia massimizzato, McKinsey & Company[5] sottolinea l'importanza di riorganizzare le strutture aziendali per rendere più coesiva la collaborazione tra dipartimenti e la creazione di team interdisciplinari (o meglio, trans-disciplinari) che ci sta conducendo velocemente al superamento del tradizionale modello funzionalista o neo-taylorista di stampo gerarchico nato sul finire dell'800 e primi del '900 con le prime catene di montaggio sperimentate nel settore automotive da Herny Ford che porteranno peraltro alla prima grande rivoluzione degli orari di lavoro scendendo dalle 60-80 ore medie (quale soglia insuperabile per il conflitto con le capacità e la fisiologia umane oltre che con l'efficienza e l'etica) alle 40 ore settimanali del primo decennio del "secolo breve" che sono ancora quelle oggi più diffuse e che darà inizio all'integrazione tra il paradigma meccanico con quello della prima automazione del sistema di fabbrica in connessione con la sua completa elettrificazione nell'illusione di potere "sostituire" allora (forse) come ora il lavoro umano lungo le linee del controllo gerarchico e funzionale della organizzazione produttiva scandita dai tempi dell'orologio e adattata allo spazio-tempo come nello smart working o viziosamente nella gig-economy.

L'adozione dell'AI sta portando ad impatti non assimilabili a quel salto paradigmatico della seconda e terza rivoluzione industriale per la forte domanda di creazione di nuovi ruoli inter-disciplinari e inter-funzionali enormemente dinamici e in forma di team-work nel potenziamento di dynamic capabilities[6] cambiando anche il top management come il Chief AI Officer (CAIO), l'AI ethicist e il CHO-Chief Happiness Officer che in generale richiedono un forte adattamento per quanto riguarda la gestione delle risorse umane, prestando particolare attenzione agli investimenti formativi del personale da integrare con Piani di Welfare aziendali e territoriali per un superiore livello di work life balance lungo linee di modelli partecipativi più capaci di resilienza e adattamento. Gartner[7] evidenzia infatti che l'AI potenzia decisamente le decisioni umane, migliorando la capacità di analizzare grandi volumi di dati e prendere decisioni più informate e tempestive ma con un forte coinvolgimento delle persone. Infatti, l'implementazione dell'AI necessita di un grande cambiamento culturale, ovvero la leadership deve guidare l'uso dell'AI non solo per l'efficienza operativa, ma

5 McKinsey & Company è una società di consulenza manageriale globale, fondata nel 1926 e con sede a New York. È nota per il suo lavoro nel supportare le principali aziende e organizzazioni governative nell'ottimizzazione delle strategie aziendali, nella gestione operativa e nell'adozione di tecnologie avanzate. Offre insight su tendenze economiche, industriali e tecnologiche a livello globale. Fonte: McKinsey & Company. (n.d.). *The state of AI in 2022—and a half-decade in review*.

6 Baravelli, Pilotti (2022), "Organizational Models and Dynamic Capabilities: From Burocratic Structures to a Freedom and Emotional Management for a Sustainable, Participative and Innovative Bank. The Case of Italian Banks", *Journal of Economics and Public Finance* Vol.8 n.4; vedi anche Pilotti (2019), *Organizzazioni Emotive (Creative e Intelligenti)*, Mc Graw Hill Italia. Autori che sviluppano l'idea che le ultime organizzazioni fordiste come le banche (o le grandi catene della GDO) stanno cambiando pelle e strutture entro modelli più organicisti e integrati che impongono linee meno gerarchiche e più partecipative motivando e includendo non solo per vie salariali (estrinseche) ma per vie intrinseche o motivazionali verso un superamento dell'efficienza statica con approcci adattativi e resilienti e un miglioramento della produttività cognitiva.

7 Gartner è una delle principali società di ricerca e consulenza al mondo, specializzata in tecnologie dell'informazione (IT). Fondata nel 1979, Gartner fornisce analisi, consulenza strategica e strumenti di benchmarking per aiutare aziende e organizzazioni a prendere decisioni informate in ambito tecnologico. Fonte: Gartner. (n.d.). *The AI advantage: Making artificial intelligence work in your business*.

anche per esplorare nuove opportunità di crescita adattativa e resiliente. Quindi la gestione del cambiamento diviene uno degli aspetti più strategici modellando organizzazioni capaci di adattamento per un'adozione efficace e diffusa dell'AI lungo tutto l'organismo organizzativo. Del tutto comprensibile - anche secondo il Boston Consulting Group (BCG)[8] - la necessità di sviluppare una governance solida per garantire che l'AI sia allineata agli obiettivi strategici e che i benefici siano distribuiti in modo equo e condiviso in tutta l'organizzazione per una crescita di lungo periodo. La logica strategica dunque tenderà a bilanciarsi con quella organizzativa non più da considerare in senso ancillare anche rispetto al top management che evolve velocemente verso logiche di coach uscendo definitivamente dalle tradizionali logiche del controllo top-down secondo linee di auto-organizzazione.

L'integrazione trans-disciplinare dell'AI non solo trasforma i processi aziendali, ma necessita anche di un significativo aggiornamento delle competenze in continuo all'interno dell'azienda verso un nuovo bilanciamento dinamico tra strategia e organizzazione. Infatti, come evidenziano diverse indagini riprese da MIT Sloan Management Review [9], le aziende devono investire nella formazione dei loro dipendenti perchè siano in grado di sviluppare competenze specifiche nell'ambito dell'AI, come la comprensione degli algoritmi di machine learning, di deep learning e data analysis, integrate nelle dynamic capabilities come capacità di team-work allargati e integrati nella trans-disciplinarietà con tecnologie avanzate. Questo processo include la creazione di programmi di formazione dedicati e personalizzati sia orizzontali che verticali per una maggiore integrazione della conoscenza e l'adozione di una mentalità e di una cultura dell'apprendere-ad-apprendere, essenziale a mantenere il personale allenato al cambiamento e all'adattamento per la resilienza dove la tecnologia fa da collante organicista di una company community. Dunque siamo anche in presenza anche di un nuova categoria di lavoro che dal mestiere ottocentesco pre-industriale evolve prima in lavoro come esecuzione rigida e burocratica governato dalla gerarchia e successivamente trasformandosi in competenze sorgenti da condizioni prestazionali trasferibili per poi evolvere verso capacità[10]. Lavoro come capacità che si libera allora dalla "gabbia prestazionale" di stampo weberiano e funzionalista vestendosi di principi auto-organizzativi e di team-working come dynamic capabilities che si fondono nella costruzione di organizzazioni resilienti dove l'efficienza statica è accoppiata da capacità adattative ai cambiamenti interni ed esterni, di community e di networking entro un dinamico e partecipativo organicismo capace di fronteggiare il cambiamento continuo e l'incertezza portando le persone anche ad assumere capacità di rischio, individuale e collettivo, con il supporto e di ruoli aperti nell'uso di AI per contaminazioni e ibridazioni continue.

Un contesto fluido che richiede nuove responsabilità alle persone e una diversa cultura etica da parte dell'impresa-community verso algoretica.

2. AI e decisioni di marketing digitale tra *predittività e predeterminazione* delle scelte

Abbiamo visto che il frutto degli algoritmi anche se "incapaci di pensare naturalmente" è quello di predire in modalità sempre più affinate sulla base della loro capacità di apprendere (o di essere allenati) da miliardi di testi "revisionati" in precedenza secondo la sequenza della scoperta di quale parola abbia la maggiore possibilità di seguire o anticiparne un'altra in una lunghissima stringa quasi infinita con possibilità di retroazione e allineamento in continuo. Imparando peraltro moltissimo sulle singole persone che la usano per gli scopi più disparati di scelta tra canzoni e brani musicali (Spotify), libri, film (Netflix), video altamente virali (Tik Tok), ricette di cucina. Ma la specifica piattaforma alimentata da AI non agisce solo ex-post al tempo t+1 ma diviene in grado di connettere il singolo profilo di una specifica persona X con le sue scelte di portafoglio Y potendone anticipare i desideri e le aspettative Z al tempo t-1 e dunque potendole anche predeterminare. Agendo non solo su scelte standard di film o canzoni ma su informazioni sensibili come le preferenze sessuali, religiose o quelle politiche e culturali e a questo "stadio del processo" interviene lo spazio di manipolazione che nella fase precedente di scelta è solo indiretta e con un portafoglio dato. L'agire che normalmente viene affidato agli amici più intimi, al compagno di squadra o alla/al fidanzata/o oppure alla moglie/marito qui viene

8 Boston Consulting Group (BCG) è una delle più importanti società di consulenza strategica a livello mondiale, fondata nel 1963. BCG è riconosciuta per il suo approccio innovativo alla risoluzione dei problemi aziendali, offrendo consulenza su strategie di business, gestione del cambiamento, innovazione e *digital transformation* . L'azienda è famosa per i suoi modelli analitici, come la matrice BCG, e per le sue approfondite ricerche su tendenze economiche e industriali globali. Fonte: Boston Consulting Group (BCG). (n.d.). *AI and the new digital economy: Powering transformation with artificial intelligence.*

9 MIT Sloan Management Review è una prestigiosa rivista accademica e di business pubblicata dal Massachusetts Institute of Technology (MIT). Fondata nel 1959, la rivista si concentra su temi legati alla gestione, all'innovazione e alla trasformazione digitale, con un focus particolare sull'impatto delle nuove tecnologie e delle strategie aziendali moderne. È nota per le sue ricerche approfondite e per offrire insight avanzati su come le aziende possono affrontare le sfide globali e cogliere le opportunità emergenti nell'economia digitale. Fonte: MIT Sloan Management Review. (n.d.). *How AI is changing business: Talent, technology, and transformation*.

10 *Capacitazione* come evoluzione del lavoro da una rigida cornice definitoria che transita in 250 anni dal mestiere artigiano pre-industriale al lavoro esecutivo industriale parcellizzato fino alla competenza auto-prestazionale individualizzante nel senso proposto da Amartja Sen quale estensione delle capacità auto-organizzative e di obiettivo che ripone al centro dell'organizzazione l'uomo, il team-work e la sua community, ridefinendo i rapporti fra l'impresa e l'ambiente con pratiche di sostenibilità per la resilienza.

assunto dal fornitore di servizi digitali on-line come avvenuto finora per i consigli per gli acquisti e lungo pratiche esperienziali di prossimità con il tipico word-of-mouth. E' tuttavia evidente che in questo caso viene messa a rischio la nostra capacità di autodeterminazione e il nostro diritto alla libertà nella privacy che deve conseguire da una adeguata protezione dei dati e da una appropriata sorveglianza.

Questa transizione dalla semplice predittività alla predeterminazione - o se si vuole ad una super/predittività - avviene a ridosso di tre snodi fondamentali che riguardano la "memoria" di Chat-Gpt che richiamiamo sinteticamente con una intelligenza artificiale che:

A - risponde a domande simulando quelle che farebbe un umano e in linguaggio naturale adattandole ad uno specifico user o target;

B - ha la "capacità di ricordare" informazioni (con parole, immagini, forme e suoni) molto dettagliate sull'interlocutore dal quale riceve domande e con il quale ha attivato una conversazione (compreso lo stile di guida su una strada o di insegnamento in una aula, oppure di scrittura di un romanzo);

C - è dotata di una memoria che tuttavia può essere "disattivata" in termini di personalizzazione, come se cancellassimo la cronologia delle attività di search engine che ormai conosciamo a fondo per qualsiasi device.

Seppure una tale intelligenza non abbia alcuna consapevolezza di sé, attraverso questa capacità di memoria "focalizzata" Chat-Gpt può disegnare con una certa precisione carattere, ambizioni, tratti della personalità, fino a rilevare tick nervosi o del linguaggio e anche patologie (espresse o inespresse) di tutti noi sia nelle attività di studio, lavoro, di scelta in un supermercato o di relax su una spiaggia e dunque indirettamente segnalando anche il contesto nel quale tutti questi comportamenti avvengono. Dunque una AI che potrebbe segnalare di noi aspetti e dimensioni del carattere e delle modalità di scelta che noi stessi non conosciamo e in grado di rispondere alla domanda "cosa sai di me che io non so?" trasformando la favola di Biancaneve e della strega davanti allo specchio ("specchio specchio delle mie brame chi è la più bella del reame") una realtà per niente immaginifica o fantastica ma molto concreta, simulando "stati del carattere nel riconoscimento facciale e/o nel linguaggio del corpo".

Del tutto evidente allora che siamo di fronte a grandi opportunità ma anche ad enormi rischi che le pratiche e le strategie di marketing proveranno a discernere selezionando quelle compatibili con il proprio core business e il proprio branding così come con la propria value proposition nel rispetto della protezione dei dati e della privacy degli utenti lungo una traiettoria di responsabilità consapevole. E tuttavia visti i rischi di deformazione (volontaria o involontaria) e di fake è altrettanto evidente che ci serviranno regole adeguate per guidare queste scelte aziendali e manageriali innanzitutto proteggendo i dati e la privacy degli utenti che è il compito primario del Garante Europeo per la Protezione dei Dati[11] verificando il rispetto delle risoluzioni dei vari AI Act, Digital Markets Act e Digital Services Act promulgati dalla Unione Europea negli ultimi due anni e prima fra i grandi player globali verificandone i livelli di responsabilità nel trattamento dei dati personali e aziendali[12]. Confermando che i dati sono il petrolio del futuro e per questo la corsa al loro utilizzo va "regolata e canalizzata" evitando usi impropri e abusi di posizione dominante che potrebbero violare le regole della concorrenza e frenare i processi innovativi o più semplicemente evitando che l'AI possa condurci verso un "potere (che) ci possa (voglia) addomesticare"[13] magari associato ad una sostenibilità che sia solamente economica (e ineguale) e non anche sociale e ambientale e tesa a ridurre le diseguaglianze[14].

3. Pratiche di marketing alla prova dell'AI e della trans-disciplinarietà

Negli ultimi 30 anni abbiamo assistito ad ambienti di mercato e comportamentali sempre più fluidi ed incerti tanto da spingere fortemente la digitalizzazione dei prodotti con robuste iniezioni di servizi (serviticing) che "vestono e veicolano" i prodotti in modi differenziati e sempre più adattivi per ottimizzarne l'interazione continua con la clientela e far avanzare lo sviluppo del prodotto in relazione ai cambiamenti di preferenze e gusti oltre che di contesti di mercato sempre più globalizzati accelerando la catena di feedback, test e prototipazione. Mutando in questo modo le esigenze dell'organizzazione verso una maggiore agilità (agile organization) caratterizzata da inter-funzionalità e ibridazione di competenze oltre che di iniezione di virtù e di etica della responsabilità (nel dialogo tra marketing manager , product

---

[11] Wojcieh Wiewiorowski è il *Garante Europeo per la Protezione dei Dati* che ha il compito di difendere il rispetto della privacy e della protezione dei dati rispetto a qualsiasi legge UE ed ha espresso recentemente (2024) l'idea largamente condivisa che gestire l'intelligenza artificiale e assegnarvi regole non è tanto porsi dal punto di vista dei diritti fondamentali, ma principalmente assumere la prospettiva della sicurezza dei prodotti e dei servizi ossia per qualcosa che deve funzionare sul mercato e deve produrre specifici vantaggi. Al Garante spettano sia le funzioni di sorveglianza del buon funzionamento dei mercati e sia le funzioni di protezione dei dati in merito all'uso dell'AI e alle soluzioni che vengono proposte dai vari player globali e che operano dentro i confini europei facendoli anche dialogare e interagire e in particolare tra scienza e industria a salvaguardia del "bene comune" in tutti i settori nei quali viene prodotta e usata l'AI e che avvenga con procedure trasparenti.

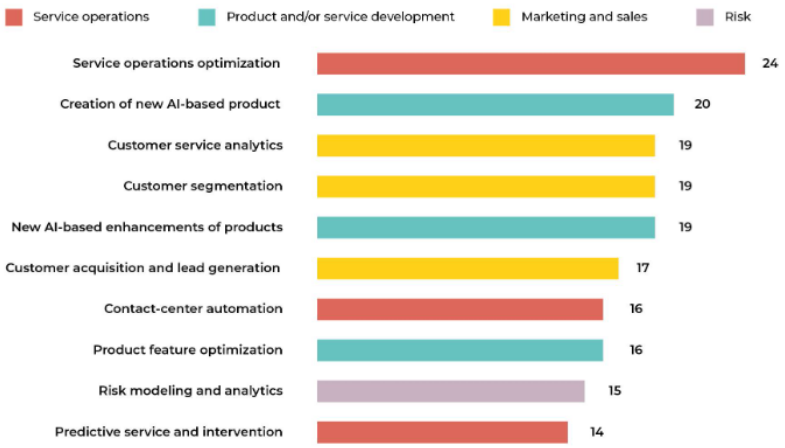
[13] Guardando ai processi di riforma avviati in Italia dalla maggioranza di estrema destra al Governo rinviamo a: G.Zagrebelsky, A.Spataro e F.Pallante (2024), *Loro dicono, Noi diciamo – su premierato, giustizia e regioni*; Laterza. Che ci spiegano in dettaglio la distinzione tra "Governo" e "governabilità" e al ruolo del potere in una democrazia matura dove lo Stato di Diritto divide i poteri per renderli "vaccinati" dalle pulsioni all'"assolutismo delle maggioranze" che quella divisione vorrebbe invece forzare deformando la democrazia e dei quali abbiamo esempi tragici in tutto il novecento e anche negli primi 25 anni del XXI sec.

[14] Pilotti (2019), *Organizzazioni emotive (creative e intelligenti)*; McGraw Hill; inoltre Pilotti, Rinolfi (2022), *Management e Governance dell'ambiente e valorizzazione delle risorse naturali e umane* (Voll.1 e 2); Wolters Kluwer

manager e user) entro un lavoro che evolve verso capacità cooperative senza perdere tensione competitiva verso la convergenza di finalità comuni triangolando strategie d'impresa a quelle di marketing e di prodotto in modo più stringente e circolare nel disegno dell'esperienza di consumo attraverso la malleabilità delle risorse digitali. Tanto che branding, posizionamento, informazione sulla clientela e segmentation si saldano con la CRM nell'attrazione, acquisizione della clientela e nel suo trattenimento entro i perimetri aziendali fidelizzando. L'esperienza di consumo diventa dunque altamente fisica e digitale insieme (phygital) coniugando e allineando marketing (riconoscibilità del marchio verso acquisto) e prodotto (coinvolgimento, ottimizzazione, esperienza post-acquisto) riducendo fattori di frammentazione e sub-ottimizzazione. Venendosi a comporre allora la triangolazione virtuosa tra Marketing, Prodotto e Tecnologia integrando il Cliente con l'agile organization supportata da agile marketing.[15] *La tecnologia e l'AI in particolare con la gestione dei dati su clienti (e fornitori e canali) supporta sia il marketing che il prodotto consolidando dynamic capabilities, inter-funzionali e inter-disciplinari spostando l'asse delle competenze verso trans-disciplinarietà*[16] *e mutando la stessa natura del lavoro verso capacità e imponendo regole condivise di un quadro algoretico (cfr. Schema 1) La tecnologia e in particolare l'AI divengono leve di allineamento tra obiettivi aziendali ed esigenze della clientela verso una organizzazione più piatta e responsiva ossia più adattativa e dunque più resiliente, responsabile e sostenibile. Vediamo intanto alcuni impatti sulle pratiche e decisioni di marketing in senso stretto considerando che «l'ampio utilizzo di internet ha portato il marketing di prodotti o servizi sulle piattaforme online rendendo essenziale per i brands ottenere visibilità e riconoscimento a livello globale»*[17]*. Questo fenomeno rientra nell'ambito del marketing digitale, ossia un vasto insieme di strategie e tecniche che sfruttano molteplici canali digitali per la promozione di prodotti, servizi e marche, con l'obiettivo di coinvolgere i consumatori in maniera diretta, efficace e personalizzata. Questo approccio ha rivoluzionato il modo in cui le aziende si relazionano con il pubblico, consentendo una comunicazione mirata ed immediata. Questo cambiamento è particolarmente evidente nei processi di targetizzazione e segmentazione del pubblico. Infatti, tradizionalmente, le aziende tendevano a lanciare campagne pubblicitarie a un pubblico ampio, sperando che il loro messaggio raggiungesse i potenziali clienti. Tuttavia, con l'avvento del marketing digitale, è emersa la capacità di segmentare il pubblico in gruppi più specifici e mirati, in base a criteri psico-comportamentali, demografici e geografici. Questo nuovo approccio ha permesso alle aziende di personalizzare le loro comunicazioni, creando messaggi più pertinenti e rilevanti a ciascun segmento di pubblico profilandone meglio le preferenze nel tempo e nello spazio.*

Schema 1 - Fattori di management e AI tra algoretica e trans-disciplinarietà



Tra le principali attività del marketing digitale rientrano - come noto - la pubblicità sui media, che permette di raggiungere target specifici in base a interessi e comportamenti, l'email marketing, utilizzato per mantenere un contatto costante con i clienti attraverso l'invio di messaggi promozionali personalizzati, e la SEO (Search Engine Optimization). Quest'ultima si concentra sull'ottimizzazione dei contenuti di un sito web per migliorare la sua posizione nei risultati organici dei motori di ricerca (SERP, Search Engine Results Page), come Google. Questo tipo di ottimizzazione avviene attraverso l'uso di keywords, ossia parole o frasi che gli utenti digitano nei motori di ricerca per trovare informazioni specifiche. Una strategia efficace per le parole chiave è essenziale poiché costituisce il legame diretto tra le query degli utenti e il contenuto presente su un sito web. Quando un'azienda seleziona parole chiave rilevanti e frequentemente ricercate nel suo settore, aumenta significativamente le possibilità di comparire tra i primi risultati dei motori di ricerca, il che si traduce in un incremento della probabilità di clic e di visite al sito (Cfr. Fig.1).

[16] Baravelli, Pilotti, *Dynamic Capabilities*…, cit.
[17] Davenport, T., Guha, A., Grewal, D., & Bressgott, T. (2020). How artificial intelligence will change the future of marketing. Journal of the Academy of Marketing Science, 48(1), 24–42.

In questo contesto, l'avvento dell'intelligenza artificiale (AI) ha ulteriormente rivoluzionato il settore. L'AI, infatti, ha trasformato estremamente il branding e il marketing, rendendo queste discipline più dinamiche, personalizzate e orientate ai dati. Grazie alla combinazione AI, big data e machine learning, le aziende possono creare strategie di marketing sempre più ottimizzate e maggiore coinvolgimento con i consumatori. I big data, ossia quell'insieme di dati raccolti, così vasti e complessi, da avere bisogno delle nuove tecnologie, come l'intelligenza artificiale, per venire processati, rappresentano una risorsa essenziale per comprendere le preferenze e i comportamenti dei consumatori[18]. L'AI utilizza questi dati, individuando schemi e tendenze che orientano le aziende nella realizzazione di campagne più specifiche e mirate. Questo avviene attraverso il processo di machine learning, ossia una branca dell'IA che sviluppa sistemi in grado di apprendere dai dati e migliorare le proprie prestazioni nel tempo e che ci interroga su prospettive di post-management.

Fig. 1: Utilizzi più popolari dell'AI da parte dei marketers

Fonte: McKinsey, 2022

Le aziende, attraverso l'uso dell'AI, dei big data e del machine learning, creano modelli predittivi che riassumono le informazioni e amplificano la loro significatività in relazione agli obiettivi di business, traducendoli in dati utili per azioni concrete, da usare per progettare strategie di mercato responsive di medio-lungo termine accrescendo il capitale reputazionale e semantico oltre che umano e sociale[19]. Sostanzialmente, lo scopo di un modello predittivo è quello di identificare automaticamente le relazioni all'interno dei dati per prevedere le future tendenze del mercato e gli stessi comportamenti dei clienti[20], fornendo così alle aziende una visione più chiara dell'andamento del mercato e delle sue possibili evoluzioni nel tempo accrescendo la competitività dei propri prodotti e servizi.

L'AI ha anche rivoluzionato l'uso delle keywords nella SEO. Infatti, i recenti progressi dell'intelligenza artificiale hanno completamento cambiato la ricerca di marche utilizzando parole chiave o ricerca vocale[21]. I motori di ricerca, grazie alle tecnologie di elaborazione del linguaggio naturale, ora sono in grado di capire il contesto e l'intenzione dietro le query immesse dagli utenti, permettendo di fornire risultati più pertinenti. Per questo motivo, le aziende devono creare contenuti che rispondano in modo preciso alle domande e ai bisogni degli utenti, migliorando così la loro visibilità nei risultati di ricerca. Questo richiede un'attenzione particolare alla qualità e alla rilevanza del contenuto, anziché concentrarsi sulla quantità. Le aziende devono, quindi, impegnarsi nella creazione di articoli, guide e risorse che non solo catturino l'interesse degli utenti, ma che forniscano anche risposte complete e approfondite alle loro domande e dunque ai loro bisogni in modo costante e continuo per migliorare e sfruttare la fidelizzazione che ne discende.

L'intelligenza artificiale ha inoltre trasformato le modalità in cui le persone effettuano le ricerche, soprattutto grazie alla diffusione di dispositivi vocali come Alexa (sviluppato da Amazon) o Google Assistant. Strumenti (anche vocali) che permettono agli utenti di interagire con la tecnologia in una maniera più intuitiva e naturale, rendendo la ricerca vocale una alternativa sempre più diffusa. A differenza delle query di ricerca scritte, che sono tendenzialmente brevi e dirette, la ricerca vocale si distingue per l'utilizzo di frasi più lunghe e colloquiali, decisamente più empatiche. Ovviamente, questa evoluzione richiede alle aziende di rivedere le proprie strategie SEO per adattarsi alle nuove modalità di ricerca ed interazione. Per garantire che i contenuti siano visibili e rilevanti, è necessaria ottimizzare i siti web in modo da rispondere efficacemente a domande formulate con un linguaggio naturale. Questo implica l'inserimento di parole chiave strategiche e la creazione di contenuti informativi e di valore che rispondano in modo diretto alle domande degli utenti e al loro sistema di valori. Perché il marketing contemporaneo è orientato al purpose e richiede crescente responsabilità e identità. Che significa in primo luogo assumere focalizzazione su questioni sociali, ambientali e/o culturali e ridefinire

al meglio e in secondo luogo l'identità che si vuole promuovere sul mercato "lasciando il segno nella vita delle persone" suscitando emozioni, coinvolgendo, evadendo dalla quotidianità o risolvendo problemi. Dunque mixando i saperi main stream del marketing manager che deve essere sempre più capace di maneggiare conoscenze di psicologia, di sociologia, di geopolitica, ma anche ambientali, di neuroscienze oltre che essere competenti di tecnologia, AI e inoltre di etica in una chiave eco-sistemica riunificando quei saperi che il marketing degli anni '70 e '80 del secolo scorso avevano separato o escluso. Fattori che ci spingono a connettere radicalmente approcci trans-disciplinari e algoretica con modelli organizzativi più partecipati.

Ma la rivoluzione è solo iniziata!

The Trade-off Between Data Privacy and Personalization in the Financial Sector: Can Generative AI be a moderator in Gen Z's Investment Decisions?

MARCO VALERIO ROSSI[1] IRENE FULCO [2] FRANCESCA FAGGIONI[3] BARBARA AQUILANI[4]

Abstract

The increasing digitization of financial services has amplified the trade-off between personalized offerings and data privacy. While tailored investment recommendations provide significant advantages to investors, especially those that are Generation Z individuals (GZIs), concerns over data security, fraud and potential misuse persist. In parallel, it accelerates the tertiarization of the sector, shifting the focus from traditional banking institutions towards an AI-driven financial ecosystem. This study explores the role of Generative AI (GAI) as a moderator in this balance, analyzing how it can facilitate investment decisions without compromising privacy. Through qualitative interviews with ten American GZIs (five males, five females), the findings suggest that while this cohort is generally inclined to share personal data for personalization, financial decision-making presents unique challenges, such as the need for human interaction in finalizing financial decisions and different feelings regarding traditional and digital banks. GAI emerges as a key enabler, providing investment insights through synthetic data generation and federated learning, ensuring both personalization and privacy. The study contributes to financial technology research by highlighting GAI's potential in reshaping investment advisory services.

Framing of the research. *The rapid digitalization of the financial sector has revolutionized how financial services are delivered, with artificial intelligence (AI) playing an increasingly central role in investment decision-making and personalized financial advising (Mavlutova et al., 2020). One of the most critical challenges in this transformation is balancing personalization and data privacy (Oyedokun, 2025). While highly customized financial services offer significant advantages to consumers, particularly younger digital-native generations (e.g., Generation Z individuals or GZIs), concerns about data security, regulatory compliance, and ethical implications persist. The trade-off between personalization and privacy has thus become a defining issue in contemporary financial service offering (Eko Retno et al., 2023).*

Financial institutions increasingly rely on predictive analytics and AI to tailor their services to individual investors. Personalized investment strategies leverage large datasets to assess risk tolerance, market trends, and user preferences, enabling financial firms to optimize asset allocation and risk management. However, achieving this level of customization often requires extensive access to personal financial data, raising concerns about data misuse and compliance with stringent regulations or Authorities, such as the Consumer Financial Protection Bureau (CFPB) in the US (Birkenmaier, 2024).

The personalization-privacy trade-off is particularly pronounced in the financial sector due to the sensitivity of the data involved. Unlike other domains where users are willing to exchange data for convenience (e.g., targeted advertising), financial information is inherently more confidential (Alhawamdeh et al., 2024).

Generative Artificial Intelligence (GAI) has the potential to reshape how financial services balance personalization and privacy. Unlike traditional AI models that rely on direct access to raw user data, GAI leverages synthetic data generation, differential privacy techniques, and federated learning to deliver personalized insights without exposing sensitive information (Chatterjee et al, 2023). This allows financial institutions to offer customized investment recommendations while minimizing privacy risks. Indeed, GAI can analyze vast amounts of financial data, detect emerging market trends, and provide tailored investment suggestions. Moreover, techniques such as synthetic data generation enable AI systems to create anonymized datasets that preserve patterns and trends without compromising individual privacy. This approach ensures that financial institutions can harness the benefits of personalization without direct access to identifiable user data. Furthermore, it accelerates the tertiarization of the sector, shifting the focus from

traditional banking institutions towards an AI-driven financial ecosystem. Another advantage of GAI in financial services is its ability to enhance financial literacy. This educational function is particularly valuable in fostering long-term financial independence while ensuring that privacy remains a top priority (Philippas & Avdoulas, 2021).

Purpose of the paper. *The purpose of this research is to explore how GZIs perceive the role of AI in financial decision-making and, specifically, the role of GAI as a moderator of the trade-off between personalization and privacy in the context of financial services.*

As financial institutions increasingly utilize AI to personalize investment strategies, a critical challenge arises: balancing the benefits of highly tailored services with the privacy concerns associated with sensitive financial data. GZIs, often characterized as the first true digital-native cohort (Fulco & Aquilani, 2023; Rossi et al., 2023), is accustomed to AI-driven recommendations in various domains, from entertainment to e-commerce. In financial services, however, their attitudes towards AI-driven personalization are more nuanced. While they generally appreciate tailored recommendations, they are also highly aware of data privacy risks, particularly in an era of increasing data breaches, fraud and cybersecurity threats (Oberoi & Puranik, 2024).

This research investigates how GAI, through privacy-preserving techniques like synthetic data generation, federated learning, and differential privacy, can address these concerns while still offering tailored investment recommendations (Long et al., 2020).

Moreover, this research proposal is particularly compelling due to the fact that many individuals within this cohort are first-time investors, often possessing limited experience in managing financial assets. As such, AI-driven education and guidance offer a significant opportunity to bridge this knowledge gap. GAI-powered virtual financial advisors, for instance, have the potential to provide scenario-based simulations that can assist young investors in understanding complex concepts such as risk-reward trade-offs, portfolio diversification, and the intricacies of making informed investment decisions.

Methodology. *To gain a comprehensive understanding of Generation Z's perceptions of the trade-off between privacy and personalization in financial services, with particular emphasis on the role of GAI, a qualitative, inductive, and exploratory approach was employed. This method was selected to uncover emerging insights without the constraints of prior predefined assumptions. This allowed for a comprehensive examination of participants' experiences and perceptions, fostering a contextually rich understanding of their perspectives on privacy concerns and the role of AI in financial decision-making.*

As the chosen data collection method, semi-structured in-depth interviews were conducted to facilitate a flexible and open-ended exchange between the interviewer and participants. This approach enabled an in-depth exploration of the research topic while ensuring a structured focus on key thematic areas (Schreier, 2012). The interviews delved into participants' attitudes towards AI-driven personalization in financial services, their concerns about data privacy, and their thoughts on how GAI could affect this balance. Given the participants' familiarity with digital technologies, including AI, the semi-structured format was particularly effective in engaging them with both personal and broader reflections on the topic (Boyce & Neale, 2006).

The study targeted 10 American Gen Z individuals (5 males and 5 females) through purposive sampling to ensure a group that was representative of the cohort's characteristics and experiences. The selection of participants aimed to include individuals who were familiar with AI and had diverse attitudes toward financial services and technology. By interviewing an equal number of males and females, the study ensured gender balance, which is important for capturing a broader range of perspectives on this sensitive topic (Carson et al., 2001).

Participants were first asked to reflect on their experiences with AI and financial services in general. Questions focused on their familiarity with AI in various contexts, such as entertainment or e-commerce, and how those experiences shaped their expectations of AI in financial decision-making. One key question was: "How comfortable are you with AI making personalized investment recommendations for you?" Participants were then asked to consider the trade-off between personalization and privacy, with questions like: "What are your concerns about sharing personal financial data with AI systems?" and "How do you think GAI could help balance the benefits of personalized financial advice with privacy protection?"

To explore the role of GAI specifically, additional questions addressed how participants perceived GAI's potential in providing tailored financial guidance while ensuring data security. For example, participants were asked: "Do you think GAI could offer personalized financial advice without compromising your privacy?" This question encouraged them to consider the innovative aspects of GAI, such as federated learning and synthetic data generation, and how these technologies could alleviate their privacy concerns. Thematic content analysis (Braun & Clarke, 2006) was used to analyze the interview data, identifying recurring themes and patterns that highlight the main concerns, preferences, and insights of Gen Z participants regarding AI in financial services.

Results. *The results of the interviews reveal significant insights into their attitudes towards AI-driven personalization in financial services, with a particular focus on the role of GAI in balancing the trade-off between personalization and privacy. The participants generally demonstrated a positive inclination towards AI, recognizing its potential to simplify and enhance financial decision-making. However, concerns regarding data privacy, especially in the context of financial services, remained relevant.*

A key finding from the interviews is that GAI could be particularly useful in addressing the initial fears of Gen Z individuals who have not yet ventured into investing. Many participants indicated that they felt uncertain or overwhelmed by the complexities of financial markets, with some admitting that they had avoided investing in the past due to lack of

knowledge and fear of making uninformed decisions. In this regard, GAI's ability to offer tailored investment recommendations using synthetic data and federated learning was seen as an important tool for easing their apprehensions. As one participant stated, "GAI could give me insights into the market without me feeling like I'm blindly trusting someone with my money," highlighting the importance of transparency and control in their financial decision-making.

Additionally, participants appreciated that GAI-powered systems could provide personalized advice without compromising their privacy. The use of such technology to generate insights while maintaining data confidentiality resonated with the participants, as they valued having a balance between personalized recommendations and privacy protection. For example, when asked about privacy concerns, one participant commented, "As long as my personal financial data is not being exposed to anyone, I'm more comfortable with AI helping me out." This sentiment was echoed by others, who expressed that their willingness to engage with AI-driven financial services would be significantly influenced by the transparency and security measures employed by the financial institutions.

Moreover, GAI's role in enhancing financial literacy was recognized as an essential benefit. Many participants admitted to having limited knowledge about investing and managing finances, often relying on family members or friends for advice. However, they noted that such guidance often lacked depth or professional expertise. Participants indicated that GAI could fill this gap by providing real-time, scenario-based simulations that help individuals understand financial principles, such as risk tolerance, diversification, and portfolio management. One participant explained, "Having a virtual financial advisor would help me understand how to balance risks and rewards. I would feel more confident making decisions on my own." This suggests that GAI's potential to educate and empower Gen Z investors could have a profound impact on their long-term financial independence.

The theme of trust also emerged as a significant factor in participants' acceptance of GAI in financial services. Despite their openness to AI-driven personalization, they emphasized the need for human involvement in finalizing decisions. Several participants expressed a preference for a hybrid model, where GAI provides initial recommendations and analysis, but human advisors play a crucial role in guiding the final decision-making process. As one participant put it, "I'd like the AI to help me get started, but I would still want a human to check over the big decisions." This reflects a broader sentiment that while GAI can enhance financial decision-making, it cannot fully replace the human element, particularly in situations that involve more complex financial choices.

When asked about the potential drawbacks of GAI, participants were primarily concerned with the possibility of over-reliance on AI and the loss of human judgment in financial decisions. One respondent noted, "If people start depending too much on AI, they might miss out on understanding the broader picture of the market." This concern highlights the importance of maintaining a balance between AI guidance and human insight, ensuring that AI is used as a tool to augment, rather than replace, critical thinking in financial decision-making.

Finally, an interesting perspective spontaneously emerged from the interviews regarding the type of bank that adopts AI, specifically distinguishing between traditional physical banks and digital banks. GZIs tend to prefer digital banks for everyday transactions, as they typically offer the same services as traditional banks at a lower cost due to their digital nature. However, when it comes to investments, rather than just savings or electronic payments, having a physical branch to visit in case of issues is considered essential. As a result, many respondents indicated that an optimal solution would be a hybrid model, where a traditional bank also incorporates a dedicated digital division functioning as a digital bank. Overall, although individuals in the United States are generally perceived as more risk-seeking compared to those in other countries, this cultural predisposition appears to be less pronounced when it comes to financial investments. The findings suggest that, despite a broader societal inclination toward risk-taking, American Gen Z investors exhibit a more cautious approach when managing their personal finances, demonstrating a heightened awareness of potential financial risks and uncertainties.

Research limitations. *While this study provides valuable insights into the role of GAI in addressing the personalization-privacy trade-off in financial services for GZIs, several limitations should be acknowledged. Firstly, the sample size of 10 American Gen Z participants, though purposefully selected, is relatively small and not necessarily representative of the entire cohort. Future research could expand the sample size to include a broader range of GZIs, considering factors such as socioeconomic background, educational level, and geographic location, to gain a more comprehensive understanding of their attitudes toward AI in financial services. Additionally, the study focused solely on American participants, limiting the cross-cultural applicability of the findings. Exploring how Gen Z in other countries, with different financial regulations and cultural attitudes toward privacy, perceives GAI in financial services would provide valuable comparative insights (Koo et al., 2021).*

Secondly, the research relied on qualitative interviews, which are inherently subjective and may be influenced by participants' personal biases or limited experience with AI-driven financial services. Future studies could incorporate quantitative methods, such as surveys or experiments, to validate and generalize the findings. Additionally, longitudinal studies could explore how Gen Z's attitudes toward AI in finance evolve over time, especially as they gain more experience with financial decision-making and AI technologies (Savin et al., 2024).

Finally, while this study focused on the potential of GAI to balance personalization and privacy, future research could investigate how other aspects of AI, such as explainability and transparency in decision-making, influence trust and engagement in financial services. Understanding the ethical implications and regulatory challenges associated with GAI

in financial services will also be crucial for developing effective policies that protect consumers while fostering innovation.

Managerial implications. *This study provides several key managerial implications for financial institutions looking to integrate GAI into their services, particularly when targeting Gen Z consumers. As this cohort becomes an increasingly important demographic in the financial sector, understanding their preferences and concerns is essential for creating personalized and privacy-conscious financial offerings. The findings highlight how GAI can be strategically leveraged to address the delicate balance between personalization and privacy, allowing financial firms to create more customer-centric services (Yadav & Tandon, 2024; Singh et al., 2024).*

Firstly, financial institutions can use GAI to offer tailored investment recommendations while mitigating privacy concerns, a key consideration for Gen Z consumers. With increasing fears around data breaches and misuse, GAI's ability to generate synthetic data and utilize federated learning techniques provides a way to offer personalized financial advice without directly accessing sensitive customer data. This not only ensures compliance with data privacy regulations but also helps in building trust with clients. Financial managers should prioritize implementing these privacy-preserving technologies into their AI systems to alleviate consumer anxieties and create a more secure financial advisory environment (Wang et al., 2024).

Additionally, the study underscores that Gen Z consumers, while comfortable with AI-driven services, do not see AI as a full replacement for human advisors. They value AI for its ability to provide initial analysis and insights, but prefer a hybrid model where human advisors offer personalized guidance and reassurance (Huang & You, 2023). This suggests the importance of adopting a hybrid advisory model that combines AI-driven recommendations with human expertise, shedding light on a research domain that is worthy of further investigations. Financial institutions should focus on training their human advisors to collaborate with AI systems, ensuring they can interpret AI insights and provide human-centered advice. This model would allow firms to offer the best of both worlds, i.e., efficiency, scale, and personalization through AI, alongside trust and emotional reassurance through human advisors. This approach will likely resonate better with GZIs, who value both technological innovation and human connection (Windasari et al., 2022).

The study also emphasizes the role of GAI in enhancing financial literacy, particularly among first-time investors (Garg & Singh, 2018). For many GZIs, investing can be an intimidating and complex experience. Financial institutions can capitalize on this by offering GAI-powered educational tools, interactive simulations, and scenario-based learning experiences that help clients understand key financial concepts. This approach could help GZIs feel more confident in their investment decisions, reduce the fear associated with complex financial markets, and ultimately foster a sense of financial empowerment. Providing these educational resources could also improve customer engagement and long-term loyalty, positioning financial institutions as trusted partners in customers' financial journeys (Desai et al., 2024).

Furthermore, firms must prioritize transparency in their AI-driven systems. Clear communication about how GAI operates, how it ensures data privacy, and how it complies with relevant regulations is essential for maintaining consumer trust. Gen Z is more likely to engage with services that offer transparency about data usage and decision-making processes. Financial institutions should provide detailed explanations of how AI models are used, the safeguards in place to protect user data, and how they align with privacy regulations. This transparency will reassure Gen Z clients, who are often wary of the potential misuse of their data and strengthen their relationship with the institution (Amarna et al., 2025).

Finally, an important consideration for financial institutions pertains to the distinction between digital banks and traditional physical banks in the integration of AI-driven services. Specifically, financial institutions should account for the growing preference for a hybrid banking model when designing AI-driven financial services, ensuring both the accessibility of digital banking and the security provided by physical branches for investment-related services (Rangaswamy et al., 2021).

Originality of the paper. *This paper presents a novel contribution to the field of financial technology by exploring the role of GAI in moderating the personalization-privacy trade-off in financial services, specifically in relation to GZIs. While there is considerable research on AI and personalization in financial services, this study is one of the first to focus on GAI's potential to simultaneously offer personalized financial advice while addressing privacy concerns, that is an issue that has become increasingly relevant in light of growing data privacy anxieties (Agu et al., 2024).*

The originality of the paper lies also in its focus on a specific cohort, i.e., GZIs, who, as digital natives, are uniquely positioned to interact with AI-driven services. Unlike previous studies that predominantly examine older generations, this paper examines the attitudes of Gen Z towards AI-driven financial decision-making, providing insights into how GAI can serve as a bridge between the desire for personalized services and the need for data privacy. The study highlights that Gen Z, while generally open to sharing data for personalization, remains cautious about privacy risks, making it essential for financial institutions to find ways to preserve privacy while offering tailored services (Srivastava et al., 2024).

Furthermore, the paper contributes to the emerging field of GAI by showcasing its potential in the context of financial advising. By utilizing innovative techniques such as federated learning and synthetic data generation, GAI can provide personalized insights without compromising user privacy. This application of GAI in financial services is still underexplored, and this research fills an important gap by offering an in-depth exploration of how GAI can be employed to balance the personalization-privacy dichotomy for those that will be the "spenders of tomorrow" (Long et al., 2020; Chatterjee et al., 2023).

Finally, this study offers a fresh perspective on risk-seeking behavior among Gen Z investors, particularly in the U.S., where individuals are traditionally perceived as more inclined toward financial risk-taking compared to other cultural contexts, such as Italy. However, findings suggest that this risk-seeking tendency is less pronounced when it comes to

personal investments, as GZIs exhibit a more cautious approach in financial decision-making. By examining how GAI can help mitigate investment hesitations and enhance financial literacy, this research sheds light on an emerging dynamic where technology plays a critical role in shaping risk perceptions and investment behaviors among younger generations (Oyewole et al., 2024).

Unveiling the Dark Side of Technological Innovation: Navigating the Sustainability Challenges of Generative Artificial Intelligence - A Preliminary Exploration

IRENE FULCO[1] MARCO VALERIO ROSSI[2] FRANCESCA FAGGIONI[3] BARBARA AQUILANI[4]

Abstract

This study explores the "dark side" of technological innovation, focusing on the sustainability challenges associated with Generative Artificial Intelligence (GAI) and its implications for business and management. While technological innovation brings significant advancements, it also entails negative environmental, social, and economic impacts, such as ecological degradation and social inequalities. Rather than directly measuring these impacts, the study investigates how Generation Z-digital natives with strong environmental and social values-perceives and reconciles the tension between the benefits of GAI and its potential negative consequences. Employing a qualitative approach through interviews with university students, the research reveals growing concerns around AI's environmental footprint, its role in widening social gaps, and the erosion of human connection. These perceptions highlight the need for a more responsible and sustainable implementation of emerging technologies. By centering the voices of Generation Z, the study offers novel insights into how future users and professionals interpret and navigate the ethical and ecological trade-offs of innovation.

Framing of the research. *The "dark side" of innovation (Coad et al., 2022; Cheng et al., 2022), while often overshadowed by the enthusiasm surrounding technological progress, warrants critical examination due to its potential unsustainable effects. Innovation, by its very nature, serves as a powerful catalyst for social and economic advancement; however, its consequences are not always beneficial. It is imperative to acknowledge the duality of innovation-while it can bring about significant improvements in quality of life and productivity, it also presents challenges such as environmental degradation, social inequalities, and economic disruption. The notion of the "dark side" of innovation encapsulates these paradoxical outcomes, emphasizing the need for a more nuanced understanding of its impact (Gossart, 2015).*

At the core of this discussion lies the concept of sustainability, which involves the long-term balance between technological advancement and ecological, social, and economic well-being (Røpke, 2012; Moreau et al., 2021). The unsustainable aspects of technological innovation manifest through various mechanisms, particularly in the form of environmental damage, resource depletion, and the exacerbation of existing societal disparities. This phenomenon is particularly pronounced in industries driven by rapid technological advancements, where growth often occurs without sufficient consideration for the finite nature of resources and the social consequences of such progress.

One of the primary manifestations of the unsustainable nature of technological innovation is the environmental cost associated with new technologies (Ceballos et al., 2017; Lenton et al. 2019; Díaz et al., 2019; Freitag et al., 2021). As innovations proliferate, the demand for raw materials increases, leading to the depletion of non-renewable resources. Additionally, the rise in electronic waste, particularly within the digital and tech sectors, contributes to an escalating environmental crisis. The growing reliance on digital infrastructures, from cloud computing to Artificial Intelligence (AI), further compounds the issue, as these technologies necessitate vast amounts of energy and produce substantial carbon footprints (Andrae & Edler, 2015; Belkhir & Elmeligi, 2018).

Simultaneously, the social ramifications of technological innovation, particularly in terms of inequality and access, must not be overlooked (Witt, 1996). While new technologies may improve certain aspects of life, they often disproportionately benefit those already positioned within socio-economic power structures. Conversely, marginalized populations may face exclusion from the opportunities offered by technological progress, deepening existing divides.

Among the most pressing contemporary examples of the intersection between innovation and sustainability is Generative Artificial Intelligence (GAI). GAI represents a distinct subset within the broader category of AI, characterized by its capacity to autonomously generate novel content-such as text, images, audio, and code-by identifying and replicating patterns from vast pre-existing datasets (Wessel et al., 2023; Lim et al., 2023). Unlike more traditional forms of AI, which primarily perform analytical or predictive tasks within fixed parameters, GAI is inherently creative and simulates human-like outputs, making it particularly relevant to fields where intuition, originality, and expression are central.

This unique creative potential, however, comes with significant sustainability concerns (Mikalef et al., 2022; Cheng et al., 2022; Barari et al., 2024).

The development and deployment of GAI require extensive computational power, translating into high energy consumption and a substantial carbon footprint. The environmental impact of GAI is not limited to infrastructure but extends to the training processes themselves, which often involve energy-intensive optimization over massive datasets.

Furthermore, GAI's ability to replicate tasks once performed by humans-particularly in knowledge-based and creative sectors-raises specific concerns about labor market disruption and job displacement. While these issues are not exclusive to GAI, its scale, speed, and scope amplify such effects, distinguishing it from other forms of AI and justifying a focused analysis. Understanding GAI's specific sustainability implications is therefore critical for developing informed, responsible innovation strategies.

Purpose of the paper. *In light of the challenges associated with the "dark side" of innovation, it is crucial to critically examine the potential negative implications that often accompany technological advancements. It is essential to consider the sustainability of innovation, especially in the context of emerging technologies like GAI (Wach et al., 2023; Kim, 2023). The rapid pace of technological change necessitates a reevaluation of traditional paradigms of innovation, where the focus has often been on the uncritical celebration of progress. Instead, a more balanced perspective is required-one that not only acknowledges the potential benefits of innovation but also critically engages with its ecological, social, and economic costs. This necessitates the development of more robust regulatory frameworks able to ensure the responsible deployment of innovative technologies, alongside the promotion of practices that prioritize environmental conservation, social equity, and economic stability.*

Ultimately, fostering sustainable innovation requires a multifaceted approach that integrates ethical considerations, environmental stewardship, and social responsibility into the design, development, and deployment of new technologies. As such, the focus should shift from mere technological advancement to a more holistic understanding of innovation-one that seeks to harmonize progress with the broader goals of sustainability and human flourishing. In the case of GAI, this holistic approach becomes even more critical, as its rapid growth demands a conscientious effort to balance technological progress with the broader goals of ecological preservation, social equity, and ethical responsibility.

This aspect will be explored as a preliminary study focusing on Generation Z, given their unique position as digital natives and their increasing reliance on technology in daily life (Turner, 2015; Dangmei & Singh, 2016; Rossi et al., 2023; Fulco & Aquilani, 2023). The growing prevalence of AI in both personal and professional spheres makes it crucial to examine how this demographic engages with AI and its potential biases. Generation Z, while deeply integrated with digital technologies, has been found to exhibit heightened awareness of social issues, including fairness and equality (MacGregor Pelikánová & MacGregor, 2020). Moreover, GAI represents a particularly relevant area of interest for this generation, as technologies, such as ChatGPT, are already embedded in their daily experiences, influencing their behaviors, decisions, and perceptions. Given the increasing energy demands of AI technologies, particularly those relying on vast computing power for model training and deployment, this study aims to explore how Generation Z reconciles their environmental values with their use and acceptance of AI-driven systems. The potential tension between embracing AI for its benefits and acknowledging its environmental cost presents an important area of investigation.

Methodology. *A qualitative, inductive, and exploratory approach was chosen as it enables a deeper understanding of participants' perspectives and reduces researcher bias (Armstrong, 1979). This method encourages the emergence of unexpected insights, allowing data to unfold organically rather than imposing pre-existing hypotheses. Given the novelty of the research topic and the lack of prior studies, an interpretative approach was considered essential for gaining a comprehensive understanding of the phenomenon.*

To facilitate this exploration, semi-structured in-depth interviews were employed, providing a flexible and open-ended dialogue between the interviewer and participants (Schreier, 2012). The interviews focused on exploring the (un)sustainability of GAI. This approach is particularly effective for exploring new and complex issues in depth, especially with young respondents who are familiar with the subject matter (Boyce & Neale, 2006). Thematic content analysis (Braun & Clarke, 2006) was used to analyze the interview data, allowing for a nuanced identification of recurring themes and patterns that emerged from the participants' responses. Thematic analysis was chosen for its flexibility and its capacity to provide rich, in-depth insights into complex phenomena, particularly when exploring subjective experiences and perceptions. This method allowed the researchers to identify key themes related to the sustainability of GAI, drawing attention to underlying concerns and perceptions within the data.

Purposive sampling was employed to select participants who could provide valuable insights into the topic (Carson et al., 2001). The study was conducted in Rome, Italy, and participants were selected from a local university. The final sample included 10 participants, all Italian students, equally divided between genders (5 males and 5 females). This composition ensured gender balance and prior experience with AI, focusing specifically on Italian respondents to explore their perceptions and experiences with AI in depth.

During the interview, participants initially engaged in a discussion focused on recalling and critically examining the key concepts under investigation, alongside an exploration of the research context. Subsequently, they shared their personal experiences with technology and AI, with particular attention to how they perceive the (un)sustainability of AI-driven systems. An example question was: "How do you feel about the environmental impact of AI? Do you think the benefits of AI outweigh its potential ecological costs?". To further explore the social aspects of sustainability, additional questions were included to understand participants' views on how AI adoption affects social structures, relationships, and communities. These questions aimed to provoke thought on the broader societal implications of AI and its potential to either foster or disrupt social well-being. For example, participants were asked: "Do you believe AI could enhance or undermine social cohesion? How might it affect societal values, such as empathy and trust?". Additionally, the interview addressed the economic dimension of sustainability, seeking to understand how participants view the economic implications of AI on industries and job markets. These questions encouraged reflection on both the opportunities and challenges that AI presents from an economic perspective. For example, participants were asked: "What are your thoughts on the economic implications of AI? Do you think AI can help create new economic opportunities, or do you see it as a potential threat to existing jobs?" or "How do you think AI-driven automation will affect job markets? Are there specific sectors that you think will benefit or suffer from AI adoption?".

Results. *The results presented in the paper offer a comprehensive and nuanced analysis of the complex relationship between environmental sustainability and technological innovation, particularly in the context of AI. Respondents universally recognized the importance of environmental sustainability but acknowledged that its complexity-especially when coupled with the energy-intensive nature of AI-makes it difficult to fully grasp and integrate into everyday thinking. While respondents were aware of the environmental implications of AI technologies, particularly regarding energy consumption, many noted that these concerns remained abstract and were rarely considered in the routine use of AI tools. In this regard, AI has become so deeply embedded in daily life that its environmental costs often go unnoticed, operating almost invisibly without prompting reflection on its broader impact.*

Nonetheless, respondents did voice concerns regarding the environmental sustainability of AI, particularly in contexts where its energy consumption might outweigh the benefits. A critical paradox emerged: while AI may provide significant efficiencies and convenience, its environmental cost-especially in energy-intensive applications-could undermine its overall value. One respondent raised a pertinent question: "If AI replaces people but still consumes a lot of energy, what's the real benefit?" This remark highlights the tension between technological advancement and the need to address environmental sustainability. The acknowledgment of AI's potential to enhance productivity is tempered by the recognition that its widespread use could contribute to unsustainable energy consumption, raising questions about its long-term viability and societal impact.

Another important theme emerging from the responses is the tension between technological advancement and the traditional values embedded in certain sectors. Respondents expressed discomfort with the over-reliance on technology in contexts where human connection and empathy are central to the experience. Many observed that certain services and industries are deeply rooted in human interaction, and the use of AI might undermine these values. As one participant remarked, "People expect a certain level of tradition and personal service. Too much technology makes the experience feel cold and impersonal." This sentiment points to the fear that excessive technological integration could dilute the human elements that are integral to positive service experiences, whether in customer service, healthcare, or other traditionally human-centered sectors.

This concern about the loss of human connection extends to broader debates about labor disruption caused by automation. Many respondents expressed unease about the displacement of human workers by AI-driven automation. While some level of AI assistance was welcomed-such as using AI for streamlining tasks like making recommendations or assisting with simple inquiries-respondents emphasized that human interaction remained indispensable, especially for roles requiring empathy, intuition, and personalized engagement. One respondent noted, "I don't mind AI helping with recommendations, but if there's no one to speak to when I need help, that's a problem." This highlights a fundamental concern about the potential over-reliance on AI in settings where human labor and interaction are essential to success. The introduction of AI could therefore disrupt not only labor markets but also societal values regarding the importance of human agency in service-based interactions.

In conclusion, while AI presents significant opportunities for efficiency and innovation, the respondents' concerns about its environmental sustainability and its potential to disrupt labor markets reveal the complex challenges surrounding its integration into various sectors. The widespread recognition of the environmental costs associated with energy-intensive AI technologies, coupled with concerns about the erosion of human interaction, suggests that the implementation of AI must be approached with careful consideration of both environmental and social consequences. As AI continues to be integrated into diverse sectors, it will be critical to strike a balance between technological progress and a commitment to sustainability, human engagement, and the preservation of the essential values that define human-centered industries. Table 1 summarizes how each aspect of sustainability plays a critical role in the ongoing discussion about AI's impact and its integration into various sectors, particularly in relation to its environmental, social, and economic implications, with these findings specifically reflecting the perspectives of Generation Z.

Table 1: Sustainability aspects in the context of AI integration: perspectives from Generation Z

Aspect of sustainability	***Key insights***	***Challenges/Concerns***
Environmental sustainability	*- Respondents acknowledge the environmental importance of sustainability.* *- Energy consumption of AI is a major concern.* *- Many are unaware of the environmental costs in daily AI use.*	*- Energy-intensive nature of AI could undermine its environmental benefits.* *- AI's environmental costs often go unnoticed due to its deep integration into daily life.*
Social sustainability (human interaction)	*- Many view human connection and empathy as central to services.* *- Over-reliance on AI in industries rooted in human interaction may devalue personal service.*	*- Excessive AI could make services feel impersonal, undermining traditional human elements of customer service.* *- AI's impact on human connection and the warmth in services is a concern.*
Economic sustainability (labor disruption)	*- Some AI assistance (e.g., recommendations) is welcomed.* *- Respondents emphasize the need for human interaction in roles requiring empathy and intuition.*	*- Automation may displace human workers.* *- AI could disrupt labor markets and societal values related to human labor.*

Source: Authors' elaboration

Research limitations. *The study has several limitations. First, it overlooked country-specific differences, thereby neglecting the variations in AI adoption and its perceived impact across diverse national contexts. The study focused solely on an Italian sample, and while the findings provide valuable insights into the Italian perspective, they may not be universally applicable or representative of other countries. Previous research (Koo et al., 2021) suggests that attitudes toward AI can differ significantly between nations, influenced by factors such as technological infrastructure, governmental regulations, and cultural attitudes toward innovation. Therefore, future research could benefit from including participants from multiple countries to better understand how national contexts shape perceptions of AI and its environmental, social, and economic implications.*

Second, the study did not consider industry-specific differences in AI adoption (Hoffmann & Mehler, 2023), which may be particularly relevant when assessing its environmental, social, and economic impacts. Different sectors, such as healthcare, finance, and manufacturing, may have distinct requirements, challenges, and opportunities related to AI implementation, which could significantly affect how sustainability issues are perceived and addressed. For example, the environmental cost of AI in energy-intensive industries like manufacturing might differ markedly from its use in service-oriented sectors. It is also important to recognize that not all industries are equally 'human-centered'. Sectors like healthcare, education, and customer service are heavily reliant on direct human interaction, while others, such as manufacturing or business automation, place less emphasis on such contact. By not exploring these industry-specific nuances, the study's findings may overlook important contextual factors that influence the integration of AI and its sustainability implications across different sectors. Future research could enrich the understanding of AI's sustainability by investigating these sector-specific variations.

Third, the study was limited to Generation Z respondents, and it would be interesting to explore how different generational cohorts-such as Millennials, Generation X, and Baby Boomers-perceive the environmental, social, and economic implications of AI. As each generation has distinct experiences, values, and levels of technological adoption, their perspectives on AI might differ significantly (Savin et al., 2024). Exploring these generational differences could provide a more comprehensive view of the impact of AI and highlight how various age groups envision its role in shaping the future. Understanding these generational dynamics could offer valuable insights into how AI is perceived and integrated across different segments of society.

Finally, the current sample consists solely of university students, which raises questions about its representativeness. While this is not a critical flaw, future research could consider expanding the sample to include both students and non-students from different educational backgrounds and regions. This would provide a broader perspective on how various groups within Generation Z perceive the environmental, social, and economic implications of GAI. Moreover, a clearer understanding of how Gen Z's concerns about the negative impacts of GAI, which remain abstract in their daily use of AI tools, may begin to influence their consumption choices could offer additional insights into their decision-making processes. Furthermore, integrating complementary quantitative analyses alongside the qualitative interviews could enhance the robustness of the study's findings. A mixed-methods approach would allow for a deeper exploration of broader patterns in perceptions of GAI, thereby offering a more comprehensive understanding of its societal implications and strengthening the validity of the conclusions drawn from the qualitative data.

Managerial implications. *The findings of this study offer valuable managerial insights, especially for businesses integrating AI into their operations (Loureiro et al., 2021; Hussain, 2023). One key takeaway is the need for companies to strike a balance between leveraging the advancements offered by AI and addressing growing concerns about its environmental sustainability. While AI provides significant efficiencies and convenience, its energy-intensive nature raises valid concerns regarding its long-term environmental impact. Managers should be aware of these environmental costs, especially in energy-consuming AI applications, and take proactive measures to mitigate them. This might include adopting more energy-efficient AI technologies, exploring methods to offset the carbon footprint of AI systems, or implementing sustainable practices in their adoption. Furthermore, transparent communication about the environmental*

efforts businesses are undertaking could help build consumer trust, particularly as more and more consumers, especially Generation Z, are becoming increasingly aware of the ecological consequences of AI.

Another critical consideration emerging from the findings is the tension between technological progress and core human-centered values. Respondents expressed concerns about the erosion of empathy and personal connection in services increasingly mediated by AI. Managers should therefore adopt hybrid models, where AI handles routine and data-driven tasks, while human agents continue to provide emotional intelligence, intuition, and personalized care. In healthcare, for example, AI can assist with administrative tasks and data management, but human providers should remain central to patient care, which relies on empathy and trust. Similarly, in education, while AI can support personalized learning, teachers should continue to foster student development through emotional intelligence and mentorship. In customer service, AI can handle routine inquiries, but human agents should still be available to address more complex issues that require empathy. This augmentation strategy (Raisch & Krakowski, 2021)-based on collaboration between humans and machines-helps maintain the human touch, ensuring that technology enhances rather than replaces human capabilities.

The study also highlights fears of labor market disruption, particularly in roles requiring emotional engagement. Rather than replacing jobs, businesses should invest in reskilling and upskilling employees to adapt to new roles emerging alongside AI. Encouraging the coexistence of human labor and AI not only mitigates workforce displacement but also strengthens service quality and operational efficiency.

Additionally, the study underscores the importance of understanding generational perspectives, especially in the context of Generation Z. As the generation most vocal about environmental and social issues, Generation Z's concerns about the environmental and social impacts of AI should not be overlooked. Managers must take these concerns into account when developing and marketing AI-based products and services. This generation places a high value on sustainability, so businesses that can demonstrate their commitment to eco-friendly AI solutions will likely appeal to this growing consumer base. Aligning AI strategies with the values and expectations of this cohort will help ensure that AI adoption is perceived as both a technological and socially responsible advancement.

Originality of the paper. *This research holds significant relevance in the context of understanding the evolving relationship between Generation Z and AI. As this generation becomes increasingly integrated into the digital ecosystem, their interactions with AI, particularly in recognizing environmental, social, and economic impacts, could play a pivotal role in shaping their consumer behaviors, trust in AI, and broader acceptance of AI-driven services. Generation Z's heightened awareness of sustainability issues positions them as a unique demographic whose perspectives on the ethical implications of AI must be carefully considered. Their ability to identify, challenge, or overlook biases embedded within AI, alongside their understanding of the costs associated with AI technologies, will inevitably influence their perceptions of these systems' fairness, reliability, and sustainability.*

Moreover, understanding how Generation Z navigates these concerns is not only crucial for adapting AI systems to align with their values, but it also provides an essential framework for the future development of AI technologies. By examining how this generation either embraces or challenges the ethical and environmental implications of AI, we can identify the key factors that influence their trust in AI and their willingness to adopt AI-driven services. This research, therefore, becomes a crucial avenue for exploring how AI systems can be designed and implemented in ways that foster ethical considerations, reduce biases, and mitigate environmental harm.

In addition, this inquiry is timely as it can offer profound insights into how innovation can be balanced with broader societal goals of equity and sustainability. By examining how Generation Z evaluates the social and ecological ramifications of AI, we can better understand the ways in which these concerns may shape future consumer behavior. This, in turn, will be pivotal for ensuring that technological advancements in AI do not perpetuate social inequalities or contribute to environmental harm.

Strategic Innovation in the Digital Age: Integrating Growth Hacking, Dynamic Capabilities, and Artificial Intelligence

DOMITILLA MAGNI[1] BENEDETTO LORENZO CANNATELLI[2] ALESSANDRO GIUDICI[3]

Abstract

In an environment of rapid technological change and increasing global competitiveness, organizations are constantly seeking innovative approaches to sustain competitive advantage and stimulate growth. This article explores the intersection of growth hacking (GH), dynamic capabilities (DCs) and artificial intelligence (AI), proposing a conceptual framework for strategic innovation management. Through a critical review of the literature, the study examines how the data-driven approach of GH can enhance the development of DCs, facilitating organizational adaptation and continuous innovation. The introduction of AI in this context emerges as a key catalyst, accelerating the identification of market opportunities and optimizing strategic decision-making processes. The findings highlight how the integration of these elements can provide organizations with a sustainable competitive advantage in the digital economy, offering significant implications for both academic research and management practice.

Framing of the Research. *The concept of dynamic capabilities (DCs) emerged as an extension of the resource-based view (RBV) of the firm, which posits that organizations gain competitive advantage through their unique resources and capabilities (Barney, 1991). While the RBV provides valuable insights into why firms differ in performance at a specific point in time, it has been criticized for its static nature, particularly in rapidly changing environments (Eisenhardt and Martin, 2000). To address this limitation, Teece et al. (1997) introduced the DCs framework, defining these capabilities as the firm's ability to integrate, build, and reconfigure internal and external competences to address rapidly changing environments. Subsequent research has refined and expanded this concept. Winter (2003) distinguished between operational capabilities (zero-order) and DCs (higher-order), highlighting that the latter involve change-oriented capabilities that help firms reconfigure their resource base. Teece (2007) further delineated three fundamental processes underlying DCs: sensing (identifying opportunities and threats), seizing (mobilizing resources to address opportunities), and transforming (continuous renewal of assets and organizational structures). More recent theoretical developments have explored the microfoundations of DCs (Teece, 2007; Felin et al., 2012; Scuotto et al., 2022), their relationship with organizational learning (Zollo and Winter, 2002), and their role in digital transformation (Warner and Wäger, 2019). Despite these advances, criticism persists regarding the vagueness and tautological nature of the concept (Arend and Bromiley, 2009), as well as the limited empirical research on how DCs are actually developed and deployed in organizations (Capurro et al., 2022).*

The current economic landscape is characterized by increasingly shorter innovation cycles and intensifying global competition (Teece, 2018). In this context, organizations are seeking innovative approaches to sustain competitive advantage and stimulate growth. Growth Hacking (GH) emerged in the startup ecosystem as a methodology focused on rapid growth through data-driven experimentation (Ellis and Brown, 2017). Originally coined by Sean Ellis in 2010, the term referred to finding scalable, resource-efficient methods to acquire and retain users. While initially associated with digital marketing tactics, GH has evolved into a broader strategic approach encompassing product development, user experience, and data analytics. The academic literature on GH remains relatively nascent. Herttua et al. (2016) conducted one of the first scholarly examinations of the concept, defining it as a process of rapid experimentation across marketing channels and product development to identify the most efficient ways to grow a business. Subsequent work by Bohnsack and Liesner (2019) positioned GH within the broader context of digital entrepreneurship, highlighting its role in accelerating market validation and resource acquisition. A distinctive characteristic of GH is its emphasis on the "build-measure-learn" cycle (Ries, 2011), which enables rapid iteration based on real-time data. This approach facilitates the development of what Blank (2013) terms "customer development", a process of understanding customer needs through continuous experimentation and feedback. The GH methodology also emphasizes cross-functional collaboration, breaking down traditional silos between marketing, product development, and data analysis (Ellis and

DOI 10.7433/SRECP.SP.2025.01

Brown, 2017). Despite its practical impact, GH remains undertheorized within management literature. Existing research has primarily focused on documenting tactics and case studies (Troisi et al., 2020), with limited attention to how these approaches relate to established theories of strategic management and organizational capabilities.

Despite the growing importance of DCs and GH fields, their intersection remains relatively unexplored in the academic literature. GH, with its data-driven approach and emphasis on rapid experimentation, potentially offers practical mechanisms for developing and applying DCs. This connection becomes even more relevant with the advent of AI, which is radically transforming the ways in which organizations acquire, process, and use information for strategic decision making (Agrawal et al., 2018). These advancements not only enhance the capabilities of GH-by enabling more precise customer segmentation, automated experimentation, and personalized marketing-but also strengthen the sensing and reconfiguration dimensions of DCs. AI allows firms to identify weak signals in the market, optimize decision-making in real time, and automate resource reallocation, thereby bridging the gap between short-term growth-oriented strategies and long-term strategic agility.

Existing research on DCs has focused primarily on theoretical and conceptual aspects (Capurro et al., 2022), with limited attention to the practical mechanisms through which these capabilities are developed and implemented in organizations. On the other hand, the literature on GH remains predominantly practice-oriented, with few attempts to frame these techniques in broader theoretical frameworks (Herttua et al., 2016).

This gap in the literature presents a significant opportunity to explore how experimental and data-driven approaches to GH can inform the development of DCs. Moreover, the integration of AI in this context offers new insights into how emerging technologies can enhance both GH and DCs by facilitating faster, data-driven decision making.

The integration of these three elements-GH, DCs, and AI-represents a promising area of research with potential significant implications for both theory and management practice. This study aims to fill this gap by exploring how organizations can leverage the intersection of these fields to effectively navigate complex and rapidly changing business environments.

Purpose of the Paper. *The primary objective of this research is to develop an integrated framework that connects GH, DCs, and AI to advance strategic innovation management. By systematically examining the interplay between these three dimensions, the study aims to provide both theoretical clarity and practical insights into how organizations can leverage their intersection to enhance agility, foster innovation, and drive sustained growth.*

This research first seeks to conceptually analyze the intersection of GH and DCs, identifying the mechanisms through which GH's data-driven approach enhances DCs development. GH is rooted in an agile, iterative mindset that prioritizes fast learning cycles, continuous optimization, and data-driven decision-making. However, while it has been widely adopted in practice, its theoretical implications remain underdeveloped. By linking GH to DCs, this study investigates how experimentation, customer-centricity, and real-time analytics contribute to the development of adaptive capabilities within organizations. Understanding these mechanisms provides valuable insights into how businesses can create and sustain dynamic capabilities in fast-evolving digital landscapes.

The study then examines the role of AI as a catalyst for the integration of GH and DCs. AI is revolutionizing business operations by automating decision-making, enhancing pattern recognition, and enabling predictive analytics (Iansiti and Lakhani, 2020). We explore how AI-driven technologies can augment the effectiveness of both GH and DCs, enabling firms to sense emerging opportunities more efficiently, optimize resource allocation, and accelerate strategic transformations. The research also considers potential challenges, such as the risks of algorithmic bias, ethical concerns, and the need for organizations to develop AI governance frameworks.

Additionally, the research identifies the organizational and contextual conditions that influence the implementation of an integrated GH-DCs-AI approach. While the integration of these elements holds great potential, its success is contingent on various organizational and industry-specific factors. These may include corporate culture, leadership commitment, governance structures, technological infrastructure, and market conditions. This study outlines the key enablers and barriers that shape the adoption and effectiveness of a GH-DCs-AI framework, offering a nuanced understanding of when and how firms can best implement such an approach.

Finally, the study derives actionable managerial implications for firms seeking to implement data-driven approaches to strategic innovation. The research bridges the gap between theory and practice, providing concrete recommendations for business leaders looking to enhance their agility, experimentation capabilities, and AI-driven decision-making processes. By translating research insights into practical frameworks, this study offers guidelines on how organizations can build scalable, resilient, and innovation-oriented business models in an era of rapid technological change.

By pursuing these interconnected objectives, this study aspires to contribute both to the academic discourse on DCs, GH, and AI-driven strategy and to managerial practice in the digital economy. As organizations increasingly operate in highly volatile, technology-driven markets, understanding how they can combine growth-oriented experimentation, DCs, and AI-driven decision intelligence will be essential for long-term success. This research, therefore, offers a comprehensive perspective on how firms can build and sustain competitive advantage by strategically integrating GH, DCs, and AI into their core business practices.

Methodology. *This study adopts a conceptual research methodological approach, based on a critical review of existing literature and the development of a conceptual framework. The choice of a conceptual research methodology is motivated by the exploratory nature of the research, which aims to synthesize and integrate existing knowledge to develop new theoretical perspectives on the intersection of GH, DCs, and AI.*

The first phase of the methodology involves a systematic literature review on the three main theoretical constructs: GH, DCs, and applications of AI in strategic management. The review uses major academic databases (Web of Science, Scopus, EBSCO) and follows a structured process of searching, selecting and analyzing relevant contributions. Inclusion criteria include peer-reviewed articles, scholarly books and, given the emerging nature of some topics, also high-quality white papers from recognized sources. The literature review focuses on identifying key concepts, theoretical relationships, and gaps in existing knowledge, with a focus on mechanisms through which GH and AI can enhance the development of DCs.

The second phase of the methodology involves the development of a conceptual framework that integrates the three theoretical constructs. This framework is constructed through an iterative process of synthesis and abstraction, based on critical analysis of the literature. The goal is to propose a theoretical model that explains how the experimental and data-driven approach of GH, enhanced by AI, can facilitate the development and application of DCs in organizations. The model is evaluated in terms of its internal consistency, explanatory capacity, and relevance to management practice.

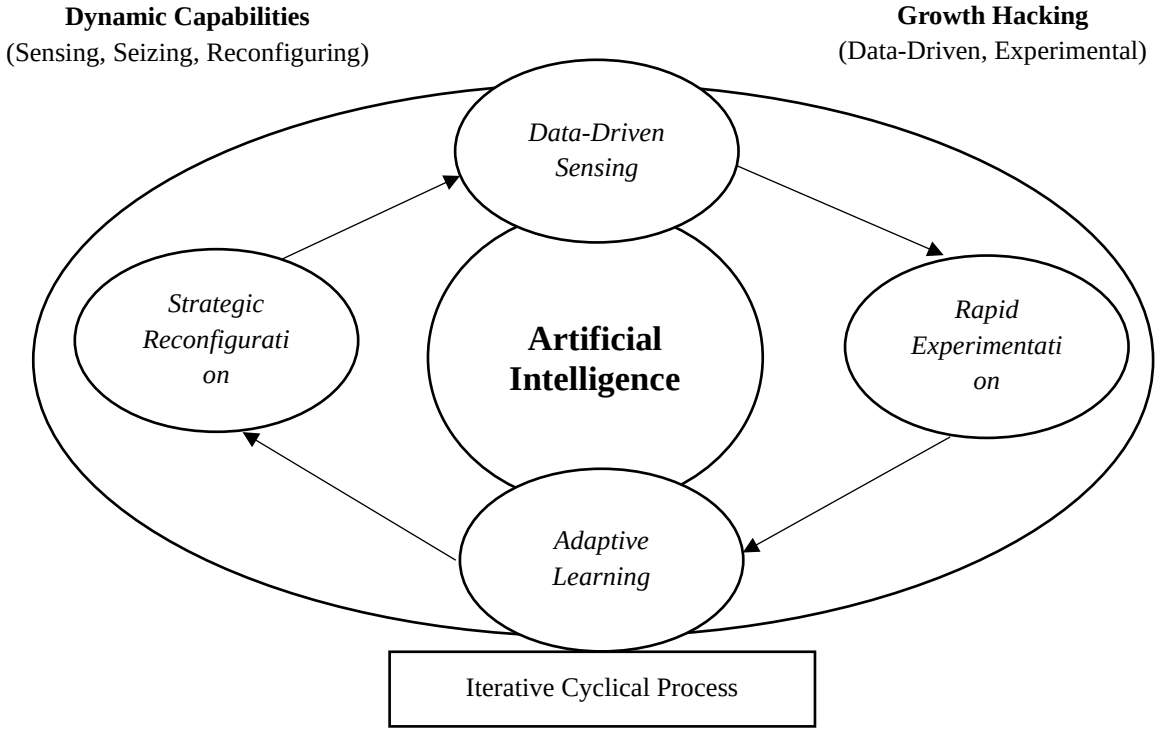
Unlike an empirical study based on case studies or quantitative analysis, this conceptual approach focuses on generating new theoretical insights through the synthesis and integration of existing knowledge. This approach is particularly suitable for exploring intersections between emerging research fields and for developing theoretical models that can guide future empirical research.

Results. *AI has emerged as a transformative force in strategic management, fundamentally altering how organizations process information, make decisions, and allocate resources (Agrawal et al., 2018). AI encompasses a range of technologies, including machine learning, natural language processing, and computer vision, which enable systems to perform tasks that traditionally required human intelligence. In the context of strategic decision-making, AI offers several distinct advantages. First, it enhances organizations' ability to process and analyze vast amounts of structured and unstructured data, identifying patterns that might otherwise remain undetected (Vlačić et al., 2021). Second, AI facilitates real-time decision-making, enabling organizations to respond more rapidly to emerging opportunities and threats (Iansiti and Lakhani, 2020). Third, AI can augment human capabilities by automating routine tasks and providing decision support, allowing managers to focus on higher-level strategic thinking (Akter et al., 2023).*

The literature on AI and strategic management has primarily focused on how these technologies can enhance operational efficiency and decision quality. Agrawal et al. (2018) argue that AI fundamentally reduces the cost of prediction, making it increasingly feasible to automate decision processes that involve forecasting. Iansiti and Lakhani (2020) extend this perspective, suggesting that AI enables the creation of "digital operating architectures" that can fundamentally transform competitive dynamics within industries. More recent research has begun to explore the organizational implications of AI adoption. Benbya et al. (2020) highlight the need for complementary human capabilities and organizational structures to effectively leverage AI technologies. Similarly, Raisch and Krakowski (2021) examine the tensions that arise as organizations navigate the integration of human and AI in decision-making processes. The literature review revealed significant patterns in the intersection of GH, DCs, and AI, leading to the development of an integrated conceptual framework for strategic innovation management. The findings are organized around four main themes that emerged from the analysis.

First, the analysis revealed specific mechanisms through which the data-driven approach of GH reinforces the development of DCs. In particular, the "build-measure-learn" cycle characteristic of GH emerged as a powerful tool for accelerating the processes of detection, capture, and reconfiguration identified by Teece (2007) as key components of DCs. The GH approach, with its emphasis on continuous experimentation and rapid learning, enables organizations to sharpen their ability to "sense", that is, to perceive environmental changes in a timely manner; to "seize", that is, to readily grasp emerging opportunities; and to "reconfigure", that is, to effectively reconfigure their resources. This relationship is particularly evident in case studies of technology startups, where data-driven cross-functional teams have demonstrated remarkable adaptability and innovation.

Second, AI has emerged as a powerful catalyst in the integration of GH and DCs. AI technologies, particularly machine learning and natural language processing algorithms, significantly improve the detection capabilities of organizations, enabling the identification of patterns and trends that would be difficult to detect with traditional methods. In addition, AI-based decision-making systems accelerate decision-making processes, enabling faster and more personalized responses to market opportunities.



The third emerging theme concerns the organizational and contextual conditions that facilitate effective implementation of the integrated framework. Critical factors identified include: an organizational culture that values learning and experimentation; flexible organizational structures that foster cross-functional collaboration; governance systems that balance autonomy and strategic alignment; and complementary expertise in analytics, technology development, and business strategy. These contextual factors act as moderators in the relationship between GH, DCs, and innovation performance.

Finally, the analysis led to the development of a processual framework that illustrates how organizations can implement an integrated approach to GH, DCs, and AI. The framework identifies four iterative steps: (1) Data-Driven Sensing, the use of data and AI to identify emerging opportunities; (2) Rapid Experimentation, the design and implementation of targeted experiments; (3) Adaptive Learning, the extraction of insights from experiments and their integration into the organization's knowledge base; and (4) Strategic Reconfiguration, the reallocation of resources and revision of strategic priorities based on the knowledge generated. This cyclical process provides a practical mechanism

for the continuous development of dynamic capabilities through the application of artificial intelligence-enhanced growth hacking principles.

Figure 1 shows how GH, DCs, and AI integrate into a cyclical process with four main phases.

Fig. 1: Integrated Framework: Growth Hacking, Dynamic Capabilities and Artificial Intelligence

These findings contribute both to the theoretical literature on DCs and strategic innovation and to managerial practice in the digital economy. The framework developed offers a theoretical lens for understanding how organizations can develop adaptive capabilities in dynamic contexts and provides practical guidelines for managers seeking to implement data-driven approaches to strategic innovation.

Research Limitations. *The conceptual framework proposed in this study suffers from several methodological and theoretical limitations that warrant careful consideration. The purely conceptual nature of this research represents its fundamental limitation. While the theoretical integration of GH, DCs, and AI is grounded in established literature, the framework lacks empirical validation across diverse organizational contexts. Without empirical testing, the validity, boundary conditions, and practical utility of the framework remain speculative. Conceptual frameworks, though valuable for advancing theoretical development, inherently lack the robustness of empirically validated models.*

The rapidly evolving technological landscape introduces significant temporal constraints to the framework's applicability. AI technologies are advancing at an unprecedented pace, potentially rendering specific technical aspects of the framework obsolete even as the broader theoretical relationships may retain their validity. This technological fluidity creates substantial challenges for developing enduring theoretical propositions about AI's role in organizational capabilities and strategic management processes.

The framework also faces contextual limitations regarding its generalizability. Its effectiveness likely varies significantly across different industries, organizational sizes, and cultural contexts based on industry-specific dynamics, organizational maturity in digital capabilities, and regional variations in technological adoption. The current conceptualization does not sufficiently address these contingency factors that may moderate the proposed relationships between GH, DCs, and AI implementations.

Implementation complexities represent another significant limitation. The integration of GH methodologies, DC development processes, and AI technologies involves substantial organizational challenges related to cross-functional coordination, knowledge management, and change management. These practical integration challenges may be considerably more complex than the conceptual framework suggests, potentially limiting its practical utility for management practitioners seeking implementation guidance.

Although the framework proposes relationships between the three central constructs, the precise causal mechanisms, potential feedback loops, and interaction effects require further theoretical refinement and eventual empirical verification. The current framework does not fully explicate whether these relationships manifest as linear progressions, recursive cycles, or complex interactions moderated by other organizational factors.

Ethical and governance aspects receive insufficient attention in the current framework. The ethical implications of AI-enhanced growth hacking strategies-including privacy concerns, algorithmic bias, and transparency issues-represent crucial considerations for organizational implementation. Similarly, governance requirements for responsible AI deployment in strategic decision-making processes are not comprehensively addressed, creating potential blind spots in the framework's practical application.

Despite efforts to conduct a comprehensive literature review, selection biases may have influenced the conceptual development process. The interdisciplinary nature of this research domain creates challenges for ensuring complete coverage of relevant literature across management, information systems, and computer science disciplines. These potential biases may have shaped the theoretical relationships proposed in the framework.

Finally, the temporal context of this research reflects current knowledge paradigms in management and technology. Future paradigmatic shifts in either domain could significantly alter the theoretical foundations upon which this framework is constructed, potentially limiting its long-term relevance in rapidly evolving business and technological landscapes.

These limitations suggest several promising avenues for future research that could enhance both the theoretical robustness and practical utility of the proposed framework. Empirical studies should test the propositions embedded within this framework, employing both qualitative case studies to explore implementation processes and quantitative methods to measure performance outcomes. Longitudinal research designs would be particularly valuable for examining how the integration of GH, DCs, and AI evolves over time within organizations facing different competitive and technological environments. Research investigating contingency factors that influence the effectiveness of the framework across different contexts would significantly enhance understanding of its boundary conditions and improve its practical applicability. Studies examining variations across industries, organizational sizes, geographical regions, and cultural contexts could provide valuable insights into the contextual determinants of successful implementation.

Future scholarly work should explore the specific mechanisms through which AI technologies enhance the relationship between GH and DCs. This could involve process studies examining how AI-enabled data analytics and decision-making processes influence organizational learning and capability development. Understanding these mechanisms would strengthen the theoretical foundations of the framework and provide more nuanced guidance for implementation. Moreover, interdisciplinary research collaborations between management scholars, computer scientists, and ethics researchers could address the ethical and governance dimensions of implementing AI in strategic management processes. Such collaborations could develop guidelines for responsible AI deployment in organizational decision-making, addressing a significant gap in the current framework.

The limitations identified in this study do not diminish the potential contribution of this conceptual framework to our understanding of how organizations can navigate increasingly dynamic business environments. Rather, they highlight the need for continued theoretical refinement and empirical investigation to advance our understanding of how organizations can effectively leverage the integration of GH, DCs, and AI to enhance their competitive positioning in digital ecosystems.

Managerial Implications. *The findings of this study offer several significant implications for managers seeking to effectively navigate complex and rapidly changing business environments. These implications are particularly relevant for business leaders, innovation managers, and strategic decision makers.*

The proposed integrated framework provides managers with a practical model for implementing data-driven approaches to strategic innovation. By adopting the cyclical process of data-driven sensing, rapid experimentation, adaptive learning, and strategic reconfiguration, leaders can build more adaptive and responsive organizations. This approach requires a mindset shift by managers from traditional planning cycles to more agile and iterative decision-making processes. Managers should consider implementing strategic "sprints" that incorporate elements of growth hacking into their planning processes, enabling more frequent adaptations in response to emerging data.

The study highlights the importance of strategic investments in data analytics capabilities and AI technologies as a basis for developing DCs. Managers should critically assess the analytic maturity of their organizations and identify opportunities to improve data infrastructure and analytic skills. This does not necessarily require massive investments in cutting-edge technologies; incremental improvements in data quality, accessibility, and core analytic skills can also lead to significant competitive advantages. Organizations can develop tiered approaches to analytical capability building, starting with foundational data management practices before progressing to more sophisticated AI applications that drive predictive and prescriptive analytics.

The results underscore the importance of creating the right organizational conditions for effective implementation of the framework. Managers should focus on developing a culture that values learning and experimentation, in which failures are seen as learning opportunities rather than mistakes to be avoided. Flatter organizational structures and cross-functional teams can facilitate collaboration and integration of the skills needed to effectively implement GH approaches. Governance systems should balance the autonomy needed for rapid experimentation with the strategic alignment that ensures consistency of initiatives. Leadership plays a critical role in modeling experimental mindsets and protecting innovation initiatives from traditional organizational pressures for immediate returns on investment.

Moreover, the results highlight the importance of a balanced approach to innovation that integrates elements of exploration (identifying new opportunities) and exploitation (optimizing existing opportunities). The proposed framework enables organizations to pursue both goals simultaneously, using data and experimentation to continuously optimize

existing offerings as they explore new strategic directions. This ambidextrous approach requires thoughtful portfolio management, with explicit allocation of resources between initiatives focused on core business optimization and those pursuing more disruptive opportunities. Organizations can develop specialized teams with distinct metrics and governance structures appropriate to these different innovation horizons, while ensuring knowledge flows between explorative and exploitative activities.

By implementing these implications, managers can position their organizations to thrive in the digital economy by developing the ability to rapidly adapt to change and capitalize on emerging opportunities through a data- and experimentation-driven approach to strategic innovation.

Originality of the Paper. *The originality of this research lies in its novel integration of three distinct theoretical domains: GH, DCs, and AI. While previous literature has examined relationships between pairs of these constructs-such as AI's role in enhancing organizational capabilities (Raisch & Krakowski, 2021) or GH's contribution to organizational agility (Ellis & Brown, 2017)-this study represents the first comprehensive attempt to develop an integrated theoretical framework encompassing all three domains. The conceptual synthesis presented advances management theory by proposing specific mechanisms through which the experimental, data-driven approaches characteristic of GH can be enhanced by AI technologies to systematically develop DCs that sustain competitive advantage in turbulent environments.*

This research contributes to the DCs literature by extending Teece's (2007) sensing-seizing-transforming framework through the incorporation of GH methodologies and AI-enabled processes. Specifically, the framework proposes that AI-enhanced GH practices can significantly improve an organization's sensing capabilities through advanced pattern recognition in market data, enhance seizing capabilities through rapid experimentation and learning, and facilitate transforming capabilities through more efficient resource reconfiguration processes. This extension addresses Winter's (2003) criticism regarding the operational specificity of DCs by providing concrete mechanisms through which organizations can systematically develop higher-order capabilities.

Furthermore, this research advances the emerging literature on GH by providing theoretical grounding for its practices within established strategic management frameworks. By positioning GH as a potential antecedent to DCs development, the study elevates GH from a predominantly tactical marketing approach to a strategic organizational capability with implications for long-term competitive advantage. This theoretical repositioning responds to calls for stronger theoretical foundations in the GH literature (Cristofaro et al., 2025).

The study also makes a distinctive contribution to the literature on AI in strategic management by moving beyond technological determinism to examine how AI technologies interact with organizational processes and capabilities. Rather than treating AI as an exogenous technological force, this framework conceptualizes it as an endogenous element that both shapes and is shaped by organizational capabilities and strategic approaches. This conceptualization aligns with sociomaterial perspectives on technology (Orlikowski & Scott, 2008) and offers a more nuanced understanding of AI's strategic implications than prevailing technocentric approaches.

Additionally, the research offers methodological originality through its integrative literature review approach spanning multiple disciplines. By synthesizing insights from strategic management, marketing, information systems, and computer science literatures, this study demonstrates the value of cross-disciplinary integration in developing novel theoretical perspectives on contemporary management challenges, responding to calls for greater disciplinary integration in management research (Thorpe & Rawlinson, 2014).

The originality of this research lies not merely in its examination of emerging phenomena, but in its theoretical integration, extension of established frameworks, repositioning of emerging concepts within strategic management theory, and cross-disciplinary methodological approach. These contributions collectively advance our understanding of how organizations can develop sustainable competitive advantage in increasingly dynamic digital environments through the strategic integration of GH approaches, AI technologies, and DCs development processes.

Using Artificial Intelligence in Business-to-Business Sales Processes[1]

LENA NIEDERER[2] ULRIKE MAYRHOFER[3]

Abstract

This short paper investigates the use of Artificial Intelligence (AI) in Business-to-Business (B-to-B) sales processes. AI technologies evolve rapidly and offer multiple benefits to companies who use them in an appropriate way. Our objective is to understand how companies can use AI to improve their B-to-B sales processes. We conducted a qualitative study based on semi-structured interviews with AI experts. Our findings show that the use of AI can automate and streamline sales tasks, and enhance customer interaction through personalized services and predictive customer behavior analytics. The implementation of AI tools can therefore lead to increased customer satisfaction and loyalty if it is aligned with the customer relationship policy of the company. Our study highlights the critical importance of ethical considerations concerning data privacy and data biases. We show that AI can optimize sales processes if ethical and trust issues as well as adaptations to customer expectations are addressed.

Framing of the research. *Artificial Intelligence (AI) leads to profound transformations in the way companies organize their activities and interact with their stakeholders. Due to its unique capabilities (Vannuccini & Prytkova, 2023), AI is becoming more integrated in organizational processes, products and services, with an almost "magical" appeal to companies and individual users (Campolo & Crawford, 2020). According to the Organization for Economic Co-operation and Development, "an AI system is a machine-based system that is capable of influencing the environment by producing an output (predictions, recommendations, or decisions) for a given set of objectives. It uses machine and/or human-based data and inputs to (i) perceive real and/or virtual environments; (ii) abstract these perceptions into models through analysis in an automated manner (e.g. with machine learning), or manually; and (iii) use model inference to formulate options for outcomes. AI systems are designed to operate with varying levels of autonomy"* (OECD, 2019).

In the field of management science, Raisch and Krakowski (2021: 192) define AI as "machines performing cognitive functions that are usually associated with human minds, such as learning, interacting, and problem-solving." Sestino and de Mauro (2022) conduct a literature review to identify the domains in which AI can be used by companies. They propose a comprehensive framework called "IAM (Implications, Applications, Methods)". Concerning the implications, AI can be used in automatization of routine tasks and enhance decision making through the analysis of vast amounts of data or the employment of chatbots. Companies need to consider ethical issues and the authors suggest the creation of a synergetic ecosystem between humans and AI. Concerning applications, AI can be used in multiple areas such as healthcare, finance and marketing, and it can contribute to the development of smarter manufacturing processes and enhanced resource management. Concerning the methods, AI provides predictive analytics that can be used for the forecasting of future trends such as sales forecasting, sentiment analysis and financial distress predictions. This forecasting can contribute to enhance information-based decision making. The capability of AI to recognize patterns or anomalies in data can help segmenting customers for targeted marketing campaigns, detecting frauds and improving risk management. Generative AI is able to perform better in some specific tasks than human beings.

Purpose of the paper. *In this "work-in-progress" paper, we investigate the use of Artificial Intelligence (AI) in Business-to-Business (B-to-B) sales processes, in which companies aim to facilitate interactions to build long-term relationships with their customers. In such processes, AI can contribute to cost efficiency and value creation, but it can also lead to value destruction if it is used inappropriately, for example in its connectivity or cognitive abilities (Canhoto & Clear, 2020). The objective of our paper is to understand how companies can use AI in B-to-B sales processes.*

Methodology. *We used a qualitative research design to investigate a largely unexplored phenomenon* (*Ghauri, Gronhaug & Strange, 2020). We conducted eight semi-structured interviews with AI experts to understand how companies can use AI in B-to-B sales processes. The interviews were conducted in April 2024 and their average duration was about one hour. We selected the participants based on their expertise in the field of AI. Table 1 presents the list of interviewees.*

Table 1: List of interviewees

Interviewee	*Function*	*Key information & background*
Expert 1	*Professional in AI Consultancy*	*Former IT manager, transitioned to AI consultancy focusing on lead generation*
Expert 2	*Professor and Trainer*	*Specialized in leadership training, incorporates generative AI into training and research*
Expert 3	*PhD Student in Public Management*	*Researches AI's implementation in local authorities, focusing on public sector applications*
Expert 4	*PhD Student in HR Management*	*Researches AI in HR processes, interested in automation and its impact on human resources*
Expert 5	*Junior Professor in Economics of AI*	*Focuses on the economics of AI and innovation by exploringg AI applications*
Expert 6	*PhD Student and AI Coaching Entrepreneur*	*Entrepreneur, PhD Student, launched AI coaching startups, specializes in AI for leadership development*
Expert 7	*Cybersecurity Manager*	*Manages cybersecurity in a company, expert in AI applications*
Expert 8	*AI Business Applications Consultant*	*IT consultant, former academic, PhD in international business, specializes in AI applications*

We conducted semi-structured interviews to allow participants to share detailed narratives about their experiencesAll interviews were conducted with Google Meets, recorded in the Google application and retranscribed by the TurboScribe software. Table 2 presents the interview grid, which was elaborated based on our literature review.

Table 2: Interview grid

1. Introductory questions
Could you introduce yourself?
What is your job/research position, your major responsibilities?
What is your professional experience with AI?

2. Understanding AI and Business Practices
How do you view the impact of AI on business practices?
Can you highlight significant advancements in AI that have fundamentally changed business practices?
How do you anticipate that AI will evolve over the next decade, especially in their application to business practices?

3. AI's Impact on Business Processes
What areas of business operations do you see as having the highest potential for transformation through AI?
Could you share an experience, a case study or piece of research where AI significantly automated tasks or enhanced decision-making?
Which emerging AI applications do you predict will be crucial in business processes in the near future?

4. Ethical Considerations and Challenges
From your research or experience, what are the most pressing ethical considerations and challenges in implementing AI in companies?
How should companies address issues of bias and fairness in AI algorithms according to your findings or insights?
What strategies would you recommend to companies for overcoming these ethical challenges effectively?

5. AI in Enhancing Sales Processes
What specific challenges or issues within sales processes are companies aiming to address when they decide to integrate AI technologies?
In your observation, how have AI applications transformed sales processes within organizations?
What processes have proven effective in overcoming resistance to AI adoption among sales teams?
What are some examples where AI has significantly improved efficiency or outcomes in sales activities?
Have you identified any potential drawbacks or limitations of AI in sales decision-making in your research? If so, how do you propose to mitigate these issues?

6. Collaboration, Knowledge Sharing and Future Directions
Who typically leads the exploration and implementation of AI technologies for sales within organizations?
How is knowledge about effective AI applications in sales shared and spread within your organization?
Based on your experience or research, what potential drawbacks or limitations of AI in sales decision-making have you identified? How might these be mitigated?
How do organizations evaluate the effectiveness of AI applications in their sales processes, and can you provide an example of when a strategy had to be significantly adjusted?
What future trends in AI utilization within sales processes do you anticipate, and how should organizations prepare to adapt?
What advice would you give to organizations looking to leverage AI technologies to enhance their sales processes based on your insights?

We used a thematic analysis to identify key themes and patterns throughout the interviews (Ghauri, Gronhaug & Strange, 2020). All interviews were carefully analyzed to gain a deep understanding of the underlying mechanisms. We created initial codes to understand the structure of each interview and to get an overview of the emerging themes. We then identified the key themes and patterns before analyzing and structuring them carefully.

Results. *The analysis of our findings highlight how companies can use AI to improve B-to-B sales processes.*

Our interviews indicate that AI can increase automation and efficiency by analyzing large datasets, which can improve the lead generation and selection. Companies can therefore optimize sales strategies and improve conversion rates through AI.

"Certainly… the lead generation, it's another area that's really interesting. Of course… how you generate leads in terms of message, in terms of managing the interaction with leads, all these things can be automated. And of course, AI can help this automation, to be more performing." (Professor and Trainer)

Our data also shows that AI can enhance innovation in areas such as product development, marketing strategies and customer segmentation. The use of AI provides new ways of engaging with customers and markets. Also, the development cycle of new products can be accelerated, and products can be adapted faster to consumer needs and preferences. There are two ways how AI can provide capabilities that improve and accelerate innovation: "enabling" capabilities help companies to develop new skills and "enhancing" capabilities support companies to improve existing products. Thereby, AI can automate routine tasks, reinforce existing processes without removing the human contribution or reveal new insights or opportunities for innovation (Gama & Magistretti, 2023). AI can change the way how the target audience is reached and marketing campaigns can be personalized to increase customer satisfaction by showing them more relevant and engaging contents. Consequently, this can drive more customers to purchase the product. The data can also be used to strategize customer segmentation. The behavior, preferences and demographic information can be analyzed by AI to allow companies to develop highly targeted sales strategies.

"The first point is to be able to improve the understanding of the clients they are going to talk to. So it's kind of making all the data available, transforming something sales persons can read immediately in a very short and readable source. So if you are prepared and you know who you are going to talk to, it's going to improve enormously your productivity. You don't have to spend hours in trying to get information here and there." (Professor and Trainer)

The analysis also highlights the importance of aligning the use of AI in sales processes with the corporate strategy to achieve a satisfactory return on investment.

"If tomorrow you are the CEO and you decide to implement AI in your company, do you want to have a good ROI, a return on investment? Yes. That's why I told you first marketing, and second supply chain, and management controlling, etc. Because if you want to install AI in your company, you have obviously a return on investment in your AI. However, for one software, it's 500,000 euros. So it's not cheap." (PhD Student in HR Management)

Our findings show that companies should also consider ethical concerns and in particular bias and privacy concerns. AI can treat sensitive data in sales processes and this can lead to transparency and security issues. The way that sensitive client data is collected, used and stored is crucial for maintaining trust and compliance. Moreover, there exist possible biases inside the training data of AI algorithms. This can lead to unfair customer profiling or other discriminatory practices. In such situations, AI might evaluate the creditworthiness based on biased datasets. It is therefore important to be compliant with the law that outlines how AI can be used in organizations.

"First of all, to train people how it works. To be aware that there's going to be biases and what is the effect of the impact of these biases. And also, to be compliant with the law, I think is important. For example, in Europe, we have the AI Act. Yes. For example, so if they don't know how to use it or what the impact may be, refer to an ethical committee to be sure of that." (PhD Student in Public Management)

It is also necessary that the salesforce receives training to develop a deep understanding of AI capabilities and limitations (Faulconbridge, Sarwar & Spring, 2023). Salespeople can then fully leverage AI applications to increase their sales performance. Continuous learning initiatives are important to ensure that employees know the latest AI-tools and how to use them in their specific roles and functions. By educating the salesforce, the company can enhance the trust in technologies and provide employees the possibility to develop their competences, and thus to improve sales processes.

"You have to educate people, you have to explain them how they can use AI to improve what they're doing, right? That's what I'm doing with, you know, with coaches or with human resources. They were all afraid, but now today, they all want to be trained. They all want to use it because they understand they can do a better job. So, that's the thing. The way to remove fear is just to explain what are going to be benefits of AI and how they can use it. Education."(PhD Student and AI Coaching Entrepreneur)

AI allows to develop the level of personalization and to tailor interactions based on individual customer behaviors and preferences. This is achieved through high-level data analysis that informs marketing strategies and optimizes product offerings. AI can thus enhance customer engagement. In addition, AI-powered tools such as chatbots and virtual assistants are revolutionizing customer services. They can provide timely and useful responses and thus improve the overall customer satisfaction. Predictive analytics can anticipate customer needs and suggest proactive actions. This process can enhance the customer experience and loyalty. Companies integrate AI with CRM systems to deepen customer insights and improve sales through targeted marketing and personalized service offerings.

"So, customer relationship management or supports, right? So here AI is going to transform and potentially completely automate. It's already the case, you know, like the customer support and all these things, because, these are very much, you know, replicable patterns. So, you have a problem with the products, you have a question, you need some intervention." (PhD Student and AI Coaching Entrepreneur)

As suggested by Elshan, Ebel, Söllner and Leimeister (2023), companies could develop smart personal assistants based on AI by using low code platforms to make the user experience even more personalized. This step could drive customer interaction and satisfaction. The reshoring of tasks that had previously been outsourced to low cost countries highlights an important shift towards more technologically advanced solutions such as chatbots. These AI tools are not

just cost-effective but also bring operations closer to the core business and can even improve control over service quality.

"But customer service anyway, once again, economically speaking, if you are a company and you try to minimize your cost, so you know what has happened in previous times, people have, companies have externalized these services to developing countries because it costs less. Is it good, is it bad? But that's something that has happened. Now, a lot of these tasks are reshored because instead of somebody in a third party country, you can do it with the chatbot."(Junior Professor in Economics of AI)

Our findings further reveal that AI can tailor communication to individual preferences, which can significantly increase conversion rates and loyalty. AI continuously analyzes metrics and provides feedback for dynamic strategy adjustments. This integration improves operational efficiency and ncreases sales effectiveness in a competitive business environment. AI can optimize sales processes in multiple ways. The capabilities include providing detailed analytics and predictions that help in negotiation, automating customer follow-ups and decreasing the workload of sales teams. By handling these operational aspects, AI allows salespeople to use their time for more strategic activities, such as refining sales strategies or addressing complex issues with key clients.

"AI is going to give me the best possible reports, the best possible predictions. So, it's going to help me negotiate […]. Yes, and then it's going to help me do the follow-up process. So, as a salesperson, it can be very tiring. We see many salespeople not doing the right follow-up for the customers […]. So, the AI is going to help me go back to my customers so I can work on something that is more important, like strategic issues for my company. Or I can put my attention on more critical and deep problems with my most important customers. So, AI can play a critical role in many different moments of a sales process from investigation to closing. You can automate your prospection." (PhD Student and AI Coaching Entrepreneur)

Indeed, AI can simplify the logistical components of sales and it can also enrich the strategic aspects, which can help sales teams to engage more deeply and effectively with their customer base. The integration of AI into sales processes enhances efficiency, accuracy and personalization, which can result in significant improvements in customer relationship management and sales outcomes.

"Right now, it's helping to streamline the sales process. Likewise, it sometimes makes documents more professional. Quite simply, sales proposals are often 10-15 pages long and badly formatted. Having them reviewed by Al means they are in better shape, more presentable to the customer. And it saves an incredible amount of time, literally. It often takes 2-3 hours to draw up a sales proposal. With Al helping us by giving us the keywords and everything else we need to fill in, in half an hour, it's done." (Cybersecurity Practice Leader)

AI is able to take over the creation of sales documents, which is a time-consuming task. Through the automatization of the formatting and the content generation of sales proposals, AI can ensure a higher standard of document creation and also significantly reduce the time sales teams spend on these activities. This allows them to allocate more time to engage directly with clients or to improve sales strategies, and thus to increase productivity and to improve customer interactions. The efficiency brought by AI through document management underlines its value in optimizing various aspects of the sales process, from administrative tasks to client communication. AI can also improve customer relationship management, particularly with the use of chatbots. By automating customer interactions, chatbots provide immediate assistance, support and answers, which helps to augment the quality of the customer's experience by reducing wait times and delivering fast responses. This level of automation can improve customer satisfaction and optimize the workload of customer service teams who can then focus on more complex requests and tasks. The integration of AI can streamline operations and significantly improve the overall quality of customer services.

"Certainly, all the consumer relationship management. This is the most obvious part. So, all these interactions, the chatbots that guide the interaction with consumers in an automatic way, that makes the life of customers easier because they don't have to wait to talk with somebody."(Professor and Trainer)

Research limitations. *Our study presents several limitations that provide interesting research perspectives. It would be useful to collect additional data by interviewing suppliers and customers to capture the diversity of AI applications in B-to-B sales processes. Future research should also examine ethical and societal concerns such as the impact of AI on employment. Further investigation into the long term effects of AI on customer relationships and sales performance would help to to gain deeper insights into the sustainability of AI-driven strategies. It is necessary to develop robust frameworks that can adapt to new AI developments and evaluate their effectiveness in decreasing biases, ensuring privacy and maintaining trust in AI-powered sales practices.*

Managerial implications. *Our study shows that companies need to carefully manage the use of AI in B-to-B sales processes. They should align the implementation of AI with their strategic objectives to increase their return on investment. They need to prepare and train their sales teams so that they can fully leverage AI capabilities, but they should also consider ethical implications when using AI for customer relationship management.*

Originality of the paper. *In this short paper, we explore how companies can use AI to enhance B-to-B sales processes. Our findings show that AI can sustain the shift towards more intelligent, efficient and customer-centric business operations. AI revolutionizes the way businesses interact with their customers and enhances data-driven decision-making capabilities, which can contribute to improve sales performances and to develop new competitive advantages.*

Key words: *Artificial Intelligence, Sales Processes, Business-to-Business.*

The Impact of AI Tool Usage on Student Well-Being in Higher Education: The Moderating Role of Self Efficacy

FRANCESCA CELIO[1] EMANUELA STAGNO[2] FRANCESCO RICOTTA[3]

Abstract

The increasing integration of artificial intelligence (AI) tools in higher education has raised critical questions about their impact on student well-being. This study examines the relationship between AI tool usage and well-being, with self-efficacy as a moderating variable. Grounded in positive psychology, the research differentiates between hedonic well-being, associated with immediate pleasure and life satisfaction, and eudaimonic well-being, which reflects personal growth and self-actualization.

Results indicate that AI tool usage negatively affects hedonic well-being unless moderated by high self-efficacy, which enables students to derive greater satisfaction from AI-assisted learning. Conversely, AI tool usage alone does not significantly influence eudaimonic well-being, but when self-efficacy is high, students experience enhanced psychological flourishing. These findings highlight self-efficacy as a crucial determinant in maximizing AI's benefits, shaping students' ability to transform technology into a tool for both subjective happiness and long-term self-development.

This study underscores the importance of analyzing the distinct effects of AI on hedonic and eudaimonic well-being, as their underlying mechanisms differ. The insights contribute to educational strategies aimed at fostering digital competence and psychological resilience in AI-enhanced learning environments.

Framing of the research. *The proliferation of artificial intelligence (AI) in educational settings has emerged as a pivotal area of study within the academic and technological communities (Chen et al., 2020). AI technologies, encompassing systems such as adaptive learning platforms, AI-driven tutoring systems and data analytics, are increasingly being integrated into university environments to enhance the learning experience and operational efficiencies. While substantial research has focused on the pedagogical and administrative advantages of these tools (Timms, 2016; Chassignol et al., 2018), less attention has been given to their broader impacts on the well-being of users-students.*

The educational environment offers a unique context for studying the impact of AI on well-being. As universities increasingly adopt AI tools for various functions, from personalized learning to administrative automation, understanding how these technologies affect the well-being of their primary stakeholders-students-becomes crucial.

The implementation of these tools has demonstrated considerable effectiveness and practicality. However, their adoption is not without drawbacks, as the potential for adverse effects remains a critical concern. As is often the case with emerging technologies, the risk of dependency is substantial (Diener et al., 1999; Kwon et al., 2016). Therefore, striking a balance between the benefits and the potential downsides of their usage presents a significant challenge.

Gaining a deeper understanding of how these technologies impact end-users' overall well-being is essential, especially given the rising usage rates among younger generations, including university students.

The current literature indicates a growing prevalence of AI in education but lacks a comprehensive examination of its implications for individuals' well-being, particularly through the lenses of eudaimonic and hedonic perspectives.

This research seeks to explore the effects of AI tool utilization on individual well-being within the context of higher education, providing a nuanced analysis of both psychological and subjective well-being. To anchor this investigation, we draw upon established theories in positive psychology (Ryff et al., 2021), which distinguish between two primary forms of well-being: eudaimonic and hedonic well-being.

Eudaimonic Well-Being sees its origin in the Greek term 'eudaimonia', which translates to 'human flourishing', eudaimonic well-being - also called psychological wellbeing- is deeply rooted in the realization of personal potential and intrinsic growth. According to Waterman (1993), based on the theory of eudaimonia, eudaimonic well-being encompasses the degree to which an individual is living in accordance with their 'daimon', or true self, thereby achieving personal excellence and their true potential. This concept is further elaborated by Ryff (1989), who identifies six key components

of eudaimonic well-being: autonomy, personal growth, purpose in life, environmental mastery, positive relatedness, and self-acceptance. Each component represents a facet of an individual's capacity to lead a rich and fulfilling life.

Hedonic Well-Being, conversely, often referred to as subjective well-being, focuses on happiness and life satisfaction. This dimension of well-being is primarily concerned with the accumulation of pleasure and the avoidance of pain, as described by Ahuvia and Friedman (1998). It emphasizes two main aspects: the overall life satisfaction and the presence of positive emotional experiences. This perspective on well-being highlights the immediate affective outcomes of engaging with life's experiences.

This study examines self-efficacy as a moderating factor in the relationship between AI tool usage and student well-being, distinguishing between eudaimonic and hedonic dimensions.

From the perspective of self-actualization-encompassing the realization of one's true self, potential, and positive experiences-the influence of psychological motivation theories and social cognition (Bandura, 1977) on the literature becomes evident, particularly through the introduction of the self-efficacy construct.

Self-efficacy, classified as a competence belief, refers to an individual's confidence in their ability to handle future situations or tasks effectively. Over the past decade, research on student self-efficacy has gained increasing prominence in the fields of academic motivation and achievement (Schunk et al., 2014). Bandura posited that self-efficacy shapes individuals' choices, effort levels, and persistence. Specifically, individuals with low self-efficacy regarding a given task tend to avoid it, whereas those who perceive themselves as capable are more likely to engage actively.

Furthermore, Nyberg et al. (2022) highlight a positive correlation between knowledge and self-efficacy, identifying it as a key predictor of performance. They associate scientific competence with self-efficacy, which they define as comprising two dimensions: knowledge of scientific content and the ability to engage in scientific reasoning. Their findings reinforce the notion that self-efficacy extends beyond academic performance, influencing motivational processes, self-regulation strategies, self-perception, and personal interests. These conclusions align with earlier research by Bandura & Schunk (1981), Klassen & Usher (2010), Pajares & Valiante (1997), and Schunk (1995), which collectively underscore the pivotal role of self-efficacy in shaping both academic and psychological outcomes.

The theory of self-efficacy is considered a fundamental theoretical contribution to the study of academic achievement, motivation, and learning (Pajares, 1996; Schunk, 1991).

Several studies have consistently shown how self-efficacy influences people's willingness to adopt new technologies (Holden et al., 2011; Zhang et al., 2017; Ellen et al., 1991). People who believe in their ability to use technology tend to be more motivated and confident in achieving good outcomes, in contrast to those who doubt their technological abilities (Noe and Wilk, 1993; Tannenbaum et al., 1991). In addition, people who feel competent with technology are more engaged, have more positive attitudes towards using technology-based services, and are more likely to continue using them than those who are less confident in their technological abilities (Dabholkar and Bagozzi, 2002).

Despite the increasing integration of AI technologies in educational settings, there remains a significant gap in empirical research concerning their impact on well-being. Existing studies (George and Wooden, 2023; Al-Surmi et al., 2022) have primarily concentrated on AI's role in enhancing learning outcomes and operational efficiency without adequately addressing the psychological and emotional states of the users. This oversight is notable, especially given the rising concern about mental health in academic environments globally.

Purpose of the paper. *This research aims to fill this gap by focusing on the direct and indirect effects of the use of AI tools on the well-being of university students, considering varying degrees of interaction with AI technologies. By adopting a longitudinal approach, the study intends to capture the dynamic changes in well-being over time, providing insights into the transient and lasting effects of AI on human flourishing and satisfaction.*

Given this background, our research aims to investigate the moderating effect of self-efficacy on the relationship between AI tool usage and the two forms of well-being. Specifically, we seek to understand how varying levels of self-efficacy influence students' ability to benefit from AI tools in terms of their psychological (eudaimonic) and subjective (hedonic) well-being. By examining this relationship across all levels of self-efficacy, we aim to provide a comprehensive analysis that could inform targeted interventions designed to enhance the effective use of AI tools in educational settings, thereby maximizing the well-being outcomes for all students.

We want to investigate how the educational context - and individual's wellbeing - shifts when new digital technologies and AI-based tools are employed by students in order to learn.

Methodology. *This study employed a quantitative research methodology to explore the effects of the use of artificial intelligence (AI) tools on individuals. We conducted a survey with students enrolled in an economics course in a major Italian university.*

At the beginning of the semester, the students were informed that they could take part in a series of surveys in exchange for extra credits. During the semester, the students were encouraged to use ChatGPT to help develop some of the assignments of the course. We collected 4 observations from the students at specific time intervals which aligned with the submission of the assessments. The survey was formed of four sections.

First, we adapted a usage intention two items scale originally developed by Venkatesh and Davis (2000) which utilizes a 2 items 7-point Likert scale ranging from 1 (not at all true) to 7 (very true).

Secondly, the students were asked to assess their level of wellbeing by answering a 8 items 7 points scale where 1 = Strongly agree and 7 = strongly disagree (Jian et al., 2019). An example of the adapted items for hedonic well-being is "Using ChatGPT makes my life more satisfying", while for eudaimonic well-being "Using ChatGPT brings me closer to my ideal self ". The chosen scale combines items from various established scales to measure consumer hedonic well-being, specifically incorporating four items from the work of Pavot and Diener (1993) and Argyle and Jill (1989). For assessing consumer eudaimonic well-being, the scale includes four items focused on self-actualization and self-affirmation, adapted from the methodologies of Ryff (1989) and Waterman (1993).

Moreover, to measure self-efficacy regarding the use of AI tools, we employed the short form of the General Self-Efficacy Scale (GSE-6) developed by Romppel et al. (2013), consisting of 10 items. An example of item is "It is easy for me to stick to my aims and accomplish my goals".

Finally, demographic information pertaining to the respondents was collected.

Results. *The study was conducted with a sample of 291 students. The demographics of our respondents were predominantly female, with 163 females (56%) and 123 males (42.3%) participating in the survey. A small number, 4 respondents (1.4%), chose not to disclose their gender. The average age of the participants was 21 years, aligning with the typical age range of university students.*

The data collection involved four distinct surveys. The first survey received 87 responses, the second 77, the third 67 and the fourth, and last one, 60 responses.

A preliminary analysis was conducted to explore the long-term effects of AI-based tool usage on well-being. However, the longitudinal analysis yielded results that were not statistically significant, and thus the dataset was analyzed in an aggregated form.

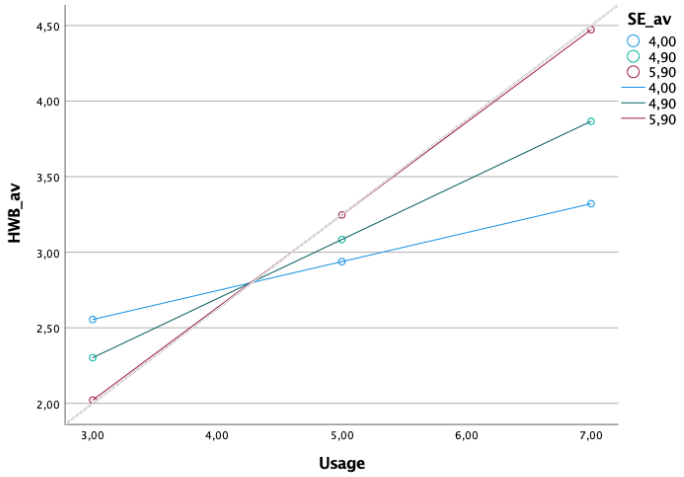
The regression analysis was conducted using the PROCESS macro for SPSS to explore the impact of artificial intelligence tool usage on the dependent variables (subjective hedonic well-being and psychological eudaimonic well-being), with self-efficacy serving as a moderator in this relationship, using the model 1 proposed by Hayes (2017).

Firstly, we analyzed the hedonic well-being and we noticed that the sample comprised 291 respondents, and the model was proven to be significative ($p < 0.0001$).

We discovered that increased usage of AI tools was associated with a decrease in the levels of hedonic well-being ($\beta = -0.6945$, $p = 0.0054$).

Moreover, the interaction between AI tool usage and self-efficacy was statistically significant ($\beta = 0.2215$, $p < 0.0001$), indicating that the effect of AI tool usage on hedonic well-being varies depending on the level of self-efficacy.

Consistent with our hypothesis, the findings highlight that self-efficacy significantly moderates the impact of AI tool usage on hedonic well-being. To identify the specific values of self-efficacy where the relationship between AI tool usage and hedonic well-being was statistically significant ($\alpha = 0.05$ criterion), we employed the Johnson-Neyman technique (Johnson and Neyman, 1936). More in detail, this technique identifies regions in the range of the self-efficacy variable where the effect of the usage (our predictor) on the hedonic well-being is statistically significant. Results of this analysis revealed the self-efficacy levels of 3,7865 as a transition point.



Upon surpassing the established threshold value, the relationship between AI tool usage and hedonic well-being (HWB) becomes statistically significant, and two distinct patterns emerge as depicted in the Diagram 1.

When self-efficacy is at level above the threshold of 3,7865, the effect of Usage becomes positive and significant. Individuals with high self-efficacy benefit from the usage of AI tools in terms of hedonic well-being, the higher the self-efficacy level and the higher their wellbeing levels.

As self-efficacy slightly decreases (while still remaining above the significance threshold), the moderating effect also weakens, still indicating a positive moderating effect, that decreases with lower self-efficacy levels.

Therefore, higher self-efficacy is associated with a stronger moderating effect.

Fig. 1: Self Efficacy's moderating role on Hedonic Well-being

Source: Our elaboration

We conducted the same analysis to investigate the relationship between usage and eudaimonic -psychological - wellbeing, withself-efficacy as a moderator.

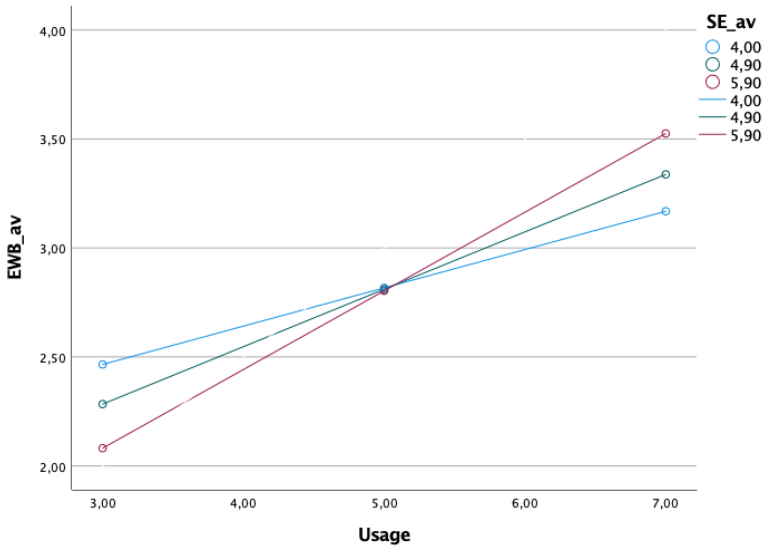
Differently from hedonic well-being, the effect of Usage on the dependent variable eudaimonic well-being was not significant on its own, as indicated by a p-value of 0.3823.

Moreover, the effect of self-efficacy on eudaimonic well-being was not statistically significant (β = -0.4949, p = 0.0635), suggesting that, by itself, self-efficacy has a marginal negative impact on eudaimonic well-being, which was not definitive in this model.

However, when self-efficacy was introduced as a moderating variable, the interaction between Usage and self-efficacy became positive and significant (p = 0.0483).

Thus, the effect of usage and eudaimonic wellbeing depends on the level of self-efficacy.

Results of the Johnson-Neyman technique identified the self-efficacy level of 3.7152 as a transition point.



Specifically, as shown in Diagram 2, the conditional effects analysis demonstrated increasing positive effects of AI tool usage on eudaimonic well-being at higher levels of self-efficacy:

At a self-efficacy value of 4.0, the effect of Usage on EWB_av was slightly positive (β = 0.1757, p = 0.0073).

The effect was stronger at a self-efficacy of 4.9 (β = 0.2635, p < 0.0001).

At a self-efficacy level of 7 (the maximum on the Likert scale), use has a very strong effect (0.4683), suggesting that people with high self-efficacy benefit greatly from using AI in terms of eudaimonic well-being. The moderating effect, in this case, appears to be weaker than the one that affects hedonic wellbeing.

Fig. 2: Self Efficacy's moderating role on Eudaimonic Well-being

Source: Our elaboration

The differing results observed in the two well-being dimensions can be attributed to the inherent differences in what hedonic and eudaimonic scales measure:

Hedonic Well-being: The analysis showed that the main effects of AI tool usage and self-efficacy were both negative, but significative, though the interaction effect was positive. This suggests that while the immediate gratification associated with AI tool usage does not generally increase without consideration of self-efficacy, it can improve under certain conditions, specifically at higher levels of self-efficacy. This indicates that merely using AI tools doesn't automatically lead to increased pleasure or satisfaction - hence hedonic wellbeing; instead, how users feel capable and confident (higher levels of self-efficacy) in using these tools plays a crucial role.

Eudaimonic Well-being: The results did not demonstrate a significant relationship between AI tool usage and well-being, but when moderated by self-efficacy, the effect on eudaimonic wellbeing is confirmed. The higher an individual's self-efficacy, the stronger the effect on well-being. Thus, confirming that eudaimonic well-being is only positively affected by the use of AI for those who have sufficient self-efficacy to use the technology effectively and productively.

Self-efficacy appears to be a more crucial factor for eudaimonic outcomes than hedonic ones. Higher self-efficacy helps individuals utilize tools in a way that aligns with their personal growth goals, thus enhancing eudaimonic well-being. In contrast, hedonic satisfaction might not require the same level of personal competence or confidence, being more dependent on the immediate benefits provided by the tools and amplified by the self-efficacy.

The usage of AI tools might enhance how individuals perceive their capabilities and future potential, thereby more significantly impacting eudaimonic well-being. Hedonic pleasure may not be as deeply influenced by these cognitive and self-reflective processes.

Research limitations. *Despite the contributions, this paper also has some limitations worth noting.*

Firstly, the research focuses on university students enrolled in an economics course at a single Italian university. Although their experiences offer valuable insights into how AI can affect student well-being in educational environments, these findings might not apply to students in other fields, different universities, other cultural contexts, and background. Future research should replicate this study across diverse educational backgrounds and international settings to enhance external validity.

Secondly, this study was conducted as a natural experiment, thus the setup was not fully controlled. Students were simply encouraged to use AI tools for their schoolwork and assignments but were not randomly assigned to treatment and control groups. Consequently, while the findings suggest meaningful relationships between AI usage, self-efficacy, and well-being, causality cannot be firmly established. A more controlled experimental design, incorporating randomized trials, could help validate the causal effects.

Thirdly, this study mainly uses self-reported data, which may be influenced by social desirability bias or subjective interpretations of well-being and self-efficacy. To gain deeper insights into the psychological mechanisms underlying these relationships, future research could integrate neuromarketing techniques, such as biometric or neurophysiological measures (e.g., EEG, eye tracking, skin conductance), to assess users' emotional and cognitive responses to AI interactions more objectively.

Lastly, while the study distinguishes between hedonic and eudaimonic well-being, the observed differences in the effects of AI usage on these two dimensions warrant further exploration. The results indicate that hedonic well-being is more directly influenced by AI tool usage, whereas eudaimonic well-being benefits primarily from high self-efficacy. However, the underlying psychological and behavioral mechanisms driving these differences remain unclear.

Future research should employ a more nuanced approach, potentially integrating mixed-methods designs, to dissect the pathways through which AI interacts with different aspects of well-being.

Managerial implications. *The findings of this study present critical managerial implications for universities and policymakers striving to integrate AI tools into educational environments while safeguarding student well-being. A strategic, student-centered approach is essential to maximizing AI's benefits while mitigating potential drawbacks.*

One key implication relates to enhancing technological self-efficacy through structured training programs. Given that higher self-efficacy mitigates the negative impact of AI usage on hedonic well-being and enhances eudaimonic well-being, universities should invest in initiatives that build students' confidence in using AI tools. Workshops, digital literacy courses, and hands-on AI-assisted assignments can empower students, reduce resistance, and foster engagement. For instance, universities could implement AI onboarding programs modeled after corporate digital skill-building courses, ensuring that students develop both technical competence and confidence in AI interactions.

Another crucial consideration is the implementation of personalized AI learning pathways. AI tools should not follow a one-size-fits-all model but should be adapted to students' varying levels of technological competence and self-efficacy. Universities can design customized learning experiences that allow students with higher self-efficacy to explore advanced AI functionalities while providing foundational support to those with lower confidence levels. Adaptive AI-driven platforms, such as intelligent tutoring systems, should incorporate real-time self-efficacy assessments to dynamically adjust learning difficulty, ensuring that AI enhances learning rather than exacerbates skill gaps.

As AI technologies become more embedded in education, the establishment of clear ethical guidelines and usage policies is increasingly relevant. Universities must implement frameworks that encourage responsible AI use and prevent over-reliance, particularly among students with lower self-efficacy, who may struggle to balance AI assistance with independent learning. For example, institutions could introduce AI literacy modules akin to academic integrity courses, equipping students with the necessary skills to navigate AI tools while fostering critical thinking and problem-solving abilities.

The need to monitor AI's impact on student well-being through systematic feedback mechanisms is also paramount. Universities should develop longitudinal assessment frameworks that track the psychological and academic effects of AI tools, allowing for data-driven decisions on AI integration. By collecting continuous feedback through surveys, focus groups, and engagement analytics, institutions can proactively refine AI strategies. AI learning dashboards, for instance, could incorporate well-being indicators that enable educators to assess student engagement levels and adjust AI interventions accordingly.

Maximizing the benefits of AI tools while mitigating risks requires fostering interdisciplinary collaboration between education, psychology, computer science, and business departments. A cross-disciplinary approach ensures that AI adoption strategies are holistically designed, balancing technological efficiency with human-centric factors such as motivation, self-efficacy, and overall well-being. For instance, psychology experts could collaborate with AI developers to design intuitive interfaces that enhance engagement without inducing cognitive overload or stress, thereby optimizing the learning experience.

Since self-efficacy levels vary among students, universities should also develop tailored AI adoption strategies that address individual needs. Students with high self-efficacy should have access to advanced AI tools for research, data analysis, and complex problem-solving, while those with lower self-efficacy should receive structured guidance,

mentorship programs, and AI-assisted learning tutorials that build confidence over time. A differentiated approach to AI integration ensures that all students, regardless of their technological competence, can fully leverage AI's potential without experiencing disengagement or frustration.

By integrating these strategic interventions, universities can leverage AI technologies to optimize student learning experiences while safeguarding psychological well-being. A student-centered AI adoption model-one that incorporates technological competence, adaptive learning, and self-efficacy-driven support-ensures that AI becomes a tool for enhancing not only academic success but also holistic personal development in higher education.

Originality of the paper. *The originality of this paper lies in its nuanced exploration of the differential impacts of artificial intelligence (AI) tool usage on the two distinct dimensions of well-being-hedonic and eudaimonic-in the context of higher education. While considerable research has investigated the broad effects of AI on learning outcomes and operational efficiencies, this study contributes to the literature by specifically examining how varying levels of self-efficacy influence these well-being outcomes when interacting with AI technologies, highlighting also the difference emerged in the two different kinds of wellbeing.*

One of the novel findings of this research is the significant negative impact of AI tool usage on hedonic well-being, while when the effect is moderated by self-efficacy the overall effects turns positive, enhancing students' hedonic wellbeing.

This is in contrast to eudaimonic well-being, where AI tool usage did not show a direct significant effect of the AI tools usage on it, but did so when moderated by self-efficacy. This distinction underscores the critical role of self-efficacy not only in facilitating effective engagement with technology but also in enhancing the personal growth and psychological well-being of students.

Furthermore, this paper is among the first to articulate and empirically test the moderating role of self-efficacy on the relationship between AI tool usage and both types of well-being in an educational setting. The findings highlight that while the use of AI tools can diminish hedonic well-being overall, higher levels of self-efficacy can reverse this effect, leading to increased life satisfaction and positive affective states. This interaction suggests that self-efficacy is a pivotal factor in ensuring that the integration of AI technologies into educational processes contributes positively to student well-being.

This research, therefore, not only contributes to the academic literature by providing empirical evidence of the nuanced impacts of AI on different types of well-being but also offers practical insights for educational leaders aiming to implement AI tools in a manner that maximizes student engagement and well-being.

Key words: *Artificial Intelligence; Well-Being; Self Efficacy; Education*

GIORGIA MARIA D'ALLURA[1] FEDERICA ROMANO[2]

Abstract

Female entrepreneurship is increasingly acknowledged as a key driver of economic growth and social impact. However, women continue to face significant challenges in this domain. Despite its growing relevance, female entrepreneurship has yet to be fully recognized as an autonomous research subject. The existing literature predominantly emphasizes quantitative analyses, often neglecting the application of theoretical frameworks that could provide deeper insights into the phenomenon. This work-in-progress seeks to address this gap by pursuing three main objectives: (i) identifying the barriers and obstacles that hinder female entrepreneurship, (ii) analyzing these challenges through the lens of various theoretical perspectives from prior studies, and (iii) integrating these perspectives to develop a more comprehensive and synthesized body of knowledge.

Framing of the research. *Studies on women entrepreneurship have noticed a rapid growth over the past 30 years; the field is in an initial phase but with a considerable number of journal articles, literature reviews and books being published on women entrepreneurs.*

For decades, entrepreneurship research has been dominated by a male-centric perspective, treating the male entrepreneur as the default model for business ventures. This bias shaped the field from its origins in the 1930s, with the assumption that male and female entrepreneurs were fundamentally the same-an oversight that delayed the recognition of women entrepreneurship as a legitimate research subject (Bruni et al., 2004). It was not until the late 1990s and early 2000s, with the launch of dedicated conferences such as the 1998 Conference on Women Entrepreneurs in Small and Medium-Sized Enterprises and the 2003 Diana International Conference, that the study of women entrepreneurs began to gain momentum (Jennings & Brush, 2013).

The traditional business model was long considered gender-neutral, yet research on women entrepreneurs has shattered this illusion, revealing that entrepreneurship is inherently gendered and often embedded within family dynamics (Jennings & Brush, 2013). This realization has led to an increasing recognition that women are not merely participants in entrepreneurship but are key drivers of economic and social transformation (Sarfaraz et al., 2014).

Despite this progress, mainstream entrepreneurship theories remain outdated, failing to account for the structural barriers, unique motivations, and alternative business models that characterize female-led ventures. Theoretical frameworks must evolve to reflect the realities of women entrepreneurs, rather than treating them as deviations from a male norm (Yadav et al., 2016).

The stakes are high. Women entrepreneurs do not just contribute to economic growth-they reshape social and familial structures, elevate their communities, and challenge entrenched power dynamics (Kaviarasu et al., 2022; Sajjad et al., 2020). A failure to critically engage with female entrepreneurship as a distinct and transformative force risks perpetuating the very inequalities that have historically sidelined women in business. It is not just about inclusion-it is about rewriting the narrative of entrepreneurship itself.

Women entrepreneurs contribute to creating employment opportunities, leading to income increase, and more new products and services available to society leading to greater benefits for society, in addition are more likely to reinvest the money they earn leading to an increase in the local economy (Atonye et al., 2024). Therefore, investing in women entrepreneurship helps in closing the gender gap, as research suggests that women owners are more likely to hire women employees (Quak et al., 2022).

Despite this, women entrepreneurs still face numerous challenges (Kaviarasu et al., 2022), the number of women-owned businesses is still in the minority and the challenges faced by them are relatively different from the challenges faced by men-owned businesses (Strawser et al., 2021).

Nonetheless, Anderson and Ojediran (2022) highlight a peculiar characteristic of female entrepreneurship: women in developed countries are attracted by opportunities, whereas those in developing countries seem to be pushed by necessity.

However, literature identifies in general, seven main barriers:

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

1. *Gender discrimination (Albattat et al. 2023)*
2. *Work-family conflict (Ahmetaj et al. 2023)*
3. *Financial obstacles (Albattat et al. 2023)*
4. *Lack of infrastructural support (Ramadani et al. 2015)*
5. *Unfavourable business, economic and political environments (Zhu et al. 2015)*
6. *Lack of entrepreneurship training and education (Sengupta et al. 2013)*
7. *Personality-based barriers (fear of failure and low self-confidence) (Al-Sadi et al. 2011)*

The lack of access is caused by gender discrimination in the financial market in which they operate (Vita et al., 2023). Moreover, research has also shown that institutional support plays a vital role in the development of women entrepreneurship. Traditional gender roles and cultural roles have also been identified by researchers to be a challenge for women entrepreneurs (Patel & Deshpande, 2018).

One of the greatest difficulties for the recognition of female entrepreneurship as an autonomous research subject is certainly a lack of theoretical concepts of the phenomenon: most studies focus on exclusively quantitative analyses, and few analyses study the phenomenon through theoretical lenses.

Theoretical frameworks such as feminist epistemology highlight the barriers women face in entrepreneurship, emphasizing the need to challenge male-dominated norms and advocate for gender equity in business contexts, but linking feminist theories to entrepreneurship reveals that existing research often adopts a feminist empiricism perspective, which may inadvertently reinforce women's subordination by failing to question male norms (Wu et al. 2019).

The application of critical theory on female entrepreneurships seems to highlight a lack of universality, this narrow focus can be seen as limiting, in particular in a globalized world with different social and cultural contexts (Said, 1993), furthermore the influence of postmodernist thought in critical theory can lead to a form of relativism that underestimates the potential for a shared understanding of justice and ethical norms, making it difficult to ground objective criteria for critique (Lyotard, 1984). The emphasis on data collection and analysis without a strong pre-existing theoretical framework of the Grounded Theory can sometimes lead to superficial findings or theories that lack strong theoretical foundation (Bryant et al. 2007), thus the theoretical support necessary for female entrepreneurship to be recognized as an autonomous research subject is lacking; in addition building theory from data leads a risk that researchers might over-interpret data or make claims that are not adequately supported by the evidence. This can bring to theories that are speculative or not grounded enough in the data itself (Glaser et al. 1967).

Purpose of the paper. *Literature recognizes the importance of female entrepreneurship, both in terms of economic growth and for its strong social impact. However, to recognize female entrepreneurship as an autonomous research subject, more contributions on theoretical concepts of the phenomenon are needed. At the moment, and as previously written, most of the studies deal with exclusively quantitative analyses using little or no theoretical lenses.*

The aim of our work is to identify the barriers and obstacles to female entrepreneurship and to analyse the different theoretical perspectives applied to the study of these barriers on the different levels of analysis: micro, meso and macro:

- *Micro Level: psychological constraints, internal doubts and insecurities of women with respect to their capabilities and strengths; feelings of isolation.*
- *Meso Level: firm's structure and organization and their relationships with trade associations or banks which they promote entrepreneurship development*
- *Macro Level: institutional context and social policies which they support female entrepreneurship.*

This contribution aims not only to increase knowledge about barriers and obstacles to female entrepreneurship, but also wants to enhance the theoretical knowledge related to women entrepreneurship.

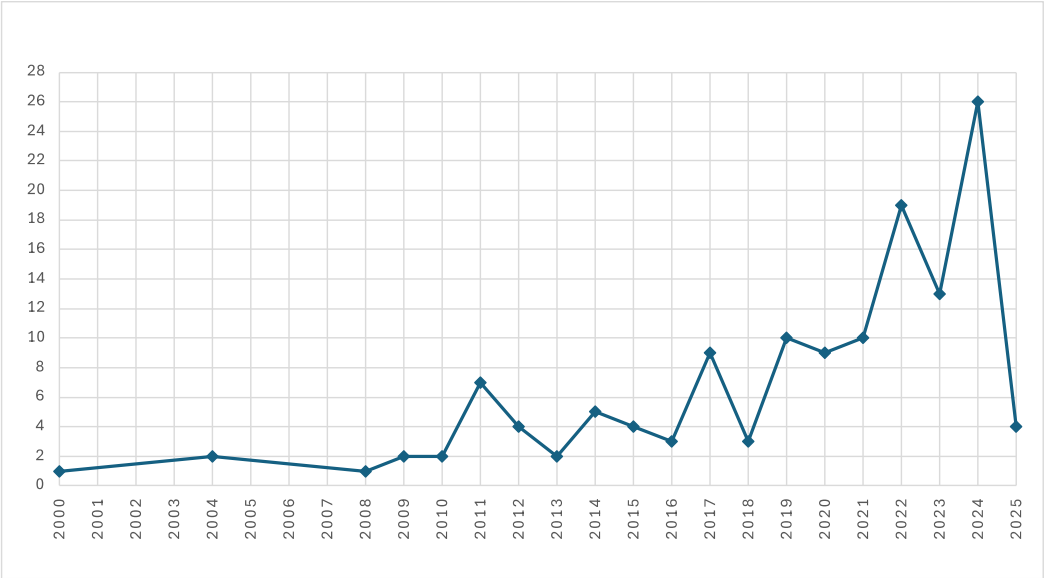
Methodology. *Literature reviews identify important knowledge gaps and motivate researchers to fill them (Webster & Watson, 2002). In this paper, we aim to conduct a systematic literature review (Cook, Mulrow, & Haynes, 1997) of relevant studies examining the barriers and obstacles to female entrepreneurship. In this sense, according to Tranfield, Denyer, and Smart (2003), to more clearly establish the conceptual boundaries, we first examined pertinent findings that were published in Management publications (select studies that applied Tranfield et al. (2003) approach are: Hoskisson, Chirico, Zyung, & Gambeta, 2017; Terjesen, Hessels, & Li, 2016). Then, we used Scopus database to search for all articles published from all years to present (March 2025) using the search terms, [women or female and entrepreneur* and incl* and barr* or obstacl*]. Manually tracking citations for additional relevant articles in highly ranked journals is an important part of the literature review (Rashman, Withers, & Hartley, 2009); however, the manual search did not produce any additional contribution on the topic.*

We searched on Scopus database widely recognized in the scientific community, with more than 27 million abstracts, and is currently considered the largest database of scientific literature (Burnham, 2006), using the phrases [women or female and entrepreneur and incl* and barr* or obstacl*], in [Article title, abstract keywords], and obtained 413 works.*

We then limited the research to Subject Area (1) [Business, Management and Accounting], using [LIMIT TO].

Considering their internal criteria, the suggestion is to use the command [LIMIT TO] to filter the [SUBJECT AREA] because it is a more inclusive command. In this step, we obtained 155 documents.

The Scopus Database includes different types of documents, including articles, book chapters, articles in press, books, and reviews. According to our research protocol, the systematic review included only articles and reviews published on journals in English at the final stage. We therefore excluded the other documents. We used both commands and



determined that in this case, use of either of the commands, [LIMIT TO (selected items)] or [EXCLUDE (selected items)], with 139 articles.

The bibliometric method known as VOSviewer software version 1.6.10 (Van Eck and Waltman, 2010, 2014) was also employed. This software enables the visual description, recognition, and categorization of groups in a related strategic matrix according to their similarities and differences (distance based mapping). This approach addresses the issue of author subjectivity influencing the qualitative study of the literature. It is possible to lessen the distortion caused by subjective variables by using the authors' own keywords. Additionally, the graphic creation of maps enables the examination of the intricate relationships between the variables, which aids in a better understanding of the nature of a research field and has become an unquestionable analysis tool (Vallaster et al., 2019; Martínez-López et al., 2018).

Results. *Figure 1 illustrates the advancement of scientific inquiry about potential impediments and challenges to female entrepreneurship over the years. This study topic has mostly evolved in recent years, with a notable surge since 2019 (n = 10) and attaining its apex of publications in 2024 (n = 26), with 2025 still underway. This increase may indicate a shift in attention towards scientific study and a persistent, expanding evolution of research in the domain of female entrepreneurship as a legitimate trend.*

To delineate the "research front" (Price, 1965) regarding barriers to female entrepreneurship through temporal overlap, we additionally employed an analysis of term co-occurrence (with a minimum of three occurrences). This is a dynamic analysis influenced by alterations in the research domain and the significance of a particular research line over time. The identification of the research frontier assists scholars in delineating the most contemporary tendencies in literature (Boyack and Klavans, 2010).

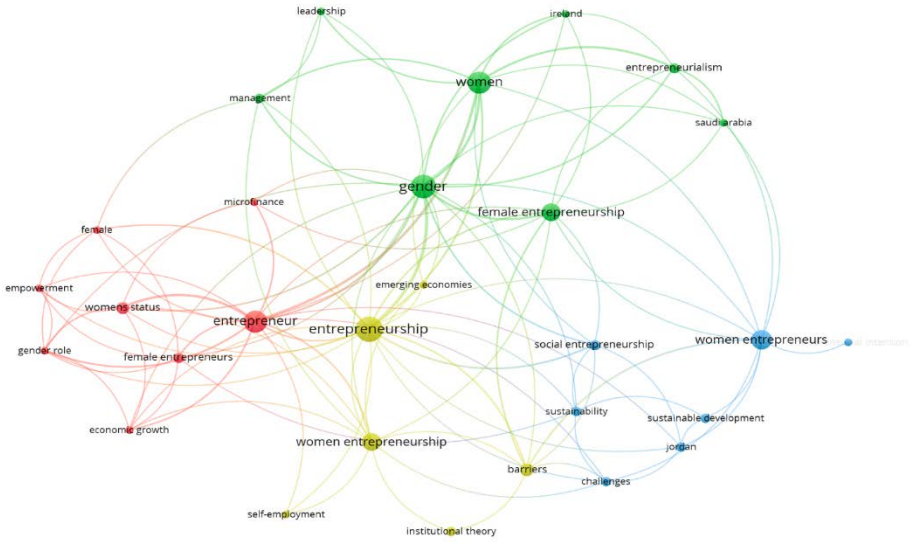


Fig. 1: Distribution of papers on annual basis

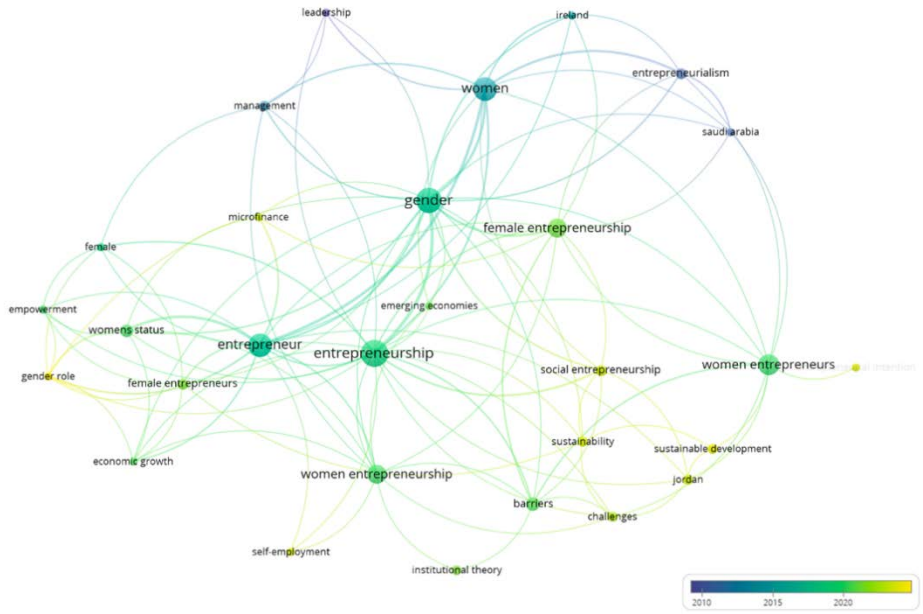
Keyword co-occurrences map (Fig. 2) offer a visual representation of the thematic landscape and progression of research on female entrepreneurship and associated concepts. Each node identifies a keyword that has emerged in the considered literature with more than three occurrences, with the node size generally indicating its frequency. The lines represent co-occurrence relationships: the greater the thickness or quantity of connections, the more frequently those keywords co-occur.



Specifically, red cluster focuses on "entrepreneur" and encompasses terms like "female entrepreneurs", "empowerment", "women's status", "empowerment", "economic growth" and "microfinance", underscoring the socio-economic aspect of women's entrepreneurship and its connection to economic development. The green cluster concentrates on "gender" "female entrepreneurship", "management", "leadership", highlighting the impact of social norms, roles, and circumstances on women's engagement in entrepreneurial endeavors. The yellow cluster encompasses "entrepreneurship", "women entrepreneurship", "self-employment", "emerging economies", "barriers" and "institutional theory," indicating a focus on structural considerations and the obstacles faced by female-led companies in emerging nations. The blue cluster encompasses "social entrepreneurship", "sustainability", "challenges", "women entrepreneurs" and "sustainable development" illustrating an organizational and cross-cultural viewpoint, with a growing interest in the social and sustainable dimension of entrepreneurship.

Fig. 2: Keywords co-occurrences

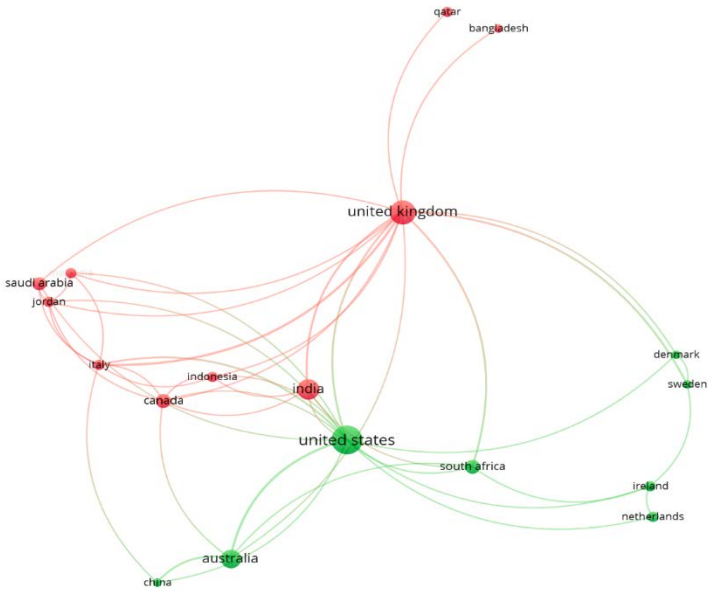
The second keywords map (Fig. 3), color-coded by time, utilizes a gradient ranging from dark blue for earlier years to yellow/green for more recent years, illustrating the evolution of attention on various topics over time. Earlier keywords such as "leadership," "management," and "entrepreneurialism" indicate that initial study concentrated on the essential definitions and functions of leadership and management within entrepreneurial settings. Emerging topics, indicated in lighter green or yellow, encompass "sustainability," "sustainable development," "challenges," "institutional theory," "gender role", and "self-employment," reflecting an increasing interest in the relationship between female entrepreneurship and sustainability, re-evaluating theoretical foundations to identify solutions to contemporary challenges, and subsequently adopting this novel entrepreneurial perspective as a viable occupational choice for women through self-employment. The map clearly indicates that "women entrepreneurship" with "gender" are consistently central theme throughout the time frame, linking to concepts such as "social entrepreneurship" and "barriers", thereby illustrating that research on women's entrepreneurial activities encompasses both historical and contemporary studies, maintaining significant relevance.

Fig. 3: Keywords co-occurrences over time

Next two co-citation maps, featuring countries as nodes, depict the nations that are frequently referenced in conjunction within the academic literature on female entrepreneurship. In the first map (Fig. 4), the United Kingdom (796 citations) and the United States (1480 citations) appear as the most significant nodes, acting as crucial reference points and signifying their frequent co-citation with various other nations. Countries like as India (121), Saudi Arabia (236), Canada (131) and Italy (204) exhibit significant connections to the UK, indicating a concentration of research that

frequently cites work from or pertaining to those areas. Simultaneously, the United States maintains a distinct yet intersecting network of affiliations, particularly with Australia (444), China (136), South Africa (133), and several European countries, indicating that research referencing US-based studies frequently includes literature from these nations. The second map (Fig. 5) employs a color gradient, transitioning from dark blue in 2010 to bright yellow in more recent years, to illustrate the variation in the average publication year of citations across different countries. India and some Middle Eastern nations (e.g., Qatar, Bangladesh) are depicted in almost yellow tone, indicating a comparatively recent influx of referenced research, while countries illustrated in mid-green (e.g., the UK, US) represent a corpus of work extending from slightly earlier to mid-range years.

Fig. 4: Co-citation countries



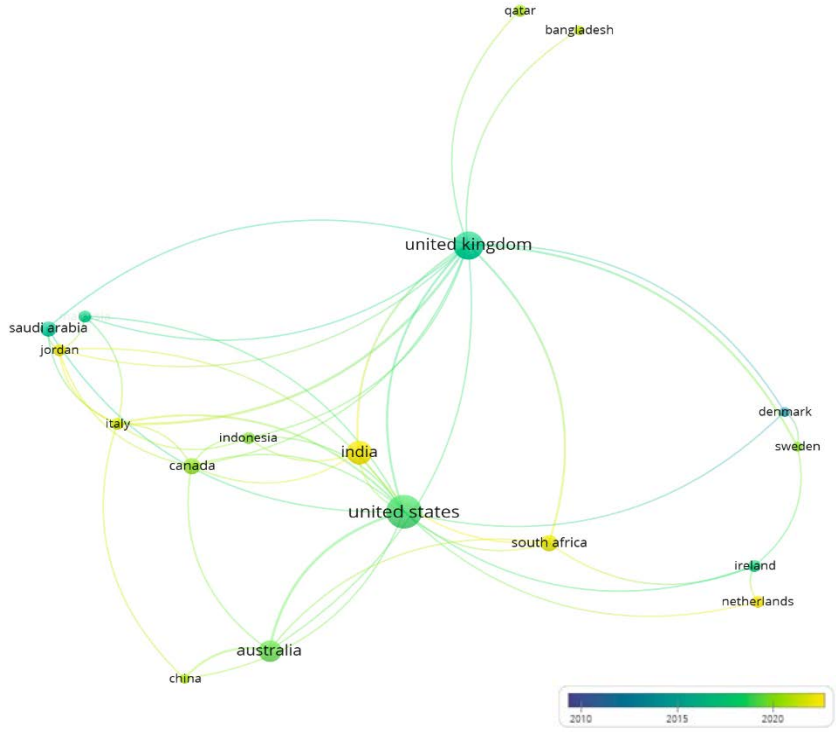


Fig. 5: Co-citation countries over time

Research limitations. *This study, despite offering new insights into the barriers to women entrepreneurship and on the theoretical perspectives applied to its analysis, encounters some limitations that need to be highlighted.*

Firstly, articles are limited to the analysis of certain geographical areas, but the barriers women face in entrepreneurship are often influenced by local cultural, economic, and institutional factors, meaning that findings from one geographical area may not be applicable to other regions. For example, while women in developed countries may face barriers related to access to capital or work-life balance, women in developing countries may face more challenges related to access to education and legal rights. Thus, research focusing on one area may not capture the broader, global landscape of women's entrepreneurial experiences. (Marlow et al. 2005).

For instance, the study of women's entrepreneurship in conservative cultures like those in the Middle East or North Africa may emphasize the role of patriarchal system and gender restrictions, whereas Western societies may have a different focus on issues like entrepreneurial ambition and work-life balance. This can lead to an overemphasis on specific barriers related to culture without considering how economic or political factors also affect women's entrepreneurship in these regions (Welter et al. 2011).

Secondly, the Institutional theory is the predominant theoretical lens to study the phenomenon, but often focuses on macro-level structures, such as legal systems, cultural norms, and market dynamics, but it pays less attention to micro-level factors, such as the personal motivations, psychological constraints, decision-making processes, and social networks that influence individual women entrepreneurs. Women's entrepreneurial behaviours can be influenced by factors like self-confidence, personal aspirations, and the availability of role models, which institutional theory may not adequately capture (McAdam et al. 2013).

Managerial implications. *This research can guide policymakers, managers and educational communities in addressing these challenges and empowering women entrepreneurs.*

Governments and organizations should create gender-sensitive policies that specifically address the unique barriers faced by women entrepreneurs. This includes initiatives aimed at improving women's access to capital, training, networks, and mentorship. Policies should also address gender biases and discriminatory laws that affect women (Marlow et al. 2005).

Managers in financial institutions and investors should be aware of gender biases in decision-making processes and actively seek to overcome them by ensuring gender diversity in investment teams, implementing bias training, and developing financial products tailored to women entrepreneurs (Brush et al. 2009).

Educational institutions and training providers should develop entrepreneurial programs that are not only accessible but also tailored to the specific needs of women entrepreneurs, providing support from both a skill-building and mentorship perspective (Ghosh, 2017).

Originality of the paper. *The aims of our literature review is to update researchers on the current state of knowledge and discoveries in the field for the synthesis and integration of findings from previous research. This is crucial to better understand the overall landscape of existing knowledge and establish connections between different studies. Through the analysis of existing literature, it is possible to identify knowledge gaps or areas where research is limited. This offers opportunities to contribute to such areas through new investigations.*

Specifically, the originality of our research lies on the exploration of new perspectives, examines under-researched contexts, and challenges existing theories; traditionally, studies of women entrepreneurship have centred on gender as the first variable, but new research emphasizes the importance of intersectionality: understanding how gender intersects with other factors such as race, class, ethnicity, age, and disability provides a new perspective to analyse the barriers to women entrepreneurship, highlighting how different women experience different challenges based on their diverse social identities.

Key words: *Women entrepreneurship, barriers, obstacles, inclusion, theory*

The role of humane entrepreneurship for sustainability: Evidence from tourism digital start-ups

ANTONELLA MONDA[1] SILVIA BAIOCCO[2] PAOLA MARIA ANNA PANICCIA[3]

Abstract

In the face of current complex environmental, social and economic challenges, this study aims to provide comprehensive empirical evidence about the influences of external and internal factors on the three dimensions of Humane Entrepreneurship and the inderdependences between them. To do so, we explore Entrepreneurial Orientation, Sustainability Orientation, and Human Resource Orientation in 10 Italian start-ups in the tourism sector adopting a combination of digital technologies, offering new and sustainable solutions. Preliminary results identify courage and collaborative networks as main factors influencing the strategic posture of human-centered investigated start-ups, with effects on sustainability. We propose an investigation of Humane Entrepreneurship in the tourism sector, widely acknowledged as a factor of sustainable development. Moreover, we focus on early entrepreneurship, still scarcely analysed in Humane Entrepreneurship in general, and in tourism in particular. We thus provide useful insights on how to incorporate not only Entrepreneurial Orientation, but also Sustainability Orientation, and Human Resource Orientation within digital start-ups entering the tourism sector.

Framing of the research. *Entrepreneurship has been attracting growing attention in theory and practice as a solution for the ever growing environmental and social problems, rather than their possible root cause, by creating momentum for innovation (Schaltegger and Wagner, 2011; George et al., 2021). It is significant that the UN General Assembly (2022) recognizes the crucial role played by entrepreneurs and firms in achieving all 17 sustainable development goals (SDGs). Not surprisingly, the UN Tourism (2020) promotes start-ups in tourism. It is exceedingly relevant given that at less than a decade until 2030, 48% of the SDG targets are off track, with 37% showing no improvement or even falling below the 2015 baseline (UN, 2023).*

Considering these challenges, the relationship between entrepreneurship and sustainability has gained significant attention over the past decade, giving rise to various research perspectives. In this context, many authors highlight the importance of balancing environmental, social, and economic goals (Hummels and Argyrou, 2021), a balance that is reflected in the concept of sustainability orientation. This strategic approach enables entrepreneurs to prioritize environmental protection, quality of life, and community well-being in their business activities (Elkington, 1997; Caselli, 2007; Baiocco and Paniccia, 2023).

Such a proactive stance is shaped by individual factors, such as education, values, and moral courage (Barnard, 1938; Paniccia et al., 2020; Paniccia and Baiocco, 2021), which allow entrepreneurs to navigate complex stakeholder relationships and reconcile contradictions (Donaldson and Preston, 1995; Paniccia, 2015).

In connection to the above, Humane Entrepreneurship (HumEnt) has recently emerged as a theoretical framework (Bae et al., 2018; Kim et al., 2018; Parente et al., 2018) drawing on the idea that entrepreneurs should broaden their focus beyond profit margins to encompass the well-being of their employees, local communities, the environment, and society at large (White Book, 2016). This approach, outlined by the Business Roundtable (2019), calls for creating value for all stakeholders, not just shareholders.

On this basis, the HumEnt framework integrates the consolidated entrepreneurial orientation (EO) construct, with two emerging ones, namely aforesaid sustainability orientation (SO), and human resources orientation (HRO), identifying them as the three interconnected dimensions of HumEnt, closely linked with firms' performance and sustainable development. Although HumEnt has garnered increasing scholarly attention (Kim et al., 2021; Cucino et al., 2024; Dębicka et al., 2022), most studies have treated its three constructs separately, mainly focusing on EO and SO (Vesci et al., 2023), neglecting the interdependencies and reciprocal effects between them and their impact on firms and society (Parente et al., 2021). This gap limits the understanding of the processes behind human-centered firms.

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

An in-depth analysis of the internal and external factors influencing Humane Entrepreneurship in start-ups is crucial. It can aid in integrating and managing the three dimensions within firms and extending their positive externalities. This holistic approach is recognized as a significant gap in research (Parente et al., 2018).

This analysis is particularly relevant for the tourism sector, which contributes 9.2% of global GDP and 9.6% of employment (WTTC, 2023), with major sustainability implications (Bramwell et al., 2017). While research on sustainable entrepreneurship in tourism is still emerging (Sørensen and Grindsted, 2021; Galbreath et al., 2023), some studies highlight the role of tourism firms in promoting sustainable tourism (Hjalager, 2010; Komppula, 2014; Paniccia and Baiocco, 2021), including digital start-ups (UN Tourism, 2020; Baiocco et al., 2024). The growing focus on humanistic tourism (Botterill, 1989; Della Lucia et al., 2021) aligns with the values of Humane Entrepreneurship, emphasizing the integration of economic, social, and environmental goals, with a focus on people's well-being.

A key challenge is the role of digital technologies in entrepreneurship, which offer new opportunities for start-ups but also raise concerns around employment, surveillance, and work quality (Melè, 2021).

Purpose of the paper. *Based on the above premises, the following research questions are posed:*

RQ1. Are the three dimensions of Humane Entrepreneurship (Entrepreneurship Orientation, Sustainability Orientation, Human Resource Orientation) simultaneously present in tourism digital start-ups?

RQ2. What are the main external and internal factors that influence the Humane Entrepreneurship Orientation of tourism digital start-ups?

RQ3. What is the reciprocal causation between the three dimensions of the Humane Entrepreneurship?

Methodology. *The research adopts qualitative multiple case studies (Yin, 2018) to explore HumEnt within its real-life context, focusing on the complexities of each case, including its history and the internal and external environments (Mayan, 2023). The case study approach is appropriate for examining the reciprocal relationships between the three dimensions of HumEnt and their effects on society, as it allows to explore in depth complex and evolving phenomena, providing empirical material useful for understanding the components of Humane Entrepreneurship (Yin, 1984; Eisenhardt, 1989), and making the results more robust thanks to the comparison between multiple cases (Yin, 2018; Herriott and Firestone, 1983). Furthermore, this approach has already been successfully applied to analyze the ways in which companies adopt the HumEnt approach (Vesci et al. 2023).*

The unit of analysis is the digital start-up in Italy's tourism sector, chosen for three main reasons. First, tourism's role as a driver of sustainable development, addressing social and environmental issues, has been widely acknowledged (UN Tourism, 1998; Zolfani et al., 2015). Second, the ongoing smart transformation of the tourism sector, shaped by digital technologies like AI, brings significant benefits to stakeholders (Gretzel et al., 2015; Pencarelli, 2020), with start-ups playing a key role in socio-economic and environmental changes (Kézai et al., 2020; Monda et al., 2023; Baiocco et al., 2024). Third, Italy's tourism sector has consistently contributed more to GDP and employment than the global average, making it a fitting context for this study (WTTC, 2016-2023).

Purposeful sampling was used to guide the identification and selection of information-rich digital start-ups in the tourism sector (Patton, 2002). Criteria for inclusion comprised registration as innovative start-ups under Italy's "Start-up Act," adoption of advanced technologies like AI and cloud computing, and offering innovative services that address emerging needs such as sustainability and immersive experiences. As table 1 shows, ten case studies were identified from Start-up Turismo Association, which represents tourism start-ups in Italy, fosters collaboration, and promotes knowledge exchange among entrepreneurs and institutions.

Tab. 1: Overview of the selected digital start-up in the Italian tourism sector

#	Start-up's name and location	Year of establishment	N. of employees	Service offered	Value Chain	Technology
1	Traveleco S.r.l SB Monza, Lombardia	2021	7	Simulations to calculate the ecological footprint of hotels, contributing to environmental sustainability in the hospitality sector	Environmental consulting services for accommodation facilities	AI, Cloud computing, Big data
2	Sicilyland Palermo, Sicily	2022	2	Experience and Bike Tours in Sicily	Experiential tourism services	Cloud computing
3	Ruralis Sant'Angelo dei Lombardi, Avellino Campania	2022	16	Short-term rentals in Italian villages	Accommodation and promotion of rural tourism	Cloud computing, Big data
4	Lucus Viaggi digitali Milano, Lombardia	2022	18	Immersive and exciting walking tour, including connection in real time with local experts	Cultural and innovative tourism through immersive technologies	Augmented reality/Virtual reality, Immersive technologies
5	Aeffective srl Firenze, Tuscany	2019	7	Advanced sentiment analysis software that transforms opinions into value	Market analysis and management of the tourist experience	AI, Big data
6	Toratora Srl Rome, Lazio	2018	4	Innovative travel platform that organizes surprise trips all over Europe	Travel planning and personalization	AI
7	RedoMap Castelnuovo Bozzente, Como, Lombardia	2020	2	App that allows to create and manage interactive digital content such as maps, routes and geolocalized tourist information in different languages	Digital solutions for tourist orientation	Immersive technologies, Cloud computing
8	PemCards Cascina, Pisa, Tuscany	2017	7	Transforms photos taken by users into physical postcards, printed and posted anywhere in the world	Personalization and digital souvenirs	AI, Contactless technologies, Cloud computing
9	Elesta Milan, Lombardia	2014	3	Thematic tours created with the help of historians, archaeologists, architects, and experts from creative and artisan backgrounds	Thematic cultural tourism	Cloud computing
10	Manet Rome, Lazio	2015	7	Digital platform that allows accommodation facilities to increase the sale of services	Digitalization and optimization of hotel services	Cloud computing, AI, Contactless technologies

Primary data were collected through semi-structured interviews (Saunders et al., 2009) with entrepreneurs from February to March 2024. Interviews were transcribed verbatim and analyzed through qualitative content analysis. To enhance validity, findings were triangulated with additional sources such as reports, websites, and relevant publications.

Aligned with the HumEnt framework (Botti & Parente, 2024), the interviews explored: 1) the effects of HumEnt's three dimensions in business contexts, 2) factors favoring/hindering EO, SO, and HRO in start-ups, and 3) the interdependencies between the three dimensions.

n our analysis of EO, we examined its three main dimensions (innovativeness, proactiveness, and risk-taking) that define start-ups' entrepreneurial behaviors in introducing and managing new business opportunities (Miller, 1983, 2011; Covin & Slevin, 1989). For SO, we examined entrepreneurs' definition of sustainability to understand whether they perceive sustainability exclusively from an environmental perspective, the adoption of sustainable practices, and social sustainability to explore their engagement with social well-being (Elkington, 1997; Roxas & Coetzer, 2012). Finally, for HRO, we focused on the four key dimensions of HRM (empathy, equity, enablement, and empowerment), as identified by Kim et al. (2018), to assess how start-ups shape employee relationships to achieve individual, organizational, and societal goals.

Results. *In line with the theoretical background, both the drafting and analysis of the interviews were conducted according to the key concepts of HumEnt. All three dimensions of HumEnt were investigated, as detailed below.*

Entrepreneurial Orientation (EO)

Innovativeness - Interviewees emphasized innovation as essential for their start-ups, leveraging digital technologies to introduce new services and business models, such as AI-powered booking systems and sharing economy platforms. Innovation was seen as fundamental to market differentiation and resource optimization. ST1 highlighted its role in attracting tourists, while ST7 stated: "At the core of our company lies innovation." However, ST10 cautioned about the risks of fast-evolving technology, noting both opportunities and challenges. Many start-ups invest in R&D, collaborating with universities to develop cutting-edge solutions and enhance entrepreneurial capabilities.

Proactiveness - Start-up founders showed varied approaches to market positioning. Some balanced competitive benchmarking with original ideas, as ST5 stated: "We try to copy from the best but also anticipate unexpressed market needs." Others focused entirely on differentiation, like ST1: "We aim to be ahead, as our mission is to stand out." Some adopted coopetition strategies, blending collaboration and competition to strengthen market positioning.

Risk-Taking - Most start-ups adopted a proactive yet calculated approach to risk. While initially aggressive, many later transitioned to more structured strategies. ST6 noted: "At first, we took bold steps; now, we have a more stable approach." Investments prioritized technology, while ST3 uniquely emphasized hiring to scale operations. Networks such as Startup Turismo played a key role in mitigating risks by providing access to clients, investors, and expertise. ST8 acknowledged: "The Association helped us find partners and grow."

Table 2 summarizes the dimensions of EO, which are derived from the existing literature, and the related practices, emerging from the analysis of the case studies.

Tab. 2. Dimensions and practices supporting EO of the selected tourism digital start-ups

Dimensions	***References***	***Practices***
Innovativeness	*Covin e Slevin, 1989; Lumpkin and Dess, 1996*	– *Adoption of new digital technologies* – *Introduction of new services into both new and established markets* – *Adoption of new business models* – *Investment in R&D and qualified human resources devoted to new services and processes development* – *Collaborations with universities and Public Research Institutions* – *Financial resources devoted to technological innovation*
Proactivity	*Miller, 1983*	– *Alignment of the strategic "what to do" and the operational "how to do it" based on temporal perspective oriented to the future* – *Introduction of new services compliant with the evolving tourism industry as well as timely implementation (first-to-market)* – *Not imitation of competitors* – *Coopetition*
Risk taking	*Miller, 1983; Lumpkin and Dess, 1996*	– *Belonging to a collaborative network* – *Launching the start-up despite the threat of loss* – *Solving problems to securing the necessary resources to start the business*

Sustainability orientation (SO)

Definition of Sustainability - The interviewees highlighted a broad vision of sustainability that goes beyond the environmental aspect to include social and economic dimensions. ST2 states: "Sustainability is everything that has a low impact, all-round: energy, environmental, and human." One of the analyzed start-ups is a B-Corporation, legally required to consider the impact of its decisions on society, the environment, and employees. ST1 states: "We help accommodation firms reduce their impact, especially the environmental one."

Environmental Sustainability - The interviewed start-ups adopt various practices to address environmental challenges, including bike tours, water-saving consulting, promotion of local products, and the use of renewable energy.

While none have ISO certifications, many operate entirely digitally, reducing the need for physical offices and promoting remote work. A notable example is ST8, which collaborates with an association to offset paper use. The interviewee explains: "We use FSC-certified paper and plant a tree for every 1,000 postcards to offset our impact."

Social Sustainability - The analyzed start-ups leverage digital technologies to improve the quality of life for tourists and industry operators, facilitating interactions with local communities and enhancing destination value. ST6 states: "Our goal is to democratize travel, making it accessible to everyone." Some start-ups develop customized maps and storytelling tools to involve local communities, while others analyze tourist opinions to support decision-making by businesses and institutions. However, some interviewees report challenges in the effective use of technology by tourists and organizations in the sector.

Table 3 summarizes the dimensions of SO, which are derived from the existing literature, and the related practices, emerging from the analysis of the case studies.

Tab. 3: Dimensions and practices supporting SO of the selected tourism digital start-ups

Dimensions	***References***	***Practices***
Definition of Sustainability	*Elkington, 1997; Shepherd and Patzelt 2011*	– *Promotion of environmental sustainability* – *Promotion of social sustainability* – *Promotion of economic sustainability*
Environmental sustainability	*Roxas and Coetzer, 2012*	– *Use of digital technologies to offer services with low environmental impact (e.g. bike tour)* – *Operating remotely without fixed offices* – *Integration of green practices into business processes (e.g., waste offsetting)* – *Collaborations with associations to develop environmental compensation practices (e.g. planting trees in collaboration with external entities to compensate for emissions related to production and logistics)*
Social sustainability	*Caselli, 2007; Paniccia and Baiocco, 2021*	– *Leveraging new digital technologies to propose innovative and intelligent solutions enhancing quality of life for managers, tourists, local communities* – *Using networks to engage local communities in the development of tourism services, such as storytelling or personalized itineraries, promoting community well-being*

Human Resource Orientation (HRO)

Empathy - Start-up founders emphasized fostering a relaxed and positive work environment, promoting open interactions and collaboration. Being mostly young entrepreneurs with small teams, they prioritize employee freedom and team-building activities, from shared lunches to off-site weekends. ST2 states: "I need a workplace where everything is relaxed. We share, joke, and enjoy working." Most interviewees also highlight the importance of transparent communication, supported by digital tools that facilitate information sharing.

Equity - Interviewees largely agreed that fairness prevails in their start-ups, with hiring based on skills rather than gender, age, or nationality. ST3 explains: "The best idea always wins. We aim for a diverse, inclusive, and LGBTQ+ friendly environment." However, ST7 notes that for public-facing roles, appearance may play a role, stating: "It's an objective evaluation based on job requirements."

Enablement - Founders recognize training as crucial, with many already offering employee development programs and others planning to introduce them. ST8 states: "You must stay updated and train continuously." Some start-ups encourage employees to explore new technologies to enhance efficiency and job performance. Only one, ST1, does not provide structured training, leaving learning to employees' initiative.

Empowerment - Delegation and autonomy are widely encouraged, though some founders maintain oversight. Many believe empowering employees fosters job satisfaction and productivity. ST2 states: "Delegation means allowing people to enjoy their job and do it well. If they know their work, I'm not needed."

Table 4 summarizes the dimensions related of HRO, which are derived from the existing literature, and the related practices, emerging from the analysis of the case studies.

Tab. 4. Dimensions and practices supporting HRO of the selected tourism digital start-ups

Dimensions	***References***	***Practices***
Empathy	*Kim et al., 2018*	– *Sharing information that affects start-ups operations with employees* – *Alignment of start-ups with employees' wishes and opinions by engaging in team-building rituals (e.g. shared lunches and planned off-site weekends)*
Equity	*Kim et al., 2018*	– *Hiring prictices emphasizing equity* – *Absence of discrimination for employees of any status* – *Objective and clear criteria for evaluation and promotion*
Enablement	*Kim et al., 2018*	– *Access to advanced employee training courses through collaborative networks, ensuring continuous updates on technical and managerial skills* – *Continuous improvement of practices and systems to enable employees to do their best*
Empowerment	*Kim et al., 2018; Arnold et al. 2000*	– *Freedom for employees to make decisions on tasks for which they have relevant responsibility and power* – *Autonomy to employees in terms of work method used, commitment, speed, and time* – *Exhorting employees to voluntarily suggest good ideas for better work*

Preliminary results confirm the presence of HumEnt's three dimensions in the investigated start-ups, highlighting the influence of internal and external factors and their interdependencies.

Externally, factors such as regulation, social pressure, and collaborative networks (Meek et al., 2010; Dai et al., 2015) support sustainability, resource management, and local engagement. Particularly, collaborative networks (Sorenson et al., 2008) facilitate knowledge exchange and strategic development. Universities play a key role by providing skilled personnel, fostering innovation, and offering entrepreneurial training based on frameworks like EntreComp and GreenComp.

Internally, corporate culture, flexible structures, and HR practices based on empathy, equity, and empowerment (Ostroff et al., 2003; Kim et al., 2018) drive HumEnt adoption. Flexible models enable remote work, while continuous training enhances technical and managerial skills.

Individual factors, particularly entrepreneurial values (Jahanshahi et al., 2017; Paniccia & Baiocco, 2021), strongly influence strategic decisions. Among these values, entrepreneurs' courage links EO, SO, and HRO, balancing financial and social responsibilities. The proactive approach of entrepreneurs, leveraging AI and digital tech, enables innovative services that engage both tourists and local communities.

The interaction of external and internal factors is key to promoting HumEnt in tourism start-ups. For instance, a sustainability-driven culture enhances regulatory incentives and network collaborations, generating broad positive impacts. Table 5 outlines these interactions and the reciprocal causation between EO, SO, and HRO.

Tab. 5: Interaction between External, Internal and Individual Factors and Reciprocal Causation in Humane Entrepreneurship

External Factors	***Internal Factor***		***Reciprocal Causation***
	Firm-specific	***Individual-specific***	
Favorable regulatory context	*Corporate culture oriented towards sustainability*	*Entrepreneur and employees' core values and courage*	*SO and EO interact: incentives and regulations encourage entrepreneurs and employees' attentive to environmental and cultural values to adopt low-impact technologies for lamentinging new sustainable practices (e.g., remote work).*
Social pressure	*HR practices based on empathy and equity*	*Empathy and focus on human relationships*	*EO and HRO mutually strengthen each other: ethical hiring practices and equity foster employee trust, which in turn enables collaboration and commitment to developing innovative and intelligent solutions that enhance the quality of life for managers, tourists, and local communities*
Collaborative networks	*Flexible organizational structures*	*Learning ability, reflective capacity, and courage to navigate uncertainties and implement changes*	*SO and HRO are interconnected: Collaborations with universities, associations, institutions and other firms support training programs and integration of green practices into business processes (e.g. waste offsetting; planting trees in collaboration with external stakeholders to compensate for emissions related to production and logistics)*
Competitive context, demand for innovation, technological progress and policies	*Technological innovation*	*Openness to change and courage to innovate responsibility*	*EO fosters SO: Entrepreneurs invest in R&D and sustainable business models, balancing risk-taking with ethical foresight, while aligning the strategic "what to do" with the operational "how to do it" based on a future-oriented temporal perspective.*

Research limitations. *The limitations of the study are primarily related to its preliminary stage, which requires further exploration to fully understand the dynamics and implications of the proposed framework. The main limitations include the research methodology used, which does not allow for generalizing the results, the small number of interviews conducted, and the scope of the study, which is limited to the Italian context.*

Managerial implications. *Although, this study is still in its early stages, interesting theoretical and practical implications emerge from its preliminary results. It responds to the call for more empirical research in the field of HumEnt demonstrating the interconnections and reciprocal influences between the three dimensions. In doing so, it identifies the main factors that influence the strategic posture of human-centered firms, thus sustainability. Carefully considering these factors and acting upon them can help decision makers, but also policy makers, to manage and solve the possible contradictions inherent in the dialectical nature of the relationships between various stakeholders that hinders progress toward sustainability.*

Drawing on the key factors that emerged from the analysis, the following coordinated actions are suggested:

- *To offer incentives, such as tax credits and subsides, to start-ups that invest in low-impact technologies, promote remote work options, and are compliant with sustainability standards (such as emissions limits, waste reduction targets).*
- *To implement mechanisms to monitor compliance with sustainability standards and require start-ups to report on their initiatives*
- *To establish certifications or awards for start-ups that demonstrate a commitment to socioeconomic and environmental values through their operations and activities.*

- *To design human resources practices that actively seek candidates with entrepreneurial mindsets (e.g., proactiveness, risk-taking, innovation) while ensuring inclusivity and fairness in selection.*
- *To co-design training programs with external stakeholders (including universities, civil society organizations) promoting a culture where risk-taking is guided by responsibility toward future generations and ecosystem integrity;*
- *To support initiatives where employees collaborate across departments and with external stakeholders (e.g., local communities, tourists, NGOs) to co-develop solutions that are both innovative and socially responsible.*
- *To organize workshops and learning events involving start-ups, firms, institutions, universities, and communities to share best practices, raise awareness, and co-design initiatives that embed green thinking into both strategy and human resources development.*

By combining these actions, decision-makers and policy-makers can create a supportive ecosystem for start-ups that aim to cultivate a purpose-driven organizational culture, align their mission with societal well-being and sustainability goals, and ensure that employees see their entrepreneurial efforts as contributing to a broader human and community-oriented purpose.

Originality of the paper. *To the best of the authors' knowledge, this is the first study to explore the interdependencies and reciprocal causation between EO, SO, and HRO within HumEnt. By identifying practices linked to these orientations, it makes the application of HumEnt to businesses more tangible.*

We explore Humane Entrepreneurship in the tourism sector, a key driver of sustainable development, focusing on early-stage entrepreneurship, which has been underexplored in both HumEnt and tourism. This research offers insights into integrating EO, SO, and HRO within digital start-ups in tourism.

Finally, this study sheds light on the importance of advancing HumEnt research by adopting holistic perspectives, particularly to better understand interdependencies, influences and reciprocal causation between EO, SO, and HRO and among HumEnt firms and the wider society. In this regard, the co-evolutionary perspective to the study of the relationships between firms and their environment (e.g. Abatecola 2020) seems particularly useful. In fact, co-evolution conceives the firm-environment relationships as circular, with mutual influence, and dialectical.

Rethinking Entrepreneurial Mindsets: Concepts and Measuring of Individual Humane Entrepreneurial Orientation

CHIARA CRUDELE[1] ROSANGELA FEOLA[2] ROBERTO PARENTE[3] RICKY CELENTA[4]
ELEONORA RUSSO[5]

Abstract

The increasing relevance of Humane Entrepreneurship calls for a deeper understanding of how its principles manifest at the individual level. While prior research has largely focused on firms, little attention has been given to the entrepreneurial mindset of individuals who embrace a Humane Entrepreneurial Orientation (HEO) in their approach to business. This study addresses this gap by proposing and empirically testing a novel measurement scale: the Individual Humane Entrepreneurial Orientation (IHEO). Through a scale development process-including item generation, factor analysis, and reliability assessments-this study establishes IHEO as a robust construct capturing the extent to which individuals integrate entrepreneurial, sustainability, and human-centric personal characteristics into their overall personal orientation. The validation is conducted on a sample of university students engaged in entrepreneurship education programs, providing initial evidence of the scale's psychometric properties and conceptual relevance. The results indicate that the proposed items exhibit an excellent fit with the constructs of Individual Entrepreneurial Orientation, Individual Sustainability Orientation, and Individual Human Orientation, reinforcing the validity of IHEO as a multidimensional measure. The findings offer significant implications for both research and practice. By providing a validated tool for assessing humane entrepreneurial orientation at the individual level, this study enables future investigations into its role in shaping entrepreneurial behavior. Moreover, educators and policymakers can leverage the IHEO scale to design programs that foster a new generation of entrepreneurs who embrace the Humane Entrepreneurial orientation-integrating environmental and social sustainability with a strong commitment to the well-being and development of human resources within their enterprises.

Framing of the research. *Today, issues such as resource overconsumption, environmental degradation, and social inequity are central to the agenda of international organizations, including the United Nations and its 2030 Agenda for Sustainable Development (United Nations, 2015). The business sector plays a crucial role in addressing these challenges, with entrepreneurial firms, in particular, having the potential to drive change through their strategic choices and behaviors. Many Micro, Small, & Medium Enterprises (MSMEs) are now responding to these global concerns by adopting business models that balance profitability with commitments to wealth creation, quality job opportunities, and social and environmental sustainability.*

The intersection of entrepreneurship, sustainability, and human-centric management has become a fundamental area of research, leading to the emergence of the Humane Entrepreneurship (HumEnt) model. This framework has been extensively analyzed in the literature, with studies highlighting its epistemological foundations (Parente, ElTarabishy, Vesci, & Botti, 2018) and its potential to create decent jobs (Kim, ElTarabishy, & Bae, 2018). Empirical research, primarily based on qualitative case studies, has explored how HumEnt principles manifest within organizations and influence their strategic and operational dynamics (e.g., Vesci et al. 2023; Anggadwita et al. 2021), along with empirical investigations examining its impact on business performance (Le, 2022). HumEnt is designed to capture the multifaceted nature of 21st-century entrepreneurship, moving beyond financial performance metrics to incorporate considerations of human welfare, planetary well-being, and workforce empowerment (Elkington, 1997).

Kim et al. (2018) propose integrating entrepreneurship, leadership, and human resource management (HRM) to create wealth and quality employment. They identify employee engagement as a critical component of organizational improvement and define Humane Entrepreneurship Orientation (HEO) through four dimensions: empathy, equity, enablement, and empowerment. Parente et al. (2018) extend this framework by incorporating social and environmental

sustainability, building on the triple bottom line (TBL) model (Elkington, 1994). Their approach suggests that HEO at the firm level can be conceptualized as the combination of Entrepreneurial Orientation (Covin & Slevin, 1989) with Sustainability Orientation and Humane Resource Orientation (Parente et al., 2018, 2020; Vesci et al., 2024b).

A key aspect of the HumEnt model is its foundation in organizational culture and the personal values of both entrepreneurs and employees (Vesci et al., 2023; Parente et al., 2018). This perspective aligns with the idea that entrepreneurship is not merely an economic activity but also a reflection of personal philosophies and ethical commitments (Vesci et al., 2022; Parente et al., 2021). While previous studies have primarily examined HEO at the firm level, less attention has been given to how these characteristics manifest at the individual level. For example, for some years EO (which is the basic component of a humane entrepreneurial strategic posture) has been considered as a firm-level construct that helped to characterize a firm (Chandrakumara et al., 2011; Grande et al., 2011; Gupta and Gupta, 2015; Hafeez et al., 2011). However, recent studies have recommended that it should also be considered as an individual-level construct (Robinson and Stubberud, 2014). Such recommendations have paved the way for researchers to explore EO from a new perspective (Koe, 2016). Taatila and Down (2012) suggest that, to assess students' drive and competencies for a successful entrepreneurial career, a practical understanding of their EO is essential.

Individual Entrepreneurial Orientation (IEO)

Entrepreneurial orientation (EO) is a concept originated from Miller (1983) which consists of three dimensions, namely innovativeness, pro-activeness and risk-taking. It was then further popularized by Covin and Slevin (1989) in their concept of entrepreneurial strategic posture (ESP). In later years, Lumpkin and Dess (1996) further refined EO and they suggested a five-dimension model which includes autonomy, innovativeness, risk-taking, pro-activeness and competitive aggressiveness. Throughout the years, EO has been widely recognized by researchers as a firm-level construct that determines a firm's performance (e.g.: Grande et al. 2011; Hafeez et al. 2011; Chandrakumara et al. 2011; Gupta and Gupta, 2015). For instance, by using a five-dimension EO model, Koe (2013) found that innovativeness, proactiveness, risk-taking, competitive aggressiveness and autonomy positively influenced the firms' performance. In addition, Dada and Watson (2013) regarded EO as a holistic construct and confirmed that it positively related to financial and non-financial performance. Nevertheless, in recent years, researchers have suggested that EO can also be regarded as an individual-level construct (Robinson and Stubberud, 2014). Such suggestion has given new rooms to researchers to investigate EO from a new level and perspective. Extant studies which examined individual entrepreneurial orientation (IEO) agreed that IEO is a multi-dimension construct and it consists of elements similar to firm-level EO. For examples, Chien (2014) found IEO to be positively related to business performance. A relationship between IEO and business success was also proven by Bolton (2012). The above studies have indeed given some new insights on IEO as an individual-level of EO. However, most of them are focusing on IEO-performance relationship. Moreover, since IEO is considered relatively new, researchers need to pay attention to the operationalization of its elements in their studies.

IEO can be defined as the capacity for, competence and willingness or drive of an individual to become an entrepreneur (Taatila and Down, 2012). As a recently developed concept, IEO also required measurement instruments and scales (Frunzaru and Cismaru, 2021). Lumpkin and Dess (1996) provided the starting point with their five dimensions of EO and subsequently Bolton and Lane (2012) developed a scale consisting of three dimensions – innovativeness, risk-taking and proactiveness. IEO is considered an entrepreneurial competency that can be developed through experiential learning (Sahoo and Panda, 2019). Recent studies show a positive relationship between IEO and EI (Ekpe and Mat, 2012; Martins and Perez, 2020; Robinson and Stubberud, 2014; Zhang and Bruning, 2011). Ibrahim and Lucky (2014), for example, studying Nigerian students at the University of Malaysia, found a positive and significant relationship between IEO and EI. Hassan et al. (2021) found direct and indirect roles of individual entrepreneurial orientation and entrepreneurship education in determining students' entrepreneurial intention through the mediation of entrepreneurial motivations. Literature is available on EO as a firm-level construct, with many studies having been conducted on its relationship to business performance, but because IEO is a more recent conceptualization, there is comparatively little literature on the construct (Martins and Perez, 2020; Hassan et al. 2021). IEO captures the extent to which nascent entrepreneurs are innovative, proactive, and risktakers in the process of starting their entrepreneurial activity. Generally, new ventures displaying higher entrepreneurial orientation have greater potential in terms of business performance (Rauch et al., 2009). Hence it is important to assess the extent to which aspiring or nascent entrepreneurs actively engage in innovation, are willing to take calculated risks, and maintain a forward-thinking approach to business development, as their entrepreneurial orientation could lead to the development of more successful businesses (Bolton and Lane, 2012; Clark et al., 2024).

Individual Sustainability Orientation (ISO)

Sustainability Orientation has been developed in the field of sustainable entrepreneurship, which remains an ambiguous area of research. As a consequence, the sustainability orientation domain is still vague. In fact, the current analysis has demonstrated that there is no agreement on the definition of SO, revealing that some authors focus on only environmental issues and others focus on both environmental and social issues. Moreover, if a large number of scholars retain SO as a firm-level conceptualization, there are influential studies that have proposed SO to be measured at the individual level (Parente et al. 2020). Additionally, it is not even clear if SO is a strategic posture, an attitude, or a motivation toward action, as scholars have adopted all these categorizations. Although the literature has proposed

numerous measurement scales of SO, the majority of them derive from the Kuckertz and Wagner scale (2010), which has been adapted over time to the attitudinal or behavioral SO conceptualization. Inasmuch as HEO is a strategic posture that is measured at the firm level, and it is both attitudinal and behavioral, the SO measurement scale has not been as well developed in the literature for the purpose of the HEO measurement. Parente et al. (2020) refer to SO as a firm-level strategic orientation demonstrated by the fact that firm behavior exhibits a high level of commitment to the preservation of the natural environment but also respects society-driven initiatives and acts: to (a) improve the health and well-being of people in the firm; (b) improve the quality of life in the local community; and (c) promote democratic business models. Accordingly, we refer to ISO as an individual-level orientation demonstrated by the fact that individual behavior exhibits a high level of commitment to the preservation of the natural environment but also respects society-driven initiatives and acts to improve the quality of life in the local community. In this sense, the starting point toward the generation of items to measure ISO as framed in IHEO seems to be the scale proposed by Muñoz and Dimov's (2015) proposal to take into account the entrepreneurs' attitudes and convictions with regard to sustainability. Since HumEnt conceives HEO as a strategic posture that is both attitudinal and behavioral, the proposed conceptualization and operationalization of ISO semantically cover both the two dimensions of environmental sustainability and social sustainability. These items are also able to capture both the attitudinal (orientation) and behavioral (actions) features that are encapsulated in the domain of SO as defined by HumEnt theorists.

***Individual Human Orientation (IHO): Definition and Measurement scale**s*

HRO is based on the assumption that respecting and engaging employees is a successful strategy to achieve organizational results (Parente et al. 2022). HRO as intended in the domain of HumEnt is a new construct: inasmuch as HRM an extensive topic, one way to assess HRO from a strategic posture perspective is to pay attention to humane resource practice in terms of the actions taken to strategically pursue given practices. Unfortunately, an accepted measurement scale of entrepreneur/top manager behavior fitting HRO as intended in the domain of HumEnt does not exist (Parente et al. 2020; Vesci et al. 2022). Moreover, no agreement can be found in the literature on the number and type of human resource policies and practices that populate HRM. Kim et al. (2018) proposed their idea of human resource policies and practices as being strictly linked with HumEnt, describing these policies and practices in light of the principles of humanistic management (Melè, 2016). Moving from the conceptualizations of Human Resources Orientation (HRO) proposed by Kim et al. (2018) and tested by Le (2022) that represent the ways in which HR Management is integrated within the authors' idea of HumEnt, we identify and define four main dimensions that should qualify IHO at individual level: (a) empathy as the extent to which an individual shares emotions and information with others; (b) equity as the extent to which an individual treats others in a fair and equal manner; (c) enablement as the extent to which an individual provide others individual what everything they needs to develop their (life) projects to the best of their abilities; and (d) empowerment as the extent to which an individual shares information and resources with another individual in developing a particular task offering him to participate in the decision-making process.

Purpose of the paper. *The purpose of this work is to develop and test a novel measurement scale-Individual Humane Entrepreneurial Orientation (IHEO)-to assess the extent to which individuals integrate entrepreneurial, sustainable, and human-centric values into their mindset and orientation. While the concept of Humane Entrepreneurship has gained traction in recent years, most studies have focused on the organizational level, leaving a critical gap in understanding how these principles manifest at the individual level. By proposing a psychometrically scale, this study aims to provide researchers with a reliable tool for measuring humane entrepreneurial orientation in individuals, enabling further exploration of its implications for entrepreneurial behavior and education. Additionally, this study seeks to contribute to practice by offering a framework that educators and policymakers can use to design programs fostering entrepreneurs who embrace the Humane Entrepreneurial Orientation-integrating environmental and social sustainability with a strong commitment to the well-being and development of human resources within their enterprises. This study investigates how the values and characteristics associated with the HumEnt approach are framed in student entrepreneurs, trying to answer the Research Question:*

***RQ**: How are the characteristics and values associated with a HumEnt approach framed in student entrepreneurs?*

Methodology. *To propose and test a measurement scale for Individual Humane Entrepreneurship Orientation, we conducted a quantitative study using Factor Analysis. Data were collected through a structured survey administered to a sample of university students engaged in entrepreneurship-related courses and activities. In line with the methodological recommendations of Churchill (1979) and Kline (2005), this study adopts multiple items on a seven-point Likert scale to measure all constructs, ensuring both reliability and validity in capturing their multidimensional nature. The survey included scales adapted from previous literature (Kim et al., 2018; Bolton & Lane, 2012; Munoz and Dimov, 2015; Le, 2022) to measure the three dimensions of IHEO:*

***Individual Entrepreneurial Orientation**: IEO captures the extent to which nascent entrepreneurs are innovative, proactive, and risktakers in the process of starting their entrepreneurial activity by means of the 10-item 7-point Likert scale by Bolton and Lane (2012).*

***Individual Sustainability Orientation**: Since HumEnt conceives HEO as a strategic posture that is both attitudinal and behavioral, the proposed ISO measurement scale has been derived from the two scales proposed by Muñoz and*

Dimov's (2015), namely the Sustainability Orientation scale (from which we adapted two attitudinal environmental and social ISO items) and the Sustainability-Oriented Entrepreneurial Actions scale (from which we adapted two behavioral social and environmental ISO items). More clearly, to measure Sustainability Orientation (SO), Muñoz and Dimov's (2015) asked about the entrepreneurs' attitudes and convictions about sustainability as reflected in their perceptions of the venture they were creating. They used a 6-item Likert scale (in turn adapted from Kuckertz and Wagner 2010, to reflect the fact that they were referring to a specific venture, rather than entrepreneurship in general). To measure Sustainability-oriented entrepreneurial actions, Muñoz and Dimov's (2015) focused on the extent to which the entrepreneurs aimed to solve sustainability problems in setting up immediate objectives in the course of developing their ventures. They use an 8-item Likert scale, the dimensions were derived from study of Dyllick and Hockerts (2002) to represent eight traditional sustainability objectives. Therefore, to assess ISO, we propose four items that semantically cover both the two dimensions of environmental sustainability (two items) and social sustainability (two items). These items are also able to capture both the attitudinal (orientation) and behavioral (actions) features that are encapsulated in the domain of SO as defined by HumEnt. Finally, we have also adapted the four selected items shifting the focus from the firm-level to the individual- level (in order to align the measure of Individual Sustainability Orientation with that of Individual Entrepreneurial Orientation).

***Individual Human Orientation**: In the original conceptualization proposed by Kim et al. (2018) HRO dimension is twofold. On the one hand, it is related to a manager's personal characteristics, on the other hand, it takes into account the point of view of the leader who, facing different challenges, understands the importance of implementing strategic HRM through HR practices. For this reason, the dimensions are intended as behaviorist constructs whose measurement is based on managers' and entrepreneurs' behaviors in terms of actions performed to realize each dimension. As a consequence, the Kim et al. (2018) measurement scale for empathy, equity, enablement, and empowerment refers to the firm level, which can be intended as the level of strategic posture conceptualize in the HumEnt domain. In order to align the conceptualization proposed by Kim et al. (2018) with an individual perspective of humane orientation, we selected one item on each dimension (empathy, equity, enablement and empowerment, for a total of 4 items) and adapted from the firm-level to an individual-level measurement, in order to align the measure of IHO to that of Individual Entrepreneurial Orientation (IEO).*

An exploratory factor analysis (EFA) was performed to identify the underlying structure of the IHEO construct at the individual level. The Kaiser-Meyer-Olkin (KMO) measure and Bartlett's test of sphericity were used to assess the suitability of the data for factor analysis. Principal Component Analysis (PCA) with varimax rotation was applied to extract and interpret the factors. Reliability and validity of the constructs were assessed through Cronbach's alpha and composite reliability (CR) indices.

Results. *The study was conducted on a sample of 223 university students from University of Salerno, recruited through classroom invitation. The sample consisted of 45,2% males and 54,8% females, with an average age of 23,1 years (SD = 2.06). Prior entrepreneurial experience was reported by 18,4% of respondents, while 60,5% had previously attended entrepreneurship-related courses.*

To assess the underlying structure of the proposed Individual Humane Entrepreneurship Orientation (IHEO) scale, an Exploratory Factor Analysis (EFA) was conducted using principal component factoring with varimax rotation, given the expected correlation between factors. For Individual Entrepreneurial Orientation (IEO), the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy was .938, demonstrating strong suitability for factor analysis. Bartlett's test of sphericity was highly significant (χ^2 = 1,989.209, $p < .000$), supporting the appropriateness of the factor model. The analysis of eigenvalues and the scree plot indicated a one-factor solution, accounting for 69.8% of the total variance. All items loaded cleanly onto this factor, with no factor loadings below 0.40 or problematic cross-loadings above 0.30, resulting in a well-defined unidimensional structure. For Sustainability Orientation (SO), the KMO value of .822 confirmed the adequacy of the sample for factor analysis. Bartlett's test of sphericity yielded a significant result (χ^2 = 968.191, $p < .001$), reinforcing the validity of the factor model. The exploratory factor analysis revealed a single-factor structure, explaining 87.2% of the total variance. No issues with factor loadings were detected, as all items exhibited strong loadings above 0.40 with minimal cross-loadings, leading to a final one-dimensional construct. Finally, regarding Individual Humane Orientation (IHO), the KMO statistic was .856, further indicating that the dataset was well-suited for factor analysis. Bartlett's test of sphericity was significant (χ^2 = 806.388, $p < .001$), confirming the factorability of the correlation matrix. The eigenvalue distribution and scree plot suggested a single-factor solution, capturing 84.6% of the total variance. The analysis confirmed that all items loaded adequately onto the factor without cross-loading concerns, resulting in a cohesive and interpretable unidimensional structure.

The internal consistency of the scale was evaluated through Cronbach's alpha (α) and Composite Reliability (CR). All subscales demonstrated satisfactory reliability, with α values ranging from .938 to .952 and CR values above the recommended threshold of 0.70. Convergent validity was assessed via Average Variance Extracted (AVE), with all factors exceeding the minimum threshold of 0.50. Discriminant validity was confirmed using the Fornell-Larcker criterion and the Heterotrait-Monotrait (HTMT) ratio, both indicating that each factor was empirically distinct. The final IHEO scale comprises 3 factors and 18 items, demonstrating strong psychometric properties. This validated measurement tool provides a reliable foundation for future research on humane entrepreneurship at the individual level.

Research limitations. *Despite its contributions, this study has some limitations to be acknowledged. First, the research is based on a sample of students, which, while relevant for investigating Individual Humane Entrepreneurship*

Orientation (IHEO), may limit the generalizability of the findings to other samples. Future studies could extend this research by examining IHEO in established entrepreneurs or across different entrepreneurial ecosystems to assess its applicability beyond the student population. Second, the study relies on self-reported data, which may introduce social desirability bias. Respondents might have overestimated or underestimated their orientation toward humane entrepreneurship due to personal or social expectations. Future research could integrate behavioral data or longitudinal studies to validate whether self-perceptions translate into actual entrepreneurial behaviors. Third, the study primarily captures IHEO at a single point in time, making it difficult to assess how these orientations evolve over time. A longitudinal approach could provide deeper insights into how students' entrepreneurial, sustainability, and human orientations develop as they transition from education to real-world business experiences. Finally, the study may be contextually constrained, as institutional, cultural, and economic factors could influence the relevance and impact of IHEO differently across regions. Future research should explore cross-cultural comparisons or test the robustness of the IHEO framework in different countries and educational environments.

Managerial implications. *The findings of this study hold significant implications for entrepreneurship educators, policymakers, and practitioners aiming to foster a new generation of responsible entrepreneurs. First, by identifying the key dimensions of Individual Humane Entrepreneurship Orientation (IHEO)-individual entrepreneurial orientation, individual sustainability orientation, and individual human orientation-this research underscores the importance of cultivating not only business acumen but also ethical and sustainability-driven mindsets in aspiring entrepreneurs. Educational institutions play a critical role in this process, as they can leverage these insights to design curricula that go beyond traditional business training. Programs should integrate experiential learning, mentoring, and exposure to real-world entrepreneurial challenges, ensuring that students develop both the cognitive and affective skills necessary to lead businesses with a balance of profitability and social responsibility. Business schools and incubators should emphasize social impact projects, interdisciplinary collaboration, and ethical decision-making frameworks, equipping students with the tools to navigate complex business environments while maintaining a strong commitment to sustainability and humane values. For policymakers, the study suggests the need to develop targeted policies and incentive structures that encourage humane and sustainable entrepreneurship at the individual level. Governments and institutions should invest in training programs, funding opportunities, and tailored mentorship initiatives for young entrepreneurs who exhibit strong IHEO characteristics. This could include grants for startups with a social or environmental mission, tax incentives for businesses founded by student entrepreneurs committed to sustainable practices, and partnerships between universities and industry leaders to facilitate knowledge transfer and support structures. Additionally, integrating IHEO-based assessment tools into government-funded entrepreneurial programs could help in identifying and nurturing high-potential individuals who align with the principles of humane entrepreneurship. By fostering a culture of entrepreneurial responsibility, both academia and policymakers can contribute to the development of an innovation ecosystem where businesses are not only profit-driven but also agents of positive social change.*

Originality of the paper. *This study contributes to the entrepreneurship literature by extending the Humane Entrepreneurial Orientation (HEO) construct to the individual level, introducing the concept of Individual Humane Entrepreneurship Orientation (IHEO). While previous research has extensively examined HEO at the firm level, there has been limited exploration of how these principles manifest in individual entrepreneurs, particularly students. By integrating Individual Entrepreneurial Orientation (IEO), Individual Sustainability Orientation (ISO), and Individual Human Orientation (IHO), this paper proposes and empirically tests a novel multidimensional measurement scale for IHEO, filling a critical gap in the literature. Furthermore, the study provides new theoretical and methodological insights by adapting validated firm-level constructs (e.g., Kim et al., 2018; Muñoz & Dimov, 2015; Bolton & Lane, 2012) to an individual-level framework. This approach aligns with recent calls in the literature to explore entrepreneurial orientation and sustainability orientation as individual-level constructs (Robinson & Stubberud, 2014; Koe, 2016), particularly in the context of student entrepreneurs. By focusing on the early-stage adoption of HumEnt principles, this research offers practical implications for entrepreneurship education and policy-making, highlighting how fostering sustainability, empathy, equity, enablement, and empowerment among students can shape the next generation of "humane" entrepreneurs.*

Key words: *Individual Humane Orientation; Humane Entrepreneurship; Student Entrepreneurship; Scale Development*

Urban Innovation, Housing Costs, and Youth Entrepreneurship: Rethinking the Smart City Model

FILIPPO MARCHESANI[1]

Abstract

The increasing digital transformation of cities has placed smart urban ecosystems at the center of economic and policy discussions. While smart city advancements are often seen as catalysts for innovation and entrepreneurship, their socio-economic implications remain underexplored. This study examines the dual role of urban innovation in shaping youth entrepreneurship, considering both its enabling effects and potential constraints. While technological progress and digital infrastructures can lower barriers to entry and create new market opportunities, rising housing costs and affordability issues in technologically advanced cities may counterbalance these benefits, restricting access to urban entrepreneurial ecosystems. By applying a Push and Pull framework, this research investigates how urban innovation fosters youth entrepreneurship and whether escalating living costs moderate this relationship. Using a longitudinal dataset covering 38 Italian cities from 2009 to 2022 and employing Generalized Method of Moments (GMM) estimation, the study explores the non-linear effects of urban innovation on youth-led business creation. Preliminary results suggest that while urban innovation initially stimulates entrepreneurial activity, its benefits diminish as housing costs increase, leading to a potential inverted U-shaped relationship. This finding challenges the assumption that smart city development inherently fosters inclusive entrepreneurship and highlights the need for policies that balance technological progress with economic accessibility. By shedding light on the trade-offs between innovation and affordability, this research contributes to the broader discourse on entrepreneurial ecosystems in digitally transforming cities, offering critical implications for urban policymakers and stakeholders.

Framing of the research. *The ongoing digital transformation of urban environments has pushed the smart city paradigm to the forefront of contemporary urban and economic research. Cities are increasingly integrating digital infrastructures, big data analytics, and artificial intelligence to enhance urban management, optimize resource allocation, and improve citizen engagement (Caragliu et al., 2011; Guo & Zhong, 2022; Kummitha, 2024). These technological advancements are often framed as universal enablers of economic and social progress, leading to assumptions that digital transformation in cities fosters innovation, entrepreneurial opportunities, and economic inclusivity (Albino et al., 2015; Christofi et al., 2021; Dameri et al., 2019). However, while much of the smart city literature emphasizes efficiency, sustainability, and technological advancements, there is a growing need to understand the socio-economic consequences of these transformations (Datta, 2015; Hollands, 2015; Marchesani et al., 2025).*

A crucial yet underexplored dimension in this debate is the intersection between urban innovation, youth entrepreneurship, and socio-economic barriers. Youth entrepreneurship is widely recognized as a driver of innovation and economic dynamism, particularly in rapidly evolving urban settings (D. Audretsch et al., 2020; Ogamba, 2019). Young entrepreneurs introduce fresh perspectives, foster community engagement, and contribute to urban economic resilience, making them key actors in smart city transitions (Marchesani et al., 2022). However, as cities become more digitally advanced, rising living costs and housing affordability have emerged as significant barriers that shape entrepreneurial opportunities and behaviors (Essafi Zouari et al., 2021; Florida, 2002; Manitiu & Pedrini, 2016). The increasing costs of urban life, especially in digitally mature cities, risk excluding younger and less financially stable entrepreneurs from urban entrepreneurial ecosystems, ultimately challenging the inclusivity of smart city innovation (Winters, 2011).

Existing studies have examined the role of smart cities in fostering innovation, as well as the economic and social challenges associated with urban transformation (Caragliu & Del Bo, 2019; Kummitha, 2018; Vanolo, 2014, Marchesani & Ceci, 2025). However, the specific impact of urban innovation on youth entrepreneurship, and how socio-economic factors such as housing affordability mediate this relationship, remain insufficiently investigated. Theoretical debates on smart cities often assume that technological progress inherently benefits all urban stakeholders (D. B. Audretsch et al., 2015; Hatuka & Zur, 2020). This study challenges that assumption by questioning whether smart city advancements foster youth entrepreneurship equally, or whether they create new economic barriers that reshape urban entrepreneurial dynamics.

By adopting the Push and Pull framework, this research positions urban innovation as a potential enabler (pull factor) of youth entrepreneurship, while simultaneously recognizing housing costs as a constraint (push factor) (Kirkwood, 2009;

DOI 10.7433/SRECP.SP.2025.01

Sahasranamam & Sud, 2016). This dual perspective allows for a more nuanced exploration of how urban innovation influences entrepreneurial entry, resilience, and long-term participation in smart cities, and whether escalating living costs distort or weaken these opportunities. The study builds on prior research on urban innovation and entrepreneurial ecosystems, extending it by focusing on the spatial and economic constraints that young entrepreneurs face in technologically advanced urban environments (D. B. Audretsch & Belitski, 2017).

Given the increasing policy focus on fostering smart city ecosystems that are not only technologically advanced but also socially inclusive, this study provides timely insights into how cities can balance innovation with affordability to maintain entrepreneurial vibrancy (Borkowska & Osborne, 2018; Hollands, 2008; Khurana & Dutta, 2024). Understanding the dynamics between digital transformation, youth entrepreneurship, and socio-economic barriers is essential for designing equitable smart city policies that do not inadvertently marginalize young business creators. By integrating longitudinal empirical analysis with theoretical insights, this research contributes to the ongoing debate on the role of smart cities in shaping future economic landscapes, offering a critical reassessment of the inclusivity of urban innovation in contemporary entrepreneurial ecosystems.

Purpose of the paper. *This study aims to explore the dual role of urban innovation as both a catalyst and a constraint for youth entrepreneurship in smart cities. While digital transformation and technological advancements are widely regarded as enablers of entrepreneurship (D. B. Audretsch et al., 2019; Kummitha, 2018; Marchesani et al., 2022), this paper critically examines whether these benefits extend equally to young entrepreneurs or if emerging socio-economic barriers, such as rising housing costs, create unintended constraints. By leveraging the Push and Pull Theory, this research investigates how urban innovation shapes youth entrepreneurial activities and whether housing affordability moderates this relationship. Specifically, the study seeks to answer two key research questions: "How does urban innovation in smart cities influence youth entrepreneurship?" and "To what extent do rising housing costs moderate the relationship between urban innovation and youth entrepreneurship?".*

The overarching goal is to challenge the assumption that smart cities foster inclusive entrepreneurship and to provide empirical evidence on whether high levels of urban innovation might inadvertently disincentivize young entrepreneurs by increasing financial barriers. In doing so, this research contributes to the ongoing debate on entrepreneurial ecosystems in urban settings, offering insights that are relevant for policymakers, urban planners, and scholars interested in the socio-economic dynamics of digital cities. By emphasizing the role of affordability and accessibility in fostering a sustainable and inclusive entrepreneurial environment, the study informs future urban policies aimed at balancing technological progress with social equity.

Methodology. *The study employs a quantitative research design based on a longitudinal panel data analysis covering 38 Italian cities over a 13-year period (2009–2022). This approach enables an in-depth investigation of how urban innovation influences youth entrepreneurship over time while considering the role of socio-economic constraints, particularly rising housing costs. The dataset integrates multiple national and international sources to ensure robustness and comprehensiveness. Youth entrepreneurship, the dependent variable, is measured as the number of businesses registered by entrepreneurs under the age of 35 relative to the total number of businesses in each city per year, using data from the Italian Chamber of Commerce. Urban innovation, the independent variable, is operationalized as a composite index incorporating multiple dimensions of smart city development, including digital public services, municipal app development, public R&D investment, broadband access, and the use of social media by municipal administrations, with data sourced from ISTAT, EUROSTAT, AGCOM, and municipal records. Housing costs, the moderating variable, are captured through an aggregated index of rental prices and property values across three urban zones (central, sub-central, and peripheral) using national real estate databases (www.immobiliare.it), municipal housing reports, and historical data retrieved from the Wayback Machine.*

To control for additional factors influencing youth entrepreneurship, the model includes several control variables such as population size and urban density to account for agglomeration effects, employment rates and GDP per capita to capture broader economic conditions, the total number of firms and entrepreneurial concentration to assess city-level business dynamics, and international connectivity, proxied by the presence of airports, to reflect a city's integration into global economic networks. Given the panel structure of the dataset, the study adopts the Generalized Method of Moments (GMM) estimator to address potential endogeneity issues and unobserved heterogeneity (Lee & Yu, 2014; Roodman, 2009; Windmeijer, 2005). This approach is particularly suited for dynamic panel models as it accounts for unobserved city-specific effects that could influence both urban innovation and youth entrepreneurship while mitigating endogeneity concerns through the inclusion of lagged dependent variables as instruments. The model also controls autocorrelation and heteroskedasticity to ensure the robustness of statistical inference.

The empirical analysis tests for a potential non-linear relationship between urban innovation and youth entrepreneurship by employing a quadratic specification. This allows for the examination of whether urban innovation initially fosters entrepreneurship but reaches a threshold beyond which its benefits diminish or reverse due to increased competition and rising living costs (Haans et al., 2016). The moderating effect of housing prices is assessed by introducing interaction terms between urban innovation and housing costs to evaluate whether affordability constraints alter the entrepreneurial potential of young individuals. According to Agostinelli (2002), stepwise regression approach is applied to progressively introduce control variables and interaction terms, ensuring that findings are not driven by omitted variable bias. To further refine the analysis, quantile regression is employed to explore whether the effects of urban innovation and housing costs vary across different levels of youth entrepreneurship activity, providing a more nuanced

understanding of whether financial constraints disproportionately affect early-stage entrepreneurs compared to more established young business owners.

To validate the robustness of the findings, multiple sensitivity analyses are conducted. The model is re-estimated using alternative measures of urban innovation, including smart city rankings and digitalization indices, to ensure consistency across different conceptualizations of urban technological development. A subsample analysis is performed to examine whether the effects vary based on economic and demographic factors, distinguishing between small and large cities as well as cities with high and low GDP levels. To further address endogeneity concerns, an instrumental variable (IV) estimation is conducted using historical smart city funding allocations as an exogenous instrument for urban innovation. Additionally, a variant inflation factor (VIF) analysis is carried out to detect and address potential multicollinearity among independent variables.

Results. *The preliminary results of this study indicate that urban innovation in smart cities plays a dual role in shaping youth entrepreneurship, acting as both a catalyst and a constraint. The initial findings suggest that technological advancements, digital infrastructure, and smart city policies foster youth entrepreneurial activity by providing enhanced access to resources, networks, and market opportunities. However, as urban innovation intensifies, the study observes a diminishing marginal effect, where excessive digitalization and economic transformation create heightened competition and increase financial barriers, particularly in housing affordability. This supports the hypothesis of an inverted U-shaped relationship, where urban innovation initially drives youth entrepreneurship but, beyond a threshold, its positive effects begin to decline.*

Moreover, preliminary evidence indicates that housing costs significantly moderate this relationship, exacerbating financial constraints for young entrepreneurs. In cities with higher living costs, the benefits of urban innovation appear to be counterbalanced by affordability barriers, reducing entrepreneurial entry and shifting young talent towards employment in established firms rather than new venture creation. This effect is particularly pronounced in highly digitized, economically developed cities, where urban attractiveness drives real estate demand and raises financial entry barriers for new businesses.

Preliminary analyses also reveal variations across city types, with larger metropolitan areas exhibiting stronger negative moderating effects due to higher living costs, while smaller smart cities with emerging digital ecosystems appear to offer more balanced conditions for youth entrepreneurship. These insights highlight the need for smart city policies that balance technological progress with socio-economic inclusivity, ensuring that urban innovation supports youth entrepreneurship without reinforcing structural inequalities. Further analyses will refine these findings to provide more concrete policy recommendations and theoretical contributions to the intersection of smart cities, youth entrepreneurship, and socio-economic barriers.

Research limitations. *This study has several limitations that should be considered. First, the analysis is limited to Italian cities, which may restrict the generalizability of the findings to other regions with different smart city policies and economic conditions. Future research could adopt a cross-country approach to capture broader variations in how urban innovation influences youth entrepreneurship.*

Second, urban innovation is measured through a composite index, which, while comprehensive, may not fully capture qualitative aspects such as governance effectiveness or policy implementation. Further studies could integrate case studies or qualitative analyses to complement these insights.

Third, the study considers youth entrepreneurship as a single category, without distinguishing between sectors or business models. Since urban innovation may have varying effects on different types of ventures, future research could explore sector-specific impacts and the distinction between necessity-driven and opportunity-driven entrepreneurs.

Fourth, housing costs are used as a proxy for socio-economic barriers, but other financial constraints, such as access to capital and operational costs, could also shape youth entrepreneurship. Expanding the analysis to include broader economic factors would provide a more comprehensive perspective.

Finally, while the quantitative approach ensures robustness, it does not capture individual entrepreneurial experiences. A mixed-methods approach incorporating qualitative data could offer deeper insights into how young entrepreneurs navigate smart city environments. Addressing these limitations would strengthen the study's contributions and refine its policy implications.

Managerial implications. *These preliminary findings could produce important managerial implications for policymakers, urban planners, and business leaders seeking to foster youth entrepreneurship in smart cities. First, urban innovation must be designed with inclusiveness in mind, ensuring that technological advancements do not create unintended barriers for young entrepreneurs. While digital infrastructure and smart city initiatives enhance business opportunities, excessive urban transformation can lead to higher living costs that disproportionately affect aspiring entrepreneurs with limited financial resources. Municipal governments should adopt balanced innovation policies that promote entrepreneurship while mitigating affordability challenges.*

Second, housing affordability should be integrated into smart city planning, as high living costs can limit the attractiveness of urban centers for young business founders. City administrations can implement measures such as affordable co-working spaces, targeted financial incentives, or zoning regulations that encourage mixed-income housing, preventing the exclusion of early-stage entrepreneurs from urban ecosystems.

Third, entrepreneurial support programs should be tailored to different business models, recognizing that not all young entrepreneurs benefit equally from urban innovation. High-tech startups may thrive in digitally advanced cities,

but small businesses and necessity-driven entrepreneurs could face greater difficulties in adapting to rapid technological change. Business incubators and public-private partnerships should provide sector-specific resources, including training, mentorship, and financial support, to ensure that diverse forms of youth entrepreneurship can flourish.

Fourth, public and private stakeholders should consider broader financial constraints beyond housing costs, as access to capital, regulatory frameworks, and operational expenses also shape youth entrepreneurial potential. Policymakers should work towards developing financial instruments, such as microloans, tax incentives, and venture capital initiatives specifically targeted at young entrepreneurs operating in smart city environments.

Finally, business leaders and urban policymakers must collaborate to align smart city strategies with economic sustainability. While digital transformation is essential for urban competitiveness, it should not come at the expense of entrepreneurial diversity and accessibility. A holistic approach that integrates technological progress, socio-economic policies, and entrepreneurial ecosystem development will be key to ensuring that smart cities remain dynamic, inclusive, and supportive of youth-led innovation.

Originality of the paper. *This study contributes to the smart city and entrepreneurship literature by offering a novel perspective on the dual role of urban innovation as both an enabler and a constraint for youth entrepreneurship. While existing research highlights the benefits of digital transformation, this paper challenges the assumption that smart city advancements automatically foster inclusive entrepreneurial ecosystems. By integrating the Push and Pull Theory, it introduces a non-linear approach to understanding how urban innovation impacts young entrepreneurs, emphasizing the moderating role of housing costs. Using longitudinal data and GMM estimation, the study provides empirical insights into how rising living costs can offset the positive effects of smart city initiatives. This research is among the first to quantitatively explore how economic barriers shape entrepreneurial opportunities in digitally advanced urban environments, offering critical policy and managerial implications for balancing innovation with affordability.*

Università e sviluppo regionale: costruire ecosistemi imprenditoriali in aree periferiche

SILVIA IOSSA[1] ANDREA PICCALUGA[2]

Abstract

Le università svolgono un ruolo chiave nello sviluppo regionale, soprattutto in aree periferiche caratterizzate da vulnerabilità economica e sociale. Questo studio analizza il contributo delle università nella creazione di ecosistemi imprenditoriali universitari (UEE), con un focus su due istituzioni italiane: l'Università della Calabria e l'Università di Camerino. Attraverso un approccio qualitativo basato su studi di caso, con interviste, osservazioni partecipanti e analisi di documenti secondari, la ricerca esplora i meccanismi con cui questi atenei favoriscono l'imprenditorialità e l'innovazione locale. I risultati preliminari evidenziano che tali istituzioni svolgono un ruolo cruciale nel colmare il divario di competenze e nella creazione di opportunità imprenditoriali attraverso incubatori, spin-off e collaborazioni con il tessuto produttivo locale. Il loro impegno nell'adattare l'offerta formativa e le strategie di terza missione alle esigenze territoriali può favorire la nascita di reti di innovazione e trasferimento tecnologico. Lo studio mira a proporre un framework teorico-empirico per comprendere e replicare tali dinamiche in altre aree periferiche.

Inquadramento della ricerca. *Le università sono oggi pienamente riconosciute come capaci di promuovere processi innovativi a livello territoriale. Ciò è particolarmente rilevante quando sono coinvolte aree periferiche (Benneworth, 2018). Infatti, le aree periferiche rappresentano contesti cruciali in termini di vulnerabilità e instabilità economica, sociale e politica (Rodríguez-Pose, 2018).*

Le università possono contribuire in modi diversi: giocano un ruolo chiave nella generazione di conoscenza, nella diffusione tecnologica, nella formazione del capitale umano e nel progresso sociale ed economico (Cinar & Benneworth, 2020; Marzocchi et al., 2019). In particolare, svolgono un ruolo essenziale nella creazione di ecosistemi imprenditoriali universitari (UEE), ovvero ambienti ricchi di risorse capaci di incentivare la crescita di imprese e innovazioni, offrendo agli studenti e agli attori locali strumenti concreti per trasformare idee in iniziative imprenditoriali (Audretsch et al., 2024; Miller et al., 2017). Gli ecosistemi imprenditoriali (EE) pongono l'imprenditorialità al centro dello sviluppo regionale, enfatizzando l'interazione tra il sistema di supporto locale e le organizzazioni (imprese, associazioni ecc.) presenti (Cho et al., 2021). Parallelamente, la letteratura accademica si è concentrata sull'analisi del contributo degli istituti di istruzione superiore allo sviluppo economico regionale e alla trasformazione sociale (Breznitz & Zhang, 2019). L'ecosistema imprenditoriale (EE) è stato descritto come "un insieme di attori e fattori indipendenti che collaborano per facilitare l'imprenditorialità produttiva", evidenziando come il contesto territoriale sia un elemento determinante (Stam, 2015, p. 1765). L'imprenditorialità è cruciale per il progresso innovativo delle regioni, e il concetto di EE deve tener conto della comunità socio-economica regionale di riferimento (Khlystova et al., 2022). A seconda della tipologia di università e della sede dell'istituzione, la costituzione di un ecosistema imprenditoriale e di sviluppo può essere condizionata da diversi fattori, tra cui il coinvolgimento degli stakeholder, le risorse interne ed esterne, l'incubazione di nuove imprese, sia in modalità fisica che virtuale (Radko et al., 2023). Tali meccanismi sono essenziali sia per l'ecosistema imprenditoriale universitario (UEE) sia per il contesto economico regionale in senso più ampio.

Su tali tematiche, mentre la ricerca si è largamente focalizzata sul ruolo delle università nelle regioni economicamente avanzate, esistono meno studi sul loro impatto nelle aree periferiche, dove il loro operato risulta più articolato e complesso (Pinheiro et al., 2012). In questi contesti, spesso caratterizzati da carenze infrastrutturali e di servizi, le università assumono un ruolo di compensazione per colmare tali lacune (Pinto et al., 2018). Esse possono attrarre e sviluppare conoscenze, diffonderle sul territorio e promuovere la crescita del capitale umano, stimolando un contesto favorevole allo sviluppo economico e sociale. Tuttavia, raggiungere questi obiettivi è complicato: gli atenei situati in aree periferiche, oltre a dover fronteggiare vincoli economici e gestionali, devono equilibrare le loro missioni istituzionali (ricerca, didattica e terza missione) con l'impegno nei confronti della comunità locale e delle imprese del territorio (Fernández-Esquinas & Pinto, 2014; Benneworth et al., 2017). Le università che operano su contesti regionali complessi possono incontrare diversi ostacoli, tra cui: (1) Risorse finanziarie limitate per le attività a livello regionale rispetto ai fondi destinati a ricerca, scienza e didattica; (2) riduzioni della spesa pubblica conseguenti alle misure di

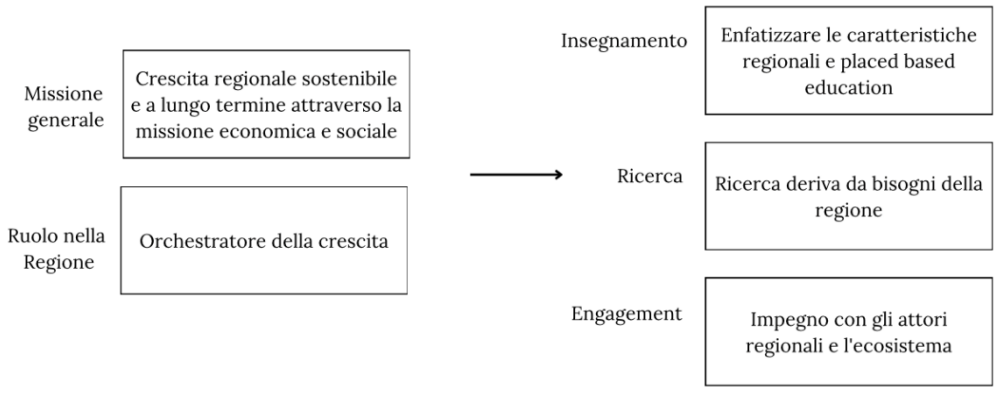
austerità post-crisi economica; (3) adozione crescente di metriche standardizzate di valutazione nell'istruzione superiore, che impongono modelli uniformi incentrati su pubblicazioni e trasferimento tecnologico; (4) riforme istituzionali in diversi paesi che favoriscono fusioni tra atenei, riducendo la diversificazione dei sistemi universitari (Pinheiro et al., 2015).



Questa ricerca parte dalla consapevolezza che operare come università in un contesto periferico comporta la necessità di rispondere a sfide e bisogni differenti rispetto agli atenei situati in contesti urbani (Benneworth, 2018). Per questo motivo, lo studio degli ecosistemi imprenditoriali in tali aree richiede metodologie e approcci specifici. Seguendo questa prospettiva, la ricerca propone un'analisi qualitativa su università situate in aree periferiche e impegnate nello sviluppo di un UEE, con particolare attenzione ai processi che ne determinano la configurazione. L'indagine adotta un approccio multidisciplinare (economico, sociale e regionale) e integra analisi empiriche sul campo, con l'obiettivo di proporre un framework innovativo applicabile anche ad altre aree periferiche europee.

Obiettivo della ricerca. *Lo studio presentato si propone di analizzare il modo in cui le università situate in aree periferiche possano sviluppare ecosistemi imprenditoriali universitari (UEEs) che rispondano alle specificità territoriali. L'obiettivo è ampliare la comprensione di questi ecosistemi in contesti periferici, spesso meno indagati rispetto alle realtà urbane, attraverso un quadro teorico ed empirico che integri le missioni universitarie con le peculiarità del territorio. La ricerca si basa su due ampi filoni di letteratura: il primo relativo al rapporto tra università e sviluppo regionale nelle aree periferiche e il secondo dedicato agli UEEs. A tale scopo, vengono adottati due framework di riferimento. Il primo, relativo alle componenti essenziali di un UEE (Alam et al., 2024), è illustrato in Tabella 1.*

Componenti	*Descrizione*
Politiche	*Regolamenti e normative che supportano l'imprenditorialità regionale*
Educazione e formazione imprenditoriale	*Sviluppo di competenze e conoscenze per il successo imprenditoriale*
Capitale d'investimento	*Disponibilità di risorse finanziarie per avviare e gestire imprese*
Infrastrutture	*sistemi di trasporto, accesso a internet, incubatori e spazi di innovazione*
Servizi di supporto	*consulenze legali, contabili e strategiche per le start-up*
Rete di contatti	*Connessioni con stakeholder chiave dell'ecosistema imprenditoriale*
Mentori	*Figure di riferimento che guidano gli imprenditori nel processo di avvio e crescita*
Cultura di supporto	*atteggiamenti e percezioni regionali nei confronti dell'imprenditorialità*

Componenti chiave di un UEE (Alam et al., 2024)

Il secondo framework di riferimento riguarda il ruolo delle università nello sviluppo territoriale e si basa sull'integrazione dei concetti di entrepreneurial university ed engaged university (Breznitz & Feldman, 2012; Guerrero et al., 2014). In questa prospettiva, le università non si limitano alla commercializzazione delle attività di ricerca o alla formazione degli studenti in funzione dei benefici regionali, ma assumono un ruolo attivo nel rispondere alle sfide e alle esigenze specifiche del territorio in cui operano (Cho et al., 2024). Il framework adottato evidenzia come le attività di insegnamento, ricerca e engagement debbano svilupparsi in stretta relazione con il contesto locale, coinvolgendo gli attori regionali non solo come destinatari, ma anche come partner strategici nel processo di creazione e consolidamento degli ecosistemi imprenditoriali universitari. In Figura 1 è illustrato il framework di riferimento.

Il framework dell'Università nella propria regione (Thomas et al., 2023)

Per condurre l'analisi, sono state selezionate due università italiane con un ruolo rilevante nel contesto regionale: l'Università della Calabria e l'Università di Camerino.

La Calabria è una delle regioni italiane meno sviluppate, con un'economia ancora distante dagli standard di altre aree del Paese (Lazzeroni, 2020). L'Università della Calabria opera, dunque, in un territorio segnato da alti livelli di disoccupazione, carenze infrastrutturali e un significativo spopolamento (Istat, 2023a). Anche l'Università di Camerino, pur situata in un contesto diverso, svolge un ruolo cruciale in un'area non metropolitana e geograficamente distante dai centri urbani e/o metropolitani (Barca, 2009).

L'Università della Calabria, istituita nel 1968 a Rende (CS), è stata concepita sin dall'inizio come un elemento strategico per favorire lo sviluppo locale. Collocata in un'area storicamente segnata da difficoltà economiche e sociali, la sua creazione mirava a innescare una trasformazione significativa del territorio (Bartucci, 2018). Il primo rettore, l'economista Beniamino Andreatta, elaborò un piano volto a promuovere la crescita socio-economica in una Regione che, all'epoca, si trovava lontana dai principali poli universitari, fondando il primo campus universitario in Italia con il motto "Campus per Eccellenza".

L'Università di Camerino, invece, è tra le istituzioni accademiche più antiche del Paese e sorge in un'area interna, distante dalle grandi città. La storia di questo territorio è stata segnata da eventi critici, sia storici che naturali, che hanno generato fasi di instabilità e situazioni di emergenza, tra cui il devastante terremoto del 2016 (Lazzeroni, 2020). Il sisma ha gravemente danneggiato numerosi edifici del centro storico, contribuendo a un significativo calo demografico. Tra il 2016 e il 2022, la popolazione nei comuni del cratere sismico si è ridotta del 6,3%, evidenziando una progressiva desertificazione demografica (Istat, 2023b). In questo contesto, l'UniCam ha sempre rappresentato un punto di riferimento culturale e sociale per la comunità locale, assumendo un ruolo fondamentale nei processi di ricostruzione post-sismica.

Alla luce della crescente rilevanza degli UEEs nel supportare lo sviluppo delle economie locali e nel rispondere alle sfide dei territori marginalizzati (Burke et al., 2024), questo studio analizza il ruolo di UniCal e UniCam come attori chiave nel rafforzamento della resilienza territoriale e nella costruzione di ecosistemi imprenditoriali che rispecchino le caratteristiche e le esigenze delle aree periferiche in cui operano (Breznitz & Feldman, 2012).

Da queste premesse emerge la seguente domanda di ricerca:

"In che modo le università situate in aree periferiche possono sviluppare ecosistemi imprenditoriali universitari (UEEs) che rispondano alle specificità territoriali e contribuiscano allo sviluppo economico e sociale delle loro regioni?"

Metodologia della ricerca. *La metodologia adottata in questo studio si basa sull'approccio della grounded theory, che permette un'analisi sistematica dei dati raccolti per identificare i temi e i concetti emergenti (Glaser & Strauss, 2017). Questo approccio risulta particolarmente adeguato, considerando che la letteratura sugli UEEs in contesti periferici è ancora in fase di sviluppo (Suddaby, 2006). Per esplorare il ruolo delle università nello sviluppo regionale di aree periferiche e la loro capacità di generare ecosistemi imprenditoriali universitari, la ricerca segue un metodo qualitativo basato su studi di caso (Yin, 2009). Questo ha consentito di approfondire la comprensione del fenomeno degli UEEs in contesti non metropolitani e del loro impatto sulle dinamiche territoriali.*

Abbiamo sviluppato due programmi di ricerca a lungo termine, condotti separatamente nelle due istituzioni analizzate, ma con il coinvolgimento di ricercatori comuni. In questa analisi, l'università è considerata come l'unità primaria di studio, permettendo di esplorarne le specifiche caratteristiche, strategie e interazioni con il territorio. Sebbene gli studi di caso non abbiano generalmente un valore di generalizzabilità statistica, essi offrono quadri interpretativi significativi e sono ampiamente utilizzati per la costruzione teorica nel campo dello sviluppo regionale e dell'imprenditorialità accademica.

Il caso analizzato ha previsto tre principali metodi di raccolta dati:

1. *Interviste semi-strutturate. Sono stati raccolti dati attraverso interviste a stakeholder locali (professori, imprenditori, amministratori, studenti, rappresentanti di organizzazioni che operano localmente ecc.) per comprendere come le università bilancino le esigenze sociali, l'innovazione tecnologica e l'imprenditorialità, mettendo a confronto modelli teorici con le evidenze empiriche.*
2. *Osservazione partecipante. L'analisi degli UEEs e del loro ruolo nei territori di riferimento è stata arricchita da un'attività di osservazione sul campo presso incubatori, associazioni universitarie e campus. Durante queste attività, i ricercatori hanno avuto interlocuzioni con figure chiave che operano all'interno dell'ecosistema universitario (es. delegati alla terza missione, studenti, giornalisti locali). L'osservazione ha incluso anche la partecipazione a eventi pubblici rilevanti.*
3. *Analisi di documenti e media. Sono stati esaminati documenti ufficiali e materiali pubblici, inclusi report istituzionali, articoli di giornale, discorsi, presentazioni (pitch), siti web, documenti aziendali, video, blog, tweet, feed di LinkedIn e altre fonti digitali.*

Sono state condotte interviste semi-strutturate con 30 individui, selezionati tra adulti (maggiori di 18 anni) coinvolti direttamente nelle dinamiche universitarie e nei loro impatti. Il campionamento non ha seguito criteri specifici legati a genere, etnia o stato di salute, ma ha mirato a includere un insieme rappresentativo di soggetti connessi all'Università della Calabria e all'Università di Camerino. Le interviste proseguiranno fino al raggiungimento della saturazione tematica.

Nella fase conclusiva, i dati raccolti verranno analizzati per sviluppare un modello teorico-empirico che descriva come le università periferiche configurano e alimentano gli UEEs, individuando i fattori chiave che ne favoriscono lo sviluppo socioeconomico e imprenditoriale. Le attività di ricerca proseguiranno nei prossimi mesi per consolidare le osservazioni iniziali.

Per l'analisi tematica è stato adottato il metodo Gioia, che permette di identificare schemi e temi emergenti nelle relazioni tra i costrutti. L'analisi è stata condotta utilizzando il software Atlas, che facilita l'elaborazione di dati qualitativi complessi, provenienti da testi, trascrizioni e file audio. Il metodo Gioia si articola in tre fasi: (1)

identificazione dei concetti di primo livello (first-order concepts, codifica), (2) individuazione dei temi di secondo livello (second-order themes) e (3) definizione delle dimensioni di terzo livello (third-order dimensions) (Gioia et al., 2012).

Infine, per garantire la validità e l'affidabilità delle interpretazioni, sono state impiegate tecniche di triangolazione, confrontando i risultati ottenuti da diverse fonti di dati.

Risultati preliminari e risultati attesi. *L'analisi ha l'obiettivo di identificare i risultati chiave che permettono a un'università situata in una regione periferica di contribuire allo sviluppo regionale e di creare ecosistemi imprenditoriali in grado di rispondere ai bisogni locali.*

Il terzo e ultimo step del metodo Gioia rende possibile la formulazione degli output della ricerca, che costituiranno la base per un nuovo framework. Tale framework unisce gli elementi chiave di un ecosistema imprenditoriale universitario (UEE) (Tabella 1) con le caratteristiche delle università e delle regioni in cui operano, dove si svolgono attività imprenditoriali e di engagement (Figura 1).

Le analisi delle interviste e delle osservazioni svolte fino ad ora hanno mostrato alcuni risultati preliminari in riferimento all'Università della Calabria e di Camerino, le quali sembrano svolgere effettivamente un ruolo di promozione della crescita regionale (Thomas et al., 2023), cercando di superare la tensione tra attività di commercializzazione della ricerca (Ambos et al., 2008) e coinvolgimento civico (Breznitz & Feldman, 2012). Alla conclusione dell'analisi, i ricercatori si attendono che i risultati evidenzino anche il ruolo delle Università nel favorire e preservare una rete di relazioni tra gli stakeholder di un ecosistema imprenditoriale.

Sebbene il potenziale di queste università di stimolare l'imprenditorialità e il cambiamento economico e sociale sia già emerso, i risultati concreti sono ancora in fase di codifica. I primi elementi emersi indicano che tali università hanno agito come catalizzatori di sviluppo per la Calabria e le Marche, in particolare grazie alla loro capacità di colmare il divario tra il centro e le aree periferiche. Dalle interviste condotte con docenti, responsabili delle attività di trasferimento tecnologico e di public engagement, nonché imprenditori locali, è emerso che l'elemento distintivo dell'Università della Calabria e dell'Università di Camerino non è solo l'integrazione tra educazione, ricerca e trasferimento tecnologico, ma il modo in cui queste funzioni vengono adattate alle esigenze di territori caratterizzati da una minore densità industriale e da un accesso limitato alle reti di innovazione nazionali. Nel dettaglio, hanno la potenzialità di mantenere ma anche attrarre potenziali talenti, concorrere alla nascita di imprese locali e favorire la circolazione di conoscenze in contesti spesso esclusi dai principali circuiti dell'innovazione. Secondo quanto emerso da una intervista:

"Oggi questa università ha una grande opportunità di fare da ponte tra il mondo accademico e l'imprenditorialità locale, e per farlo bisogna continuare a lavorare per colmare il gap tra l'insegnamento teorico e l'applicazione pratica sul campo".

L'attività di supporto imprenditoriale, attraverso incubatori, laboratori di innovazione e programmi di accelerazione, ha iniziato a produrre effetti positivi in entrambe le università, seppur con ritmi e impatti differenti. Nell'Università della Calabria, il modello di incubazione si sta consolidando grazie a una crescente collaborazione con il tessuto imprenditoriale locale che si sta sviluppando negli anni - come l'apertura di una sede di NTT Data e Accenture -. Diversamente, nell'Università di Camerino, gli effetti di queste iniziative sono ancora in una fase embrionale, complicati dalle difficoltà strutturali legate al terremoto del 2016 e ai ritardi nella ricostruzione, che hanno ridotto la capacità di attrarre investimenti e trattenere talenti.

"L'incubatore di UniCam è un ottimo esempio di come l'università possa stimolare la nascita di imprese, ma il vero impatto arriverà solo se riusciremo a consolidare una rete di supporto più forte tra università e imprese locali."

Nonostante queste sfide, l'incubatore di UniCam rappresenta un'opportunità concreta per favorire la ripresa economica della zona, a patto che si riesca a rafforzare le connessioni tra università, imprese locali e istituzioni, ricreando quell'ecosistema di innovazione che ha subito un'interruzione significativa a seguito del sisma.

Nel loro ruolo di agenti di sviluppo regionale nelle aree periferiche, le università hanno il compito di rafforzare le capacità locali di innovazione e imprenditorialità, contribuendo a ridurre il divario di conoscenza e competenze tra il territorio e la ricerca accademica (Rodriguez-Pose, 2018). Più che colmare un generico divario tra conoscenza accademica e territorio, queste università si trovano a operare in ambienti in cui la mancanza di infrastrutture e la fuga di talenti limitano la creazione di ecosistemi imprenditoriali solidi.

L'Università della Calabria ha avviato diverse iniziative per supportare l'imprenditorialità, quali ad esempio l'incubatore accademico TechNest, nato appositamente per offrire a team di persone fisiche, spin-off e startup innovative anche esterne all'Università l'accesso a programmi di incubazione. Il programma di mentorship risulta ancora in fase di sviluppo e la connessione tra le attività di ricerca universitaria e il tessuto produttivo regionale può essere ulteriormente rafforzata, anche al fine di contribuire allo sviluppo di nuovi spinoff. Come ha osservato un intervistato, "manca ancora la forte integrazione tra i progetti di ricerca e le esigenze delle imprese locali."

L'Università di Camerino, invece, si trova ad affrontare sfide ancora più complesse a causa delle conseguenze del sisma del 2016. Nonostante le difficoltà strutturali, l'ateneo sta cercando di capitalizzare le proprie risorse e sviluppare iniziative volte a stimolare l'innovazione, come dimostra il crescente impegno specialmente nei programmi di formazione imprenditoriale. Come sottolineato da un intervistato, "ci vuole tempo per cambiare il modo in cui i giovani vedono l'imprenditorialità. Le università stanno facendo un ottimo lavoro nel promuovere l'educazione imprenditoriale, ma dobbiamo fare di più per far capire che l'imprenditorialità è una carriera concreta e non solo una teoria."

Sebbene i primi risultati siano in generale positivi, gli esiti definitivi dipenderanno dalle successive analisi che sono ancora in corso d'opera.

L'ecosistema imprenditoriale universitario (UEE) ha il potenziale per diventare una leva strategica per lo sviluppo regionale (Cho et al., 2024), ma questo scenario è ancora in fase di costruzione e di verifica. I risultati preliminari suggeriscono che il processo di integrazione tra le due università e il territorio è in corso. Sarà fondamentale che nei prossimi mesi emerga una maggiore coesione tra le iniziative locali, i programmi di ricerca applicata dalle Università e le necessità imprenditoriali delle regioni.

Sebbene i primi segnali siano incoraggianti, i risultati finali non possono essere considerati definitivi.

Limiti della ricerca. *Questa ricerca presenta alcune limitazioni che è opportuno tenere in considerazione. Innanzitutto, l'analisi si basa su dati qualitativi raccolti attraverso interviste, osservazioni dirette e fonti secondarie, i quali possono essere soggetti a interpretazioni soggettive da parte dei ricercatori. Per ridurre al minimo eventuali distorsioni, sono state adottate strategie di triangolazione e verifica con i partecipanti.*

Un altro aspetto da considerare riguarda la composizione del campione e i criteri adottati per la selezione degli stakeholder, che potrebbero aver condizionato la varietà e la profondità delle informazioni ottenute. In particolare, la scelta di focalizzarsi su due università situate in contesti periferici potrebbe limitare la possibilità di estendere i risultati ad altre realtà. Per superare questa restrizione, ricerche future potrebbero adottare un approccio combinato tra metodi qualitativi e quantitativi (Creswell & Creswell, 2018) e includere un numero più ampio di casi. Inoltre, sarebbe utile ampliare l'ambito dello studio su scala nazionale, considerando ulteriori università situate in diverse aree periferiche italiane.

Un'ulteriore limitazione riguarda la specificità geografica della ricerca, che si concentra esclusivamente su istituzioni accademiche italiane. Ciò potrebbe non consentire un confronto diretto con altre realtà internazionali. Tuttavia, alcuni studi evidenziano l'Italia come un contesto significativo per l'analisi dello sviluppo regionale (Bellandi et al., 2021; Bellandi & Santini, 2019). Indagini condotte in altri paesi europei potrebbero servire a testare la validità dei risultati emersi.

Infine, è importante sottolineare che la ricerca è stata realizzata in un preciso periodo temporale. Poiché sia l'ambiente accademico sia quello socioeconomico sono soggetti a continui cambiamenti, i risultati potrebbero non mantenere la stessa rilevanza nel tempo. Per affrontare questa sfida, studi futuri potrebbero adottare un disegno longitudinale, utile a monitorare l'evoluzione del fenomeno e a garantire la continua attualità delle conclusioni raggiunte.

Implicazioni manageriali. *La ricerca mira a fornire raccomandazioni pratiche per le università situate in aree periferiche che intendono sviluppare ecosistemi imprenditoriali universitari (UEEs) in grado di rispondere alle specificità territoriali e di favorire lo sviluppo socioeconomico regionale. Per tali motivi, i risultati di questo studio possono avere rilevanti implicazioni per la governance e il management universitario, per i responsabili delle politiche accademiche e per gli stakeholder coinvolti nella creazione e nel consolidamento di tali ecosistemi a livello locale.*

La ricerca ha già evidenziato, in continuità con precedenti studi (Fernandez-Esquinas & Pinto, 2014; Pinto et al., 2018; Benneworth et al., 2017), la necessità per le università di integrare in modo strategico le proprie missioni istituzionali - didattica, ricerca e terza missione - con le esigenze specifiche del territorio. Ciò implica una maggiore attenzione alla creazione di programmi formativi mirati allo sviluppo di competenze imprenditoriali. Inoltre, la costruzione di un ecosistema imprenditoriale efficace richiede un impegno proattivo nel rafforzare le reti di collaborazione con amministrazioni locali, imprese, associazioni di categoria e investitori (Audretsch et al., 2024; Miller & Acs, 2017). Questa ricerca evidenzia come le università possano assumere un ruolo di orchestratori della crescita regionale (Thomas et al., 2023), di facilitatori e promotori del dialogo tra questi attori (Thomas & Pugh, 2020), favorendo un ambiente favorevole alla nascita e alla crescita di nuove iniziative imprenditoriali (Pugh et al., 2021). A tale scopo, è cruciale lo sviluppo di infrastrutture adeguate, quali incubatori, acceleratori e spazi di co-working, che possano supportare concretamente le start-up e gli spin-off accademici (Cunningham et al., 2022).

Un'ulteriore implicazione riguarda la necessità di adattare le strategie di engagement e comunicazione per valorizzare l'impatto degli UEE nei contesti periferici. In particolare, la promozione di una cultura imprenditoriale regionale può essere incentivata attraverso eventi, programmi di mentoring e percorsi di accompagnamento per aspiranti imprenditori (Breznitz & Zhang, 2019).

Originalità del paper. *Questa ricerca offre diversi contributi originali alla letteratura esistente sugli ecosistemi imprenditoriali universitari (UEEs) (Miller & Acs, 2017; Gueguen & Delanoe-Gueguen, 2021; Hayter et al., 2018) e sul ruolo delle università nello sviluppo regionale (Breznitz & Feldman, 2010; Goddard et al., 2016), con particolare attenzione ai contesti periferici (Storti et al., 2023; Palmieri, 2015). In primo luogo, lo studio nasce da una lacuna nella letteratura, che ha prevalentemente analizzato gli UEEs in contesti urbani o altamente sviluppati, trascurando le sfide e le opportunità specifiche delle università situate in aree periferiche (Pinheiro et al., 2012). Esplorando il modo in cui questi istituti possono adattare e modellare i loro ecosistemi imprenditoriali in funzione delle caratteristiche territoriali, si vuole offrire una prospettiva innovativa e ancora poco approfondita.*

Un ulteriore elemento di originalità risiede nell'approccio empirico adottato, che permette di analizzare in modo approfondito e contestualizzato il fenomeno degli UEEs nelle specifiche aree periferiche selezionate. Lo studio conferma e amplia modelli teorici esistenti (Breznitz & Feldman, 2010; Goddard et al., 2016; Rodriguez-Pose, 2018), ma mira a fornire nuove evidenze sulle strategie più efficaci per rafforzare gli ecosistemi imprenditoriali universitari in contesti meno favoriti.

Infine, il lavoro contribuisce a una comprensione più sfumata del ruolo delle università non solo come istituzioni accademiche, ma come attori chiave dello sviluppo sociale locale. Volendo mettere in luce le strategie e le pratiche che possono rendere gli UEE più sostenibili nel lungo periodo, la ricerca offre spunti utili non solo per la letteratura accademica, ma anche per i decisori politici e i manager universitari interessati a massimizzare l'impatto delle università nei territori periferici.

Parole chiave: *università nelle periferie; sviluppo territoriale; ecosistemi imprenditoriali universitari; innovazione*

How do strategic decision-makers make sense of Artificial Intelligence?

ALESSIA MUNNIA[1] JAMES A. CUNNINGHAM[2] REBECCA CASEY[3] MARCO ROMANO[4]

Abstract

This study aims to explore how the perception of Artificial Intelligence (AI) is constructed by strategic decision-makers, by adopting a sensemaking perspective. We conduct a cross-country qualitative study based on semi-structured interviews to investigate, via reflexive thematic analysis, which cognitive mechanisms shape different ways of understanding AI. Our findings evidence that there are some macro-themes through which the perception of AI is developed: vision, personal adaptability, praxis, reluctance, AI accessibility, decision-making quality and knowledge management. Based on the degree of importance attributed to them and on the sentiment embodied by decision-makers toward them, different (non-mutually exclusive) sensemaking approaches emerge: AI as a peer advisor, AI like any other technology, AI as humans' binoculars, AI as incompatible with strategic needs.

Framing of the research. *AI systems are evolving and spreading at a rapid pale, reshaping both our daily lives and professional activities in unprecedented ways. Within organisations, the impact of AI is huge for decision-making processes at all levels, spanning from routine, operational decisions that require (often fully automatised for greater efficiency) to infrequent and complex strategic decisions (Shrestha et al., 2019). However, the application of AI at an organisational strategic level is still limited and there is therefore wide scope for improvement in terms of adoption and awareness in using it. What may influence the decision to use AI or not in support of strategic decisions is the way AI and the potential collaboration with human intelligence is perceived.*

Purpose of the paper. *The purpose of this work is to study how Artificial Intelligence is perceived and conceptualised by strategists by using a sensemaking perspective. The study is guided by the following research question: How do strategic decision makers make sense of AI as a support tool for their decisions? To address this question, we investigate their perception of AI barriers, drivers and outcomes in order to reach a broad understanding of different ways of viewing it. Existing management literature has adopted the lens of sensemaking to investigate several phenomena (e.g. IT adoption (Hsieh et al., 2011), IT value (Tallon and Kraemer, 2007), coopetition (Lundgren-Henriksson and Kock, 2016), CSR (Sendlhofer and Tolstoy, 2022)). Building on this body of research, our paper aims to capture underlying mechanisms of sensemaking of such a disruptive phenomenon like AI adoption at a strategic level within an organisation.*

Literature considerations.

Sensemaking theory as theoretical lens

The term sensemaking was introduced by the organisational psychologist Karl Weick to define the process performed by leaders to make sense of the surrounding context and of the complex and shifting phenomena characterising it. He literally defines it as "making of sense"(Weick, 1995).

Sensemaking has also been theorised as a key leadership capability included in a broader "4-Cap" model that encompasses: sensemaking, relating, visioning, and inventing (Ancona et al., 2007), as well as a crucial capability for leaders to "explore the wider system, create a map of that system, and act in the system to learn from it" (Ancona, 2012), enabling them to effectively face the unknown.

Weick's model of sensemaking has been developed over the years (Weick, 1979, Weick, 1988, Weick, 1995, Weick et al., 2005), entailing changes and updates that eventually lead to the following conceptualisation: ecological change, enactment, selection, retention (Cristofaro, 2022). Ecological change refers to all those trigger events arising from a chaotic reality and that represent the input of a sensemaking process. To address the complexity of such events, leaders as decision makers undergo the enactment phase: they apply existing mental models to maximise the understanding of the world - the so called noticing activity - and create their own representation of reality (bracketed environments) through what is defined bracketing activity. People therefore go beyond mere observation and interpretation of events, by enacting and creating their own reality. Leaders are then engaged in the selection activity that comprises the application of mental models with the purpose to categorise cues and reduce equivocality and ambiguity, thus creating a

DOI 10.7433/SRECP.SP.2025.01

reasoning or schema that are consistent with the past events and preconceptions (i.e. extraction of cues and retrospection activities). Eventually, the selected schema is retained based on plausibility evaluation (selective retention). This schema in turn influences future ways of building meaning.

In summary, sensemaking within organisations enables leaders to make clarity out of complex and uncertain situations by leveraging cues that emerge from the environment to a create plausible understanding of the event that eventually feeds future sensemaking (Maitlis, 2005, Maitlis and Christianson, 2014, Weick, 1995, Weick et al., 2005).

At organisational level, sensemaking is considered a core activity that impacts, innovation processes (Drazin et al., 1999, Hill and Levenhagen, 1995, Möller, 2010, Shin et al., 2017), learning (Christianson et al., 2009, Schwandt, 2005, Thomas et al., 2001), as well as strategy and decision-making (Gioia and Chittipeddi, 1991, Gioia and Thomas, 1996, Kurtz and Snowden, 2003, Rouleau, 2005, Thomas et al., 1993). Drawing on the idea that strategists as individuals and as decision-makers may make sense of AI differently as a result of several individual, organisational and environmental factors, we aim to investigate which are these underlying cognitive mechanisms shaping their perception of AI and how these mechanisms are connected to different sensemaking approaches.

Methodology.

Exploratory cross-country qualitative study

A qualitative approach is deemed appropriate, given the exploratory nature of the study, which aims to enhance the general understanding of a complex and still understudied topic, as the adoption of AI to support strategic decision-making. Qualitative research is suitable to accomplish this goal since it enables a direct interaction with people who have hands-on experience, and exploring their in-depth views, perspectives and interpretations of phenomena and, in particular, of processes (Hinings, 1997). The resulting insights may represent a starting point to expand the existing theoretical perspective in the field (Creswell and Poth, 2016).

Among qualitative approaches, the basic qualitative study was selected (Merriam and Tisdell, 2015). The main justification for this choice is that the focus of the study is on meaning, rather than on a specific bounded system. The unit of analysis is represented by managers as individuals responsible for making strategic decisions.

Our study is exploratory in nature since it aims at capturing the different perspectives of managers involved in strategic decision-making. This level of decision-making, compared to the tactical and operational one, is still less impacted by the use of AI tools, whose use is still limited. This poses the need for a deeper investigation of how AI is perceived by strategists, to enhance the overall understanding of the mechanisms underlying AI adoption and use at a strategic level and future avenues of research. Our study is a cross-country qualitative study. Indeed, participants from both Italy and North East of England have been involved.

Sampling and data collection

We have adopted purposeful sampling to select potential participants (decision-makers at a strategic level) who can provide rich, relevant, and insightful data for the study (Patton, 1990). In particular: we have contacted 100 potential participants, operating both in Italy and in the North of England. We have received 40 replies and we have conducted 33 interviews.

There are contrasting guidelines in the literature concerning sample size for interview-based qualitative studies: ≥ 15 (Bertaux, 1981), 12-60 (Baker and Edwards, 2012), 5-25 (Brinkmann and Kvale, 2015). However, we believe that we reached data saturation since many participants referred to similar contents during the interviews.

Table 1 provides details about the interviewees constituting the final sample.

We have relied on semi-structured interviews as data collection method. The interview protocol was grounded on existing literature. In particular, it included questions on the strategic decision-making process, on the current use or non-use of AI, on the perceived barriers, drivers, outcomes and bias of using AI.

All the semi-structured interviews were conducted via an online platform, four of them in English and 29 in Italian, ranging from 30 to 45 minutes in duration. All interviews took place between September and December 2024.

The participants to our study shared reflections based on both their direct experience and their perceptions of other decision-makers' experiences from their network (e.g. those who show to recognise the potential and the value of AI also provide insights on the behaviour and approach of those who they think are not open to implementing and using it). Therefore, our findings arise from both these direct and indirect perceptions. In addition to the interview transcripts, field notes taken by the author conducting the interview were included in the final dataset. Those notes allow to account for impressions of the researcher that capture nuances emerging from participants' tone and attitude. This combination of data contributed to the final theorizations of strategists' sensemaking approaches to AI for strategic decision making.

Data analysis

All interviews were analysed in their original language (Italian or English) to preserve the nuances of meaning conveyed by participants in their preferred language. The transcripts were initially read multiple times in order to familiarise with the data and some notes were taken on some initial impressions (Yin, 2011). The transcripts were subsequently uploaded into NVIVO 14 to conduct the analysis in a structured way.

We conducted reflexive thematic analysis (Braun and Clarke, 2006, Braun and Clarke, 2021, Cooper et al., 2012), which allows to deeply and iteratively engage with the data, relying on the researcher's reflections to augment the overall understanding of concepts. The analysis was conducted adopting an inductive approach (Patton, 2014) and encompassed

repeated cycles of reading to review and refine the coding structure, as well as an effort in constructing meaningful narratives to explain the derived second and third order codes (see Table 2).

Tab. 1: Sample of participants

ID	Job Title	Male/ Female
1	Founder & Managing Director	Male
2	Sales Account	Male
3	Founder & CEO	Male
4	General Management Consultant	Male
5	Intelligent Automation Expert, Senior Advisor and Managing Director	Male

23	Chief Financial Officer	Male
24	Founder & CEO	Male
25	Founder & CEO	Male
26	Co-founder and CEO	Female

In analysing the data, we adopted a sensemaking lens to investigate how strategic decision makers perceive and therefore make sense of AI as a potential support to their decision making process. As we immersed ourselves in the interview transcripts and notes, we gradually realised that the emerging categories and themes were consistent with some overarching narratives and conceptualisations of AI, which can also partially overlap, and that we refer to as sensemaking approaches. Such approaches are grounded on some cognitive mechanisms (our third-order themes). The themes and categories are embodied (e.g. through an attitude or a tone of voice) or approached to (e.g. through the perceptions verbalised) with varying sentiments that demonstrate how much each of them aligns or resonates with the higher level sensemaking approach.

First-order codes	Second-order categories	Themes
Openness towards a broader adoption Openness towards AI implementation and use AI embedded in organisational culture Commitment to stay ahead	Forward-thinking and long-term value recognition	Vision
Awareness of AI benefits Need for AI	Recognising AI potential	
Stimulating adoption at all levels Willingness to learn how to use AI properly Creating internal AI-tools and or dedicated teams or functions Experimenting with AI use Externalise AI use Generational turnover Combining different AI tools Gradual implementation	Practical effort	
Degree of structuring of SDM Degree of efficiency of SDM Attachment to long-standing habits Tendency to rely on instinct and impulse Necessity led vs opportunity led proactive decision making	Strategic decision-making flexibility	
Curiosity Enthusiasm Openness toward accepting different views Resistance to trust external views (AI or consultant) Personal culture and mindset	Mindset	Personal adaptability
Approach toward innovation Courage Digital literacy	Behaviour	
Training and exploiting the output Interacting and asking the right questions Confirmation Awareness of AI limitations in support of human intelligence Awareness of AI fallacy	Confidence	Praxis
AI as a habit Using AI naturally Embeddedness in personal life	Routines	
Quality of input data Data availability Data security	Input concerns	Reluctance
AI can miss contextual information AI insights are too generic AI is not precise AI lacks knowledge coming from human relationships Trust	Output robustness concerns	
Fear of AI hallucinations Fear to be overwhelmed Generalised aversion and fear	Fears	

Table 2: Coding structure

Findings.

Cognitive mechanisms that shape strategic decision-makers' sensemaking approaches toward AI

1) Vision

Strategic decision-makers may embody different degrees of vision when it comes to adopting AI in their organisation, in particular at a strategic level, locating themselves on different points of a spectrum that ranges from farsightedness to myopia.

Managers that appear to be visionary and farsighted in relation to AI, declare or show to adopt forward-thinking approaches in realising the value AI can bring in the long run to their decision-making. Consistently they show to be aware of AI potential and declare to have invested in it, even stimulating its adoption at lower levels within the organisation. In some cases, even some of the "visionaries" initially declare they don't use AI for strategic purposes. Then, as the interview unfolds, they realise and declare that they indirectly or directly use it to support some strategic decisions. There might still be lack of awareness in this sense.

The actions through which this vision takes place may include the effort in making individual and unstructured experimentations, or by externalising analysis based on AI in order to test its usefulness, so that its future internalisation can be smoother, having already practically appreciated its power and potential.

The strength of the vision is also impacted by the degree of flexibility of the decision-making process. The more structured and efficient it is, the more likely it for strategist to be open toward AI, in line with an opportunity-led and proactive decision-making approach and with the recognition of human instinct and impulse limitations.

A weaker vision in this sense characterises individuals who argue that they don't see the value of AI to improve their strategic decisions, or that they believe it is not a necessary in their specific industry.

On the opposite side of the spectrum there is what we refer to as a myopic view. This is instead expressed by those individuals who limitedly recognise AI potential and are aware of its benefits. This is expressed by the lack of practical efforts to embrace AI or a limited effort in embracing just to perform operational tasks. This view is more likely to emerge within organisations characterised by a centralised and unstructured decision-making process, with strategist that tend to over-rely on their instinct, in more traditional industries where the need to stay ahead in competition is perceived as weaker.

2) Personal adaptability

Strategist as individuals may show different degrees of adaptability, depending on the mindset characterising them, in terms of general curiosity and enthusiasm toward technological advancements, as well as an openness in accepting recommendations that may contrast their view (e.g. from hired consultants or lower-level collaborators). The type of mindset is then reflected by a behaviour that leads to embrace innovation and/or to endeavour to improve in digital literacy, whose lack may be largely responsible for a myopic vision.

3) Praxis

The way in which strategists make sense of AI is hugely impacted by the degree of routinisation in AI use and the consequent confidence developed. Some managers (mainly younger managers, some of which operating in digital industries) may show a greater confidence in interacting with AI in terms of what to ask and how to exploit the outputs as well as in terms of awareness of AI limitations and fallacy, and this may be linked to a higher degree of embeddedness of AI both in work and in personal life, that makes AI a habit and leads to using if naturally and with familiarity. This routinisation of AI use that makes it a praxis is strongly linked to the sensemaking approach of AI as a peer advisor.

4) Reluctance

Reluctance toward AI is mainly driven by concerns decision makers may have on both AI input data and output insights, as well as by their fear of reduced human control, AI hallucinations (among others). The degree of these concerns and fears determine the emergence of a different sensemaking approach. Typically, we found that they are stronger in managers of a previous generation, who are not native with this technology and maintain a certain degree of scepticisms, despite clearly recognising AI potential in their strategic decision-making tasks.

5) AI accessibility

How accessible AI is perceived is determinant in shaping the sensemaking approach. From an infrastructural point of view, accessibility depends on the availability of AI tools that turn out to be suitable for the company's needs in terms of compatibility with existing technological infrastructure, as well as in terms of degree of targetisation to the strategic goals to perceive. A key role is also played by the perception of cost (for many decision makers who increasingly rely on generative AI, the cost is perceived as non-prohibitive, while other decision-makers who aim to implement targeted AI solutions to process massive amounts of internal data, which should be highly targeted, the cost is perceived as a barrier). AI is also accessible depending on how trained the manager is to properly interact with it and how much he can be inspired by successful cases of AI use at strategic level, as well as on the degree of regulation (which for someone is still too weak, while others fear an excess of regulation in the near future).

6) Decision-making quality

The perception of benefits of AI in terms of increased decision-making quality is highly relevant. Such advantages are mainly linked to effects that are observed at an individual level. The decision-maker is therefore empowered in terms of increased robustness, increased propensity to risk (because of AI confirmation or because of AI creative suggestions), he is more capable of managing complexity and also more effective in balancing time and effort for the purpose of decision-making.

7) Knowledge management

AI also empowers the strategic decision-maker in its ability to manage knowledge, both its pre-existing knowledge, the hidden knowledge and the new knowledge he can create to support strategic decisions. This happens thanks to an improved understanding of available alternatives among which he is called to decide, a stronger tendency to explore even unexpected possibilities through knowledge discovery mechanisms supported by AI, and eventually thanks to an enhanced knowledge creation mechanisms that benefits from triggers to human creativity, as well as from empowered capability to research and map knowledge on which new knowledge can be built.

There is a link between the above described mechanisms. For example, those who show to have strong vision, perceive certain advantages of AI, especially in terms of strategic knowledge creation (P1), and especially in doing it rapidly, which can make the difference in the competition game.

Overarching sensemaking approaches toward AI

The analysis of macro-themes discussed above, distinguishing the sentiment and importance attributed to each of them by participants, we were able to identify the main sensemaking approaches toward AI. In some participants an overlap between different views was observed. For this reason, the approaches identified shouldn't be considered as a rigid categorisation.

AI as a peer advisor

Perceiving AI as a peer, as an advisor entails to make sense of it with a somewhat detached attitude: AI is seen for what it is, It is not overestimated, neither underestimated. Managers with this approach believe it can be of help, up to a certain point. They believe it can augment humans but still strongly put emphasis on the central role of humans and are sceptical on the possibility of AI to replace humans for strategic purposes. As the others, they are aware of AI limitations and fallacy, but this awareness does not lead them to desist from using it. On the contrary, they are enthusiast about using it but with full awareness and control. In particular, it seems typical of younger participants to have AI embedded in their daily life and tend to avoid overrating it. They see it for what it is and consider it as a peer. They are not worried or intimidated, they are restrained by such limitations, simply because they know AI, they are familiar with it, they feel confident in using it, they feel like they know exactly how to handle it and to what degree it can be considered as reliable

"It is a tool that everyone uses anyway, just as if it were their own right arm, so everyone then with their own role in the company, and uses it accordingly for different reasons" (P1).

"I use it absolutely in a friendly manner. I have established a relationship as a work colleague, that is. He is more of a colleague than a machine" (P2).

"Ah it helps me a lot because he is that good co-worker who is always available and does not get impatient and above all follows you" (P6).

"Actually all the time, because whenever I need, both in my private life and in business, to confront someone, I confront the artificial intelligence, but always taking into account the fact that it can make mistakes"(P16).

AI like any other technology

Making sense of AI by comparing it to other technological breakthroughs in human history recognises that AI can support humans in general, and decision makers, while emphasising the need for a deeper integration in it in our lives in order to appreciate its potential. Those who are native with a certain technology will have an advantage over those who need to learn how to interact with it from scratch and overcome a generational barrier.

This approach can be contaminated by the idea of AI as a peer or by the idea of AI as a binoculars.

"No one who I think really uses it regrets it. It is the same principle as with the i-phone or the automatic gearbox: that is, if one unlocks, one uses it. You don't unlock those who either don't have that kind of literacy or are not used to it" (P1)

"I went ahead and stated that it is obviously part of any process of human evolution, of technological evolution, or rather of human evolution through technology" (P9).

AI as humans' binoculars

Making sense of AI as a binoculars for humans, means recognising in it a huge potential, even bigger than those attributed to AI as a peer. This sensemaking approach is often accompanied by a humility in admitting that current experience is limited but there is great curiosity and great expectations based on what experts say and on the current, despite limited, experimentations made. This approach is characterised by huge excitement about AI power and potential, especially by making comparisons with past experiences of tasks that required considerable endeavours.

"But if this mission is augmented by binoculars, by a computer tool, by an artificial intelligence, I broaden my views, I have a range of alternatives, of choices that is certainly superior" (P6).

"It could not be otherwise, given that they are N minds-over 10,000, from what I have read-functioning as if in perfect unison" (P7).

AI as incompatible with strategic needs

This approach incorporates the highest level of resistance towards AI, which is perceived as lacking usefulness and its potential at a strategic level is almost totally neglected. However, this perspective is the least interviewee in our study.

"Because artificial intelligence for me has limitations, because it doesn't speak Italian very well and so we use it for this reason [replying quickly to emails], then for the rest, for the rest, no, because I repeat, if we have to make purchases, for example in logistics and transport - the important investments we make are in transport equipment, so tractors, semi-trailers, vehicles that we allocate to intermodality - it is clear that when we make an investment of this we are talking about millions of euros. I don't think that artificial intelligence can give us a hand in asking for quotes from suppliers who build this equipment" (P13).

Research limitations. *Despite our sample being fairly large and varied, there still remain potential concerns in terms of scope and generalisability of our conclusions.*

Managerial implications. *Our study enhances the understanding of the different way of strategists to perceive and interpret AI and its use for strategic purposes. From a managerial point of view, this could help managers broaden their perspective and push them toward experimenting AI benefits more extensively. Furthermore, some biases or prejudices on AI may be mitigated thanks to an increased awareness of how AI is perceived by other managers. Managers may therefore be pushed to overcoming the reluctance characterising the more sceptical sensemaking approaches, thus finding the motivation to experiment more the benefits of AI pointed out by the braver "visionaries", who have already made experience of the clear benefits of AI in supporting the strategic decision making process.*

Originality of the paper. *Our study sheds light on the main cognitive mechanisms underlying the different sensemaking approaches towards AI, combining all the aspects that characterise existing literature (technological, managerial, or ethical dimensions of AI adoption) under a sensemaking lens that unlocks a new perspective on these aspects.*

Furthermore, novel insights emerge from our study, concerning AI conceptualisation as a praxis, emphasising how it is increasingly embedded in strategic decision-makers personal and organisational routines. This contributes to technology adoption literature (Orlikowski, 2000, Schneider and Leyer, 2019), while evidencing some peculiarities that characterize AI if perceived as a peer advisor.

Additionally, we evidence the micro-level mechanisms through which the support to knowledge management activities is mainly perceived, thereby contributing to the literature on knowledge management processes mediated by technology, in particular by AI (Del Giudice et al., 2023, Jarrahi et al., 2023).

Key words: *sensemaking, technology adoption, strategist, artificial intelligence*

Artificial Intelligence and The Paradigms of Authenticity in Entrepreneurship: Charting a Research Agenda

SILVIA RANFAGNI[1] MASSIMO ROSATI[2] KRISTIAN GIANASSI[3]

Abstract

In a context characterized by high uncertainty and volatility, such as the one opened up the advent of AI, responding to the paradigm of authenticity and ethical human-centered values becomes ever more important. The paper gets back fundamental thoughts about authentic entrepreneurship and organizations intercepting them with the latest disruptive technologies. An examination on the entrepreneurial domains majorly hit by AI has been brought forward through an in-depth analysis of 55 articles. The areas that are significantly influenced by the most recent changes are: *"the journey of self-negotiation", "the pursuit of individual and societal wellbeing", "the re-definition of human-technology interactions in organizational processes", "the challenge of education & training". Authentic entrepreneurs and companies need to provide answers to the changes opened up in these areas and further investigation on how they will and could do that is needed. This is why the paper ends up with a research agenda that aims at stimulating further analyses*.

Framing of the research. *Post-modernity, our context, is characterized by fragmentation, uncertainty and dynamism (Lyotard, 2014). Due to such an environment authenticity has established itself as the new paradigm upon which businesses try to position, considering that customers make a major call for it in their essay of getting back some meaning in their shattered lives. It's not a case that academics have given birth to a rich plethora of researches that deal with objective, relational, and individual authenticity. Whereas the first two tend to be more associated with companies and brands, the latter perspective discloses the individual dimension of the entrepreneur (Ranfagni, 2018; Burresi, Ranfagni & Rosati, 2022). A similar player responding to the principles of authenticity emerges as a subject that provides answers to some specific processes. The authentic entrepreneur is someone who brings forward an existential project based on a profound passion and remaining true to himself. In such a journey he tends to display wider interests compared to mere individual wellbeing.*

The idea of authentic entrepreneurship has deep roots in philosophy (Avolio & Gardner, 2005). His ***existential project*** *is a dynamic of personal growth in which past, present and future are enmeshed and the actor, although recognizing its connection to the context and its vicissitudes, is able to continuously re-write his path towards his goals and an envisioned future (Golomb, 1995; Kaufmann, 2016). Such a view can be identified in Sartre ("man is free, man is freedom") and Heidegger's ("project thrown into the world", "poiesis") existentialist perspectives (Kaufmann, 2016; Severino, 1986; Ferrando, 2019). It can be summed up in Kant's idea of getting out from immaturity (Shaw, 2023) or in Aristotle's belief that Men can determine their personality and do not just undergo it (Hühn & Meyer, 2023).*

The journey follows the values, principles, and beliefs of the same leader that has to stick with himself and remain loyal to its principles (Trilling, 2009). Hence, it's not just a path of self-creation, rather also one of self-discovery, since in the essay of ***remaining true to himself*** *and respecting his values, he discovers them at the same time. This can be done through periods of social engagement, since interrelation with others is paramount, but also moments of mindfulness, isolation, and introspection (Akrivou et al., 2011; Kelly, 2023). Apart from a wide set of positive states of mind identified by various authors, such as for example optimism, trust, loyalty, and more (Green et al., 2003; Huy, 1999; Luthans, 2002; Luthans & Avolio, 2003; Lenton et al., 2013) the authentic leader is most of all characterized by self-awareness (the capacity of discerning his emotions and actions), relational transparency (presenting to others one's real self without faking feelings, emotions, and values), balanced processing (the capacity of evaluating all necessary information before formulating decisions), and internalized moral perspective (the leader is guided by his own thoughts and not others' influence)(Walumbwa et al., 2008; Walumbwa, Christensen & Hailey, 2011).*

The two processes of creation and discovery are led by a strong inner ***vocation or calling****, that drives the entrepreneur's approach to work. Such a passion is driving factor for the constant improvement of the leader, who tries*

to leave his mark pushed by either an inner stimulus of self-realization, or an external sense of duty (Duffy & Dik, 2013).

The three dimensions are strongly interconnected among them. The glue that allows this connection is the last, and fourth, category generally associated to authentic principles, meaning a general attitude of ***care for others****. Once again, ideas related to the topic can historically be found extensively. Levinas optimally represents the thought evidencing that a disposition towards others' wellbeing should be positioned at the center of a meaningful life (Shaw, 2023; Golomb, 1995; Kaufmann, 2016, Dierksmeier, 2013; McPherson, 2013). The contemporary concept that best represents the situation is the one proposed by Freeman and Auster in "Freeman & Auster (2011); Auster & Freeman (2013)". Not casually the idea of poetic self gets back together all what said up to now. A player responding to such a model is someone who forges himself enmeshing past, present, and future in interconnection with others. The communities within which he/she lives are fundamental traits for its own existence and this is why they should require special attention and care (Freeman & Auster, 2011; Auster & Freeman, 2013). Ethical and worthwhile ends should be sought to this purpose (Palmer, 2009; Bishop, 2013).*

However, the influence generated by entrepreneurs respecting the principles of authenticity gets beyond the individual dimension reaching the wider organization. Per extension the ***authentic company*** *respects the criteria previously mentioned for the singular dimension (Shen & Kim, 2012). Freeman & Auster (2015) talk about poetic organization referring to a reality in which the poetic self of each individual is respected, meaning that each subject's existential journey is recognized and value fit within members can be reached only through open discussion about beliefs. It's an organization open to the individuals' capacity of creating, connecting, relating, discussing and sharing (Freeman & Auster, 2015).*

Through these lines an overall picture of what entails being an entrepreneur or company trying to follow the principles of authenticity has been presented. A paramount aspect should be kept into account: authenticity is a process, not a state. This process has to be reinforced and has to find confirmation day by day in each action in order to build it over and over (Erickson, 1995; Helmuth et al. 2023). Hence, it is something dynamic and hard to catch. This is probably the reason why many authors have criticized it (Gardner & McCauley, 2022; Gardner et al, 2021; Alvesson & Einola, 2024).

The question at this point is how will such players deal with the advent of revolution 4.0? Digital technologies, and more specifically artificial intelligence, are re-shaping industries and economic sectors. In the most recent years AI has demonstrated its autopoietic properties in its capacity of evolving autonomously and working as an independent agent impacting significantly the world from which it has been generated (Mikkilineni, 2022). Such a pre-disposition has led to the development of problem solving, adaptation, and generator capabilities that have strongly impacted many sectors (Lee et al., 2019). Competitive landscapes, factors of production, and dynamics of entrepreneurship have been changed too, as well as new decision-making, optimization, and innovation opportunities have been identified (Weng et al, 2024). This new techno economic paradigm has led to changes from manufacturing to engineering (Kim et al., 2022), passing through healthcare, finance, ecommerce, education, and more (Poalelungi, et al., 2023; Dakalbab et al., 2024; Zhang et al., 2021; Gligorea et al., 2023). Objective Intelligence, Uncertainty Management, Complexity Management, Novelty Generation, Low-Cost Modeling and Optimization are all frameworks that have been opened up by the advent of these technologies (Kordon, 2020). Furthermore, as we delve deeper into the implications of AI, it becomes essential to consider the philosophical and scientific reflections on the nature of reality and the paradigm of authenticity. In an era where AI is redefining entrepreneurial dynamics, it is vital to explore how these philosophical insights can inform business practices. A multidisciplinary approach that incorporates reflections on authenticity can provide valuable frameworks for understanding how entrepreneurs can navigate the challenges posed by AI. This not only enriches our understanding of AI but also offers insights into maintaining authenticity in a constantly evolving context (Barbour, 1999). From more operational aspects to discussions on the very essence of humanity, AI is, and will be, the topic of discussion for the next years. This is because we are probably dealing with a new form of intelligence that challenges even our basic assumptions on human society and it is impellent that also entrepreneurs respecting the principles of authenticity take a stand with respect to this new technology. The question is, which will it be?

Purpose of the paper. *The paper aims at understanding which are the impacts generated by AI on entrepreneurs and companies that align with the principles of authenticity. The hypothesis is that authentic leaders and organizations will undergo some specific process while interacting with artificial intelligence. Such dynamics correspond both to the individual dimension of subjects, as well as more collective-based shades. This can be supposed based on the fact that artificial intelligence might be seen as a different form of intelligence, if by intelligence we mean not merely comprehension, rather also the capacity to link concepts and information. The topic of discussion raises many questions about society, humanity, and even intelligence itself. For what concerns the first front, society at large has divided itself in "apocalyptic" and "integrated" (Eco, 1964; Floridi, 2023), meaning that some see AI as a means to disaster, whereas others as a panacea to all sins. The question is what will distinguish humanity from machines in the very next future? Which will be distinctive human qualities and which could be imitated? These are inquiries to which we can provide answer only after having identified the grey areas still not fully understood and that should find further investigation in literature. The research question primarily addressed is therefore this one:*

"Which are the individual and collective dimensions of subjects, especially entrepreneurs responding to the principles of authenticity, that are hit by revolution 4.0?"

Based on such a research statement, the ultimate goal is to develop a research agenda aimed at stimulating further investigation.

Methodology. *To fully understand the relation between authenticity, entrepreneurship, and artificial intelligence a literature review has been undertaken. Academic databases such as Scopus, Web of Science and EBSCO have been used to look up a set of keywords such as "AI", "Authenticity", "entrepreneurship", "machine learning", and their derivatives. After a screening process of title and abstract, the initial research yielded 79 papers debating on the theme. A second, and more detailed, screening process was conducted in order to validate the content within the articles. The process led to the deletion of 24 papers, resulting in 55 academic works deeply analyzed in order to understand current emerging trends, grey sections and key themes that may have responded to the purposes of the present work. Here below a table summarizing the articles and papers analyzed has been reported.*

* = the article deals with this theme of discussion plus another one; ** = the article deals with this theme of discussion plus two other ones; *** = the article deals with this theme of discussion plus other three ones	

Results. *As said, the ubiquity of AI is leading to major disruptions and innovations at both individual and collective level (Menon, 2024). The analysis of the 55 articles has evidenced that this transition has resulted in major implications in at least four areas of discussion, that have been identified with the processes of: 1) "**the journey of self-negotiation**", 2) "**the pursuit of individual and societal wellbeing**", 3) "**the re-definition of human-technology interactions in organizational processes**", 4) "**the challenge of education & training**".*

Concerning the first one, AI raises many interrogatives about the change that human subjectivity is going to deal with in the next future. In a context in which it becomes ever more difficult to identify what responds to principles of authenticity compared to what is clearly inauthentic, AIs tend to ulteriorly complicate such a situation (Mei & Genet, 2024). This evidences a need for a process of self-negotiation, particularly impellent for those that respond to the paradigm of authenticity. Such a dynamic makes a call for the valorization of the most distinctive qualities a human being possesses and that differentiate it from machines (Todariya, 2024). In their actions, subjects should put particular emphasis on those traits that cannot be replicated by AIs and a synergy between automata and Men should be

established for which each of the two subjects of discussion should do at the maximum extent what they are best capable of (Todariya, 2024; Marino, Cananzi & Aragona, 2024). This means that sentient beings, such as humans, should preserve their human touch, characterized by emotions, sensations, passion, empathy, self-awareness (Kelly, 2023; Knox, Sütterlin & Lugo, 2023; Deptula, Hunter & Johnson-Sheehan, 2025), whereas AIs should be deployed in areas in which humans can be empowered, such as the capacity of analyzing great amounts of data (balanced processing) (Noponen, Auvinen & Sajasalo, 2023). Due to this it is important to understand which areas of subjectivity will be impacted by AIs, which will remain undiscussed, and which will be written from scrap due to the advent of these new powerful technologies. It's a discussion that involves many sides of the individual sphere, from autonomy, spontaneity, and creativity (Werthner et al. 2024; Chesterman, 2020; Giuggioli & Pellegrini, 2023), passing through spatio-temporal and relational dimensions (Barthelmeβ & Furbach, 2023; Giuggioli & Pellegrini, 2023), reaching teleonomy, autopoiesis, indeterminacy, and consciousness (Beerends & Aydin, 2024; Dehaene, Lau & Kouider, 2017).

Regarding the second aspect, the "pursuit of individual and societal wellbeing", on its behalf, puts in direct contact the individual with the collective sphere. AIs have the potential to both improve or mine the wellbeing of individual players and collective entities. On the one hand, there's the danger that people might be shifted away from their actual self and that both companies and subjects would be perceived as less authentic (Cotter, 2019; Gonçalves, et. al., 2025; Jago, 2019; Jago, Carroll & Lin, 2022; Lee & Kim, 2024). On the other, these technologies stimulate a reflection on the responsibilities that players at the apex of society, that may determine collectivities, such as entrepreneurs and companies, have in managing these devices (Deptula, Hunter & Johnson-Sheehan, 2025). One side of the coin highlights the belief that artificial intelligence has the power to give life to a new human renaissance in which creativity and human touch are at the center of the working environment (Giuggioli & Pellegrini, 2023). The second focuses on the very negative implications that might stand out due to a bad management of such devices. It is hence important to grasp that AIs are simply tools in the hands of human agents that on their behalf should take a pro-active role in the management of such tools for the development of a good "AI-society" (Harari, 2024; Cath et al., 2018).

About the third area of discussion, AIs make therefore a higher call for an optimal integration within working environments. Human-AI interaction is something that should be optimized as best as possible. All phases of entrepreneurial activity might be touched by these innovations (Giuggioli & Pellegrini, 2023). It has been reported in literature that AIs have the potential to help in the identification of new business opportunities, improve business practices, reduce uncertainty, introducing new business models and freeing the creative potential of individuals (Knox, Sutterlin & Lugo, 2023; Upadhyay, Upadhyay & Dwivedi, 2022). Apart from more analytical and operational tasks, the question is whether or not AI will be capable of empowering the creative potential of humans (Lee, Park & Hahn, 2023), structuring co-creative systems (Rezwana & Maher, 2023) and fully re-designing company processes (Shepherd & Majchrzak, 2022).

Last but not least, it is paramount to grasp how, and if, entrepreneurs and companies will be capable of developing training programs for both AIs and employees interfacing with these tools, in the essay of directing machines and men towards the values, goals and missions of the company. It's important to train people in order to teach technologies to reach certain ethical values and goals (Noponen, Auvinen & Sajasalo 2023). Only in such a way it would be possible to deal with the agency locus transition that is happening in society (Sundar, 2020). Concerns like, what is ethical, which values are the ones we should teach, etc. are all aspects that now get in the discussion in the effort to lead the transition towards an ideal envisioned future.

From this panoramic view a set of interrelated questions should be further investigated in literature in order to optimally manage the transition happening in society, that is especially important for those players that try to follow the principles of authenticity. Some fundamental ones concerning the process of self-negotiation are:

- *Which traits should an authentic individual, or company, preserve in order to remain true to itself in the era of AI?*
- *On which dimensions of the authentic entrepreneur does AI impact? Does AI primarily impact self-awareness, or does it have significant implications in other domains? If artificial intelligence is an element that can influence the process of self-negotiation, how can the authentic entrepreneur tackle this new challenge?*

Regarding the pursuit of individual and societal wellbeing it is important to understand:

- *In a society in which the same concept of wellbeing might change, what will be the role played by an authentic entrepreneur? Should he become carrier of moral and ethical values? And which are these?*
- *What impact will a technology, capable of establishing new paradigms, have across all layers of society?*

Concerning human-technology interactions in company processes:

- *The possible trade-off between immediate business opportunities stemming from the use of AIs and the loss of authenticity is another field that should be deeply investigated.*
- *What is the limit of dependency from technologies that we should accept? Is there some threshold that should not be crossed?*
- *How should AI be used in entrepreneurial contexts? Should its application be limited to operational tasks, or expanded to additional domains to unleash the creative potential of individuals?*

Finally, on education & training it might be interesting to investigate on:

- *How can the training strategies for employees and the input that we have to provide to machines be designed to ensure ethical and operational alignment with authenticity values? What criteria should guide the selection of data and teaching methodologies to maximize the effectiveness of AI in supporting entrepreneurial authenticity?*

These questions should lead the talk in the next academic future in order to grasp the individual and collective spheres of a kind of entrepreneurship that is driven by authentic principles.

Research limitations. *This paper serves as an initial study aimed at further exploring the individual themes of discussion raised. Due to its broad perspective, two significant limitations have emerged. The first pertains to the investigation strategy. While comprehensive, some notable publications may have been overlooked in the selection process due to filtering criteria. Therefore, further investigation into the identified areas is necessary to encompass all the elements of the discussion. Second, because of its wide scope, the nuances and specialized viewpoints within specific sectors could not be fully integrated, limiting the understanding of particular circumstances. Additional research on these specific sections and their implications is essential. Furthermore, as this is primarily a qualitative analysis of the selected papers, quantitative studies should be conducted to assess potential generalizability. Future observations should also consider the darker aspects of authenticity, particularly the trade-offs inherent in authentic entrepreneurship. Ongoing research across various domains should be pursued, and a multidisciplinary framework is recommended to fully grasp the topic's diverse dimensions.*

Managerial implications. *This paper highlights significant implications for entrepreneurs in the context of an increasingly technology-driven future, where human relationships and values may be compromised by powerful technologies. It is crucial for entrepreneurs, particularly those who advocate for authenticity and prioritize ethical and human values, to adopt a proactive approach in shaping a positive future. Understanding which individual traits should be emphasized and which aspects may be overshadowed by the rise of AI is paramount. The influence of AI extends beyond ethical and moral considerations to operational aspects as well. It is essential to explore how to effectively integrate AI into company processes, not merely to automate basic functions but to enhance the creative potential of individuals. This integration should also encompass the training of both employees and AI systems, ensuring that all stakeholders are aligned and work towards a human-centered, AI-driven society. Moreover, as AI continues to evolve, the challenge lies in maintaining authenticity while leveraging these technologies. Entrepreneurs must navigate the delicate balance between utilizing AI for operational efficiency and preserving the unique human qualities that define their organizations. By fostering a culture that values ethical considerations and human connection, businesses can thrive in an AI-enhanced landscape, ultimately leading to a more authentic and sustainable entrepreneurial environment.*

Originality of the paper. *This paper investigates the intersection of artificial intelligence (AI), authenticity, and entrepreneurship, highlighting the diverse impacts of technology on entrepreneurial contexts. It emphasizes that AI influences not only collective aspects but also the individual and psychological development of entrepreneurs. By addressing the lack of literature examining this triad, the paper fills a significant gap in existing research. Focusing on the entrepreneurial areas most affected by AI, it presents a research agenda that serves as a roadmap for future studies. This agenda encourages scholars to explore how authentic entrepreneurs can navigate the challenges posed by AI while preserving their core values, thus contributing to a deeper understanding of this evolving landscape.*

Key words: *Authenticity; Entrepreneurship; Artificial Intelligence; AI-thenticity; Human-Machine Collaboration; Digital Transformation*

How to Improve the Quality of Entrepreneurship Education Programs? Managerial Insights from Service Marketing

SERENA GALVANI[1] |FRANCESCA MARIA CESARONI[2]

Abstract

This illustrative case study provides an opportunity to examine how service marketing principles can be applied to enhance the quality of an Entrepreneurship Education program. By combining literature from Entrepreneurship Education with pillars from Service Marketing literature, the study conceives teaching modules in the context of Entrepreneurship Education as services, therefore aiming to provide an original approach to unveil the elements contributing to the overall service quality. Applying a managerial perspective to educational processes helps describe co-creation of value in Entrepreneurship Education by considering the perspective of both the customer - students - and the service provider - the university. From this viewpoint, insights can emerge into higher education institutions on how to improve the quality of Entrepreneurship Education programs.

Framing of the Research: *The topic of entrepreneurship education is gaining increasing interest among scholars, as evidenced by the high number of published articles, scientific journals, conferences and workshops and other scientific initiatives offered in different parts of the world. At the same time, an increasing number of Entrepreneurship Education (EE) programs are being delivered at different educational levels or outside the school system.*

The increasing focus on EE has been accompanied over time by a shift in the content and objectives of EE programs, as well as in the perspective adopted in studying EE. Early EE research was primarily focused on promoting new venture creation and characterized by a predominantly vocational approach, with educational efforts mainly aimed toward equipping students with the skills necessary to launching a start-up business venture (opportunity recognition, business development, self-employment, and the creation and growth of a business).

As discipline matured, researchers began advocating for an expanded conception of EE that goes beyond mere venture creation and embraces the need to develop students' entrepreneurial mindset. This conceptual evolution represents a significant paradigm shift in EE theory: moving from a "narrow" to a "wide" perspective (Lackeus, 2015).

While the traditional "narrow" approach mainly aims to train future entrepreneurs, providing participants with the necessary skills to start and run a business, in the new "wide" approach to entrepreneurship education the aim is to prepare "entrepreneurial" people, that is individuals capable of tackling problems with an innovative and proactive spirit in different contexts, in the belief that these skills are "relevant to all walks in life" (Lackeus, 2015:6). Accordingly, emphasis is placed on developing in participants qualities such as personal development, creativity, autonomy, initiative and action orientation. Current literature increasingly acknowledges the psychological components of entrepreneurship as crucial. For instance, Shabbir and colleagues (2022) highlight a detachment from purely methodological instruction toward personal developmental outcomes - specifically intentions, motivational factors, and mindset cultivation. At the same time, Tiberius and Weyland (2023) categorize modern EE research into two principal domains: psychological dimensions (encompassing attitudes, motivational factors, and determination) and quantifiable entrepreneurial metrics (including behavioral patterns, skill acquisition, and enterprise establishment).

This rethinking of the EE concept has also been accompanied by a broad reconsideration of the other fundamental dimensions of EE - not only "what" content should be delivered, but also "why" entrepreneurship matters, "how" it should be taught, and "who" should convey such information (Fayolle, 2013).

Within this wide EE perspective, the "how" dimension has gained prominence (Baggen et al., 2022; Nikou et al., 2023). Indeed, untangling how to effectively develop EE programs holds relevance in today's rapidly evolving environment, characterized by unprecedented change and dynamicity and therefore calls for constant educational assessment.

Looking at how to develop EE programs also poses questions about how to manage relationships within this context, as the relational aspects of an educational program can significantly affect its efficacy and how it is perceived by students.

The importance of relatedness as a major factor in influencing the efficacy of an educational program, how it is perceived by students and their intrinsic motivation is clearly revealed by the Self-Determination Theory (SDT). This theoretical model, conceptualized by Ryan and Deci (2000), unveils that the ability of a teaching program to stimulate students' autonomy, competence and relatedness can significantly trigger students' motivation and inspire engaging

DOI 10.7433/SRECP.SP.2025.01

behaviors toward the educational initiative (e.g., Lu et al., 2023; Lavigne et al., 2007; Reeve, 2002). Here, relatedness refers to the human need to feel connected to others, to care for and be cared for by others, and to have a sense of belonging with individuals and the community (Deci & Ryan, 2002). In an education context, relatedness encompasses the quality of interactions between student-educator and student-student within the educational environment. Its importance is multifaceted. First, it contributes to students' intrinsic motivation to engage in entrepreneurial learning, as it satisfies a fundamental psychological need. Second, it facilitates the social learning processes that are essential for developing entrepreneurial competencies. Third, it creates a supportive environment where students feel comfortable taking risks and expressing creative ideas - key aspects of entrepreneurial behavior.

With regard to EE studies, the topic of relatedness and its influence with respect to the quality and effectiveness of education programs has been rarely investigated, although, when the how of EE is addressed, understanding how relatedness can affect students' satisfaction and active participation, as well as the overall effectiveness of EE programs, is paramount.

The focus on relatedness aligns well with service marketing literature, which emphasizes the importance of interactions between service providers and customers, as well as among customers themselves, in determining service quality and customer satisfaction (Wilson et al., 2021). By conceptualizing students as customers of the educational service provided by universities, service marketing principles can be applied to enhance the quality of EE programs. Service marketing literature, indeed, provides a set of concepts and tools to describe the intrinsic characteristics of an EE program, which can be conceived as a service.

While EE literature proposes various suggestions for improving educational programs, these suggestions are mostly developed from the perspective of the service user (the student), through metrics and analytical tools based on evaluating the entrepreneurial mindset that students achieve after training or the concrete results they develop. However, there seems to be a lack of a managerial perspective in evaluating EE programs, which could help focus on crucial aspects of today's education needs such as flexibility or customization to guarantee elevated service quality. Adding the perspective of the service provider (the university) could reveal additional insights into how to structure an EE program, considering that it represents a service delivery process where the quality is determined by achieving satisfaction for both parties involved (students and university). Service marketing literature entails different theoretical foundations and models that potentially help in analyzing EE programs from a service-based viewpoint. Among them, the concept of "interactive marketing" - i.e., the type of real-time marketing happening during service delivery - and the model of "augmented service offering" developed by Grönroos (2009) and deepened by Wilson et al. (2021) are particularly interesting since they put customers at the center of service conceptualization and supply, therefore preserving a focus on EE students. Additionally, Zeithaml et al. (2012) help understand how to conduct training at the service process level, where the key element is the functional quality of the service process more than the technical quality and content of the service itself. Similarly, the "7Ps of service marketing" model (Grönroos, 1997; Zeithaml et al., 2012) expands the traditional marketing mix to include people, physical evidence, and processes beyond the classic four pillars of operational marketing mix (product, price, place, and promotion) - all critical elements in educational services. In substance, there are reasons to believe that adopting a service marketing perspective holds potential value to increase the overall quality of EE programs by providing benefits for both students (as customers) and universities (as service providers). For universities, this perspective can help create value by increasing student engagement and satisfaction, implementing complementary post-program services, and optimizing resources allocation. For students, the benefits include an enriched educational process, revised and optimized to encourage participation and interaction.

Purpose of the Paper: *Given these considerations, this paper represents a first attempt to introduce the combination of two complementary perspectives - the pedagogical perspective related to educational aspects and the managerial perspective related to service aspects - to understand if and how such combination can support a process of improvement in the overall quality of EE programs.*

Potentially, Service Marketing tools constitute a valid means of evaluation of educational programs, ensuring an objective and structured approach. The theme of how to evaluate the effectiveness of EE programs is indeed an ongoing debate in education literature. Following the narrow approach to EE, assessment methods measure entrepreneurial intentions and business creation outcomes. However, in a wide perspective, such metrics prove inadequate for evaluating the development of entrepreneurial competencies. A reason is that entrepreneurial mindset is the focus in the wide EE approach, whose emergence becomes evident only in the long run (Loi & Fayolle, 2021). Fayolle and Gailly (2015) stress how EE benefits often emerge gradually, requiring longitudinal assessment approaches. As Nabi et al. (2017) point out, many of the available evaluations rely on short-term indicators, potentially missing crucial long-term impacts. The need to assess new practices to evaluate EE programs effectiveness is evident: a universal performance evaluation process is still lacking (Tiberius & Weyland, 2023; Fayolle & Gailly, 2015; Daspit et al., 2023).

With an experimental attitude, we propose adopting a Service Marketing lens and focusing this investigation on relationships that unfold within an entrepreneurship education program. On the one hand, this is in line with the SDT, that emphasizes the importance of relatedness as one of the three key dimensions, along with autonomy and competence, that determines students' motivation to participate in EE programs. On the other hand, Service Marketing principles underline how value in services is co-created during the provider-customer interaction, i.e., in a relationship. The idea is to apply a Service Marketing lens as an analytical tool to observe EE programs and identify crucial aspects of the service delivery process, in order to develop strategies and coping practices accordingly.

The intent of this study is to propose a transition in the perspective adopted to design EE programs: from a purely pedagogical approach to a more managerial one - linking the evolution of pedagogy and service marketing in a complementary and integrative perspective, therefore generating a multi-disciplinary reflection. We believe that a fresh and managerial approach to EE could contribute to enriching the research topic with novel insights and contribute to identifying areas of improvement in terms of service process design, delivery, and evaluation. Therefore, the following research questions are addressed:

What insights can emerge from the combination of educational and managerial approaches in the study of EE programs in the context of higher education? How can a service marketing approach contribute to enhancing EE programs' quality and evaluation process?

Methodology: *This research employs a case study approach, focusing on Uniurb Lab, an EE project developed by the University of Urbino. The case study methodology allows for an in-depth examination of the program's structure, implementation, and outcomes, providing rich contextual data for analysis (Dubois & Araujo, 2004).*

Uniurb Lab is an optional program open to students from the University of Urbino from the first year of undergraduate studies to the last year of doctorate - regardless of course and subjects of study - that aims to stimulate the development of an entrepreneurial spirit in participants. The program takes place annually for the duration of a semester and in 2025 reaches its ninth edition. The maximum number of participating students is 30; each year, classes consist of approximately 20 students from varied backgrounds (students of sports science, psychology, literature, foreign languages, economics, education sciences, nutrition sciences, computer science, etc.).

The course is divided into training modules delivered on a weekly basis and follows a predefined scheme. The first module is called "Exploration". This is the opening moment of the laboratory, in which the potential of the participants is explored to obtain even greater motivation and awareness. "Self-empowerment" is the second module, focused on the transversal skills (soft skills) of the participants. The purpose is to allow them to acquire a greater knowledge of themselves and their skills, in order to be able to implement a process of self-assessment of their entrepreneurial aptitudes. The third module is named "Team building". This is the moment when, based on skills and inclinations, teams are formed that will work together in the following part of the course to elaborate the business idea and start an initial phase of project development. In the fourth module, "Idea generation", participants are stimulated to formulate and propose entrepreneurial ideas, which will be developed in the subsequent phases of the course. This phase is carried out starting from the identification of latent or partially/totally unsatisfied needs, to which profit opportunities are associated to be exploited through entrepreneurial ideas aimed at their satisfaction. "Idea validation" is the name of the fifth module, where participants are offered a series of meetings in which the theory and application of the Lean Startup method are addressed. This is an innovative approach to the realization of an entrepreneurial project, which allows reducing implementation times as well as costs and probabilities of failure. It is an approach based on constant iteration between potential customers/users and the proposer, from the early stages of product/service development, based on a minimum viable product (e.g., simplified version of the product/service). This approach allows the implementation of a learning process and continuous improvement (validated learning process) based on feedback received from potential users/customers of the new product/service (for example contacted via telephone interviews or other means). In this phase, participants work in teams, built to maximize the advantages deriving from the contamination between different skills and backgrounds. Finally, the last module is called "What's next?". In this phase, participants meet actors, located in the territory, who can guide the subsequent development of entrepreneurial projects after the end of Uniurb Lab. In particular, meetings are planned with entrepreneurs and startuppers, some fully established, others still in the initial phase of the business, in order to allow participants to interact with young entrepreneurs who have been able to enhance their idea and bring it to market successfully. Visits are also planned to some structures present in the territory, created to support entrepreneurial initiatives and offer training, contamination and networking: certified incubators of innovative companies, coworking spaces, innovation hubs, etc.

In line with a wide perspective on EE, the main purpose of this program is not to generate new businesses or transform students into entrepreneurs, but to ensure that they can build entrepreneurial skills, and a mindset oriented towards entrepreneurship to be applied across different areas of their lives - not exclusively and not necessarily only in the creation of new businesses.

The present article introduces the Uniurb Lab case in a preliminary and illustrative way, considering that data collection and analysis are still ongoing. The Uniurb Lab will be adopted as the main unit of analysis in this research, on which to test the application of a widespread Service Marketing tool, the Service Blueprint (Shostack, 1984). This managerial model encompasses a visual tool used to systematically map service processes, capturing customer actions, frontstage and backstage interactions, and support systems. Widely applied in service design and management, the Service Blueprint helps organizations analyze and improve customer experience and operational efficiency (Bitner et al., 2008). Therefore, it can be considered as a valid analytical instrument to evaluate the Uniurb Lab program and identify potential areas for improvement.

The research design resides in the adoption of the Uniurb Lab case as the main unit of analysis, selected based on the following three criteria: i) it is a well-established EE program where the service design process is consolidated over more than eight years of activity; ii) the program modules follow the directions of the EntreComp model developed by the European Union, therefore allowing for comparison with similar programs in other countries or educational contexts;

iii) researchers have access not only to each lesson of the program, but also to the pre- and post-delivery phases, including service design and evaluation.

Data collection is based on qualitative approaches and on a combination of primary and secondary data sources. Primary data sources include: i) participant observation during Uniurb Lab classes; ii) interviews with students attending teaching modules, educators, and others (members of the university administrative staff, tutors and experts, and academics) involved in the design, organization, and management of Uniurb Lab; iii) focus group discussions with students and educators. Secondary data is represented by archival material available from the ongoing edition of Uniurb Lab and the previous ones, such as the recording of motivational interviews made to students during the pre-laboratory selection process.

The collected information will be used to build the Service Blueprint of the Uniurb Lab, which will constitute the main tool for data analysis. Data analysis will, therefore, follow the aforementioned service marketing perspective with a double aim. On the one hand, data analysis will be implemented with the goal of verifying if and how the Service Marketing tool is effective in unveiling the strengths and weaknesses of the Uniurb Lab program. On the other hand, we expect that by adopting a service marketing perspective we will be able to identify potential areas of improvement in the program and therefore delineate strategic actions to redesign the program's features for its future editions.

Results: *As previously mentioned, data collection and analysis are still ongoing; therefore, the results presented below should be considered preliminary and based on general insights drawn from knowledge of the case study and the foundational principles of the adopted theoretical lens, i.e., Service Marketing. The analysis conducted so far reveals insights into the program as a service offering. First, following the framework of service offering proposed by Grönroos (2009), it is possible to understand the layers composing the service and the interactions they entail. In particular, the framework identifies three layers of services including the core service, facilitating services, and supporting services. The core service of Uniurb Lab is the set of teaching modules developed to stimulate an entrepreneurial mindset among students, which combines traditional lectures with interactive lessons and gamification. Facilitating services include additional interaction moments that enable the delivery of the core service, such as meetings with established entrepreneurs, visits to incubators or innovative firms, and networking opportunities with local organizations and entrepreneurs. Supporting services include extra interaction moments that enhance the value of the core service without being necessary for its delivery, such as informal meetings with Uniurb Lab tutors or social interaction moments such as informal meals with tutors and educators.*

Second, according to Grönroos (2009) a service offering model must be customer-oriented and include all aspects of a service that customers perceive. The accessibility of the service, the interactions with the service provider, and the customer participation are three fundamental elements that constitute the service process from a management perspective. These elements should be added to the basic elements that constitute a service to form the so-called "augmented service offering". In Uniurb Lab, accessibility is ensured by opening the program to students from all disciplines and levels of study. Interactions occur through weekly modules and team-based activities. Customer participation is high, with students actively engaged in the learning process through team projects and idea development. Interaction, in particular, is a key aspect in service delivery, and it can be of different types. While human interaction between the customer and the service provider is the most prominent one, interaction could also happen between the customer and a self-service technology or between the customer and a retailer. In the case of Uniurb Lab, customers experience a service delivery that includes not only the content delivered in each module but also a series of interactions between students and instructors or among students themselves, and the overall learning environment. Therefore, interactions are deep and direct between students and service providers. Mapping all the interaction moments within a service delivery is crucial to recognize what Zeithaml et al. (2012) define as the "moments of truth". It is on these occasions that customers receive an instant impression of the quality of service provided by the organization; each contributes to the overall satisfaction of the customer and their willingness to turn to that provider again. In Uniurb Lab, these moments of truth occur during each module, with particular emphasis on team formation, idea generation, and interactions with external stakeholders.

Third, a key insight from service marketing literature that applies to Uniurb Lab is the role of customers (students) as co-creators of the service experience. As Zeithaml et al. (2012) observe, in the provision of service, that is, actions or performances - usually produced and consumed at the same time, customer participation is somehow inevitable. In many cases, employees, customers, and other subjects present in the service environment interact to produce the service itself. In Uniurb Lab, this aspect appears to be particularly relevant, since students are not passive recipients of knowledge but active participants in the learning process. They contribute to the service experience in various ways. For instance, they contribute with new resources in the sense that students bring their diverse backgrounds, knowledge, and perspectives to the program, enriching the learning environment for all participants. Through their engagement in team activities and idea development, students also directly influence the quality of the educational experience, therefore participating in the process of service quality co-creation. Finally, in some cases students could serve as mentors: in teamwork, more experienced students may take on mentorship roles for others, enhancing the overall learning experience. Customers showing a mentorship role can have very positive effects on the perceived quality of the service and they tend to increase loyalty, as well as supporting satisfaction of all other customers (Zeithaml et al., 2012).

Finally, the analysis of Uniurb Lab through a service marketing lens highlights opportunities for enhancing service design and customization. While the program has a structured format, there is potential for greater customization to meet the diverse needs and backgrounds of students. Service marketing literature emphasizes the importance of service flexibility and adaptability to customer needs. As Zeithaml et al. (2012) note, not all customers have the same desire for participation, and different options can therefore be offered for various market segments that include higher or lower levels of involvement. In the context of Uniurb Lab, this could involve offering different tracks or optional components based on students' prior experience with entrepreneurship, their specific interests, or their disciplinary backgrounds. This approach would align with Fayolle and Gailly's (2015) suggestion that differentiated programs tailored to specific student profiles could be considered.

Research Limitations: *This study presents some limitations that should be acknowledged - even though it should be noted that the work is still in progress, and it is currently shaped in a preliminary form. First, it is based on a single case study, which limits the generalizability of the findings to other EE programs in different contexts. While Uniurb Lab provides valuable insights, multiple case studies across different institutions and cultural contexts would provide a more comprehensive understanding of how service marketing principles can enhance EE. Second, the study focuses primarily on the design and delivery of the EE program rather than measuring its outcomes. As noted in the literature review, evaluating the effectiveness of EE programs remains a significant challenge, and this study does not address this gap directly. Future research should incorporate outcome measures to assess how service marketing-enhanced EE programs impact students' entrepreneurial competencies and mindset. Third, the study adopts a theoretical approach to applying service marketing principles to EE, without empirical validation of the proposed framework. Empirical studies involving surveys, interviews, or focus groups with students and instructors would provide valuable data to validate and refine the framework.*

Managerial Implications: *The integration of service marketing principles into EE programs can entail some managerial implications for universities and other educational institutions offering entrepreneurship training. For instance, viewing EE programs through a service marketing lens enables institutions to design more effective and engaging educational experiences. By considering the core service, facilitating services, and supporting services, program designers can ensure a comprehensive and cohesive offering. To do this, adopting a customer-oriented approach is key. It means recognizing students as customers of the educational service and designing programs that meet their needs and expectations by, for example, conducting regular needs assessments to understand students' expectations and preferences, adapting program content and delivery methods based on student feedback, or offering differentiated service options to accommodate diverse student backgrounds and learning styles.*

Additionally, service marketing emphasizes the importance of interactions between service providers and customers, as well as among customers themselves. For EE programs, this suggests training instructors to facilitate positive and productive interactions with students, designing activities that promote meaningful peer-to-peer interactions, and creating physical and virtual spaces that encourage spontaneous interactions and knowledge sharing. In this perspective, recognizing students as co-creators of the educational experience rather than passive recipients changes how programs are designed and delivered. It therefore becomes essential to involve students in program design and continuous improvement, provide opportunities for students to contribute their knowledge and experiences, and encourage student-led initiatives within the program. Not only, maintaining relationships with students beyond the duration of the program could enhance its long-term impact. In this sense, interesting initiatives could include developing alumni networks to maintain connections with former participants or offering follow-up services to support students in their entrepreneurial journeys.

Finally, even though it was not possible to deploy a specific analysis within the present study, the application of service marketing literature to EE could provide a set of frameworks for measuring and enhancing service quality. Managerial tools such as the ServQual Model or the Service BluePrint model could constitute valid opportunities to highlight the main features, issues, and innovative solutions related to the EE program conceived as a service.

Originality of the Paper: *This paper contributes to the literature on entrepreneurship education in several original ways. First, it bridges two previously separate domains - entrepreneurship education and service marketing - to create an interdisciplinary framework for enhancing EE programs. While EE literature has extensively discussed pedagogical approaches and outcomes, the application of service marketing principles to EE represents a novel contribution. Second, the paper shifts the focus from the traditional emphasis on EE outcomes (such as new venture creation or entrepreneurial intention) to the process of service delivery and the relational aspects of EE. By highlighting the importance of interactions, co-creation, and customer orientation, the paper offers a fresh perspective on how to enhance the quality of EE programs. Third, the paper addresses the ongoing challenge of evaluating EE effectiveness by proposing service quality as an additional dimension for assessment. It complements existing outcome-based measures and provides program administrators with more immediate feedback on program quality. Fourth, the paper emphasizes the dual perspective of both service providers (universities) and service users (students), recognizing that successful EE programs must create value for both parties. This balanced approach is often missing in EE literature, which tends to focus primarily on student outcomes. Finally, by analyzing Uniurb Lab through a service marketing lens, the paper demonstrates the practical applicability of service marketing concepts to EE program design and delivery. This case-based approach provides concrete examples that can guide other institutions in enhancing their EE programs. In summary, looking at Uniurb Lab as a service process allows for generating a more attractive service and contributing to*

the quality of the service itself. This interdisciplinary approach opens new avenues for research and practice in entrepreneurship education, with potential benefits for students, universities, and the broader entrepreneurial ecosystem.

Learning and experimentation throughout the pre-entry phase of the entrepreneurial processes

MARCO CORSINO[1] FILIPPO RIZZATO[2] SALVATORE TORRISI[3]

Abstract

This preliminary study investigates the pre-market-entry phase of entrepreneurship, exploring how team size and composition, in particular the heterogeneity of team members' work experience and field of education, are associated with the gestation activities performed by entrepreneurial teams. We measure these activities by the number of steps teams undertake to validate their entrepreneurial ideas. Analyzing participants' data collected from the application forms of three different editions of an Italian startup business plan competition, we examine the relationship between these steps and team heterogeneity. We also examine how the interaction between team size and heterogeneity correlates with the number of steps. The findings suggest that larger teams with higher diversity in their educational backgrounds engage in more entrepreneurial steps, while work experience is weakly associated with entrepreneurial steps. These insights contribute to research on entrepreneurial learning and team dynamics, highlighting the importance of a detailed examination of how team characteristics shape entrepreneurs' actions during the initial stages of the venture-building process.

Framing of the research. *The wide variation in firms' performance, even within the same sectors, has long puzzled scholars who have focused on the gestational period of new ventures in search for the origin of the key factors of performance. To explain performance heterogeneity, researchers have explored various possible causes, including firms' initial resource endowments (Barney, 1986), the behavioral and cognitive limitations of decision-makers (Gavetti, 2012; Simon, 1979), and the role of uncertainty and expectations in shaping entrepreneurial actions (Camuffo et al., 2024; Felin & Zenger, 2017; Zellweger & Zenger, 2023).*

Recent research highlights that startup survival and performance are primarily "determined by ex-ante heterogeneity rather than persistent ex post shocks" (Sterk et al., 2021, p. 547). Beyond market opportunities and resource endowments, these initial differences largely stem from founders' actions before firm incorporation and market entry (Bennett & Chatterji, 2023; Chen et al., 2018). These actions pertain to specific stages of entrepreneurial endeavors: initiation (e.g., opportunity recognition, intention, entry, and team formation) and engagement (e.g., organizing and learning) (Shepherd et al., 2019). The collection of actions undertaken during this pre-market phase, known as gestation activities (Arenius et al., 2017; Reynolds, 1997), constitute the gestation process (Carter et al., 1996; Hopp & Sonderegger, 2015; Lichtenstein et al., 2007) and can be categorized based on their intended aim or effect (Bennett & Chatterji, 2023; Reynolds, 2006; Reynolds & Curtin, 2008). Some of these actions portray a learning process, that is, an iterative experimental approach to validating the expected profitability of the business idea through practical steps, such as developing business plans, participating in competitions, creating prototypes, gathering customer feedback, and seeking funding. The extent and duration of this validation process are influenced by various factors, including the characteristics of prospective entrepreneurs-e.g., employment status, industry experience, prior entrepreneurial experience, and psychological traits like confidence (Bennett & Chatterji, 2023; Camerer & Lovallo, 1999; Chen et al., 2018; Li et al., 2023; Roelandt et al., 2023).

While prior research has significantly contributed to our understanding of early-stage entrepreneurial activity, we still lack a comprehensive theory that connects the antecedents of the entrepreneurial steps undertaken to validate a business idea (e.g., characteristics of the entrepreneurial team or their resources) with the number and type of entrepreneurial steps (e.g., pivoting, termination of the project, or performance of survived projects) and the consequences of such steps. Indeed, extant research has primarily examined "what" entrepreneurs do, often considering specific activities (e.g., developing a business plan) in isolation rather than adopting a holistic perspective (Müller et al., 2023). The absence of a unifying theoretical framework is underscored by the plethora of different approaches used to identify and categorize entrepreneurial activities (Bennett and Chatterji ,2023; Li et al., 2023; Roelandt et al., 2023).

DOI 10.7433/SRECP.SP.2025.01

To address the limitations highlighted above, this study aims to explore the process through which prospective entrepreneurs learn about the market potential of their business ideas. Specifically, we investigate how team-level characteristics, rather than just individual traits, shape the learning process. Building on research on the effects of team-level heterogeneity on post-entry performance (Bantel & Jackson, 1989; Carpenter, 2002; Hambrick et al., 1996), we propose that team-level heterogeneity is also a significant factor during the gestation phase of entrepreneurial projects.

Purpose of the paper. *Within the three-phase business creation process proposed by Reynolds (2016), we examine how the ex-ante characteristics of the entrepreneurial team relate to the entrepreneurial steps they undertake in both the active nascent and business creation phases, which comprise all activities done before (or close to) incorporation like hiring the first employee or performing the first sale, and that ultimately influence post-entry performance. Specifically, we explore the relationship between the number of entrepreneurial steps and the following team-level characteristics: (1) team size, (2) the educational diversity of team members, and (3) the work experience diversity of team members. Although variables related to team composition have been extensively researched in the past (Williams & O'Reilly, III, 1998), the focus of earlier studies has been mainly on how those characteristics shape performance (Carpenter, 2002; Guzzo & Dickson, 1996; Jin et al., 2017; Naranjo-Gil et al., 2008; Wang et al., 2017), while rarely focusing on how team characteristics affect what the team does. Meanwhile, the literature concerning the gestation activities performed in the pre-entry phase primarily focuses on the individual entrepreneur (Bennett & Chatterji, 2023) rather than the team. Therefore, this study aims to bridge this gap by examining the role of team characteristics in pre-entry gestation activities.*

Methodology. *Much research on entrepreneurial behaviors and actions utilized archival data from the PSED dataset (Müller et al., 2023). PSED-based studies cover nascent activities such as the development of a business plan, the creation of a prototype, the identification of competitors and target markets as well as the formal market entry (Delmar & Shane, 2003; Hopp & Sonderegger, 2015; Kim et al., 2015; Liao et al., 2005; Menzies et al., 2006). These studies concentrate on the overall population of nascent entrepreneurs, which implies a high heterogeneity at the individual level.*

Data used in this study were collected from the application forms filed by entrepreneurial teams that took part in StartCup Lombardia, a prominent business plan competition taking place in Italy. This competition attracts early-stage entrepreneurial teams, including those with startups less than one year old, with at least one member affiliated with a Lombardy university. The data covers the period 2022-2024 and comprises 329 projects and 1129 participants. The use of data on entrepreneurial teams related to academic research allows us to answer the call to investigate the entrepreneurial process in more homogeneous settings (Bennett and Chatterji, 2023).

Table 1 presents descriptive statistics for our study variables. At the individual level (upper part of Table 1), the variable WORK EXPERIENCE indicates that team members have 8.6 years of overall work experience on average.. Moreover, the median value computed for this variable, 5 years, suggests that team members are still inexperienced professionals. We use a set of binary variables to categorize the field of education of participants (e.g., EDUCATION_ENGINEERING, EDUCATION_BUSINESS). In our context, 71.3% of the participants specialize in a STEM discipline, with 40.0% of team members earning a title in Engineering. We also find that 22.0% of individuals were trained in a business-related discipline. This piece of evidence suggests that while a background in STEM disciplines may be necessary to identify entrepreneurial ideas in science or technology-based fields, the availability of managerial competencies in the founding team is important to translate those ideas into an actual startup.

The lower part of Table 1 displays descriptive statistics for team-level variables. We start by considering ENTREPRENEURIAL STEPS, a variable that counts the total number of gestational activities carried out by each team. To construct this variable, we exploited the unstructured data we retrieved from the application forms and the attached documents (presentation decks, resumes, and official documents from the chamber of commerce). To analyze the applications, four independent reviewers extracted text from various fields (e.g., project description, product or solution description, target customers/market, and competitors). These reviewers then analyzed and codified the extracted text to identify the entrepreneurial steps each team undertook before applying to the competition. The set of entrepreneurial steps, adapted from Bennett and Chatterji's (2023) taxonomy, includes 18 distinct actions that can be grouped into the following categories: i) Explicitly identifying the startup's direct and/or indirect competitors; ii) Contacting an external partner with relevant industry experience; iii) Building a prototype or pilot project; iv) Reaching out to potential customers for the product/service being offered; v) Securing funding from non-professional investors. Descriptive statistics for ENTREPRENEURIAL STEPS indicate that teams in our sample carried out an average number of 6.62 steps with a standard deviation of 3.56. The top 10 percent of teams in our sample carried out 11 or more steps.

Tab. 1: Descriptive statistics

	Observations	Mean	Median	Std. Dev.	Minimum	Maximus
			Individual level			
WORK EXPERIENCE	1129	8.569	5.000	9.116	0.000	50.000
EDUCATION_BUSINESS	1129	0.220	0	0.414	0	1
EDUCATION_ENGINEERING	1129	0.400	0	0.490	0	1
EDUCATION_LAW	1129	0.019	0	0.135	0	1
EDUCATION_LITERARY STUDIES	1129	0.049	0	0.215	0	1
EDUCATION_MATHEMATICS	1129	0.019	0	0.138	0	1
EDUCATION_SCIENCE	1129	0.159	0	0.365	0	1
EDUCATION_TECHNOLOGY	1129	0.135	0	0.341	0	1
			Team level			
ENTREPRENEURIAL STEPS	329	6.620	6	3.559	0	16
TEAM SIZE	329	3.432	3.000	1.748	1	10
TEAM SIZE CATEGORY	329	0.416	0.000	0.494	0	1
DIVERSITY WORK EXPERIENCE	329	0.509	0.445	0.469	0.000	2.828
WORK EXPERIENCE HETEROGENEITY	329	0.495	0	0.501	0	1
DIVERSITY EDUCATION	329	0.317	0.444	0.270	0.000	0.800
EDUCATION HETEROGENEITY	329	0.398	0	0.490	0	1

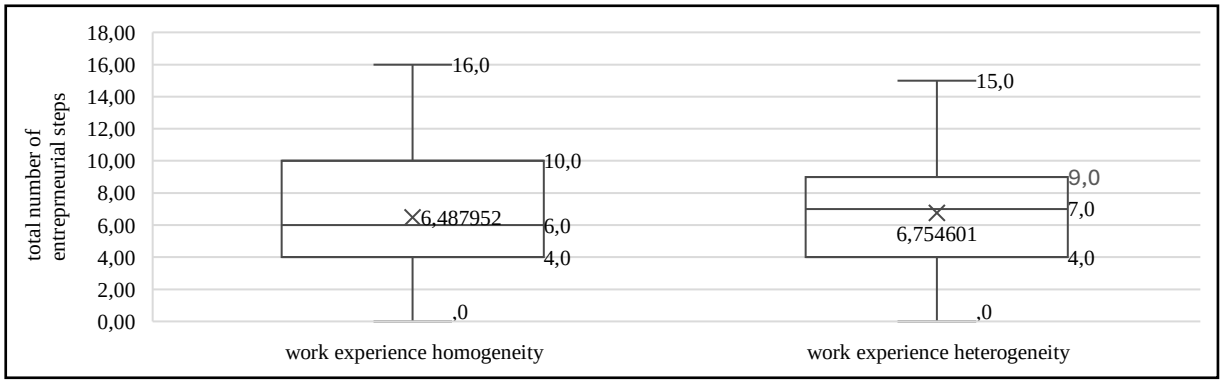
As for the factors associated with the number of entrepreneurial steps undertaken by each group, we focused on the following three antecedents. We considered the number of individuals involved in each group to construct the variable TEAM SIZE. Descriptive statistics for this variable show that the average team comprises 3.43 people with a standard deviation of 1.75 and a median equal to 3. Starting from this variable, we constructed a two-category variable, TEAM SIZE CATEGORY which takes on the value 0 (i.e., small team) if the number of team members is lower or equal to the sample median for the variable TEAM SIZE, and the value 1 (i.e., large team) for observations with a value greater than the median.

The construction of the second variable, WORK EXPERIENCE HETEROGENEITY, builds on data referring to the variable DIVERSITY WORK EXPERIENCE. This latter variable was calculated with the coefficient of variation $\left(CV = \frac{\sigma}{\mu}\right)$ *using the data from WORK EXPERIENCE consolidated at the team level using the relative averages (μ) and standard deviations (σ). The average CV is 0.51-meaning that, on average, the standard deviation of DIVERSITY WORK EXPERIENCE is around half the average of the work experience, while the overall standard deviation of the same variable is 0.47. Using the median of the CV (0.45) as a reference point, we construct the binary variable WORK EXPERIENCE HETEROGENEITY, which is used to cluster teams into two groups. WORK EXPERIENCE HETEROGENEITY is equal to 0 for teams with a computed CV lower or equal to the median (more homogeneous in terms of experience). WORK EXPERIENCE HETEROGENEITY is equal to 1 for teams with a coefficient higher than the median (more heterogeneity).*

EDUCATION HETEROGENEITY, our third variable, derives from DIVERSITY EDUCATION, which is calculated with the Gini-Simpson's index of diversity $(Diversity\ Education_i = 1 - \sum_{i=1}^{R} f_i^2)$*, where* $(f)_i$ *are the frequencies of the i-th education field among the seven EDUCATION variables. DIVERSITY EDUCATION has an average value of 0.32, a standard deviation of 0.27, and a median of 0.44. Moreover, almost 62% of the projects have a value of DIVERSITY EDUCATION below 0.5. EDUCATION HETEROGENEITY is equal to 1 for values of DIVERSITY EDUCATION above 0.44, the sample median (heterogeneous teams) and is equal to 0 for values below the median (homogeneous teams).*

Results. *To illustrate our preliminary results we report two boxplots: one refers to the relationship between ENTREPRENEURIAL STEPS and WORK EXPERIENCE HETEROGENEITY (Figure 1), and the other the association between ENTREPRENEURIAL STEPS and the interaction between TEAM SIZE CATEGORY and EDUCATION HETEROGENEITY (Figure 2). In the figures, the boxes describe the interquartile range (hereafter, IQR, or the range between the third and the first quartiles), while the upper (lower) bound of the "whiskers" is calculated by taking the largest value of the dataset within 1.5 times the value of the IQR above the third quartile (below the first quartile). The horizontal line is the median, while the cross is the mean. Any dot outside the whiskers are "outliners", i.e., observations with a value of more (less) than the upper (lower) bound.*

Fig. 1: Number of entrepreneurial steps by work experience



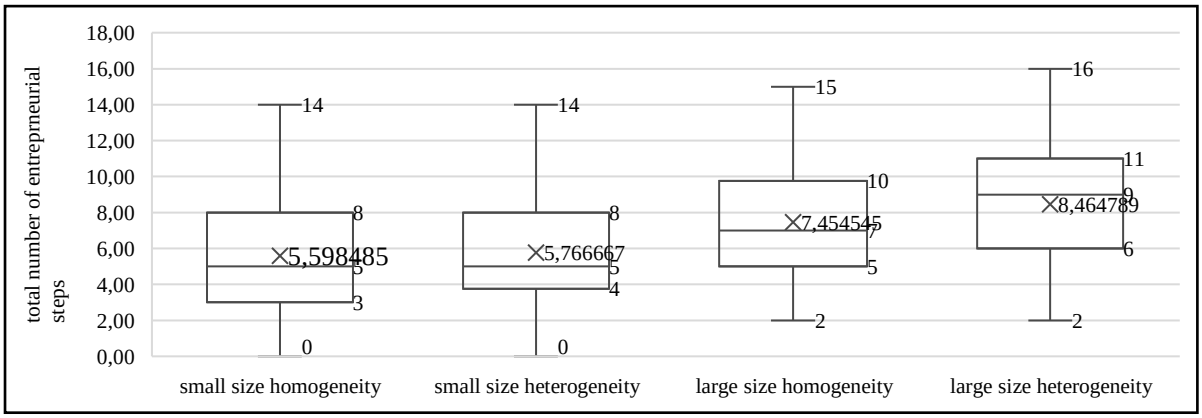


Fig. 2: Number of entrepreneurial steps by team size and field of education

Work experience heterogeneity (Figure 1) is weakly correlated with the average number of steps undertaken by the teams (from 6.49 to 6.76). Looking at the interaction between educational background heterogeneity and team size when considering the number of steps undertaken by the team (Figure 2), the boxplots show that, for larger teams, educational heterogeneity is associated with a unitary increase in the number of steps performed on average-from 7.46 of the homogeneous teams to 8.47 of the heterogeneous teams, an increase of 13.55%. Instead, in smaller teams, an increase in work experience heterogeneity is associated with a 3.02% increase in the average number of steps, from 5.60 to 5.77 steps. We also find that larger, homogeneous teams perform more steps on average compared with smaller, homogeneous teams, from 5.60 to 7.46 steps or a 33.17% increase. The difference between large and small teams is more marked among heterogeneous teams, from 5.77 to 8.47 steps on average or a 46.78% increase. Finally, larger teams always perform at least 2 steps, while some smaller teams (7.16% of teams) perform 1 or less steps.

Research limitations. *Our research is not without limitations. First and foremost, our primary dataset relies on texts and data collected at the time the teams submitted their application to the business plan competition, which we did not oversee. This means that relevant information (such as the timing of steps) was often missing and thus could not be included in our analysis. Moreover, we had to code and interpret the steps undertaken by the entrepreneurial teams from self-reported texts. We tried to limit potential biases and errors in interpretation and coding of the data by assigning this line of work to multiple researchers and cross-checking the outcome of their tasks for (dis)agreements to converge on a common ground.*

There might also be some questions about the context from which we draw our results. The competition was held in the Lombardy region, which is the most prominent Italian region in terms of startup activity, with more than a quarter of the total number of innovative startups (Unioncamere et al., 2024). Moreover, participation was limited to entrepreneurial teams with at least one member affiliated with a university based in the same region, which might limit the generalizability of our results to other startups that do not have connections with a university in the same region or other regions.

Another limitation is that we used general work experience instead of focusing on work experience specific to the economic sector of the entrepreneurial project, which might partially explain why we observe a limited correlation between $ENTREPRENEURIAL\ STEPS$ *and* $WORK\ EXPERIENCE_{HETEROGENEITY}$*. To mitigate this limitation, we are developing two other databases: one on team members' job experience and career, and the other on team members' education. Based on the resumes provided by applicants and their LinkedIn profiles we started to track the educational career of team members-relevant bachelor degrees, master degrees, and PhD degrees and the related institutions, while we are also collecting information about their professional experience by looking at the evolution of their career path, the position and job title, the employer type (if relevant), and the time spent on each position.*

Once the dataset is integrated as reported above, we plan to undertake additional analyses that exploit more advanced statistical tools. On the one hand, we will carry out a cluster analysis on the entrepreneurial steps (i.e., administrative vs. learning steps) to identify recurrent patterns in the types of gestion activities performed by teams with specific characteristics. On the other hand, we will conduct a multivariate regression analysis to examine the association between the variables described in this paper, while controlling for individual traits of the team leader.

Managerial implications. *Our preliminary results suggest that work experience heterogeneity does not translate significantly into more intense testing of the entrepreneurial idea measured by the number of steps carried out by the team. Educational heterogeneity is also weakly correlated with the number of steps. However, the difference between homogenous and heterogenous teams in terms of educational background is substantial in large teams. Thus, team size seems to be the primary driver of the number of steps and interacts with educational background heterogeneity. These findings have an interesting implication for nascent entrepreneurs as they highlight the benefits of taking on board more team members, preferably with a differentiated technical background. We should note that these results could be partly due to the limited average size of the sample projects; a small increase in the number of members in a small-sized team may significantly impact on the division of labor among team members and the ability to test their entrepreneurial idea on a larger scale.*

Originality of the paper. *We contribute to studies that view entrepreneurship as a process and explore how would-be entrepreneurs test the viability of entrepreneurial ideas before startup incorporation or around the time of market entry. More precisely, we provide two contributions. First, we provide further insights on entrepreneurial steps undertaken by future and nascent entrepreneurs by using an original source of information, which comprises a relatively more homogeneous set of individuals, that is, individuals with connections with academic research, as compared with previous studies. For instance, Bennett and Chatterji (2023) collect data on individuals from the general U.S. population; thus, they had to track entrepreneurial intention ex-post (for those who had yet to launch a startup). Instead, our research used data about entrepreneurial teams and individuals that applied for a business plan competition, which implies that they already manifested a clear motivation for entrepreneurship and, in some cases, had started a new firm. Second, we answer the call for more granular and detailed information about nascent entrepreneurial individuals (Bennett & Chatterji, 2023; Li et al., 2023; Roelandt et al., 2023). To the best of our knowledge, previous research mainly used the educational level of entrepreneurs without focusing on how different educational backgrounds impact the gestation process, i.e., the steps undertaken to test the quality of their business idea. Finally, we also address the call of Shepherd et al. (2019) for a deeper understanding of the role of teams' characteristics in entrepreneurial endeavor.*

Key words: *Entrepreneurial steps; Team characteristics; Education background; Work experience; Business plan competition*

Entrepreneurial Mindset and Cultures: The African context through the lens of an insider perspective

BICE DELLA PIANA[1] FORSTER AMPADU[2]

Abstract

Many scholars have written on the significant impact an entrepreneurial mindset has on entrepreneurship in general. Most of these scholars agree that these mindsets are, however, heavily influenced by the local culture of the people. Adopting a multiple case study approach with an underlying emic perspective involving five indigenous businesses in South Africa, this paper seeks to provide information about how the Ubuntu philosophy influences the mindsets of entrepreneurs in Sub-Saharan Africa. An insider's perspective is used to describe a particular culture in its terms, designed as an emic perspective, and build five case studies of African businesses. The preliminary results highlighted that the entrepreneurial mindset is culture-bound and that some variations between them are due to specific conditions that act as facilitating factors.

Framing of the research. *Entrepreneurial mindset as a key component to successful entrepreneurship has gained significant acceptance within academia and industry over the last couple of years (Kuratko et al., 2020; Jemal, 2020) after remaining an underdeveloped construct for a while (Morris & Tucker, 2021). Various definitions of entrepreneurial mindset (e.g, Daspit et al. 2023; Naumann, 2017) linked it to the cognitive way of thinking and leveraging resources to seek opportunities, especially in circumstances of uncertainty, which is the bedrock of every culture (Della Piana et al., 2024). An entrepreneurial mindset comprises traits such as independence, passion, action orientation, need for achievement, nonconformity, risk acceptance, and little preference for structure (Davis et al., 2016). Identifying factors that stimulate and cultivate entrepreneurial mindsets have intrigued researchers and policymakers in different domains, including management and education, to promote entrepreneurial activities around the world (Pidduck et al., 2023). Researchers acknowledge the value of understanding the concept of entrepreneurial mindset and contextual factors since the mindset depends on sociocultural contexts within which it is embedded (Bayraktar et al., 2022; Ratten, 2020; Pollack et al., 2023).*

Cultural values direct the degree to which communities and societies consider entrepreneurship (Hayton et al, 2002) as the innate elements of every culture is directly related to 'resource mobilizing', 'opportunity seeking', or 'opportunity recognition' and remains a key aspect of the entrepreneurial mindset (Thurik & Dejardin, 2011). However, societal cultures affect how an individual recognizes or evaluates the feasibility of opportunities or the way they realize the need for and prioritize resource allocation (Autio, 2013; McMullen & Shepherd, 2006; Mueller & Thomas, 2001).

Ratten (2020) posits that entrepreneurship is often culturally constructed in terms of how innovative activity is viewed in society and that entrepreneurs construct their identity based on cultural conditions. This also shows how entrepreneurial mindsets may be highly prone to be shaped by cultural values prevalent in societies (Hayton et al., 2002). An entrepreneurial mindset is expected to be culture-bound as mindsets are not fixed but rather evolve along with the individual's interaction with the environment by scanning and interpreting information through the process of entrepreneurial cognition which is heavily influenced by culture (Mathisen & Arnulf, 2013; Pinollos & Reyes, 2011; Rarick & Han, 2015; Li & Liao, 2025), and other life experiences including the sociocultural contexts of entrepreneurs impacts the way they recognise opportunities (Outsios & Kittler, 2018).

SSA and Africa, in general, have a rich cultural history, however, it is inaccessible because it is usually oral and lived rather than written (Nussbaum, 2003), and due to colonialism, much of the written ones are realised from a Western perspective (Murove, 2018). One such rooted philosophy in indigenous African culture is Ubuntu, which translates to humanness (Broodryk, 2005). This is a reference to "humanness in its most intense and natural sense, a genuine human approach to fellow human beings and the environment, including the real world of management and should not be confused with the general philosophy of Western Humanism" (Broodryk, 2005, p.1).

1.1 Entrepreneurial mindset in indigenous African businesses

An entrepreneurial mindset refers to cognitive abilities and behaviours that enable individuals to identify opportunities, take risks, and innovate within uncertain business environments (Daspit and Findley, 2021). In the African

context, Indigenous entrepreneurship is shaped by unique socio-cultural, economic, and historical factors that differentiate it from Western business models.

One characteristic of indigenous African entrepreneurship is its community-oriented nature, rooted in cultural philosophies such as Ubuntu, which emphasizes collective well-being over individual success (Kupangwa, 2024). Unlike Western entrepreneurial models, indigenous African businesses often function within cooperative networks, leveraging social capital and communal support for sustainability and growth rather than prioritizing profits (Bothello & Weiss, 2025). This collaborative approach fosters trust-based relationships, resource-sharing, and long-term resilience in business operations and opportunity recognition, which is deeply influenced by local knowledge and traditional economic activities. Entrepreneurs often identify gaps in markets by leveraging indigenous knowledge in agriculture, crafts, and trade (Manyaga et al., 2024).

1.2 Ubuntu philosophy and entrepreneurship

Ubuntu is an African philosophy centred on the belief that "I am because we are" emphasizing interconnectedness, mutual respect, and shared prosperity; thus teaching how to "express compassion, reciprocity, dignity, harmony and humanity in the interests of building and maintaining community with justice and mutual caring" (Nussbaum, 2003, p. 2). Ubuntu is lived by most Africans daily whether it is intentional or not, but because it is engrained into the culture of SSA indigens, it has become a constant in the lives of the people, so in this sense Ubuntu can be described as the essence of being African (Broodryk, 2005).

Paramount to Ubuntu is adhering to individuality and communal interactions, which underscores the mutual respect for individual rights while upholding communal shared values, but restricting an overemphasis on personal rights, rather steering all persons towards collective responsibility and shared rights (Adeola, 2024). These values of Ubuntu transcend beyond cultural makeup and also influence entrepreneurship and how businesses are carried out across indigenous African countries (Mabasa, 2020). Businesses operating with Ubuntu values understand the importance of sharing responsibilities, mutual respect and interconnectedness.

1.3 Ubuntu Values

The teachings of Ubuntu have found their way into all spheres of study and daily lives from social work, management and various other fields of studies (e.g. Nussbaum, 2003). Several scholars (Abubakre, et al., 2021; Broodryk, 2002, 2005) identified several pillars of Ubuntu which resonate and interconnect with each other; Adeola (2024) groups these into four main values: collective welfare, humility, reciprocity and benevolence.

1.3.1 Collective welfare

"African societies place strong emphasis on collective welfare, collaboration, interdependence, and shared action and highly value the well-being of the entire group and prioritise mutual understanding and tolerance because of the cultural emphasis on oneness (Adeola, 2024 p.125). This assertion is supported by the score of some SSA countries in the GLOBE Framework with specific regard to the cultural dimension of "ingroup collectivism" defined as "the degree to which individuals express pride, loyalty and cohesiveness in their families or close groups" (House et al., 2004). According to several authors (i.e. Alon et al., 2016, Hsee & Weber, 1999), in a collectivist society, individuals have a safety net which allows them to take higher risk, whereas in some instances in individualistic societies, such a safety net does not exist, making the individuals more risk averse. Thus, it could be argued that the ubuntu value of collective welfare enhances collective action (within the group they belong to) and plays a role in the overall goal of entrepreneurship within indigenous African societies. Twinomurinzi et al. (2010), in their research, found out that when Ubuntu is incorporated into businesses, it reduces inequality and enhances collectivism in South Africa, therefore highlighting the impact of Ubuntu in promoting collectivism in businesses.

1.3.2 Benevolence

In general societies, kindness is seen as a good virtue that defines who a person is and isn't, and kind people stand out in a crowd because they are seen as friendly and well-respected by others (Broodryk, 2005). Benevolence is seen as a moral string of human behaviour that reflects empathy for one another, which goes beyond personal desires, but rather with a society-wide collective outlook (Abubakre et al., 2021).

The level of empathy within a community depicts the level of support given and received from one another. As a society that supports each other (Rabe & Kumswa, 2022), the high empathy levels in Africa could be seen as a good promoter of entrepreneurship drives within the region. Central to the virtue of kindness is the act of giving, which in Ubuntu, promotes resource sharing and caring for each other, shaping the behaviours of people through establishing a societal cohesion in the search of shared objectives (Nussbaum, 2003). In Abubakre et al. (2021), some respondents articulated that their commitment to Ubuntu values gave them joy and a sense of positive contribution when they provided aspiring entrepreneurs with free tools to empower them on the entrepreneurial drive.

1.3.3 Reciprocity

Treating people with respect irrespective of their race, gender, or socioeconomic status is a bedrock of African societies (Adeola, 2024). Ubuntu promotes a sense of shared humanity where all humans are regarded as equal and how

you treat someone will be reciprocated back to you in the same way; therefore, if you show respect to your community members, they will also show you the same respect and vice versa.

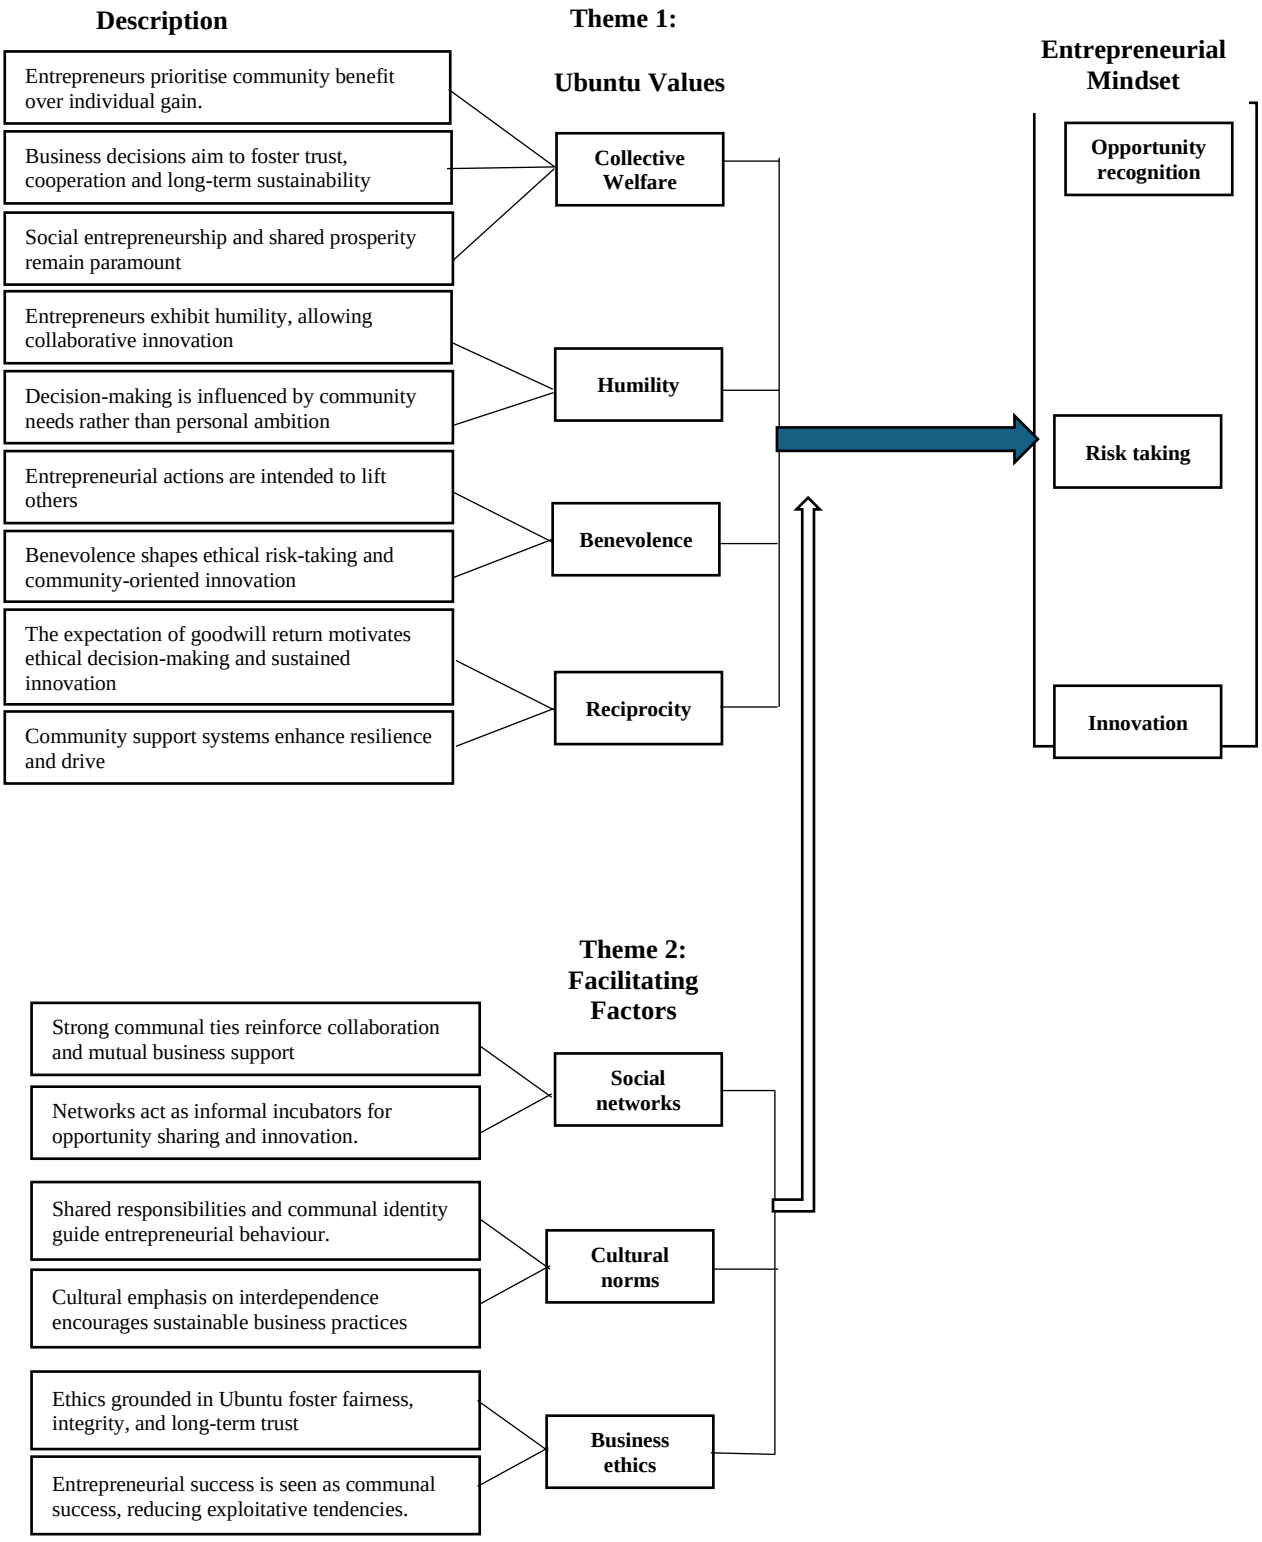
When the community assists a member in need, the resources spent to assist the needy member are reciprocated back to the community by other members and vice versa, thus promoting the power dynamics through mutual exchange (Tavernaro-Haidarian,2018). In Hussain et al (2024), the entrepreneur used in the study explained that his company was not just set up for economic purposes but rather to meet the critical needs of the community and this assertion was put to test when the owner was torn between folding up the business or injecting personal resources to keep the business afloat just to retain employees during the Covid 19 era. Injecting personal resources was reciprocated by the employees as now the owner is not involved in the day-to-day running of the business, but the employees are always coming up with new business models, which enabled the business to become self-financing, and the owner receiving daily payments. Drawing from the concepts of Ubuntu, reciprocity can impact the entrepreneurial mindset of entrepreneurs, as businesses would like to produce goods and services as a sort of payback to the society that will benefit all.

1.3.4 Humility

Humility as a virtue is defined by Newstead et al. (2018, p.446) "as a human inclination to feel, think, and act in ways that express moral excellence and contribute to the common good". Humility concerns how individuals regard themselves in the context of how they have treated others. Respect reflects in humility because it is a generally accepted norm that a humble person will respect other people and vice versa (Broodryk, 2005) and manifests itself in the way business activities are carried out. Adeola (2024) explained that Africa's resistance against colonialism could be attributed to the human principles and humanism advocated by Ubuntu, a philosophy which teaches human dignity and respect, signalling a shift from confrontation to reconciliation. This can be considered as a core component of entrepreneurial thinking as humble people are deemed to have an ability to listen and take feedback from business stakeholders, a trait which will determine if one will be a successful entrepreneur or not. Humble entrepreneurs harbour these interrelated traits: accurate self-awareness, an appreciation of others' contributions, openness to feedback, and a transcendent self-concept (Roundy & Lyons, 2022). They are not afraid to surround themselves with people who support his/her strengths and weaknesses, creating a collaborative environment which harnesses the strengths of others to ensure collective improvement in the entrepreneurial drive (Luna, 2022). Someone who isn't humble will find it difficult to accept they have weaknesses and thus will struggle to leverage the strengths of others to hedge against their weaknesses.

Purpose of the paper. *The main purpose of our paper is to analyse the relevance of the Ubuntu values to local entrepreneurship and explore how these values shape entrepreneurial attitudes and behaviours, highlighting potential variations between the five cases of indigenous African businesses from the point of view of African entrepreneurs (inside perspective).*

Methodology. *This study adopts the emic perspective aiming to develop culture-specific concepts (Galperin et al., 2022) related to the entrepreneurial mindset, specifically to understand how the Ubuntu philosophy influences the entrepreneurial mindset of indigenous African businesses using the inside perspective. According to Headland (1990), Kenneth L. Pike was the person who first coined the terms emics and etics in anthropology and linguistics and who first used them in print in 1954 (Pike, 1967). By the 1980s, the terms were being used in unrelated disciplines, including management and IB. An examination of the Academy of Management Journals identifies several papers in the 1990s that discuss emic and etic research issues and focus on which is the "better" approach (Elsbach et al., 1999).*



The authors used this approach as it is seen as a valuable method in studying the links between dynamics (Halkias et al., 2022), e.g. between culture - like the social-cultural context shaped by Ubuntu - and entrepreneurship. Since Ubuntu philosophy is a culture-specific phenomenon which is not comparable across other cultures, the most suitable perspective to understand the culture is from a native's point (Lu, 2012); thus, we used the emic approach.

At this stage of our research, we are still analysing the five indigenous businesses in South Africa through their key informants - n. 10 owners, CEOs and their respective representatives - using in-depth semi-structured interviews based on three times. All five businesses were chosen from South Africa, as there was an existing contact in the country that enabled the authors to gather the necessary information. The in-depth semi-structured interviews offered us flexibility and adaptability during the entire data collection period (4 months) while keeping on track with the direction of the research to reach the expected amount of information to complete the case studies (Ruslin et al., 2022). We met respondents virtually twice starting three months ago; the first one (Time 1) started with the first round of the in-depth semi-structured interviews (1 hour and a half each); the second one (Time 2) was devoted to share the information gathered from the first-round interview and refine the interview arguments to use in the last stage (2 hours each). We are currently at the last stage (Time 3), aiming to complete the third-round interviews (we expect 1 hour and a half each) devoted to making reflections together with the key informant of each business about our preliminary results. Each interview was recorded, manually transcribed, coded and analysed individually by identifying common themes within all the Cases. We opted to analyse our data using thematic analysis because it is seen as the most appropriate method of analysis for our research as it has proved useful in entrepreneurial research when examining old and new constructs in entrepreneurship with an undertone of cultural variations (Jones et al., 2011, Gupta and Levenburg, 2010)

Results. *Our preliminary results highlight that the Ubuntu values - collective welfare, humility, benevolence, and reciprocity serve as the philosophical and moral foundation that guides the entrepreneurial mindset in communities*

within SSA. These values prioritise the well-being of the community over individual success. For example, collective welfare drives entrepreneurs to make decisions that benefit their community rather than maximising personal profit, leading to trust, long-term relationships, and sustainable ventures. This echoes Beck and Zwiegelaar's (2024) argument that Ubuntu promotes social innovation for the many rather than personal gain. Also, just like in Hussain et al. (2024), our results depict that entrepreneurs sometimes embrace risk if they are sure of providing products that will ensure communal prosperity. For each value and facilitating factor, we report at least one quote to reinforce the idea about the influence of Ubuntu philosophy on entrepreneurial mindset (Fig.1).

Fig. 1: Analysing the impact of Ubuntu values on entrepreneurial mindsets (Authors' construct)

Following, are two quotes about the conversation we had regarding the relationship between collective welfare and decision-making.

"We decided to take the risk of venturing into this line of business because we realised the filth plastic was causing to our environment and how it was affecting the surrounding communities, the idea of doing this was initially just to help clean the environment. However, we realised we could recycle collected plastics into other products. Now we can pay the communities members per kilo of every plastic they brought to our warehouse using one stone to kill two birds; we helped clean the environment and the people earned some money" (Alpha Case, CEO, 2025, female)

"We source our raw materials locally because we believe in financially independent rural and township communities. We are passionate about our community development" (Delta Case, CEO, 2025, female)

Similarly, *humility*, as a core value, underpins leadership and innovation by encouraging entrepreneurs to be open to feedback and prioritise communal needs. This value is particularly relevant in collaborative ventures and supports inclusive leadership-critical for innovation, as shown in (Saunders, 2022; Metz, 2020; Adeola, 2024).

The subsequent two quotes, derived from our interactions with entrepreneurs, underscore the relationship between humility and its impact on entrepreneurial mindsets concerning innovation and opportunity recognition.

"I am a hands-on businesswoman, so I am ready to get my hands dirty. Some of my workers, one asked why we were not growing our own maize to make the feed for our pigs, I asked myself why I hadn't thought about that? So we ventured into maize growing to help feed our animals, but now we sell maize and soya beans, including our original livestock farming" (Beta Case, CEO, 2025, female).

"Sometimes I hear suggestions from customers, and it might sound crazy, but you're better off listening to them and considering the variation of that product because ultimately, that is what will work or is in demand" (Epsilon Case, CEO, 2025, male)

Reciprocity reinforces a culture of ethical risk-taking. Entrepreneurs often invest in their ventures not only for financial returns but to meet social needs, expecting goodwill and support to be returned by the community. This shared responsibility strengthens social capital, increases resilience, and motivates continuous opportunity recognition and ethical decision-making, echoing the study by the Philanthropy for Active Civic Education (2019). The following quote vividly illustrates how the expectation of community reciprocity, rooted in cultural resonance, can drive significant ethical risk-taking in pursuit of an unmet social need and entrepreneurial opportunity.

"Being a sneaker head myself, I realised there were no sneakers which resonates the South African Culture, I felt this was an untapped field and worth the risk, so I resigned from my well paid white-collar job and decided to start this business. I knew people would patronise the product once it reflected our culture and could be called one of our own" (Gamma Case, CEO, 2025, male)

Benevolence influences entrepreneurs by shaping their ethical risk-taking and driving community-focused innovation. Rather than solely pursuing profit, benevolent entrepreneurs assess risks based on potential social impact, leading them to develop solutions that address community needs. This mindset fosters sustainable, socially responsible innovations that strengthen community ties and contribute to long-term success. This is evident in the words of the CEO in our Delta Case:

"There is not a lot of income in rural communities, especially for women. However, most of these women have family lands undeveloped. As a way of helping to uplift them, we offer them seeds and plants to grow, help them with their farming and then when the produce is ready for harvest, we purchase them for our shops". (Delta Case, CEO,2025, female)

The Ubuntu values are not static but are amplified by facilitating factors - social networks, cultural norms, and business ethics. The assertion that *social networks* serve as vital channels for resource sharing, information exchange, and emotional support, thereby fuelling Ubuntu values in entrepreneurial mindsets, finds strong support in the experience of Gamma Case, CEO. He explains,

"For me, this business has been more than just a personal success.

The support network we have, employees, and the community members, serve as a strong social network which are not just channels for information exchange, but sometimes as emotional support and remain key to our success. Without these networks, it would have been impossible to get to where we are today"

Similarly, cultural norms, grounded in Ubuntu, create an environment where, for example, benevolence and reciprocity are not just virtuous acts but are deeply ingrained social expectations reinforcing shared responsibilities and trust. This was articulated by one of our entrepreneurs,

"In our lives as Africans, one's success is not their own and success is shared, and when we lend a hand, we trust that our communities will return the favour. The spirit of lending a hand and trusting reciprocity is just the way things are. It is woven into the fabric of our culture. We don't just see it as a nice thing to do, but it's what is expected" (Alpha Case, CEO, 2025, female).

Business ethics, grounded in Ubuntu, further promote fairness and integrity, which are vital for building sustainable enterprises. Entrepreneurs guided by Ubuntu understand that their actions have ripple effects throughout the community and that their success is intertwined with the ethical treatment of stakeholders, including employees, customers, suppliers, and the wider community. This inherent sense of responsibility fosters a commitment to fairness in all business dealings. This is reiterated by the CEO of our Epsilon Case:

"We are nothing without our customers, so we always make we remain fair to our customers with all our business decisions..."

The synergy between the Ubuntu values and the facilitating mechanisms shapes the entrepreneurial mindsets of innovation, opportunity recognition and risk taking. Our preliminary findings suggest that Ubuntu values shapes entrepreneurs' mindset on innovation by directing them towards solving communal problems, while shaping their mindsets on opportunity recognition into collective insights and communal feedback. Lastly, entrepreneurial mindsets on risk taking are made feasible by shared communal support and collective benefit, therefore making it essential that risks are taken on with an inner consideration of long-term sustainability and social harmony.

Research limitations. *The research is limited in the scope as we only used businesses in South Africa as part of the research; therefore, generalization could be questioned as Ubuntu is not practiced only in South Africa but in several SSA countries. Therefore, the results of this research will serve as a foundation for future research, where we plan to adopt a multi-sited ethnographic approach to assess the broader impact of Ubuntu on entrepreneurship across Sub-Saharan Africa (SSA). A multi-country analysis will enable us to explore both similarities and differences in how Ubuntu shapes entrepreneurial thinking across diverse contexts. Additionally, this study will examine the role of country-specific cultural factors in shaping the extent to which Ubuntu principles influence entrepreneurial behaviour in the region.*

Managerial implications. *The practice of Ubuntu philosophy into entrepreneurship presents significant managerial implications, particularly in shaping of mindset, decision-making, and business sustainability. Entrepreneurs and business leaders who embrace Ubuntu values-such as collective welfare, reciprocity, humility, and benevolence ethical responsibility-can create enterprises that prioritize shared success over individual gain.*

By leveraging strong social networks, cultural norms and business ethics, entrepreneurs can develop an entrepreneurial mindset that incorporates the values of Ubuntu in the recognition of opportunities, innovation drives, risk taking and making ethical business decisions. Such an integration into entrepreneurial thinking will force entrepreneurs to create businesses that are not only profitable but also socially responsible, resilient and deeply rooted in community-driven success. This, however, begs whether it is possible to be an Ubuntu entrepreneur in locations where some of these facilitating factors are unavailable, for example in individualistic economies which don't have strong social networks and cultural norms.

The managerial implications presented by Ubuntu-inspired entrepreneurship could be viewed as a way of ensuring communal well-being, and thus it is imperative that it is promoted across the continent which could be fostered and strengthened through policy formulations and educational and training frameworks.

At the educational and training levels, Ubuntu could be integrated into schools' curriculum by developing training content that explicitly explores Ubuntu values and their relevance to business decisions and ethical leadership. Educators could also institute simulation activities to help students build understanding of Ubuntu values in general and business lives. This could be done, for example, by implementing simulation-based learning where students negotiate, lead and solve problems in community-centric business scenarios; such an exercise could shape their mindsets as pass through the education system.

Originality of the paper. *Our study addresses contextual factors (Tung and Stahl, 2018) in entrepreneurial research in emerging economies. Following the arguments of Teagarden et al. (2018) and Galperin et al. (2022), highlighting that it is still unclear how models and theories developed in traditional Western contexts are relevant or apply to the under-researched regions, a gap our study tries to fill.*

Key words: *Entrepreneurial mindset; Ubuntu philosophy; Emic; research; African businesses; Culture; Entrepreneurship*

Building the Foundation: How Dual Team Formation Shapes Early Venture Trajectories

MOHAMMAD HAWILY[1] PAOLA GIURI[2] MARCO CORSINO[3]

Abstract

This study investigates how entrepreneurial team (ET) formation approaches-specifically, the intensity of adopting a dual strategy (integrating resource-seeking and interpersonal attraction) influences early entrepreneurial performance. While recent research has begun to explore the dual approach, a significant gap remains in understanding how and why the intensity of adopting this strategy, rather than its mere adoption, affects early entrepreneurial outcomes. Drawing on human capital and homophily theories, the research analyzes 185 entrepreneurial teams participating in a business plan competition, supplemented by interview data. Preliminary findings indicate that a higher intensity of the dual formation approach significantly enhances team productivity, which, in turn, mediates the relationship between team formation intensity and early legitimacy. This research contributes by shifting the focus from singular to dual formation approaches, examining intensity rather than mere adoption, and uncovering the mechanisms through which formation intensity influences early entrepreneurial success.

Framing of the research. *Entrepreneurial team (ET) formation has garnered significant scholarly interest (Knight et al., 2020; Patzelt et al. 2021). This focus is well justified, as most startups are team-based rather than founded by solo entrepreneurs (Beckman et al., 2007), reflecting the crucial role of these teams in shaping the trajectory of an entrepreneur's journey (Cooney, 2005; West, 2007; Kollmann et al., 2016). Despite the prevalence of team-based startups, the process of ET formation remains a significant challenge (Gray et al., 2024a). High failure rates among startups, often attributed to internal conflicts within founding teams (Wasserman, 2012; Genome, 2022), underscore the importance of understanding ET formation approaches-how founders choose co-founders to launch a new venture (Lazar et al., 2020)*

Existing literature identifies two primary approaches to team formation: resource-seeking and interpersonal attraction (Philips et al., 2013). The former emphasizes acquiring complementary skills and expertise to address venture needs (Agarwal & Shah, 2014), while the latter prioritizes familiarity, similarity, and trust among team members, often drawing from existing social networks (Ruef et al., 2003; Aldrich & Kim, 2007). While these approaches are often discussed as two opposing strategies, emerging research suggests that entrepreneurs may combine them as a dual approach (Francis & Sandberg, 2000; Forbes et al., 2006). Recent studies have begun to examine the influence of this dual approach on entrepreneurial outcomes, showing its superiority over single-strategy approaches in enhancing both team effectiveness and startup performance (e.g., Shah et al., 2019; Lazar et al., 2022).

Despite evidence supporting the benefits of this formation strategy, research in this area remains in its early stages (Hawily et al., 2024). Much of the existing literature treats team composition as a given in later stages of venture development, making assumptions about team formation strategies. However, a key drawback of this approach is its ineffectiveness in addressing the interplay between resource-seeking and interpersonal attraction (Agarwal, 2019; Zellmer-Bruhn et al., 2021). Therefore, to deepen our understanding of this issue, it is essential to complement early research on dual formation while offering fresh insights by going beyond its mere adoption and examining the extent to which it is applied. Building on this foundation, we aim to address how and when the intensity of adopting a dual formation approach from the onset can influence early entrepreneurial outcomes.

Purpose of the paper. *Building on the previous foundation, this paper investigates how lead entrepreneurs' decisions regarding co-founder selection from the outset influence early entrepreneurial performance. While ET formation may seem a team-level phenomenon, studies have shown that ETs are often built around a single individual, the lead entrepreneur (Shah et al., 2019). Specifically, this research work seeks to answer the following: how and when does the intensity of adopting a dual formation approach from the outset impact early entrepreneurial outcomes?*

This study complements prior research by focusing on the intensity of the dual formation approach rather than simply its presence or absence. It argues that the degree to which entrepreneurs balance resource needs and interpersonal

compatibility has significant implications for team productivity and subsequent entrepreneurial outcomes. Drawing on human capital theory (Becker, 1994; Schultz, 1961) and homophily theory (Lazarsfeld & Merton, 1954), the research develops a framework for understanding and measuring the intensity of these combined approaches.

Adopting an input-process-outcome framework, the study examines the relationship between team formation intensity, team productivity, and early entrepreneurial performance. It analyzes data from 185 entrepreneurial teams participating in a prestigious business plan competition, supplemented by insights gathered from in-depth interviews with lead entrepreneurs and their co-founders. By focusing on the nascent stage and examining the intensity of the dual formation approach, this research aims to provide a more nuanced understanding of how team formation influences team processes and entrepreneurial success.

Methodology. *To investigate pre-founding ET formation approaches from inception and their impact on early entrepreneurial performance we relied on a sample of nascent ETs participating in a business plan competition (BPC). The BPC serves as an ideal context for collecting primary data on ETs at the nascent stage. Prior research has effectively utilized BPCs to study entrepreneurial teams in the early phases of venture development (e.g., Foo et al., 2005; Foo, 2011; Lazar et al., 2022).*

The BPC in this study is based in Italy, a country recognized for its entrepreneurial ecosystem, particularly in one of its most entrepreneurial regions (Mazzoni et al., 2022). Organized by a consortium of local stakeholders, including Chambers of Commerce, industrial associations, bank foundations, and universities, this competition has been a prestigious attraction for nascent entrepreneurs in the region for over 20 years.

The competition is held annually without restrictions on the number of applicants or business ideas; the competition is open to teams at the ideation stage or those who have established ventures no older than 12 months. These ventures must not yet have achieved consistent positive cash flow or completed their first sale. This criterion ensures that all participants are genuinely in the nascent stage of entrepreneurship.

To qualify as nascent entrepreneurs, participants must actively engage as founders or co-founders of emerging ventures that have taken measurable steps toward realization. However, ventures must not yet have reached the stage of generating regular positive cash flow, which aligns with definitions from Davidsson and Gordon (2016). This ensures that the study captures entrepreneurial teams at a critical formative stage, allowing for exploring team dynamics and performance during the early phases of venture creation.

In this BPC, nascent ETs go through two main stages. In the first stage, teams participate in the business competition by submitting a description of their entrepreneurial idea; some of them submit a business plan. However, writing a business plan, whether formal or informal, is optional for a team to take place in the PBC. Next, team members are supposed to attend a training course, in which they are asked to submit a first draft of their business plan to be evaluated by the external scientific committee. The committee comprises experts in the field of entrepreneurship (i.e., advisors, business angels, investors, and academics), selects the most promising ideas, and invites the selected team to attend the second stage. Teams continue refining and developing their business ideas in this stage, culminating in an award ceremony recognizing the top-performing teams.

To test our hypotheses, we utilized data from two stages of the business plan competition spanning from 2021 to 2024. In the first stage, we examined the relationship between team formation approach and team performance, focusing on 185 teams. Hypotheses 2, 3, and 5 were tested in the second stage, which involved 108 teams. Below is a detailed description of how we arrived at these final sample sizes.

In the open participation phase (first stage), we collected the list of all participants. Entrepreneurs were asked to provide information about their business ideas, including descriptions and demographic details. At this stage, team leaders were required to fill out the information, though in many cases, other team members contributed and identified the team leader. A total of 525 projects were submitted between 2021 and 2024. We had contact information for all team leaders and some other members, which was obtained through the business plan competition organizers, who assisted in reaching the entrepreneurs. Of the 525 projects, 231 responses were received to our questionnaire, resulting in a response rate of 44%. After reviewing the 231 responses, 19 were from non-lead entrepreneurs. We verified that these responses were consistent with those of the lead entrepreneurs and subsequently excluded them, leaving 212 projects. Of these, 24 were from solo entrepreneurs. Given our focus on team formation, we excluded these and focused on 185 teams, which included 599 members (with 185 team leaders and 411 co-founders).

In the second stage, 80 teams were disqualified from the competition, leaving 108 teams for evaluation by the committee. These teams were assessed for early performance in the context of our study. Thus, for testing hypotheses 2, 3, and 4, we used the data from 108 teams, which included 238 co-founder selection cases.

To ensure comparability between the teams in the first and second stages of the competition, we conducted independent two-sample t-tests to examine differences across four key variables: team formation dual intensity, team formation personal intensity, team formation skill intensity, and the sum of nascent activities. The results showed no statistically significant differences between the dropped teams and those that continued.

To assess the intensity of team formation approaches, we developed a set of questions with 11 attributes that lead entrepreneurs could choose from to describe how they selected their co-founders. Specifically, we asked entrepreneurs to specify how they selected their co-founders using the options provided below while allowing them to write their own responses if they felt the options did not fully capture their selection process. The attributes were grounded in theoretical discussions on team formation and co-founder selection, drawing from the work of Forbes et al. (2006), Aldrich & Kim

(2007), and Lazar et al. (2020), all of which offer valuable theoretical insights into how team formation approaches can be identified.

The attributes we included align with concepts from Human Capital Theory and Homophily as they focus on competencies, experience, and personal ties, which are central to these theories. The attributes asked entrepreneurs to select their co-founders based on the following: complementary competencies (different from those available), experience in creating startups, experience in the industry sector related to the business idea, managerial experience, access to important financial resources, similar competencies to those already available, ties of parenthood or being a couple, full confidence in the person, shared educational background (same school/university), belonging to the same professional network, and enjoyment of working with the person. We also asked entrepreneurs to specify their reasoning, though no formal specification was provided for the competence of these attributes.

We conducted 60 interviews with lead entrepreneurs and their co-founders to validate this approach further. During these interviews, we asked lead entrepreneurs how they selected their co-founders and also inquired of the co-founders about their reasons for being selected. The findings confirmed our approach to measuring team formation. This method represents a novel contribution to team formation measurement, as previous methods have typically relied on text analysis or relationship-based metrics found in written text (Gray et al., 2024; Lazar et al., 2022). Our approach was supported by a theory-driven, grounded method for understanding and measuring team formation based on direct interactions and the practical decisions made by entrepreneurs.

To measure the intensity of team formation approaches, we calculated three variables: personal intensity, skill intensity, and dual intensity. Interpersonal attraction intensity was computed by dividing the number of personal attributes selected by 5. Resource-seeking intensity was calculated by dividing the number of skill attributes selected by 6. Dual approach intensity was the product of personal and skill intensity scores, reflecting the combined influence of both factors in team formation.

The scores range from 0 (no intensity of a specific formation approach) to 1 (maximum intensity). Team formation ranges between 0 and 0.4. For the dual formation approach, 27.1% of teams reported no adoption of this approach, while almost 63% scored between 0.03 and 0.4. The intensity of resource-seeking and interpersonal attraction approaches was higher, with resources seeking with 70.2% scoring between 0.16 and 0.33 and 75.0% of interpersonal attraction scoring between 0.2 and 0.4. Given the nature of the formula, it is typical to observe lower average dual intensity values compared to personal or skill intensity values. Most teams are unlikely to score high on both dimensions simultaneously, and the product reflects this combined moderate emphasis. This is an inherent measurement characteristic and provides insight into how teams balance these two approaches. All the main independent variables were standardized to improve the interpretability of coefficients and ensure comparability among predictors with different scales.

For our model, traditional outcome variables like profitability or firm value were not applicable for two reasons. First, the teams in our sample were in a very early stage, with 89 teams legally registered and 99 not yet registered, representing 53% of our sample. Using financial measures would not only unfairly exclude a large portion of the sample but also be inappropriate for teams at this stage (Davidsson & Gordon, 2016). Second, team performance is not always directly aligned with the financial outcomes of organizations (Mathieu et al., 2008). Research on the link between team composition and productivity suggests that team behavior is a stronger indicator of performance and dynamics than financial outcomes (Beal et al., 2003). Consequently, we focused on team productivity rather than financial outcomes, aligning with recent studies that have successfully adopted this approach to examine team composition and performance in early entrepreneurial teams (e.g., Ko et al., 2022).

To measure productivity, we assessed the number of gestational activities initiated by each team, representing progress toward organizational creation. The PSED was the first to introduce this method, which captures activities to advance venture creation across four dimensions: intentionality, resources, boundary, and exchange. Following this approach, we included 24 activities: selling a product, contacting first customers, purchasing equipment, developing a product, registering a new venture, and others. Each completed activity was assigned a value of 1, while uncompleted activities were scored 0. The total score for these activities provided a measure of the behavioral performance of entrepreneurial teams during the nascent stage. The team performance ranges between 1 and 18, with a mean of 2.27.

We adopted an approach consistent with our team performance evaluation and current entrepreneurship studies to measure early entrepreneurial performance. Selecting a metric that reflected outcomes directly tied to early-stage team production was crucial. Given that the quality of nascent activities indicates entrepreneurial team (ET) competence (Ko et al., 2022), ensuring that the measurement aligned with the nascent context was essential. To achieve this, we utilized committee evaluations of business plans submitted by teams to measure early entrepreneurial outcomes.

The business plans detailed the nascent activities undertaken by the teams, including key aspects such as market segmentation, market size, the level of product or service development (accompanied by detailed descriptions), the presence of trademarks or patents, marketing activities performed, and other relevant actions. This approach aligns fully with our indicator of team performance. Additionally, the business plans included team member CVs and their roles within the project, ensuring alignment with the independent variable of team formation.

The evaluation committee comprised diverse members with backgrounds in entrepreneurship, including serial entrepreneurs, investors, incubator experts, and university professors specializing in entrepreneurship. Each member independently assessed the business idea based on the aforementioned dimensions. The final decision determined whether

a team advanced to the second stage of the competition, with typically 10 to 17 teams progressing. Teams advancing to the final stage were assigned a value of 1, while others received a 0.

This evaluation process has been validated in numerous entrepreneurship studies investigating ET processes and outcomes at the early entrepreneurial stage (Foo et al., 2005; Lazar et al., 2022).

We examined several control variables to address factors influencing entrepreneurial performance. "Age" was included as a proxy for entrepreneurial experience and knowledge, as well as the individual's position in their life cycle, which impacts entrepreneurial behavior. The age of lead entrepreneurs ranged between 18 and 77 years, with a mean of 36.38 years. "Age" was measured as a continuous variable, calculated as the difference between the entrepreneur's birth date and the date of participation in the competition. "Gender" was also controlled for, as prior research indicates performance differences between male and female entrepreneurs, with men often outperforming women in entrepreneurial outcomes. Gender was coded as a dummy variable (1 = female, 0 = male). The majority of lead entrepreneurs are men, marking 77.6% of the sample. Moreover, we control for lead entrepreneurs' "general self-efficacy" that influences the entrepreneurial process at different stages. We measured self-efficacy following the approach of Maurer and Pierce (1998). This involved using items rated on a 5-point Likert scale ranging from "strongly agree" to "strongly disagree" and calculating the average score across all items to determine the overall self-efficacy level. Lastly, at the individual level, we controlled for the number of idea initiators, reflecting additional leadership roles that may influence team performance. Lead entrepreneurs identified team members who originated the idea and recorded it as a count. In the sample, 73% reported one initiator (always the lead entrepreneur), 21% reported two, and 6% reported three or more. "Industry type" was included to account for variations in the resources required and success rates across industries. This variable was coded as 0 for manufacturing and 1 for services. We controlled for "team size", measured as the total number of team members, as larger teams tend to provide greater human resources, which can enhance firm performance. Lastly, we included the "time gap" between the founding of the entrepreneurial idea and participation in the competition. The duration and timing of organizing activities can significantly impact performance, implying that teams that start developing their ideas earlier are likely to have more time to refine their entrepreneurial projects and achieve better performance. This variable was measured using the number of years to capture the impact of this time difference on entrepreneurial outcomes.

Results. *This study investigated the relationship between team formation approaches and early entrepreneurial performance. Three primary hypotheses were tested, focusing on the impact of dual, resource-seeking, and interpersonal attraction formation strategies.*

The first hypothesis posited that the intensity of the dual formation approach (combining resource-seeking and interpersonal attraction) would be positively associated with early-stage entrepreneurial team performance. Regression analysis revealed a significant positive relationship between dual formation intensity and team productivity. Teams exhibiting a higher intensity in balancing skill-based and interpersonal attributes demonstrated better performance in early entrepreneurial activities. This finding supports the hypothesis, suggesting that integrating both resource acquisition and interpersonal compatibility is crucial for early team success. Control variables, including time gap and team size, also significantly influenced team performance.

The second hypothesis proposed that the intensity of the dual formation approach would be positively associated with early entrepreneurial performance. Logistic regression analysis demonstrated a significant positive impact of dual formation intensity on early entrepreneurial performance. Teams with a higher intensity in the dual approach were more likely to achieve positive early outcomes. However, when control variables were introduced, this effect became marginally significant. Other factors, such as the number of idea initiators and leader self-efficacy, emerged as positively associated with early performance, while gender showed a marginally negative effect.

The third hypothesis examined the mediating role of entrepreneurial team performance in the relationship between team formation approaches and early entrepreneurial performance. Following established procedures, mediation analysis revealed that entrepreneurial team performance fully mediated the relationship between dual formation intensity and early entrepreneurial performance. This suggests that the positive effect of dual formation intensity on early entrepreneurial performance is channeled through its positive influence on team productivity. In other words, teams formed with a high intensity in the dual approach achieve better early outcomes because they are more productive.

Additional analyses explored the individual effects of resource-seeking and interpersonal attraction approaches. Resource-seeking intensity significantly and positively affected team performance, although weaker than the dual approach. However, its effect on early entrepreneurial performance was not significant, and the mediation analysis suggested that team performance only partially mediated this relationship. On the other hand, interpersonal attraction intensity showed no significant relationship with either team performance or early entrepreneurial performance, indicating that this approach alone does not significantly influence early outcomes.

In summary, the findings highlight the importance of the dual formation approach for both team productivity and early entrepreneurial performance. The results strongly support the idea that balancing resource acquisition with interpersonal compatibility is a key driver of early entrepreneurial success, and that this effect operates through enhanced team productivity. While resource-seeking can contribute to team performance, it does not translate directly into improved early entrepreneurial outcomes. Interpersonal attraction alone appears to have little impact on either team performance or early success.

Research limitations. *Cross-sectional data limits understanding of the dynamic team formation process. While common in multi-stage analysis, sample size reduction in the second stage could affect robustness. Finally, the Italian context may limit generalizability, suggesting a need for cross-cultural studies.*

Managerial implications. *Unlike other team formations, ET formation offers lead entrepreneurs unique freedom in co-founder selection (Knight et al., 2020), while co-founders also have agency in deciding to join (Huovinen & Pasanen, 2010). This freedom can be a double-edged sword: lead entrepreneurs have the autonomy to choose their partners to grow their ventures, yet finding individuals who balance both skills and interests remains a challenge (Lazar et al., 2022). Previous research has offered suggestions on how to navigate this challenge-either by strategically leveraging qualified individuals within the lead entrepreneur's close circle (Zellmer-Bruhn et al., 2021) or by expanding their networks to seek individuals with complementary skills and actively building relationships with them (Hawily et al., 2024). Accordingly, our recommendation to entrepreneurs regarding whether to exploit existing ties or form new ones to achieve a dual formation strategy is to pursue this approach as intensively as possible. In practical terms, this means selecting potential co-founders based on multiple skill sets and interpersonal attributes. Our study demonstrates that doing so can enhance team productivity and contribute to early entrepreneurial success.*

Originality of the paper. *This study contributes to the ET formation literature by examining the intensity of dual formation approaches-the strategic balance of resource-seeking and interpersonal attraction-and its impact on early entrepreneurial performance. While prior research acknowledges the importance of both skills and interpersonal factors (Francis & Sandberg, 2000; Forbes et al., 2006; Shah et al., 2019), it often treats these approaches as distinct or simply examines their presence rather than the degree to which they are integrated. This study addresses this gap by focusing on the intensity of the dual approach, arguing that the specific balance between these factors significantly influences team dynamics and venture outcomes.*

Our findings offer several key insights. First, the intensity of the dual formation approach is positively associated with both team productivity and early entrepreneurial performance. This underscores the value of strategically combining complementary skills with interpersonal compatibility from the very beginning of the venture. Second, we demonstrate that team productivity mediates the relationship between dual formation intensity and early entrepreneurial performance. This suggests that the benefits of the dual approach are realized through enhanced team functioning and effectiveness. Third, while resource-seeking alone can contribute to team performance, it does not directly translate into improved early entrepreneurial outcomes, highlighting the crucial role of interpersonal factors in early success. Finally, interpersonal attraction alone shows little impact on either team performance or early outcomes, suggesting that while cohesion is important, it must be coupled with the right mix of skills and expertise.

This research makes several important contributions. It advances the ET formation literature by expanding the ET formation-process-outcome model in three distinct ways. First, it shifts the focus from the presence of different formation approaches to the intensity with which they are adopted. Second, it explores the mechanisms through which this intensity influences entrepreneurial outcomes via early team productivity. Third, we examine these nuanced aspects of team dynamics at the nascent stage-a phase often overlooked in this context-yet marked by limited resources and high uncertainty, which influence both current and future entrepreneurial outcomes. Finally, combining survey data with in-depth interviews, our methodological approach provides a rich and robust understanding of the team formation process.

In conclusion, this study emphasizes the strategic importance of the dual formation approach for nascent ventures. By deliberately balancing the acquisition of diverse skills with the cultivation of interpersonal compatibility, lead entrepreneurs can build high-performing teams better positioned to navigate the challenges of early-stage venture development and achieve entrepreneurial success. Our findings offer practical guidance for entrepreneurs seeking to build strong foundations for their ventures, highlighting the critical role of thoughtful and strategic co-founder selection.

Key words: *Entrepreneurial Teams (ETs), Resource-Seeking, Interpersonal Attraction, Dual Formation Approach, Early Entrepreneurial Performance.*

Development and Retention of Entrepreneurial Competencies: A case study from a management course

ALESSANDRA SCROCCARO[1] ALESSANDRO ROSSI[2]

Abstract

This work-in-progress paper explores how the challenge-based learning (CBL) approach impacts university students' entrepreneurial skills development and retention. We adopted a longitudinal case-study approach focusing on a curricular management course on sustainability and social entrepreneurship at the University of Trento. Using the Entrepreneurial Competences Framework (EntreComp), we collected data at three intervals (pre-course, post-course, and 12-month follow-up) to answer two main research questions: RQ1: What entrepreneurial skills do students acquire through a CBL and hands-on course? RQ2: Which skills persist in the long term, and which tend to diminish over time? Findings illustrate significant short-term improvements across all entrepreneurial competencies immediately after the intervention. However, while some skills remained stable at the one-year follow-up, others reverted to the baseline. This paper outlines managerial implications for educators, program designers, and managers. This contribution also highlights methodological limitations and directions for future research.

Framing of the research. *Over the last three decades, higher education institutions (HEIs) have been stimulated to becoming more entrepreneurial, taking initiatives, and starting innovation hubs (Britchenko et Al, 2019; Ashton & Comunian, 2019; Youtie & Shapira, 2008) or entrepreneurship centers (Menzies, 2009), fostering entrepreneurial and innovation (E&I) education (Katz, 2003; Kuratko, 2005), supporting the commercialization of research outcomes, and supporting academic startups and spin-offs (Guerrero et al., 2016). Universities are abandoning the "ivory tower" paradigm to become entrepreneurial universities (Etzkowitz, 1983), seen as "entities offering opportunities, practices, cultures and favourable environments that actively encourage and embrace the entrepreneurship of students and graduates" (Mascarenhas et Al, 2017, p. 317). And they become crucial actors in their local innovation ecosystems (Zhang et al., 2016) in the context of triple and quadruple helix (Gianiodis et al., 2016; Ratten, 2014; Urbano & Guerrero, 2013).*

Entrepreneurial universities offer various E&I education initiatives, such as curricular or extracurricular courses, challenge-based courses, hackathons, entrepreneurship programs (Von Graevenitz, 2010), winter or summer schools dedicated to entrepreneurship and innovation, and start-up labs (Scroccaro & Rossi, 2022). Among these formats, challenge-based learning (CBL) (Nichols & Cator, 2008; Nichols et al, 2016; Pérez-Sánchez et al, 2020; 2023; Vignoli et al, 2021) is gaining momentum worldwide because of many internal and external factors (Perna et Al, 2023; Vilalta-Perdomo et Al, 2022; Leijon et Al, 2022). CBL is a constructivist and experiential learning approach that starts with real-life challenges offered to students from public and private organizations (challenge providers) seeking innovative and creative solutions.

CBL has been studied for its impact in terms of learning, teaching, and innovation (Sukacke et al, 2020). Firstly, from prior research, we know that CBL is a valid tool to stimulate entrepreneurship mindset and skills (Ktoridou & Eteokleous, 2012; Hölzner & Halberstadt, 2022). Thanks to instructive and experiential learning (Norrman et al., 2022), students are stimulated to improve their entrepreneurial skills and can experience a real job context. Secondly, CBL is a way to innovate the didactics and the teacher's role as a learning process facilitator in class (Eldebo et Al, 2022). CBL revolutionizes the way of teaching and the role of the teachers, who become coaches and mentors for students. Teachers are part of the learning process and become learners as well while they are teaching. Thirdly, CBL allows universities to impact communities by providing knowledge, expertise, and tools (García-Zambrano & Ruiz-Roqueñi, 2024). CBL delivers real solutions and outcomes regarding products, services, and processes that challenge providers can implement partially or totally.

CBL, as an active learning method, is an excellent methodology for fostering entrepreneurial competencies (Perez et al., 2020; Perez et al, 2023; Rincon et al, 2023). Alain Fayolle (2007) defines entrepreneurial skills as a combination of knowledge, behaviors, and attitudes that enable students to identify and exploit opportunities, manage resources, and navigate the complexities and uncertainties inherent in entrepreneurial activities. Despite the increasing use of CBL in HEIs to stimulate management students' entrepreneurship skills, research on its effects on students and entrepreneurial

competences is still limited (Johnson et al. 2009; Martinez and Crusat, 2020; Palma-Mendoza et al. 2019; Vignoli et al. 2021; Colombelli et al, 2022). Only a few studies have investigated the CBL effectiveness in acquiring, cultivating, and retaining entrepreneurial skills (Fayolle et al, 2006; Dewettinck & van Ameijde, 2011; Portuguez Castro & Gomez Zermeno, 2021). In addition to this lack in literature, all studies limit their research on entrepreneurial skills development through pre- and post-tests, not considering their retention with a follow-up test (Colombelli et al, 2002; Silveyra-Leon et al, 2023; Bolzani & Luppi, 2021; Berginc et al., 2023). For that reason, the present paper aims to investigate how the CBL approach impacts not only the development but also the retention of entrepreneurial skills among university students. Thus, this study answers the following research questions: RQ1: What entrepreneurial skills do students acquire through a CBL and hands-on course? RQ2: Which skills persist in the long term, and which tend to diminish over time?

Entrepreneurial skills can be assessed by different scales and tools (Geisinger, 2016). The authors opted for the EntreComp framework (Bacigalupo et Al, 2020), which outlines 15 entrepreneurial skills divided into three macro areas: the ability to identify ideas and opportunities, the ability to mobilize helpful resources to solve problems and generate solutions, and the ability to manage a project. This tool has been chosen since it measures the achievement of entrepreneurial competencies (Ratiu et Al, 2023), unlike other questionnaires that assess the entrepreneurial intention (Vankov et Al, 2022; Armuna et Al, 2020) such as the Entrepreneurial Intention Questionnaire (EIQ) (Linan and Chen, 2009), or the entrepreneurship tendency such as the General Enterprising Tendency (GET) test (Caird, 1991). Specifically, the GET test focuses primarily on personality traits associated with entrepreneurial behavior, such as need for achievement, autonomy, and internal locus of control, and it is more oriented toward profiling rather than competence development. The EIQ, based on the Theory of Planned Behavior (Ajzen, 1991), measures entrepreneurial intention through constructs like personal attitude, subjective norm, and perceived behavioral control. It has theoretical robustness and is predictive of entrepreneurial behavior. However, it does not measure competencies or skills directly.

In contrast, the EntreComp questionnaire provides a more granular and developmental approach, emphasizing the learning process and the development of competences over time, making it more appropriate in educational contexts, particularly when entrepreneurship is not limited to business creation but also includes value creation in a broader sense. Furthermore, the EntreComp framework aligns well with the pedagogical principles of CBL, which emphasize active, experiential, and problem-oriented learning. In CBL settings, students engage in real-world challenges, collaboratively with stakeholders, teachers, and mentors, which stimulates the acquisition of competences such as creativity, mobilizing resources, working with others, and taking initiative-core components of the EntreComp framework. Thus, the use of the EntreComp questionnaire allows for the measurement of competencies that are not only relevant but also directly fostered by the CBL methodology applied in this study. This alignment ensures that the assessment tool reflects the learning objectives and pedagogical strategies employed in the intervention.

Thus, this study aims to fill some gaps in the literature. Most applications of CBL focus on student engagement or satisfaction, but not on measurable competence acquisition using established frameworks. The second one is the lack of standardized assessment tools in CBL contexts. There is no standardized, validated tool commonly used to assess entrepreneurial competence in CBL contexts, leading to fragmentation in how outcomes are measured. Many assessments rely on course-specific rubrics, self-perception surveys, or anecdotal reflections. The last one is the underexplored role of institutional and contextual factors: most research looks at CBL and entrepreneurial learning at the classroom level, while the influence of institutional support, educator competencies, and cross-sector collaboration remains underexplored.

Sustainability and Social Entrepreneurship course. *The 2023/2024 edition of the Course on Social Entrepreneurship and Sustainability is an integral component of the master's program in Management at the Department of Economics and Management, University of Trento. This 48-hour course, carrying 8 ECTS credits, focuses on hybrid and sustainable enterprises and is a CBL and hands-on course, requiring students to develop a project idea and social business model in response to real-world challenges posed by various entities (challenge providers) in the Trento region, such as organizations, cooperatives, and associations. Students are expected to propose innovative and sustainable solutions by engaging directly with these challenges.*

The course is divided into three main parts: problem validation, idea generation, and solution validation. In the problem validation phase, teams engage with challenge providers to understand the challenges, collect data through fieldwork, interviews, and desk research, and utilize tools such as fishbone diagrams, the iceberg model, and the five whys technique. They also envision future scenarios and trends and conduct market analysis using SWOT, PESTEL, stakeholders, and competitor analysis. During the idea generation phase, teams brainstorm to generate multiple solutions for the challenges, participate in structured brainstorming sessions to stimulate creativity and identify disruptive ideas, and present their ideas to challenge providers for feedback and selection of the final solution. In the solution validation phase, teams iteratively develop and validate the solution through fieldwork and interviews, create a social business model canvas and a business plan, and finally present their solutions in a pitch to an audience of teachers, investors, and entrepreneurs.

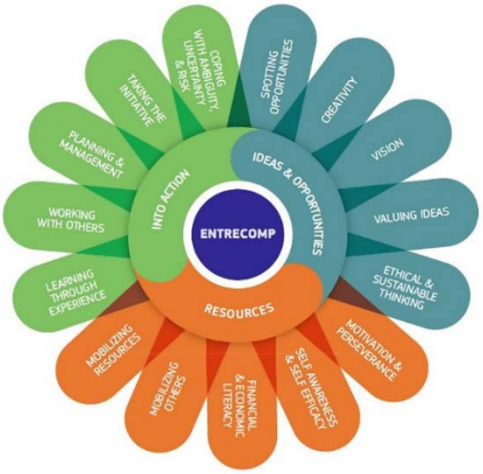
The class comprised 18 students, two of whom were non-attending. Students were divided into four heterogeneous teams, while the two non-attending students formed a separate team. Teams were constituted based on gender, a personality test, and students' preferences for specific thematic areas. This approach aims to create diverse groups that simulate real-world job situations where individuals do not select their colleagues.

Teachers selected five challenges from social organizations in the Trento region to address local social issues across various domains, including urban requalification, social inclusion, rural depopulation, sustainable tourism, and local food valorization. The selection process, which spanned two months, involved meeting and interviewing representatives from at least ten diverse organizations. The five chosen organizations were selected based on the relevance and urgency of their societal issues, their motivation to engage with students, and their capacity in terms of time, resources, and staff support. The challenge providers represented a range of organization types, including cooperatives, working integration social enterprises (WISEs), start-ups, foundations, and social organizations. The following five challenges were designed before the course's commencement (see Table 1).

Tab. 1: The five selected challenges and the challenge providers

Challenges	***Themes***	***Challenge providers***
1. Social tourism	*Social tourism project to generate funds and raise awareness of social issues among travelers, creating a replicable model in other cooperative settings.*	*Local social foundation and local cooperative*
2. Remote work in the valleys	*Fighting the depopulation of mountain areas, the closure of commercial activities, and the consequent abandonment of mountain areas. Teams had to work on fostering smart working places located in misused buildings.*	*Rural bank and cooperative*
3. Urban requalification and sustainability	*Support an urban requalification project to transform some spaces of the Trento train station into a public civic hub dedicated to addressing climate change and biodiversity loss.*	*Network of associations, local government, and public transportation*
4. Social Employment	*Relaunching the subcontracting business unit by identifying innovations in the contracting production process to maintain a significant turnover.*	*Local W.I.S.E.*
5. Ethical food delivery and local communities	*Support local restaurateurs in a phase of profound change, oriented towards sustainability and new technologies, starting with sustainable and ethical food delivery and developing the local communities.*	*A start-up based in Trento*

Purpose of the paper. *This working progress paper explores how the CBL approach stimulates the entrepreneurial skills' acquisition and retention among university management students.*



Methodology. *To measure not only the acquisition of entrepreneurial skills but also their retention, this study follows a qualitative case study approach (Yin, 2017), which is particularly suitable for addressing the complexities in innovation management research and providing an in-depth understanding of emerging phenomena based on qualitative data (Siggelkow, 2007). Data were collected from students using an EntreComp-based questionnaire administered at three distinct points in time: pre-test (beginning of the intervention - February 2024), post-test (end of the intervention - June 2024), and follow-up (12 months later from the beginning of the intervention - February 2025). The strengths of this tool are that it is a widely accepted framework in Europe; it is holistic and competence-based rather than trait- or knowledge-based, and it is suitable for integration into various disciplines and in the CBL. The main limitation may require contextualization for specific learning environments.*

The EntreComp questionnaire assesses 15 entrepreneurial competencies grouped into three key domains (Bacigalupo et al., 2020): (i) Ideas and Opportunities (Spotting opportunities, Creativity, Vision, Valuing ideas, Ethical and sustainable thinking), (ii) Resources (Self-awareness and self-efficacy, Motivation and perseverance, Mobilising resources, Financial and economic literacy, Mobilising others), and (iii) Into Action (Taking the initiative, Planning and management, Coping with ambiguity, uncertainty and risk, Working with others, Learning through experience). The questionnaire consists of 45 closed-ended questions, each structured as a Likert-type item (rated from 1 - lowest - to 10 - highest), grouped into 15 Likert scales corresponding to specific entrepreneurial competencies. Each competence was measured through three Likert-type items. For statistical analyses, individual competency scores were calculated by averaging responses across these three items for each participant, thus treating the data as continuous and suitable for comparative statistical procedures. To assess changes over the three measurement points (pre-test, post-test, and follow-up), non-parametric analyses were applied-specifically, pairwise Wilcoxon signed-rank tests-as recommended when analyzing Likert-scale data, which typically violate the assumptions required for parametric testing (Norman, 2010). This approach guarantees methodological rigor and enhances robustness in evaluating longitudinal changes in entrepreneurial competencies.

General Risks in the EntreComp Questionnaire are four. The first one is the self-report bias: the EntreComp-based survey relies on self-assessment, which may be affected by overconfidence or social desirability bias (Paulhus, 1984; Podsakoff et al, 2003). The second one is the Common Method Variance (CMV): using a single survey instrument for all measures can inflate correlations between constructs (Podsakoff et al, 2003). The third one is the multidimensionality complexity: the presence of 15 competences can create multicollinearity, especially if factor structures are not confirmed. And finally, the fatigue bias: with 45 items, respondents may suffer from fatigue or reduced attention, especially in post-test or follow-up settings (Diamantopoulos & Siguaw, 2006; Lavrakas, 2008). Each dimension and competence has detailed risks, common mitigation, and strategies considered for this study (Tables 2, 3, and 4). In general the first mitigation strategy is the Pre-Test/Post-Test/Follow-Up design: the use of a within-subjects, repeated-measures design allows for the assessment of relative change in competences, which is less prone to individual overstatement bias. This design helps control for individual differences and self-perception errors. The second one is the nonparametric statistical analysis (Wilcoxon Test): given the ordinal nature of Likert data and potential violations of normality due to small sample sizes or skewed distributions, the Wilcoxon signed-rank test was chosen. This nonparametric approach reduces the risk of Type I and II errors caused by inappropriate parametric assumptions. The third one is the item and dimension-level descriptive analysis. To identify problematic items or dimensions with extreme variance or low reliability, descriptive

statistics and internal consistency checks were conducted. Where needed, items showing low variance or poor interpretability were flagged for refinement in future iterations. The fourth one is the clear instructions and anonymity assurance. To reduce social desirability bias, participants were informed that their responses were anonymous and used only for research purposes, encouraging honest self-assessment. And, finally, the last one is the consistency in administration. All three survey waves were administered under similar conditions (timing, platform, guidance), limiting procedural biases that could arise from changes in context or facilitation.

Fig. 1: The EntreComp flower (Bacigalupo et Al, 2020)

Tab. 2: Risks, common mitigations and mitigation strategies for this study for Dimension 1: Ideas and Opportunities

Competence	***Definition***	***Potential Risks***	***Common Mitigations***	***Mitigation strategies***
1. Spotting opportunities	*Identifying opportunities to create value.*	*Overestimation of ability; confusion between opportunity and idea.*	*Use of concrete examples in items.*	*Repeated-measures design to track relative change.*
2. Creativity	*Developing creative and purposeful ideas.*	*Social desirability bias; inflated self-perception.*	*Encourage reflection or scenario-based items.*	*Anonymity + consistent survey conditions.*
3. Vision	*Imagining future scenarios to guide effort.*	*Vague responses; "halo" around idealized self-image.*	*Link to real experiences or past actions.*	*Prompting recall of recent learning experience.*
4. Valuing ideas	*Making the most of ideas and understanding their value.*	*Conceptual confusion (value vs. novelty); social pressure to rate oneself highly.*	*Clarify the distinction between idea value and originality.*	*Repetition in follow-up helped track durable change.*
5. Ethical and sustainable thinking	*Assessing impact and acting responsibly.*	*High social desirability risk; normative answers.*	*Include dilemmas or trade-offs; triangulate with observed behaviors.*	*Stress on anonymity and non-evaluation context.*

Tab. 3: Risks, common mitigations and mitigation strategies for this study for Dimension 2: Resources

Competence	***Definition***	***Potential Risks***	***Common Mitigations***	***Mitigation strategies***
6. Self-awareness and self-efficacy	*Knowing one's strengths and believing in one's ability.*	*Risk of overconfidence, particularly in post-tests.*	*Balance self-efficacy with behavioral anchoring.*	*Wilcoxon test to assess internal shifts.*
7. Motivation and perseverance	*Staying focused and recovering from setbacks.*	*Subjectivity and emotional bias, especially post-intervention.*	*Use of comparative ratings or time-specific scenarios.*	*Follow-up test adds temporal robustness.*
8. Mobilizing resources	*Gathering and using material, non-material resources.*	*Inflated self-perception (especially for intangible resources).*	*Specify resource types in survey items.*	*Wording aligned with the real course activity.*
9. Financial and economic literacy	*Understanding financial decisions and sustainability.*	*Competence is overestimated without practical exposure.*	*Combine with task-based testing when possible.*	*Self-assessment focused on perceived learning, not mastery.*
10. Mobilizing others	*Inspiring and involving others.*	*High risk of overclaiming leadership or influence.*	*Peer-assessment, or triangulation with team feedback.*	*Group setting recalled during item completion.*

Tab. 4: Risks, common mitigations and mitigation strategies for this study for Dimension 3: Into Action

Competence	***Definition***	***Potential Risks***	***Common Mitigations***	***Mitigation strategies***
11. Taking the initiative	*Taking responsibility to act.*	*Likely overstatement due to ideal self-image.*	*Contrast frequency vs. perceived importance.*	*Time-based repetition in the study adds reliability.*
12. Planning and management	*Prioritizing and setting achievable goals.*	*Misinterpretation of planning as overconfidence.*	*Clarify with concrete timeframes or contexts.*	*Questionnaire wording aligned with the course structure.*
13. Coping with uncertainty, ambiguity and risk	*Managing unpredictability.*	*High bias potential; may conflate stress tolerance with competence.*	*Scenario-based phrasing; behavioral anchoring.*	*Instructions encouraged honesty; post/follow-up tracked evolution.*
14. Working with others	*Collaborating effectively in teams.*	*Inflated ratings, especially in group-based courses.*	*Cross-validation with peer ratings.*	*Participants recalled specific team experiences.*
15. Learning through experience	*Learning from both success and failure.*	*Bias toward reporting learning from success; self-serving attribution.*	*Prompt reflection on past learning moments.*	*A follow-up test is particularly relevant here.*

Results. *Findings illustrate significant short-term improvements across all entrepreneurial competencies immediately after the intervention, confirming previous similar research (e.g., Bolzani & Luppi, 2021; Colombelli et al, 2022; Silveyra-León et al, 2023). Comparative analysis between the pre- and post-EntreComp questionnaire shows that, in general, students enhanced entrepreneurial competences. Table 5 shows the percentage of participants self-assessing 7 or more (meaning high level) for each competence at the beginning (Pre), at the end (Post), and after 12 months (Follow-up). There is a general progression between before and after the course. A notable progression can be seen in spotting high-value opportunities, coming up with innovative ideas, anticipating which new developments will be important in a specific field, and assessing various ways in which an idea can be developed successfully. Participants showed progression in contacting unknown people and making difficult decisions. Also, participants showed an advancement in financial and economic literacy, especially in the item concerning the project control costs. Moreover, participants advanced in competences like creating a plan, dealing with uncertainty when implementing new activities, and looking for new opportunities to develop new knowledge and skills.*

Tab. 5: Pre-, Post-, and follow-up EntreComp results

EntreComp	***Items for each competence***	***Pre (% ≥7) (18)***	***Post (% ≥7) (18)***	***Follow up (%≥7) (18)***
Spotting opportunities	*1. Identify opportunities for innovative value creation within your field of expertise*	*50.00*	*94.44*	*100.00*
	2. Anticipate which opportunities will be of high value	*33.33*	*77.78*	*94.44*
	3. Select the most valuable opportunity when faced with multiple options	*61.11*	*94.44*	*94.44*
Creativity	*4. Come up with innovative ideas*	*22.22*	*72.22*	*72.22*
	5. Come up with new and different solutions	*55.56*	*77.78*	*94.44*
	6. Find new ways of solving problems	*55.56*	*88.89*	*100.00*
Ethical and sustainable thinking	*7. Assess the social and ecological impact of your ideas*	*66.67*	*100.00*	*88.89*
	8. Apply sustainability values (social and ecological) to your practice	*66.67*	*100.00*	*88.89*
	9. Assess what is seen as "good sustainable practice" within your field of expertise	*66.67*	*88.89*	*88.89*
Valuing ideas	*10. Identify the novel value in new ideas within your field of expertise*	*44.44*	*77.78*	*83.33*
	11. Assess which needs and requirements are necessary to solve the most important challenges within your field	*55.56*	*83.33*	*83.33*
	12. Anticipate which new developments will be of importance within your field	*33.33*	*77.78*	*64.71*
Vision	*13. Assess various ways in which your ideas can develop successfully*	*38.89*	*83.33*	*77.78*
	14. Imagine novel connections and relationships that will be important for the development of your ideas	*50.00*	*94.44*	*100.00*
	15. Anticipate what you need to do to reach the goals you set	*61.11*	*88.89*	*94.44*
Self-awareness and self-efficacy	*16. Achieve goals that you set for yourself*	*94.44*	*100.00*	*100.00*
	17. Perform tasks that you are unfamiliar with	*55.56*	*88.89*	*77.78*
	18. Succeed in endeavours that you set your mind to	*72.22*	*94.44*	*88.89*
Motivation and perseverance	*19. Finish tasks that you have started, even if you are tired of them*	*77.78*	*100.00*	*83.33*
	20. Continue to work on tasks despite setbacks and failures	*72.22*	*94.44*	*94.44*
	21. Immediately start working on tasks, even if they are challenging	*66.67*	*83.33*	*82.35*
Mobilising resources	*22. Actively network to increase your number and quality of your contacts*	*50.00*	*100.00*	*61.11*
	23. Find the right people to assist you with various tasks	*66.67*	*83.33*	*88.24*
	24. Contact people you do not know when you need something	*44.44*	*94.44*	*66.67*
Financial and economic literacy	*25. Estimate a budget for a new project*	*50.00*	*77.78*	*72.22*
	26. Control costs in projects	*55.56*	*88.89*	*77.78*
	27. Read and interpret financial statements	*72.22*	*77.78*	*77.78*
Mobilising others	*28. Make people enthusiastic about your ideas*	*61.11*	*88.89*	*77.78*
	29. Convey your ideas in an enthusiastic manner	*66.67*	*88.89*	*72.22*
	30. Convince others to engage in your activities	*50.00*	*88.89*	*82.35*
Taking the initiative	*31. Be the one who takes the initiative*	*72.22*	*83.33*	*94.44*
	32. Make difficult decisions	*55.56*	*88.89*	*77.78*
	33. Quickly assess complex situations	*61.11*	*83.33*	*77.78*
Planning and management	*34. Create a project plan*	*50.00*	*88.89*	*66.67*
	35. Organise and structure tasks in a project	*61.11*	*83.33*	*77.78*
	36. Set project goals	*66.67*	*88.89*	*88.89*
Coping with ambiguity, uncertainty, and risk	*37. Deal with uncertainty when implementing new activities*	*55.56*	*94.44*	*77.78*
	38. Work under stress and pressure	*72.22*	*88.89*	*83.33*
	39. Deal with sudden changes and surprises	*66.67*	*94.44*	*77.78*
Working with others	*40. Work with many different people*	*77.78*	*100.00*	*88.89*
	41. Actively participate in teamwork	*88.89*	*100.00*	*100.00*
	42. Promote your ideas and opinions when working in a group	*72.22*	*88.89*	*94.44*
Learning through experience	*43. Look for new opportunities to develop new knowledge and skills*	*55.56*	*88.89*	*72.22*
	44. Learn from challenging tasks	*83.33*	*94.44*	*94.44*
	45. Select challenging work tasks that you can learn a lot from	*66.67*	*100.00*	*77.78*

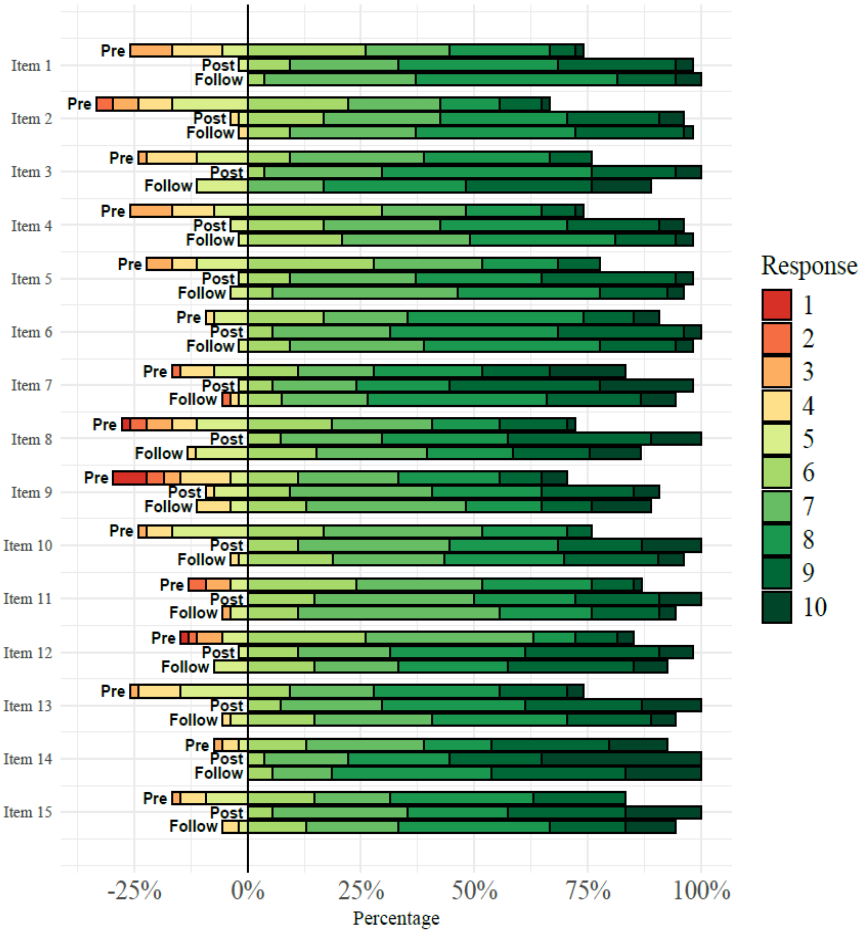
However, while some skills remained stable at the one-year follow-up, others reverted to the baseline. Table 5 also shows that for certain competences, there is a regression, meaning that some competences are harder to maintain than others between immediately after the course and after 12 months. Specifically, the ethical and sustainable thinking seems a more "fluid" competence: assess the social and ecological impact of your ideas, apply sustainability values (social and ecological) to practice, and assess what is seen as "good sustainable practice" within the field of expertise. Participants regressed in the Valuing ideas and vision competence: assessing which needs and requirements are necessary to solve the most important challenges within the field, anticipating which new developments will be of importance within the field, and assessing various ways in which ideas can develop successfully. Moreover, some aspects of self-awareness,

self-efficacy, and motivation and perseverance decreased, such as performing unfamiliar tasks, succeeding in endeavours, and finishing tasks. Mobilising resources was affected by a regression, too, and in particular, actively networking to increase the number and quality of contacts and contacting unknown people. Taking initiative, Planning and Management, and Coping with ambiguity, uncertainty, and risk, as well as learning through experience, are competencies that have decreased.

Table 6 summarizes results from Wilcoxon signed-rank tests comparing students' entrepreneurial competencies at three measurement points: before the intervention (Pre), immediately after the course (Post), and at a one-year follow-up (Follow-up). Statistical significance was evaluated using a threshold of $p < 0.05$. All competencies improved significantly immediately following the intervention (Pre-Post comparison), with the strongest effects observed for Mobilising resources (+1.76 points; $p < 0.001$), Spotting opportunities (+1.54 points; $p < 0.001$), and Creativity (+1.41 points; $p < 0.000$). On the contrary, the weakest effects can be observed for Self-awareness and self-efficacy (+0.57 points; $p = 0.03$), Motivation and perseverance (+0.93 points; $p = 0.03$), and Working with others (+0.94 points; $p < 0.003$), and Taking the initiative (+0.96 points; $p < 0.001$). This pattern demonstrates the clear short-term effectiveness of the educational intervention across the EntreComp framework.

At the one-year follow-up (Pre-Follow-up comparison), improvements relative to the baseline persisted for many, but not all, competencies, though typically with smaller effect sizes. Specifically, sustained improvements were consistently found for all competencies within the Ideas and Opportunities area. An example of this can be observed in Creativity (+1.56 points; $p < 0.000$), Spotting opportunities (+1.52 points; $p < 0.000$), and Ethical and sustainable thinking (+1.29 points; $p < 0.000$). In contrast, competencies primarily related to Resources and Into Action areas (e.g., Self-awareness and self-efficacy, Motivation and perseverance, Mobilising resources, Coping with ambiguity, uncertainty, and risk, Working with others, Learning through experience) did not maintain statistically significant improvements relative to baseline after one year, suggesting a return to initial levels. The most visible effect can be noticed in Motivation and perseverance (+0.30 points; $p = 0.57$), Self-awareness and self-efficacy (+0.30 points; $p = 0.38$), and Learning through experience (+0.57 points; $p = 0.06$).

However, complementary insights are provided by the Post-Follow-up comparison, which directly assesses whether competencies declined significantly between the immediate post-course measurement and the one-year follow-up. According to this analysis, declines observed in competencies such as Self-awareness and self-efficacy, Motivation and perseverance, Working with others, and Learning through experience were not statistically significant. This result indicates that the apparent losses in these competencies, according to the previous analysis, might be a relatively minor case. Nevertheless, caution is warranted when interpreting this finding due to the study's relatively small sample size and associated methodological limitations.



Taken together, these findings highlight two crucial insights: competencies related to creativity, idea generation, vision, and ethical thinking (Ideas and Opportunities area) seem inherently more stable, maintaining improvements over the long term, while competencies related to personal resilience, mobilization of resources, and coping strategies (Resources and Into Action) appear less stable, indicating that sustained reinforcement or ongoing support might be needed to ensure their retention.

Figure 2 complements these results by graphically illustrating the evolution of students' entrepreneurial competencies across the three measurement points through a clustered diverging stacked bar chart. This visualization reveals both the magnitude and consistency of changes across competency levels. In particular, it highlights the near disappearance of negative ratings after the intervention (Post), a positive shift which is largely sustained at the Follow-up assessment.

Tab. 6: Averages comparison between pre- and post- and between pre- and follow-up

Areas - EntreComp	Items - EntreComp	Delta (Pre-Post)	V (Pre-Post)	P-Value (Pre-Post)	Delta (Pre-Follow-up)	V (Pre-Follow-up)	P-Value (Pre-Follow-up)	Delta (Post-Follow-up)	V (Post-Follow-up)	P-Value (Post-Follow-up)
Ideas and Opportunities	*Spotting opportunities*	1.54	2.00	0.00	1.52	1.00	0.00	-0.02	63.00	0.82
	Creativity	1.41	1.00	0.00	1.56	7.50	0.00	0.15	63.00	0.54
	Ethical and sustainable thinking	1.22	16.50	0.01	1.29	4.50	0.00	0.07	50.50	0.61

	Learning through experience	1.04	17.50	0.01	0.57	22.50	0.06	-0.46	80.00	0.09

Fig. 2: Clustered diverging stacked bar chart

Research limitations. *This study is a work-in-progress and a pilot one, and it is in a preliminary analytical stage. It presents several limitations. The number of students considered as a sample is small and makes it difficult to obtain generalised results. The EntreComp test is a self-reported questionnaire and might be critical in terms of impartiality: it can be affected by cultural and personal biases (Schmidt & Hunter, 1998), as well as self-overestimation or self-underestimation of one's entrepreneurial skills. To mitigate these limitations, the current data will be enriched by extracts from students' reflection reports (Gibbs, 1988), served as a structured document guiding students through six stages to reflect on their experiences, allowing them to organize their thoughts, identify what went well and what did not, and plan their future actions. The reflection reports were completed and delivered by students at the end of the course, in conjunction with the EntreComp post-test (end of the intervention - June 2024). The integration of qualitative data, such as the Reflection Reports, can explain some of the results gathered from the EntreComp post-test.*

To enlarge the sample, the authors have started a new cycle of data collection, administering the EntreComp questionnaire to 2024/2025 students' courses. The EntreComp questionnaire will be administered at three distinct points in time: pre-test (beginning of the intervention - February 2025), post-test (end of the intervention - June 2025), and follow-up (12 months later from the beginning of the intervention - February 2026). The new data will be integrated into the study and analysed.

In addition, the authors consider making a comparative study between students of different business schools.

Managerial implications. *This study provides detailed insights into how challenge-based learning (CBL) courses can be effectively designed and managed to optimize entrepreneurship education initiatives. Based on the experiences documented in this research, we identify five key managerial implications that educators and administrators may consider to improve similar CBL-based educational programs to help students develop and retain entrepreneurial competencies (Table 7). First, careful selection of challenge providers is essential. Organizations participating as challenge providers might need more time to be ready for this new way of interacting with students. The CBL is a new way of teaching and learning that is far from the traditional one, and companies need to be used to working interactively with students. Providers with clear internal governance structures typically offer stronger guidance to students, enhancing student motivation. Additionally, allocating sufficient time for meaningful interactions between students and providers is critical for maximizing student engagement and outcomes. Educators should prioritize partnerships with organizations that demonstrate openness to collaboration, have clear internal structures, and are willing to dedicate time and resources to the learning process. To stimulate students' entrepreneurial thinking, providers should be encouraged to involve students*

in real, unresolved strategic issues that require initiative, creativity, and value creation. Long-term engagement with providers through feedback loops and post-course mentoring opportunities can help maintain motivation and reinforce entrepreneurial identity.

Second, effective challenge design is fundamental and should occur well in advance of course commencement. Articulated objectives, expected outcomes, and defined project boundaries must be established collaboratively with challenge providers to provide students with a structured framework. To enhance entrepreneurial skills such as opportunity recognition and strategic planning, educators can embed milestone checkpoints that require students to refine their ideas using business model tools, customer validation, and structured feedback sessions. This process promotes critical thinking and disciplined initiative-core components of the EntreComp framework.

Third, theoretical foundations and relevant methodological tools should be introduced comprehensively during the initial phases of the course. Early exposure to these concepts equips students with essential knowledge and techniques needed for effectively tackling the challenge. To foster knowledge retention and application, these tools (e.g., lean startup, design thinking, stakeholder mapping) should be directly tied to the students' challenge work through applied workshops, peer teaching, and reflective assignments. Encouraging students to maintain a learning journal or entrepreneurial logbook can help internalize key frameworks and connect them to their own experiences and growth.

Fourth, the course structure should be adapted to allocate increased time for the validation and development of practical solutions. Adequate time for hands-on experimentation and iterative refinement processes is necessary to enhance the effectiveness and applicability of student solutions. To stimulate entrepreneurial perseverance and problem-solving, educators can incorporate "pivot moments" into the course timeline-deliberate review points where students reassess assumptions and potentially reorient their strategies based on real-world feedback.

Finally, the fifth implication is connected to dedicating more time to soft skills exercises, primarily focusing on creativity, getting out of the comfort zone, and stress management. This can be achieved through creativity warm-up sessions, improvisation games, resilience-building exercises, and structured team debriefings. For long-term impact, students can be encouraged to co-develop personal development plans (PDPs) that link entrepreneurial self-efficacy goals with ongoing behaviors, even after the course ends.

Tab. 7: Managerial implications and recommendations for stimulating and sustaining entrepreneurial skills

Managerial implications	***Recommendations***	***Suggestions to Stimulate & Sustain Entrepreneurial Skills***
1. Careful Selection of Challenge Providers	*Choose providers with clear governance and readiness for interactive collaboration.*	*Select real, unresolved strategic challenges.*
		Encourage post-course mentoring from providers.
		Foster long-term engagement with students.
2. Effective Challenge Design	*Co-design challenges with clear objectives, outcomes, and boundaries.*	*Use milestone-based progress tracking.*
		Integrate business model tools and customer validation steps.
		Conduct structured feedback and reflection sessions.
3. Early Introduction of Theory & Tools	*Teach relevant frameworks and methods at the beginning of the course.*	*Link tools directly to challenge activities.*
		Use applied workshops and peer-teaching.
		Assign learning journals or entrepreneurial logbooks.
4. Time for Validation & Development	*Allow more time for iterative solution testing and validation.*	*Include prototyping, field testing, and stakeholder interviews.*
		Introduce "pivot moments" for strategic reassessment.
		Encourage trial-and-error learning and adaptive thinking.
5. Soft Skills Development	*Emphasize creativity, stepping out of the comfort zone, and stress management.*	*Use creativity exercises and improvisation games.*
		Include stress resilience and reflection practices.
		Guide students in developing personal development plans (PDPs).

Originality of the paper. *This case study offers a unique perspective by measuring not only the development of entrepreneurial skills but also in retention level of entrepreneurial skills in a management challenge-based course. While previous studies have focused on the skills acquisition using pre- and post-tests, this paper considers and compares pre-/post and follow-up students' entrepreneurial competences evaluations. Its originality lies in the cross-analysis of data from the same course. The paper contributes to applying CBL into entrepreneurship education literature, analyzing the immediate acquisition and long-term retention of entrepreneurial skills. The research contributes to a deeper understanding of how CBL can optimize skill development and retention among students. Ultimately, this study seeks to highlight how educators can adapt CBL methods to better support the development of entrepreneurial competencies.*

Key words: *Challenge-Based Learning; Social Entrepreneurship; Entrepreneurial competences; Entrepreneurial University*

La Teoria della Attribuzione come quadro per la comprensione delle determinanti che guidano l'individuo verso la scelta di lavorare nella sostenibilità

NORA ANNESI[1] VALENTINA CUCINO[2]

Abstract

La crescente pressione normativo-istituzionale nei confronti dei temi della sostenibilità ha influenzato le organizzazioni nei propri processi di assunzione e, conseguentemente, ha orientato le scelte formative e professionalizzanti di molti.

La comprensione delle cause di successo o di fallimento verso un obiettivo professionale individuale orientato alla sostenibilità sono, quindi, aspetti importanti per coloro che devono individuare/selezionare i soggetti più idonei a intraprendere un percorso formativo o professionalizzante.

In questo contesto la ricerca analizza il successo delle carriere professionali di 63 soggetti che hanno frequentato il primo corso formativo italiano dedicato alla sostenibilità.

I risultati mostrano i tratti comuni tra coloro che hanno trovato spazio nel mercato del lavoro dedicato alla sostenibilità.

Framing of the research. *La crescente pressione normativo-istituzionale nei confronti dei temi della sostenibilità ha influenzato le organizzazioni nei propri processi di assunzione e, conseguentemente, ha orientato le scelte formative e professionalizzanti di molti.*

Da un lato le imprese si muovono alla ricerca di professionisti competenti sui temi della sostenibilità o indirizzano risorse già presenti verso questi temi. Dall'altro le grandi società di consulenza hanno dichiarato un trend di assunzione senza precedenti dedicato ai professionisti della sostenibilità.

Dal punto di vista formativo, le università pubbliche e private così come centri di formazione di altro tipo hanno orientato nuovi corsi di studio o moduli specifici dedicati alla sostenibilità.

In questo contesto risulta importante capire quali siano i driver che fungono da determinanti per il successo delle carriere individuali e, per osmosi, per il successo dell'organizzazione stessa.

La ricerca presentata ha proprio lo scopo di rispondere a questa domanda: quali sono i driver che determinano la capacità dell'individuo di entrare nel settore della sostenibilità.

Il disegno di ricerca si basa sulla Teoria dell'Attribuzione, qui applicata come framework per leggere quali determinanti possano aver costituito i driver di un percorso di carriera verso la sostenibilità. In particolare, attraverso la lettura delle lettere motivazioni di accesso ad un corso formativo dedicato alla sostenibilità, la ricerca cerca di individuare pattern comuni che possano portare alla definizione di determinanti aver influenzato il percorso di carriera verso la sostenibilità.

In questo senso, il percorso di carriera di 63 studenti che hanno preso parte a un corso formativo in gestione della sostenibilità è stato osservato dal loro primo approccio alla sostenibilità, ovvero l'iscrizione al corso formativo, fino all'attuale ruolo ricoperto.

La novità è che tali determinanti sono osservati dal ricercatore a posteriori piuttosto che dagli studenti stessi sulla base dell'osservazione del proprio percorso.

La ricerca mette in luce implicazioni manageriali sia per le imprese sia per le organizzazioni formative.

Purpose of the paper. *La teoria dell'attribuzione fornisce il quadro necessario per comprendere come gli individui spiegano perché si sono verificate alcune dinamiche all'interno del proprio ambiente (Heider 1958)*

Negli studi di management, la teoria dell'attribuzione è utilizzata per spiegare come gli attori delle organizzazioni, manager e/o dipendenti, interpretano le cause dei successi o dei fallimenti all'interno del proprio contesto lavorativo (Martinko et al., 2011). Negli ultimi anni, i database dei contributi scientifici pubblicati hanno messo in evidenza un crescente interesse sulla teoria.

L'identificazione delle attribuzioni consente di comprendere le motivazioni, di gestire i conflitti interni, plasma la cultura aziendale e incide sulle performance dei team e dell'organizzazione tutta. I manager che comprendono come le

DOI 10.7433/SRECP.SP.2025.01

attribuzioni influenzano le dinamiche lavorative possono migliorare le loro pratiche di gestione, ottimizzare le performance e creare un ambiente di lavoro più positivo e produttivo.

Attraverso la comprensione dei processi di attribuzione, gli stessi sono emersi anche come un importante aspetto per moderare il comportamento di supervisione e le eventuali illegittime segnalazioni da parte dei subordinati (Mackey, 2017).

La teoria dell'attribuzione relativamente alla crescita delle carriere individuali è stata utilizzata nel settore medicale (Merril et al., 1996) e nelle carriere federali (Daley, 1996). Altri studi hanno utilizzato la teoria per descrivere le barriere allo sviluppo delle carriere (Albert e Luzzo, 1999) e nell'identificazione delle discriminazioni nei luoghi di lavoro (Randle et al., 2012). Infine, gli studi di management hanno utilizzato la teoria dell'attribuzione per osservare lo sviluppo della sindrome dell'impostore nelle donne (Vaughn et al., 2020).

Secondo quanto osservato, la teoria delle attribuzioni non è ancora stata utilizzata come strumento per osservare le dinamiche di carriera nel settore della sostenibilità. In questo senso il contributo teorico è in primo luogo una estensione dell'utilizzo della teoria e una sua concreta applicazione anche ai fini manageriali per l'identificazione dei soggetti chiave da formare e coltivare per lo sviluppo della carriera.

Methodology. *La ricerca condotta si basa sull'analisi dei percorsi individuali di carriera di studenti che hanno deciso di intraprendere un corso di studio incentrato sul sustainability management. In particolare, gli studenti oggetto di analisi sono stati quelli che nel triennio 2021-2023 hanno preso parte ad un corso formativo avviato nel 2007, primo in Italia, focalizzato sul tema del ciclo integrato dei rifiuti. Il corso formativo ha quindi vissuto una evoluzione in linea con i nuovi aggiornamenti normativi e le nuove sensibilità sui temi ambientali. Dal 2017 il corso formativo analizzato infatti ha integrato il tema dell'economia circolare, nella prospettiva dell'Agenda 2030 per lo Sviluppo Sostenibile delle Nazioni Unite e continua il suo aggiornamento sui temi della rendicontazione di sostenibilità ed il Green Deal.*

La ricerca condotta si è basata sull'analisi delle motivazioni fornite dagli stessi studenti in fase di adesione al corso formativo. Considerato che le motivazioni che conducono a scelte professionali sono di natura soggettiva, la scelta di analizzare i dati attraverso un approccio qualitativo ha assicurato la piena comprensione del contenuto e dei percorsi intrapresi.

Osservando i percorsi di carriera a seguito del corso formativo, le ricercatrici hanno quindi cercato di capire quali motivazioni personali (fattori interni) e quali motivazioni di contesto (fattori esterni) addotte per evidenziare la propria motivazione e l'interesse ad entrare al corso formativo costituiscano le basi per la costruzione di un professionista e/o un manager effettivamente operante nel settore della sostenibilità.

In particolare, sono stati osservati 63 studenti di cui il 45% donne ed il 55% uomini. Gli studenti, ormai inseriti nel mondo del lavoro, sono stati classificati come "operanti" o "non operanti" all'interno del settore della sostenibilità e in "figura operante in ruolo manageriale o con percorso manageriale in corso" o "figura operativa".

Le ricercatrici hanno quindi individuato 4 cluster di studenti quali: (1) manager della sostenibilità, (2) manager altro, (3) operativi della sostenibilità e (4) non operativi della sostenibilità.

I 4 cluster individuati sono quindi stati analizzati indipendentemente l'uno dall'altro per capire quali pattern comuni di motivazione accomunano i soggetti ricadenti al loro interno.

L'analisi condotta ha quindi seguito un approccio induttivo (Edmondson and McManus, 2007) dei dati grezzi così come erano stati raccolti negli anni dagli uffici amministrativi per conto del comitato scientifico del corso formativo. L'analisi di codifica svolta è stata quindi condotta manualmente da una delle ricercatrici che ha poi condiviso le interpretazioni certe, per ottenere conferma, e quelle incerte, per condividere dubbi, con l'altra ricercatrice. Il doppio step analitico ha avuto lo scopo di ridurre gli elementi di soggettività tipici delle ricerche di tipo qualitativo.

Results. *Complessivamente i 4 cluster individuati hanno mostrato come dei 63 studenti analizzati, 16 hanno ottenuto un ruolo manageriale o hanno intrapreso un percorso di crescita professionale in quel senso, mentre 47 coprono una posizione operativa.*

Rispetto al posizionamento nel settore della sostenibilità, 40 ex studenti hanno effettivamente intrapreso una carriera nel settore mentre 23 sono operativi in altri settori.

Attribuzioni interne

L'analisi delle lettere ha messo in evidenza come tra le motivazioni interne, principalmente sia diffuso il desiderio di intraprendere una conoscenza dei temi della sostenibilità per avviare una crescita professionale. Gli studenti, infatti, hanno evidenziato come la consapevolezza di un settore in crescita li abbia guidati verso la partecipazione al corso di formazione oggetto di analisi.

Tuttavia, la differenza tra coloro che hanno ottenuto una posizione manageriale e coloro che hanno ottenuto una posizione operativa all'interno del settore sta nel livello di ambizione.

Le lettere mettono infatti in evidenza come i primi abbiano principalmente parlato di un interesse verso una crescita professionale generica, mentre i secondi (gli operativi) abbiano parlato di ambizioni manageriali. In questo senso emerge come una ambizione professionale più alta rappresenti quasi un ostacolo rispetto ad un desiderio di crescita professionale generica.

Altro aspetto chiave è quello che gli operativi hanno spesso racchiuso nel concetto di "contributo alla transizione sociale alla sostenibilità". In questo senso, il contributo alla sfera sociale è emerso come importante per ottenere una posizione lavorativa nel settore, ma non in un ruolo apicale.

Infine, l'interesse personale al tema, spesso declinato sui temi dell'energia, caratterizza sia coloro che hanno successivamente ottenuto una posizione come operatori "semplici" che come manager.

Attribuzioni esterne

L'individuazione di attribuzioni esterne, e quindi derivanti dall'ambiente in cui gli studenti osservati si muovono, è emerso come aspetto meno diffuso.

In questo senso gli studenti osservati sono mossi principalmente da motivazioni interne.

L'ambiente sociale emerge come driver dell'avvicinamento alla sostenibilità principalmente grazie ai temi dello spreco delle risorse da parte degli ambienti urbani e delle imprese.

In questo senso emerge che chi ha una maggiore sensibilità rispetto ai temi dello spreco sembra avere maggiore capacità di ricoprire ruoli manageriali. Dati i risultati è ipotizzabile che le imprese, ambienti nelle quali viene poi sviluppato il percorso di carriera, siano più attente a questi temi e che selezionino i soggetti che mostrano maggiore competenza ed interesse sul tema.

Secondo aspetto emerso è quello di avvicinamento ai temi della sostenibilità poichè i principali player economici mostrano interesse sul tema. Tale aspetto caratterizza principalmente coloro che hanno ottenuto una posizione come operativi nel settore.

Research limitations. *Criticità dello studio sono legate alla dinamicità che caratterizza la crescita professionale degli individui. In questo senso è possibile che i soggetti osservati che più recentemente hanno concluso il loro percorso di studi ottengano nei prossimi anni una posizione all'interno del settore o una posizione in un ruolo manageriale.*

Altra criticità è legata al fatto che l'osservazione delle posizioni ricoperte dai soggetti analizzati è stata fatta attraverso l'analisi dei loro profili professionali social. In questo senso non si ha la certezza del livello di aggiornamento delle informazioni reperite.

Lo studio presentato è ancora in fase di elaborazione ed è possibile che gli sviluppi successivi possano, in parte, contrastare i risultati ottenuti fino ad ora. Sviluppi futuri dello studio metteranno in luce eventuali temi che emergono come barriere all'ingresso nel settore.

Managerial implications. *In termini di implicazioni manageriali, i risultati del paper possono essere di supporto principalmente per due tipi di soggetti: gli attori del settore formativo e gli operatori dell'HR.*

In questo senso, i formatori potranno selezionare quei soggetti che hanno maggiore possibilità di avviare una carriera professionale nel mondo della sostenibilità. Tale aspetto risulta fondamentale per il posizionamento di un corso di formazione che necessità una affermazione sul mercato dei corsi professionalizzanti. Le statistiche sul successo della carriera degli individui a valle di un percorso formativo sono infatti spesso aspetti che orientano sia i futuri studenti che le imprese che intendono supportare economicamente un percorso formativo dal quale poi attingere per la selezione di future risorse umane.

La ricerca mette in luce significative implicazioni manageriali capaci di incidere sul successo o il fallimento dell'organizzazione nei confronti della propria transizione verso la sostenibilità. La scelta di soggetti interni idonei a ricoprire il ruolo di responsabile della sostenibilità può infatti portare l'impresa a rispondere in modo più idoneo alle pressioni socio-istituzionali rispetto all'integrazione dei temi di sostenibilità nelle proprie operazioni.

Originality of the paper. *Secondo quanto osservato, la teoria delle attribuzioni non è ancora stata utilizzata come strumento per osservare le dinamiche di carriera nel settore della sostenibilità.*

Key words: *organizzazioni no-profit; stili di leadership; tratti della personalità; performance; ricerca-azione*

Decentralized Finance as an alternative financing channel for SMEs: Challenges and Opportunities

CRISTINA DE SILVA[1] ANNA GERVASONI[2] FRANCESCO FERRARA[3]

Access to capital markets is a major challenge for small and medium-sized enterprises (SMEs), especially in countries with a strong manufacturing and industrial base such as Italy. Traditional financing methods often impose barriers due to credit availability and managerial constraints. Decentralized Finance (DeFi), based on blockchain technology, offers an innovative solution through smart contracts, tokenization, and decentralized exchanges (DEX).

This exploratory study analyzes how SMEs can leverage DeFi tools-such as stablecoins, lending platforms, and asset tokenization-to optimize liquidity and increase market competitiveness. The study highlights both advantages and potential risks, including regulatory challenges and technological constraints. A key driver of this transformation is the expertise of investors who fund SMEs through DeFi tools, while SMEs themselves must develop strong financial and technological skills to access these new financing methods in a responsible and sustainable way.

The findings suggest that DeFi presents an opportunity to revolutionize financial accessibility for SMEs, though institutional and managerial adaptations are required for effective adoption.

Keywords: *Decentralized Finance, SMEs, Blockchain, FinTech, Tokenization, Alternative Financing*

Introduction. *Small and medium-sized enterprises (SMEs) have long played a vital role in global economic development and job creation. In Italy, their importance is even more pronounced, with nearly 4 million registered SMEs as of 2023. Over the past 25 years, the number of micro (0-9 employees), small (10-49 employees), and medium-sized (50-249 employees) firms has grown by more than 30%, contributing significantly to employment, innovation, and industrial specialization (European Commission, 2023). Specifically, in the EU, SMEs constitute 99.8% of all enterprises in the non-financial sector, accounting for 65.2% of the workforce and generating more than half of the total value added. Similarly, in the rest of the world, for example in Indonesia, SMEs contribute 60.5% to the country's GDP. It should also be noted that SMEs are predominant in some sectors, such as construction, tourism and textiles, which are the top three areas where SMEs generate a higher percentage of value added than large enterprises. (OECD, 2022).*

As of 2024, the global economic outlook remained stable, with growth forecast at 3.2 % and inflation expected to fall to 4.3 % by 2025. The EU's economic outlook remains uncertain, with geopolitical tensions and vulnerabilities in energy security posing significant risks. With regard to Italy's economic development, as we will go into in more detail below, GDP in 2024 will increase by 0.5% compared to 2023, thanks to an increase in consumption and foreign demand, while investment will drop by 3.7%. On top of that, GDP is expected to grow by 0.8% in 2025, with a further contraction of investment by 1.2% (EY, 2024)

Despite their crucial role in the economy, small and medium-sized enterprises (SMEs) face a range of significant challenges, including globalization, rising interest rates, and geopolitical tensions. A notable example is the Trump administration's decision to impose tariffs, an action estimated to reduce U.S. GDP by 0.4%, with cascading effects on the global economy.

For Italy, where exports account for nearly one-third of national GDP, such developments are especially critical. A study by Macchi (2025) reports that Italy achieved a €34 billion trade surplus in 2023 yet also stresses how import-driven trade policies can benefit fast-growing economies by ensuring access to essential raw materials. These dynamics underline vulnerability and complexity. The same study points out that, by contrast, running a trade deficit can be advantageous for rapidly growing economies, as they often require large quantities of imported raw materials to fuel their production capacity. These dynamics highlight the vulnerability and complexity of the environment in which SMEs operate, especially in export-oriented economies like Italy (Macchi, 2025).

Access to finance remains a critical issue for SMEs globally, with various sources of funding, including bank loans, venture capital, private equity and alternative financing methods such as crowdfunding, becoming increasingly important. In fact, the value of private equity transactions in Italy reached USD 10.24 billion in 2024, an annual growth rate of 11.19% compared to USD 9.20 billion in 2024. while the European private equity market hit USD 193.28 billion, with a projected 3.3% increase in 2025 (Statista, 2024).

The European Investment Fund (EIF) also explains how one in four SMEs continues to report significant financing difficulties, in some areas, there are signs of recovery, particularly due to improved economic conditions and increased availability of public and private lenders. Bank loans are used by 14% of SMEs, while almost half consider them important but difficult to obtain. Equity finance faces even more significant challenges: although 12% of SMEs consider it a relevant source of capital, only 1% manage to access it, highlighting the high barriers limiting its uptake. At the same time, other forms of alternative financing are gaining relevance on the Italian scene, including invoice trading, peer-to-peer (P2P) lending, and equity crowdfunding. The strengthening of these instruments is part of a broader European context, in which alternative financing for SMEs (excluding the UK) has increased from EUR 595 million in 2015 to over EUR 5.1 billion in 2020.

The aim of the following paper is precisely to provide a general overview of the potential use of DeFi for small and medium-sized enterprises. To this end, it is necessary to explain - firstly - how the blockchain is structured and what the process is, which is the basis on which the structure of the DeFi ecosystem is built.

The European Digital Agenda defines it as a distributed ledger technology (DLT) that enables the secure and permanent recording of exchanges and information through the sharing of a decentralized database. This eliminates the need for traditional intermediaries, as each node in the network holds an updated copy of the ledger, ensuring transparency and immutability of data.

In a blockchain, information is organized in blocks that are linked sequentially and protected by cryptography. Each block contains a set of transactions or data and a reference to the previous block, thus forming a continuous chain. This mechanism ensures that once data is added, it cannot be altered without the consent of the network, guaranteeing the integrity and security of the system.

Currently, this system is used for value exchanges through cryptocurrencies, supply chain management, smart contracts, and many other areas requiring secure and transparent records. Over time, an increasing number of experts from the finance and technology sectors have recognized the revolutionary role of blockchain. Don Tapscott, author and co-founder of the Blockchain Research Institute, stated: "Blockchain is the most important technology of our time. It represents the second era of the Internet, an Internet of value," thus emphasizing the importance of having a strategy to ride the new wave, after the wave missed by many entrepreneurs during the early 2000s Internet era. This statement was made by Tapscott during his TED Talk "How the Blockchain is Changing Money and Business", where he explores the transformative potential of blockchain in the economic and financial realms.

Secondly, it is essential to introduce and clarify the concept of Decentralized Finance (DeFi) and its mechanisms. As defined by A Ozili (2022), DeFi is described as the delivery of financial services via public blockchains and internet infrastructure. This broad framework includes all financial products and services developed on open-source, decentralized platforms, outside the control of traditional intermediaries.

Ozili highlights how DeFi contributes to financial inclusion, enables permissionless innovation, removes intermediaries, guarantees immutability of transactions, resists censorship, and facilitates cost-effective cross-border operations. At the same time, he emphasizes critical risks, such as smart contract vulnerabilities, legal uncertainty, data breaches, systemic interconnections, third-party reliance, and exposure to illicit activities.

Recent studies confirm and expand on these insights. For example, Schär (2021) explores how DeFi redefines the architecture of financial markets by replacing trust in institutions with trust in code. Similarly, Chen et al. (2022), in their paper "Defi Protocols and Systemic Risk", investigate potential contagion effects and liquidity risks emerging from protocol interdependencies within the DeFi ecosystem.

These contributions underline the need to critically assess both the transformative potential and underlying fragilities of DeFi, especially as its adoption spreads across emerging financial ecosystems.

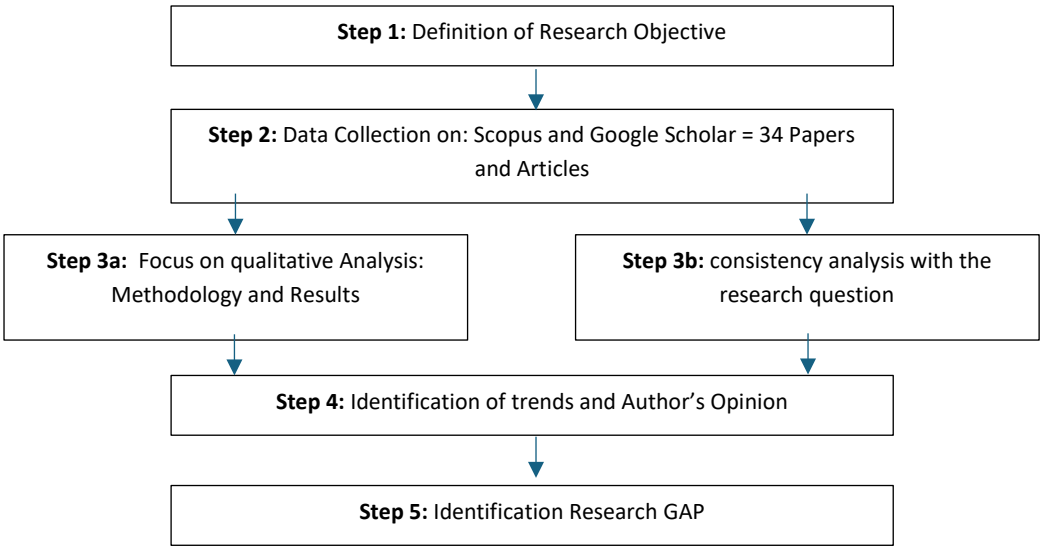
Finally, Javaid et al. (2022)[4] describe decentralized finance (DeFi) as a valuable tool for enhancing authenticity, security, and risk management in financial and banking services, including credit management. Increasingly, institutions have recognized the potential of DeFi as an alternative channel for returns and income compared to traditional finance. Furthermore, the same paper highlights the need for DeFi within banking services and, more broadly, the financial sector. Given that the global financial system handles billions of transactions daily, this volume presents a significant challenge for financial infrastructures. Hence, it is important to emphasize how DeFi is envisioned in the coming years as a potential solution to the major inefficiencies and problems faced by large institutions and regulators.

In addition, the costs of stock markets are increased by the presence of stakeholders like regulators, brokers, stock exchange and more. Moreover, the essence of the decentralised management strategy is gaining effectiveness that may be increasing through the next years. Equity markets are getting ready to decentralise as a result. Blockchain technology makes it possible to conduct every type of investor-company interaction securely and without intermediaries, lowering expenses.

[4] This citation corresponds to the content discussed in the section "Need of Blockchain" in the article*: A review of Blockchain Technology applications for financial services.*

The current study aims to fill a research gap by evaluating whether and how Italian SMEs can practically adopt DeFi tools to enhance liquidity management, diversify funding channels, and support strategic growth. The analysis builds on recent findings from the Global DeFi Adoption Index (Chainalysis, 2021), which shows that countries leading in DeFi usage also exhibit robust infrastructure for digital asset exchange and institutional participation.

The exploratory study applies a mixed-method approach, integrating expert interviews with a quantitative descriptive analysis utilizing a dataset extracted from DEX platforms, DeFi environments, and institutional sources, addressing topics such as ICOs, lost funds, and audits conducted on issued tokens metrics. It seeks to answer three guiding questions:



1. *How can SMEs leverage DeFi to access new sources of financing and optimize liquidity management?*
2. *What structural transformations can be observed in SMEs that adopt DeFi-based solutions, such as asset tokenization, stablecoins, and decentralized lending platforms?*
3. *What are the key regulatory and technological barriers hindering the implementation of DeFi in SME financing?*

This study contributes to the ongoing debate on alternative financing for SMEs by proposing DeFi as a complementary solution to traditional financial mechanisms. It emphasizes the need for enhanced digital and financial literacy among SME stakeholders and for institutional frameworks that can accommodate the emerging architecture of decentralized finance.

The remainder of this paper proceeds as follows. Section 2 outlines and discusses the methodology adopted in the study. Section 3 shows the key results of the analysis conducted through a mixed-method approach. Section 4 concludes the study, summarizing the key findings, discussing the managerial implications, and the limitations of the research.

Methodology. *We adopted a two-tiered methodological approach to explore the applicability of decentralized finance (DeFi) as a complementary financing mechanism for small and medium-sized enterprises (SMEs). The first phase consisted of a qualitative analysis, inspired by Ding (1994), based on semi-structured interviews with academics and financial professionals. These interviews aimed to assess the perceived feasibility of DeFi in the borrowing/lending segment for SMEs and to understand the level of awareness regarding DeFi-related technological and financial developments. This phase allowed us to capture insights into both opportunities and critical barriers to adoption, while also outlining conceptual directions for DeFi integration into traditional financial frameworks. The second phase involved a descriptive quantitative analysis based on data extracted from decentralized exchange (DEX) platforms, broader DeFi ecosystems, and institutional sources. This dataset included key variables such as trading volumes, token audit frequencies, ICO activities, and incidents of lost funds. By analyzing these indicators over a period of 5 to 10 years, we identified trends, patterns, and correlations that offer empirical grounding for evaluating DeFi's real and potential impact on SME financing, particularly in the context of macroeconomic challenges such as rising interest rates. The integration of qualitative and quantitative perspectives aimed to address a significant gap in the existing literature and stimulate awareness within both academic and professional communities.*

In accordance with the Qualitative analysis, the Methodological diagram is presented as follows:

The following diagram illustrates the research objective of the qualitative analysis, namely, to understand the presence or absence of academic material and studies carried out on the topic of the following paper. It was necessary to clearly define a framework in order to orientate the reader on the aims and approach of the study. The academic literature search was performed on Scopus and Google scholar, focusing on English and Italian language contributions within areas such as 'Business, Management and Accounting' and 'Economics and Finance'.

Subsequently, search strings[5] were used, such as:

(TITLE-ABS-KEY("decentralized financ") OR TITLE-ABS-KEY("blockchain") OR TITLE-ABS-KEY("alternative financ*") OR TITLE-ABS-KEY("fintech")) AND (TITLE-ABS-KEY(sme*) OR TITLE-ABS-KEY("small and medium*"))*

Criteria	Details
Objective	Literature analysis for a greater awareness of how academia approaches DeFI to the world of SMEs
Approach	Qualitative analysis (network visualization and review of individual paper characteristics)
Time Frame	All years up to April 2025
Language	English and Italian
Database	Scopus and Google Scholar (title, abstract, keywords)
Subject Areas	Business, Management and Accounting; Economics, Econometrics and Finance; Social Sciences
Final Sample Size	34 articles

The following table summarises the process about Review of the lecterature

In the existing literature (Aria & Cuccurullo, 2017; Xu et al, 2024), a comprehensive tool for conducting quantitative bibliometric research. The table reported below illustrates the current research gap by comparing two of the most comprehensive databases in the world, namely Scopus and Web of Science (WoS).

Tab. 1: Sample collected from major academic databases (WoS and Scopus), filtered according to specific search criteria related to "Decentralized Finance"

Search Query String	**WoS**	**Scopus**	***Total***
Title "Decentralized Finance"	459	1,327	*1,786*
Abstract "Decentralized Finance"	27,718	11,842	*39,560*
Year 2020-2024	4,889	3,933	*8,822*
Document Types: Article and Review	4,529	2,132	*6,661*
Language: English	4,175	2,099	*6,274*
Research Area: WoS and Scopus	1,453	610	*2,063*
Exclude: Publication Title with "Decentralized Finance"	1,231	590	*1,821*
Include: All Open Access	122	66	*188*

Based on the general framework outlined above, it is necessary to provide a more in-depth discussion of the results obtained from this literature review. Despite the considerable number of publications available on the topic of decentralized finance, the majority of them remain confined to a theoretical discussion, while studies that concretely address the application of DeFi as a peer-to-peer financing and investment tool are extremely rare-if not almost entirely absent. The research conducted using various search strings on the Scopus database confirms that only a limited number of published articles or papers analyse not only the benefits but also the operational and structural challenges of DeFi.

This observation is further supported by the fact that, within a sample characterised by a certain heterogeneity between research subject and the research question presented in this paper, out of approximately thirty articles, only three exhibit features that highlight critical issues or structural processes useful for applying decentralized finance to the credit system. In light of the above, the aim of this first step of analysis is to emphasise how insufficient and rudimentary the current research still is on topics that, in recent years, have seen a growing volume of use and practical demand. While it is essential to share the potential benefits of DeFi, it is even more crucial to express opinions and propose ideas on how to structure the use of a tool that, when placed in the hands of actors such as small and medium-sized enterprises, could support the economic growth of a country or even entire markets and sectors.

Results. *The findings reveal that DeFi has the potential to revolutionize financial accessibility for SMEs in multiple ways. SMEs can benefit from DeFi-enabled lending platforms, which facilitate peer-to-peer loans without the need for collateral typically required by banks. These platforms use smart contracts to automate lending agreements, reducing transaction costs and improving credit access (Filling the SME Credit Gap, 2023). Tokenization allows SMEs to convert real-world assets into digital tokens that can be traded on blockchain-based platforms. This innovation democratizes investment opportunities by enabling fractional ownership and broadening investor participation (Application to SMEs' Credit Platform, 2023). The use of stablecoins pegged to fiat currencies reduces transaction volatility and enhances cross-border payment efficiency. This is particularly beneficial for SMEs engaged in international trade, where traditional banking transactions may be costly and time-consuming (Decentralized Finance Research, 2022). By leveraging DEX platforms, SMEs can bypass financial intermediaries, reducing reliance on traditional banking infrastructure and associated fees. This fosters greater financial inclusion and enhances capital efficiency (Momtaz, 2022).*

In the following paragraphs, the results emerging from the study and the application of the adopted research methodology will be analysed. In particular, attention will be given to aspects such as the findings from the analysis of the existing literature, with the aim of understanding the current state of academic knowledge and the depth of theoretical reflections on the world of decentralized finance. Subsequently, the perspectives of both academic and professional

[5] Illustrative example.

practitioners will be examined, as their assessments provide a concrete viewpoint on the potential for DeFi adoption by SMEs. The critical contribution-marked by analytical capacity and expert judgement-offered by the interviewees will enable a realistic evaluation of the practical and everyday applicability of this new financial paradigm. Finally, the results obtained from the quantitative analysis of the dataset extracted from TORD will be discussed, with the objective of understanding the general trend in the use of DeFi and the corresponding challenges related to its applicability.

Qualitative analysis. *The following analysis has focused not only on the more general aspects of the DeFi system from an academic and theoretical standpoint, but more importantly on the challenges related to its use, in order to understand the true operational potential for the credit system in Italy and in countries that share a similar feature: a dense and extensive network of small and medium-sized enterprises at the national level.*

As a next step, through institutional contacts at the university and personal contacts, it was decided to broaden the scope of the research by including individual interviews on those topics that during the literature analysis appeared to be clearly insufficient and inconclusive for applicability in the day-to-day life of the SME credit system.

Regarding the opinion of experts from the banking world and academia, we decided to adopt an individual approach, as mentioned before, with interviews focused on the domain of practitioners. The central peculiarity of the interviews is to adopt an equal firing line. In other words, the goal is to understand the general perceptions and implementation challenges that interviewees identify regarding the use of DeFi in providing capital and financing for SMEs.

The interviews were structured with five main questions, which were branched out according to the nature of the practitioner according to the respondent's field of interest. For example, illustrative, if the interviewee was a banker, the questions targeted areas of interest, such as: the Italian and European credit system, regulations, opinion on the subject and how such a system would be implemented for small and medium-sized enterprises.

The pattern of questions explored and chosen, for a better understanding of the current framework, is structured as follows:

1. *Access to capital through DeFi: The ability of DeFi to emerge as an alternative to traditional finance channels is explored, with a focus on the advantages in terms of increased accessibility and financial flexibility for SMEs. In this first part of the interview, it is also asked how a peer-to-peer model can be approached in a credit system context.*
2. *Technological innovation and digital transformation: The question sets ask about the use of innovative technologies such as blockchain, tokenization, stablecoin, lending/borrowing platforms, DEX systems and digitisation tools (including artificial intelligence, open banking and credit scoring automation). The aim is to understand how much technology applications are currently taking place in the banking and traditional finance world and how much both financial intermediaries and retailers are inclined to use them.*
3. *Implementation process and operational requirements: In the following chapter of questions, there is an interest in definitions of the essential steps to create and implement a DeFi-based platform or process. Therefore, it is examined which elements and strategies are essential to start such solutions and which operational steps have to be considered to make the system scalable in the Italian context.*
4. *Barriers to adoption and structural criticalities: Both in the P2P context and in the adoption of DeFi in general, the main barriers - both structural (regulations, technological complexity, infrastructure) and behavioural (resistance to change, distrust of digital) - that may hinder the adoption of these financing models are analysed.*
5. *Managerial and strategic implications for SMEs: This theme includes both academic and economic perspectives as well as case studies and practical examples that show real change for SMEs (e.g. Binance and YoungPlatform S.p.A.). Consequently, the following thread is the discussion on how the adoption of digital and decentralised financial instruments can influence managerial decisions, business strategy and, ultimately, the competitiveness and organisational structure of SMEs.*

These thematic blocks highlight aspects that, as emerged from the literature review, represent an important research gap. The aim of the questions asked was to directly investigate the operational reality, gathering not only opinions, but also perceptions on the advantages and obstacles of adopting DeFi. This approach helped to more clearly delineate what the result, and thus the expected conditions, are for implementing DeFi to today's small business financing possibilities.

Considering the concepts discussed above, the questions designed and selected for this study-aimed at practitioners and academics operating in the financial sector-are as follows.

Tab. 2: Interview questions categorized by target group (Professionals vs. Academics) for the study on decentralized finance (DeFi) adoption in Italian SMEs

Target	No.	Interview Question
Professionals	1	*Considering the current macroeconomic framework-with new tariffs, geopolitical instability, and logistical challenges-what do you consider the fundamental strategic levers to support Italian SMEs?*
	2	*From the standpoint of open banking and automation, how can technology contribute to credit assessment, and what differences emerge in credit provision between micro/small enterprises and medium-sized firms?*
	3	*Based on your experiences, how would you evaluate the mindset of small Italian entrepreneurs towards adopting innovative technologies for capital sourcing?*
	4	*In a peer-to-peer system where decentralized financial sourcing enables interest-free monetary exchanges (thus reducing transaction costs), how would you assess the applicability of this model to the financing of Italian SMEs?*
Academics	1	*In the context of a P2P system, do you believe that applying DeFi to the financing of Italian SMEs can represent an effective alternative to traditional models? What advantages do you see in terms of access to capital and financial flexibility? What are the main structural barriers that could hinder its implementation? Are there any concrete examples (use cases) of SMEs that have already experimented with this approach?*
	2	*What are the essential elements to consider when implementing a DeFi-based financing platform for SMEs? From an academic and economic perspective, what are the principal managerial implications arising from the adoption of DeFi in SMEs?*
	3	*What phases do you consider essential for developing a process that facilitates SMEs' access to capital through DeFi? Are there ongoing experiments or notable case studies? Which strategies could make DeFi a scalable solution for the Italian entrepreneurial ecosystem? What specific barriers must SMEs address to adopt a DeFi-based model?*
	4	*From the enterprises' perspective, how is the adoption of blockchain and DeFi perceived? Are they primarily driven by innovation and competitive interests, or do they fear adoption-related risks? Which SME sectors appear most predisposed to integrate these technologies?*

Based on the premises just discussed, the overall framework of the responses provided by the interviewees deserves more in-depth analysis. According to the structure presented in Table 2, the first question addresses the strategic levers that could enhance financial and economic support for small and medium-sized enterprises (SMEs).

The feedback received from interviewees categorized under the "Professionals" target group is summarized as follows:

1. *Clear distinction between medium-sized enterprises and micro/small enterprises: As stated by one of the interviewees, co-founder of the Italian fintech bank, it is essential to make this distinction, as these categories have fundamentally different financial needs.*
2. *Focus on medium-sized enterprises: These firms tend to generate a more significant economic impact and, at the same time, require more structured financing solutions. The general consensus among the interviewees is that traditional capital markets, such as stock listings or bond issuance, are not always effective or accessible for this specific segment.*
3. *Potential strategic levers: Encouraging the expansion of pension funds through regulatory mechanisms that require them to allocate a share - even below 10% - to private capital. This idea was briefly reflected upon. Furthermore, the role of the state is considered crucial, as public institutions should facilitate a broader allocation of private capital in support of enterprise financing, overcoming the constraints and limitations that currently hinder greater private capital penetration.*

Moving on to the following two questions (questions 2 and 3), which are closely related-specifically, those concerning technology and automation in credit processes and the corresponding openness of entrepreneurs toward new technologies, several fundamental insights emerged that warrant particular attention. Firstly, with the advent of Artificial Intelligence (AI), all interviewees noted how the credit system has significantly accelerated, reducing not only costs but also the time required to deliver results. For micro and small enterprises, for instance, when applying for financing in the range of €200,000, the cost and time involved in analysing a business plan through traditional methods are often prohibitive. For this reason, the use of automated processes becomes essential to quickly assess creditworthiness without allocating excessive resources. In contrast, for medium-sized enterprises-which generally require funding in the order of millions more in-depth and tailored analysis is indispensable. In such cases, the human ability to interpret and evaluate a business plan remains vital, highlighting the value of professional experience and expertise. Secondly, contrary to initial expectations regarding entrepreneurs' approach to technological systems, the widespread use of technologies such as AI or online platforms (e.g., e-commerce)-especially following events such as the COVID-19 pandemic, the mandatory adoption of electronic invoicing, and the growing prevalence of personal digital tools (e.g., video conferencing, everyday use of tech services)-has been a key factor in confirming that entrepreneurs are indeed willing to embrace new technologies.

In summary, the data collected indicates that a cultural shift is underway. Small business owners are increasingly making use of digital tools not only for financial communication but also for financial management and access to capital.

To conclude with the questions addressed to the "professionals" target group, the final question focused on gathering professional opinions regarding the use of DeFi. Most of the interviewees initially expressed skepticism, as many believe the main difficulty lies in determining whether both peers involved possess the necessary skills to adequately and independently assess the financing and related investment. Furthermore, European regulations impose significant barriers, making decentralized finance less scalable for large-scale application. This highlights a major practical obstacle: the regulatory framework.

In addition to the insights provided by professionals, the questions posed to the interviewees identified as "Academics" (Table 2) yielded the following responses: Regarding the first question, the main advantages highlighted with respect to the application of DeFi in the credit system for SMEs include disintermediation and the ability to operate at any time, also reducing transactional costs (for instance, in international remittances, where fees can reach as high as 15-16%).

Based on these responses, a framework of potential benefits from this approach can already be inferred, as it facilitates direct lending and borrowing operations and allows for the bypassing of traditional financial channels, thereby improving access to capital. In this regard, the interviewees referenced examples in the banking sectors such as Revolut or N26-which have demonstrated that it is indeed possible to build an innovative financial ecosystem with substantial user bases and notable levels of capitalization. These examples bring to light an often-overlooked aspect of the research question: the concrete use of digitalization and decentralized technologies can constitute a valid alternative channel.

Regarding the second question-what the essential elements are-a general response can be summarized as follows. Several key points need to be addressed for the future implementation of DeFi. These include:

1. *Regulation and standardization: Platforms must comply with European regulations that have already begun addressing some critical issues-such as MICA, DORA, and the TPF (Third Party Framework). It is essential to determine whether to apply asset categorization criteria (e.g., EMTs, payment tokens, utility tokens, etc.).*
2. *Institutionalized intermediaries: Although the core idea of DeFi is decentralization, for an initial transactional phase, it is necessary to assess whether to involve a third party acting as a "clearing" intermediary between the parties.*
3. *Managerial skills and training: As previously mentioned in the interviews with "professionals," from a managerial perspective, there is a clear gap in the number of managers with the necessary skills to operate effectively within a decentralized finance context.*

The managerial implications identified through these interviews are examined more thoroughly in response to the third question. According to the interviewees, the managerial implications translate into the need to rethink the role of the manager, equipping them to utilize innovative tools and manage the transition from a traditional financial model to a digital and decentralized one. Furthermore, based on the opinions gathered, the limitless technological infrastructure, the transparency of the underlying assets, and systemic financial risks emerge as the most critical elements of decentralized finance.

From the perspective of the other peer-namely, the entrepreneur-question 4 reveals that firms still demonstrate a certain degree of caution towards new technologies and alternative processes for accessing capital. The main concerns highlighted are the fear of associated risks and the skills gap. Many companies remain wary of the volatility of digital assets and the lack of an established regulatory framework. Moreover, the inclination toward innovation also varies depending on the industry in which the small and medium-sized enterprises operate.

A noteworthy point to emphasize, once again highlighted during the interview, is that the prospective use of blockchain will not be limited to the financial domain but may also extend into the civil sphere. Blockchain technology could potentially become an integral component of data notarization systems, with significant implications for the civil sector economy.

Quantitative Descriptive Analysis: Data Evaluation and Trend Identification

In the Third section of this purely mixed analysis, the relative aim is to consolidate an approach that is also statistical. Or at least, an approach that gives the study a solid foundation. Accordingly, a database containing more than 6 thousand tokens stored from 2021 to the present was analysed. The following dataset was constructed by Paul P. Momtaz (Syracuse University - Whitman School of Management - Visiting Associate Professor). The Token Offerings Research Database (TORD)[6] *consists of hand-collected ICOs, IEOs, and STOs. As of January 2021, the TORD is more comprehensive than any other publicly available token offerings database. The TORD partly resolves several issues with commercially available data, such as the pronounced survivorship bias.*

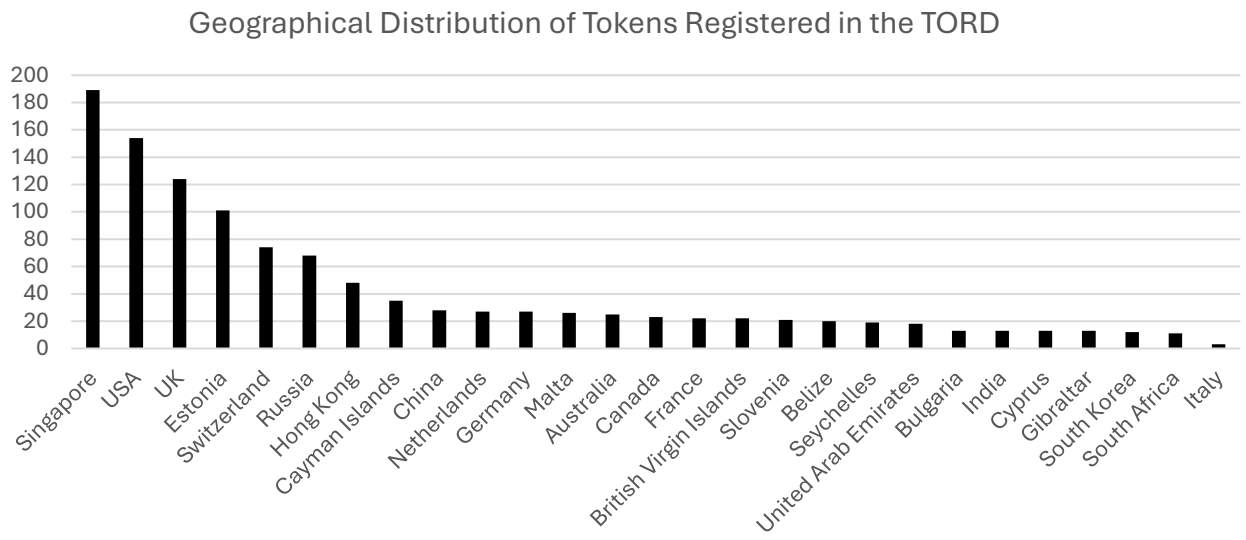
An analysis of data from the Token Offerings Research Database (TORD) was conducted considering three main dimensions: geographical, temporal and economic-monetary. The choice to delve into these three areas responds to the need to provide a more articulated and coherent view of the phenomena related to the adoption and diffusion of DeFi. In particular:

1. *Geographical Element: the analysis focuses on an understanding of how DeFi is accepted and used around the world. As a first step, a cleansing of the data was performed, trying to understand first the trends of the continents that use it most. After that, the study went deeper, analysing which countries have the most interest in DeFi. The analysis was structured by calculating the number of tokens created in each country and respective continent, quantifying the respective percentage weight of the tokens' history in the database.*
2. *Temporal Element: In this section of the quantitative analysis, the common thread was the examination of the timeliness with which Initial Coin Offerings (ICOs) were launched and the evolution of their price over time. The main objective was to understand the frequency with which ICOs were launched and to analyse the average trend in offer prices to identify any recurring patterns or significant variations over the period considered.*

[6] Momtaz, P. (2024). *Token Offerings Research Database (TORD)*. Retrieved from https://www.paulmomtaz.com/data/tord.

3. *Economic-Monetary Element: As a final piece of this study in line with the previous analysis, an analysis was carried out on the collected capital of each token, quantifying the distribution of the collection according to the number of tokens. To this end, a descriptive statistical analysis was carried out, including the calculation of mean, median, percentiles (25th and 75th), standard deviation, as well as an analysis of the shape of the distribution through the skewness index and the kurtosis coefficient.*

After that, the study was implemented with an additional variable in play: the Lost Funds. The aim is to understand what is the peculiarity that created the loss and what are the related problems that create very high money losses (in view of an SME approaching the DeFi world with reduced power compared to those whale companies that move the market trend with a financial operation). Hence, a quantification of the number of problems that were listed and that have high money losses was carried out. To this step, a further fundamental step was added for a sample of these funds. That is, to compare the amount of loss with the market capitalization, creating a synthetic indicator for this study.



$$Lost\ Funds\ Ratio = \frac{Total\ Funds\ Lost\ by\ Token}{Token's\ Market\ Capitalization}$$

Based on the statistical-descriptive analyses conducted on the information contained within the TORD database, the following results were obtained. Firstly, the geographical analysis of the use of DeFi - through token ICOs - shows a high concentration in the Asian continent. In fact, the city-state of Singapore accounts for approximately 189 ICOs registered in the TORD. Only thereafter do countries such as the USA, the UK, and Estonia exceed the 100 ICOs mark. The latter exhibits a strong inclination towards technological and financial innovation.

It is quoted by a more successful blog Be(in)Crypto[7] "Matis Mäeker, head of the Financial Intelligence Unit, emphasised the change. He emphasised the need for cryptocurrency companies to implement robust systems. These should resemble those of traditional banks, effectively safeguarding customers' assets."

The following chart provides a more detailed view of the top 25 countries characterized by a high number of token issuances through ICOs, as recorded in the TORD database. Additionally, Italy is included in the analysis, ranked 56th, with only 3 tokens registered in the dataset.

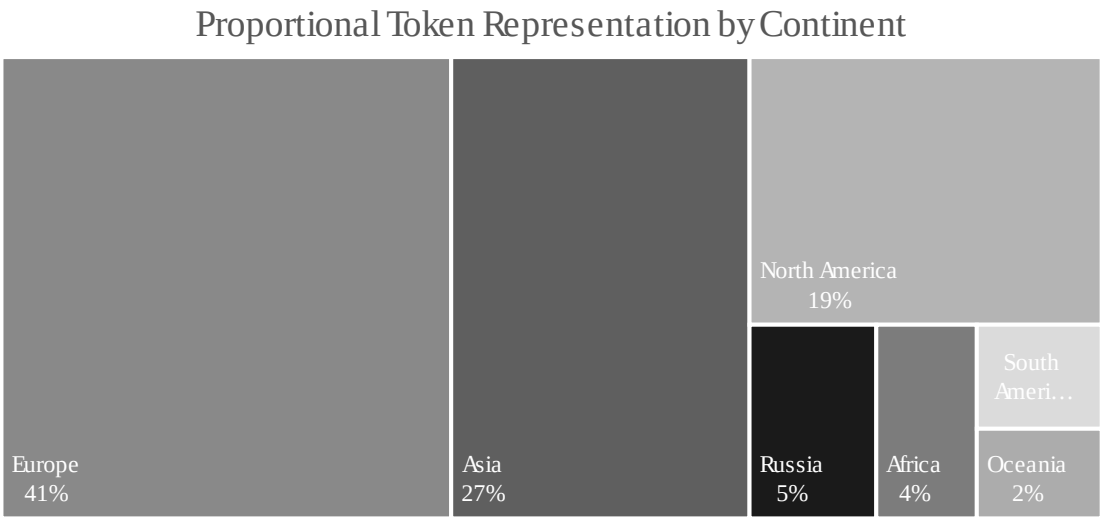


Chart 1. This bar chart shows the top 25 countries by number of tokens registered in the TORD via ICOs, with Italy (ranked 56th) included for comparison.

Below is the geographical distribution, broken down by continent. It is observable that Europe accounts for more than one-third of the tokens issued. This tree map illustrates trend misalignments when compared to the previously presented chart (Chart 1), which quantifies the tokens issued in individual countries.

[7] Notariya, H. (2024, March 22). *Estonia approves crypto regulation while OKX exits India*. BeInCrypto.

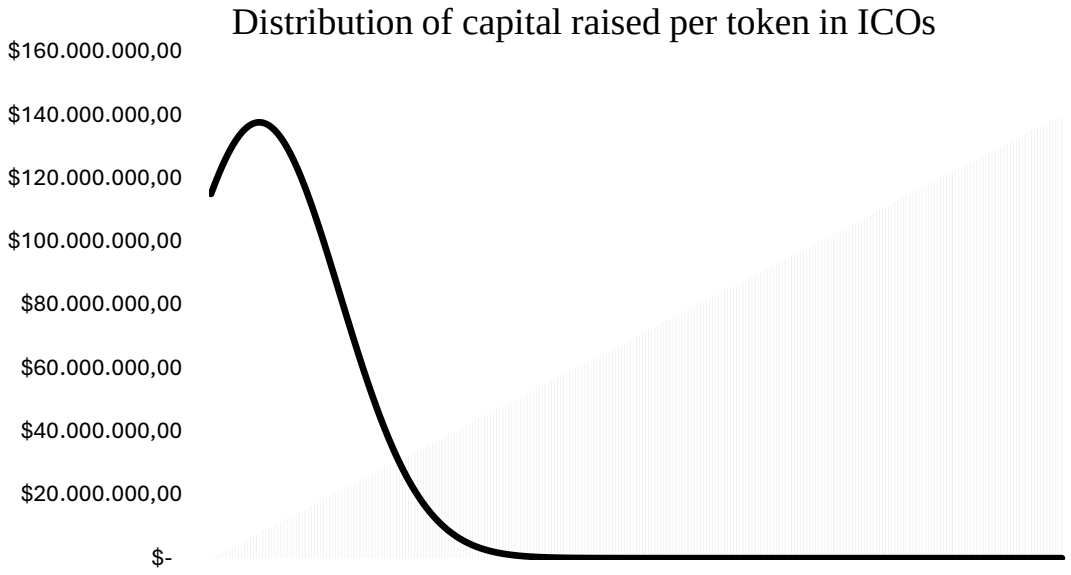

Chart 2. The treemap illustrates the distribution of tokens registered in the TORD across different continents. Each rectangle's size is proportional to the number of tokens associated with that continent, highlighting the regions with the highest concentration.

The following chart presents a frequency distribution of tokens by capital raised, which approximates a Gaussian (normal) distribution. It illustrates how the number of tokens varies across different capital-raising intervals.

The scatter plot shows that the capital raised tends to cluster just below USD 10 million. In particular, the mean and median are USD 7,935,512.95 and USD 3,433,235.00, respectively. Finally, the maximum capital raised and recorded is approximately USD 140 million, while the minimum is USD 189.

Chart 3. The chart shows how capital raised per token in ICOs is distributed, highlighting the most common funding ranges and variability across tokens

The following table shows with greater granularity the details regarding the distribution of capital in relation to token numbers and the percentage weight of the range, the latter being defined by various stress tests (through the calculation of various percentiles per cluster), in order to homogenise the ranges and calculate their relative weights in the total.

Tab. 3: Distribution of values in USD across different ranges, showing the absolute frequency, percentage within each range, and percentage of the total

Value Range (Usd)	*Absolute Frequency (No.)*	*% Within Range*	*% Of Total*
< 500K	*226*	*16,69%*	*78,29%*
500K - 1M	*118*	*8,71%*

TOTAL	**1354**		***100%***

The following section analyzes- as referenced in the methodology chapter - the phenomenon of lost funds within the DeFi ecosystem, focusing on the most critical vulnerabilities that, in numerous cases, have led to substantial financial losses. These losses are often attributable to weaknesses, deficiencies, or outright failures in security mechanisms and control frameworks.

The table below presents the most significant categories of issues that have resulted in financial losses within the DeFi space. It provides a comparative view based on the number of incidents, the total amount of funds lost (in USD), and the relative weight (%) of each category. The data covers the period from January 2019 to April 2025.

Tab. 4: Summary of major DeFi-related exploit categories by type, number of incidents, total value lost (USD), and relative weight (%) for the period from January 2023 to April 1, 2025. The data was taken from https://de.fi/rekt-database

Type Of Issue	***Numerosity***	***Amount For Each Issue***	***Weight***
Exit Scam	*15*	*$ 54.432.189.570,00*	*72,45%*
Rugpull	*34*	*$ 14.819.301.379,00*	*19,72%*
Controllo accessi	*3*	*$ 2.325.000.000,00*	*3,09%*
Access Control	*51*	*$ 1.583.783.758,00*	*2,11%*
Exploit	*45*	*$ 828.956.877,00*	*1,10%*
Borrowing	*6*	*$ 453.515.761,00*	*0,60%*
Exchange	*2*	*$ 229.000.000,00*	*0,30%*
Reentrancy	*5*	*$ 133.055.856,00*	*0,18%*
Phishing	*22*	*$ 115.941.209,00*	*0,15%*
Bridge	*2*	*$ 103.300.000,00*	*0,14%*
Flash Loan Attack	*21*	*$ 37.314.861,00*	*0,05%*
Borrowing	*7*	*$ 27.097.591,00*	*0,04%*
Yield Aggregator	*5*	*$ 20.754.517,00*	*0,03%*
Market Access	*4*	*$ 11.500.000,00*	*0,02%*
Token Phishing	*2*	*$ 9.560.000,00*	*0,01%*
Yield Aggregator	*1*	*$ 1.900.000,00*	*0,00%*
Token Rugpull	*1*	*$ 1.600.000,00*	*0,00%*
Token Other	*1*	*$ 1.563.286,00*	*0,00%*

In view of the topic just addressed, it is necessary to present the results of a sample of losses that have occurred in the last two years approximately, in relation to the existing market capitalization. This data helps to understand not only the

critical issues and vulnerabilities that deserve attention, but above all how much the market value of a token can be volatile after a single event or a series of events.

Tab. 5: Selected cases of lost funds categorized by problem type and chain, showing the amount lost, date of the incident, and its impact relative to market capitalization.

Chain	Category	Problem Type	Funds Lost (USD)	Date	Market Cap (USD)	Weight (%)
CEX	CeFi	Access Control	$1,700,000	28/11/2024	$10,097,805.31	17%
XRP	CeFi	Access Control	$300,000,000	31/05/2024	$3,752,031,527.89	8%
ETH	DeFi	Exploit	$115,000,000	04/06/2023	$2,268,328,139.15	5%
PlusToken	CeFi	Rugpull	$2,900,000,000	16/12/2019	$524,140.61	553,30%

Conclusions. *This paper contributes to the emerging literature on DeFi by applying its principles specifically to SME financing. Unlike existing studies that focus on large corporations and institutional investors, this research examines the practical challenges and opportunities for small businesses. By bridging the gap between theoretical discussions and real-world applications, the study provides actionable insights for entrepreneurs, financial managers, and regulators. In light of the analyses conducted, the paper confirms the evident need for small enterprises to access capital through alternative channels, proposing a potential solution and assessing its applicability by analyzing the advantages and limitations of integrating DeFi into everyday operations. The evidence reinforces the persistent shortage of capital access for small-scale enterprises, with nearly one in four reporting such difficulties, in line with the European Investment Fund's annual report, highlighting the challenges small enterprises face, which collectively represent 98% of the European economy. Building upon the analytical foundation of the results section, it becomes clear that both qualitative analysis and descriptive-statistical investigation reveal the potential of decentralized finance to expand access to innovative financing solutions, not only for micro and small enterprises but also for medium-sized companies, which often require capital in the range of millions of euros.*

The table below illustrates how DeFi may support not only micro and small enterprises, but also medium-sized companies-as emphasized by one of the interviewees-who pointed out that medium enterprises often have capital needs in the range of millions of euros, in contrast to the tens of thousands typically required by smaller firms.

Tab. 5: This Table Explain how DeFi can support with a wide range of financed capital

	Results	Token's Name
Min Capital Raised	$ 189,00	SRX Token
Average capital raised	$ 7.935.512,95	
Max Capital Raised	$ 142.686.051,00	GXB

The study acknowledges limitations, such as limited empirical data on SME DeFi adoption, regulatory uncertainty, and the financial risks associated with DeFi market volatility. Future research should explore longitudinal studies on SME performance post-DeFi adoption and conduct deeper policy analysis to assess regulatory evolution. From a managerial perspective, integrating DeFi solutions requires training and education on blockchain and DeFi applications, as well as the development of risk management strategies to mitigate crypto volatility; strategic partnerships with blockchain-based financial service providers could facilitate technological adoption. Policymakers are encouraged to establish clear DeFi regulations to enhance legal certainty and investor protection, fostering a stable environment for SME engagement with decentralized finance. Interviews conducted with financial professionals and academics emphasize the need to create specific managerial competencies related to cryptoassets, decentralized finance, and blockchain basics, and underline the importance of regulating the DeFi system. Although the financial intermediary is not a natural component of DeFi, one interviewee notes that its use could be facilitated through the introduction of an intermediary acting as a clearinghouse for securities or money, suggesting that managerial implications could support the evolution of DeFi and its integration into the Italian and European credit systems, as seen in the example of Estonia.

Dalla resilienza dell'imprenditore alla resilienza dell'impresa: intuizioni da un caso studio qualitativo

SONIA CATERINA GIACCONE[1] PASQUALE MASSIMO PICONE[2]

Abstract[3]

Le imprese hanno bisogno di sviluppare la capacità di resilienza per riuscire a superare crisi indotte da shock *esogeni. Sebbene molti studi riconoscano la resilienza personale degli imprenditori come un antecedente della resilienza d'impresa, i meccanismi sottesi alla trasformazione della resilienza degli imprenditori in resilienza organizzativa non appaiono ancora adeguatamente investigati. Attraverso l'analisi di un caso studio nel settore del turismo, questa ricerca mette in luce, in primo luogo, il ruolo degli eventi critici affrontati nella vita personale nel plasmare la resilienza di un imprenditore. Un riscontro ancora più interessante è rappresentato dall'aver notato che, nel caso in parola, le esperienze di vita avverse hanno aumentato anche la sensibilità dell'imprenditore verso le pressioni sociali e l'attenzione verso le altre persone, facilitando così il miglioramento delle relazioni con gli stakeholder interni ed esterni dell'impresa. Il nostro studio fa emergere come, in corrispondenza ad un evento esogeno avverso, la resilienza dell'imprenditore, come persona, abbia un valore potenziale, che diviene efficace nel "contagiare" e plasmare la resilienza d'impresa, quando si combina con relazioni forti con gli stakeholder dell'impresa.*

Framing of the research. *Eventi come recessioni economiche, guerre e pandemie rappresentano minacce significative per la sopravvivenza e le performance delle imprese (Iftikhar et al., 2021; Linnenluecke, 2017; Mihotić et al., 2023; Pal et al., 2014). Pertanto, nel corso della loro vita, le imprese devono sviluppare capacità di resilienza per affrontare questi shock esogeni, limitando i danni e - ove possibile - sfruttando le opportunità derivanti da nuove condizioni (Conz, Magnani, 2020). Il tema della resilienza ha suscitato un crescente interesse da parte degli studiosi di imprenditorialità, in particolare nel contesto delle piccole e medie imprese e delle imprese familiari (Calabrò et al., 2021; Conz et al., 2020; Santoro et al., 2021; Yilmaz et al. 2024), che sovente patiscono una carente disponibilità di risorse e una limitata capacità di gestire l'esposizione al rischio (Iborra et al., 2020; Pal et al., 2014).*

Un tema chiave nella letteratura di imprenditorialità è il ruolo cruciale degli imprenditori nel plasmare la resilienza d'impresa, nel trasferire convinzioni e sentimenti ad altri membri dell'organizzazione e nel guidare l'organizzazione (Su, Junge, 2023). Tuttavia, sebbene molti studi considerino la resilienza degli imprenditori come un antecedente chiave della resilienza d'impresa, i meccanismi che trasformano la resilienza individuale in resilienza collettiva dell'impresa non sono ancora ben compresi.

L'attenzione sulla resilienza - osservano Conz e Magnani (2020) - è cresciuta così significativamente, negli ultimi decenni. In generale, la resilienza si è affermata in letteratura come un concetto poliedrico (Munoz et al. 2023, p. 185); dunque, nel tentativo di chiarire il posizionamento di questo studio, noi facciamo riferimento alla resilienza come alla capacità di un'impresa di assorbire shock esterni (Dahles, Susilowati, 2015; Iborra et al., 2019; Ortiz-de-Mandojana, Bansal, 2016) e successivamente adattarsi a nuove condizioni (Korber, McNaughton, 2018).

In estrema sintesi, la letteratura sulla resilienza delle imprese si muove in tre direzioni principali. La prima direzione coinvolge studiosi che cercano di stabilire una tassonomia *di eventi avversi, classificandoli in base alla velocità con cui emergono, alla possibilità di sfruttare conoscenze ed esperienze passate nell'affrontarli e alla gravità dello shock esogeno (Su, Junge, 2023).*

La seconda direzione sottolinea la necessità di una concettualizzazione della resilienza come capacità dinamica *(Conz, Magnani, 2020). La natura dinamica della resilienza, a sua volta, è legata a tre fasi chiave. La prima è la capacità di resilienza proattiva, usualmente interpretata in letteratura come la capacità di anticipare a eventi imprevisti. La seconda fase è la capacità di* absorptive resilience*, che implica il mantenimento della stabilità delle performance o, più in generale, la conservazione delle risorse per sostenere le normali operazioni d'impresa (Bhamra et al., 2011). La terza fase implica la capacità di* riconfigurazione *della catena del valore, o di parti di essa, per ripristinare l'equilibrio a un livello uguale o migliore rispetto a prima.*

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

La terza direzione della letteratura esamina gli antecedenti della resilienza d'impresa a vari livelli di analisi *(Aversa et al., 2024), inclusi imprenditori, imprese e* supply chain*. In generale, esplorando gli antecedenti della resilienza di un'impresa, la letteratura sostiene che la resilienza di un sistema umano dipenda dal contesto del sistema in esame (Wilson, Wilson, 2019).*

Data la nostra domanda di ricerca, che intende esplorare il ruolo cruciale degli imprenditori nel plasmare la resilienza organizzativa, ci concentriamo sulle dinamiche alla base della resilienza d'impresa, un aspetto che diventa ancora più critico per le piccole imprese che per le grandi imprese (Hadjielias et al., 2022). In particolare, la letteratura ha indicato caratteristiche individuali degli imprenditori - sia stabili sia soggette a cambiamento nel tempo -, che supportano la resilienza (Kovoor-Misra, 2020; Sommer et al., 2016). Tra le caratteristiche stabili ci sono tratti come narcisismo, avidità ed empatia (Su, Junge, 2023); le caratteristiche non stabili, d'altra parte, includono la hubris (Picone et al. 2025). L'idea fondamentale è che la resilienza degli imprenditori si materializzi in una forza motivazionale che guida l'azione collettiva in risposta agli shock esogeni (Williams, Shepherd, 2016). In nuce*, questa letteratura si basa su un argomento chiave: forti propensioni individuali, come la capacità di cercare diverse opzioni in circostanze difficili, la perseveranza, la gestione efficace di situazioni multiformi e la determinazione di soluzioni appropriate, si traducono dall'essere caratteristiche individuali dell'imprenditore al diventare una caratteristica collettiva dell'impresa (Hadjielias et al., 2022). Questo argomento sottolinea il ruolo delle risposte cognitive e comportamentali degli imprenditori a tali eventi (Lengnick-Hall et al., 2011; Shepherd et al., 2020). Empiricamente, Branicki et al. (2017) dimostrano che gli imprenditori, grazie alle loro precedenti esperienze che li hanno aiutati ad affrontare circostanze imprevedibili e difficili, tendono ad essere altamente adattabili e a sviluppare competenze che aiutano le piccole imprese a rimanere resilienti (Shepherd et al. 2020). Su e Junge (2023) sostengono che "la resilienza individuale può (ma non necessariamente) portare alla resilienza organizzativa" (p. 1093). Sulla base di questa revisione ragionata della letteratura, riteniamo di poter affermare che gli imprenditori possono svolgere un ruolo cruciale nel plasmare la resilienza d'impresa, seppur non sia ancora chiaro come la resilienza individuale dell'imprenditore possa influire sull'emergere di una capacità organizzativa.*

Purpose of the paper. *Questo articolo esamina il ruolo degli imprenditori nel dare forma e sviluppare la resilienza d'impresa, ovvero la sua capacità di adattarsi e rispondere agli shock esogeni. In particolare, ci concentriamo sugli antecedenti della capacità di resilienza cosiddetta di assorbimento (Bhamra et al., 2011; Conz, Magnani, 2020), non solo perché tale capacità è essenziale per preservare le funzioni principali e garantire la stabilità a breve termine (Grego et al., 2024) ma, cosa ancora più importante, perché sembra fungere da prima linea di difesa, gettando le basi affinché l'impresa esplori strategie adattive e trasformative in seguito. Inoltre, in questo contesto, il ruolo dell'imprenditore sembra essere particolarmente amplificato, data la sua capacità di implementare buffer e garantire risorse critiche (Conz et al., 2023). La nostra ricerca si basa sullo studio del caso Four Points by Sheraton Catania Hotel & Conference Center, durante la pandemia di COVID-19. Questo caso è particolarmente interessante per la decisione coraggiosa (quasi "eroica") e non convenzionale dell'imprenditore di fronteggiare la crisi pandemica mantenendo aperto l'hotel nonostante le ampie restrizioni imposte dal governo italiano nel periodo del lockdown.*

Attraverso un'analisi approfondita di questo caso, come in ricerche precedenti (Ayala, Manzano, 2014; Duchek, 2018; Lee, Wang, 2017; Pathak et al., 2024), identifichiamo il ruolo fondamentale degli eventi critici personali nel plasmare la resilienza di un imprenditore (nel nostro caso di una donna imprenditore). Ancora più interessante, tuttavia, è il fatto che evidenziamo che le esperienze di vita avverse aumentano la sensibilità di un imprenditore alla pressione sociale. Pertanto, gli eventi critici personali svolgono una duplice funzione: in primo luogo, come meccanismo che può influenzare le relazioni con gli stakeholder dell'impresa attraverso la percezione delle aspettative sociali; in secondo luogo, come un modo per sviluppare la resilienza degli imprenditori.

Methodology. *Gli studi qualitativi consentono un approccio di ricerca aperto (Bluhm et al., 2011) ed una comprensione approfondita delle ragioni e dei meccanismi attraverso i quali eventi e circostanze alla base della resilienza dell'imprenditore si svolgono lungo una traiettoria specifica e diventano resilienza d'impresa (Van de Ven, Huber 1990). Per questa ragione abbiamo intrapreso l'analisi di un caso studio (Eisenhardt,1989; Flyvbjerg, 2011; Gibbert et al., 2008; Yin, 2014), specificamente il caso del Four Points by Sheraton Catania Hotel & Conference Center, un hotel situato ad Aci Castello, in provincia di Catania, gestito dalla famiglia Laneri nel 1983. È un hotel 4* che si rivolge sia al segmento business che al segmento* leisure*, grazie alla sua posizione privilegiata sulla costa e all'accesso privato al mare. Per analizzare il nostro caso studio, abbiamo condotto interviste semi-strutturate ed utilizzato fonti secondarie, come informazioni da siti web e articoli di stampa. Abbiamo intervistato per prima l'imprenditrice, che è CEO dal 2014 e che ha reso possibile ricostruire scelte e azioni messe in atto per superare la crisi pandemica da COVID-19. Successivamente, sulla base della segnalazione dell'imprenditrice stessa e poi degli altri intervistati (usando la tecnica denominata "snowball"), abbiamo identificato gli stakeholder interni ed esterni dell'impresa da intervistare, tra cui il direttore generale della struttura, alcuni dipendenti (ad esempio, un barista e lo chef) e fornitori, che hanno contribuito a gestire la crisi pandemica. Intervistare gli stakeholder ha consentito di ricostruire, attraverso diversi punti di vista, le azioni e le dinamiche relazionali che hanno contribuito a rendere l'impresa resiliente nell'affrontare la crisi del COVID-19. In totale, per la ricerca ancora* in fieri*, abbiamo condotto 7, interviste semi-strutturate nel 2024, durate tra i 25 e i 70 minuti. Le interviste sono state registrate e trascritte. Talvolta, come nel caso dell'imprenditrice, sono stati effettuati più round di interviste per arricchire il quadro informativo o perfezionare le informazioni precedentemente acquisite aggiungendo ulteriori dettagli. Abbiamo creato uno schema-guida per la conduzione delle interviste, che è stato adattato in modo flessibile in relazione ai diversi intervistati e alle risposte ottenute (Gioia et al., 2013).*

I dati raccolti dalle fonti primarie e secondarie sono stati analizzati applicando il metodo di Gioia e colleghi (2013). Concentrando l'analisi del caso sul periodo circostante la pandemia di COVID-19, sono stati esplorati i fattori e i processi che hanno favorito lo sviluppo della resilienza dell'impresa. Dopo aver letto attentamente le interviste e gli altri materiali, abbiamo attuato una attività di codifica aperta e abbiamo identificato una serie di codici correlati a decisioni e azioni. Considerando insieme i concetti emergenti dalle interviste e la nostra conoscenza della teoria, abbiamo intrapreso una procedura di codifica assiale, in cui abbiamo identificato relazioni tra le categorie di codici aperti e li abbiamo raggruppati in temi più astratti. Infine, abbiamo aggregato i temi identificati in tre dimensioni principali, attraverso le quali spieghiamo teoricamente la resilienza d'impresa.

Il processo di raccolta ed elaborazione dei dati, ancora in corso, è teso ad assicurare una maggiore sistematicità e un più ricco livello di approfondimento dell'analisi; si presterà attenzione alla triangolazione delle fonti e ad una più ampia selezione degli stakeholder da intervistare.

Results. *L'analisi del caso, sebbene la ricerca sia ancora* in fieri*, ha mostrato che diversi eventi avversi hanno segnato la vita personale dell'imprenditrice e hanno contribuito a forgiare il suo atteggiamento e la sua resilienza. Ad esempio, l'impossibilità di intraprendere la desiderata carriera da regista, a causa del divieto paterno, se da una parte rappresentò una delusione importante, dall'altra non scalfì la sua passione, che la stessa imprenditrice sentì di avere realizzato gestendo la sua impresa "Quando gestisci un'impresa, sei un regista" (Imprenditrice). Un altro evento critico fu una crisi significativa nell'impresa di famiglia, che fece sentire l'imprenditrice in dovere di prendere la dolorosa decisione di abbandonare i suoi studi universitari in Architettura per tornare in Sicilia a dare il suo contributo in azienda. Se davanti alla difficoltà familiare l'imprenditrice sentì una forte pressione sociale che le fece anteporre la necessità di aiutare la sua famiglia al desiderio di realizzarsi completando il suo percorso universitario, nel tempo la sua passione per l'architettura e l'arte riuscì comunque a trovare appagamento. Ad esempio, dal 2017 l'imprenditrice dirige la Fondazione OELLE che si propone di valorizzare il patrimonio culturale e artistico creando nuove opportunità per giovani artisti. La passione dell'imprenditrice per l'arte è oggi evidente anche all'interno dell'hotel Fuor Points by Sheraton Catania, che ospita la fON Art Gallery, uno spazio che si sviluppa tra i diversi piani dell'hotel con mostre temporanee di artisti emergenti e opere provenienti dalla collezione della Fondazione OELLE. Gli eventi avversi, i lutti familiari e le sfide professionali affrontati nel tempo hanno allenato e forgiato l'atteggiamento resiliente dell'imprenditrice, rendendola più forte e pronta a reagire e gestire prontamente le situazioni difficili che potevano presentarsi. In relazione alla drammatica emergenza della pandemia di COVID 19, l'imprenditrice ha osservato come, sebbene non sarebbe stato possibile prevedere la crisi pandemica, il fatto di avere vissuto una "vita complicata" aveva stimolato il suo atteggiamento verso la resilienza facendola sentire pronta a fronteggiare nuove emergenze. L'aumentata resilienza personale e la sensibilità alle pressioni sociali hanno influenzato le scelte adottate per gestire l'impresa durante la pandemia, nonché il modo in cui l'imprenditrice ha gestito e coltivato le relazioni con gli stakeholder interni ed esterni. Ciò è dimostrato, ad esempio, dall'attenzione rivolta all'inclusività e all'equità di genere all'interno dell'impresa, nonché dalla cura e dal senso di responsabilità verso il benessere dei dipendenti e degli ospiti dell'hotel.*

Quando le restrizioni governative hanno limitato la mobilità delle persone in Italia, le prenotazioni hanno improvvisamente subito un rallentamento e molti clienti hanno richiesto rimborsi per le prenotazioni annullate. Considerata l'imprevedibilità della crisi pandemica, una decisione particolarmente critica e rischiosa per gestire l'emergenza fu quella di lasciare aperto l'hotel, anche contro il parere dei familiari. Tale scelta è stata fortemente motivata dalla pressione sociale percepita nei confronti dei dipendenti e dalla volontà di garantire protezione, salvaguardia, serenità e benessere di tutto lo staff. Nonostante il numero limitato di ospiti durante il periodo COVID, l'obiettivo primario era quello di offrire un ambiente accogliente e sicuro dove si potesse sviluppare un senso di comunità e relazione. Essendo l'unico hotel aperto in zona, ospitava avventori che per necessità dovevano mettersi in viaggio, in un periodo in cui era difficile trovare servizi aperti anche in autostrada. Per gli ospiti che arrivavano esausti, il Four Points by Sheraton Hotel "rappresentava l'ultimo baluardo dell'ospitalità" (Imprenditrice), dove poter trovare anche un pasto caldo. Per fronteggiare con successo le problematiche economiche legate alla crisi esogena dovuta alla pandemia, data la forte contrazione degli ospiti negli alberghi e i problemi economico-finanziari che inevitabilmente si sono presentati, l'impresa da una parte ha fatto ricorso alla cassa integrazione guadagni per sostenere economicamente i dipendenti, dall'altra ha intrapreso azioni volte a negoziare con i fornitori (ad esempio banche, fornitori di energia, fornitori di alimenti e bevande) condizioni di favore al fine di colmare il gap di liquidità. L'imprenditrice ha dichiarato di avere molto apprezzato l'ampia disponibilità ricevuta da diversi fornitori che, in virtù del rapporto di fiducia consolidato nel tempo e dell'affidabilità dimostrata dall'impresa, si sono resi disponibili a sospendere o rateizzare i pagamenti programmati. Ha inoltre ricevuto ampia disponibilità da parte delle banche ad aumentare la linea di credito per far fronte alla crisi di liquidità legata al crollo delle prenotazioni. D'altra parte, i fornitori intervistati hanno dichiarato come il rapporto di fiducia consolidato nel tempo e l'apprezzamento dei comportamenti dell'imprenditrice durante il periodo pandemico abbiano contribuito a stimolare la disponibilità nei confronti dell'impresa.

In realtà, implementare efficacemente la decisione di tenere aperto l'hotel è stato possibile grazie all'impegno e alla collaborazione degli stakeholder interni ed esterni all'impresa. Pertanto, coltivare le relazioni con questi stakeholder si è rivelato un fattore critico della resilienza dell'impresa. Inizialmente, la fiducia e l'amicizia tra l'imprenditrice e il Direttore generale hanno giocato un ruolo cruciale nel creare la giusta solidarietà e sinergia per andare avanti. Tuttavia, la disponibilità riscontrata da parte degli altri membri dello staff ad essere presenti in struttura è stata ampia e cruciale. Collaborare e facendo squadra per affrontare uniti il momento di difficoltà legato alla pandemia ha rappresentato, come

ammesso dagli stessi intervistati, la risposta diretta alla chiara percezione dell'atteggiamento di rispetto, attenzione e protezione che l'imprenditrice aveva dimostrato nei loro confronti.

Durante l'emergenza pandemica, l'imprenditrice ha intrapreso una serie di azioni volte a prendersi cura anche degli ospiti dell'hotel, al fine di creare e consolidare relazioni di fiducia che potessero contribuire alla resilienza dell'impresa. Data l'incertezza sulla fine della pandemia, ha inizialmente offerto ai clienti dei voucher da utilizzare in hotel in un altro periodo anziché rimborsarli per le prenotazioni cancellate. Ciò ha consentito di limitare i danni delle cancellazioni delle prenotazioni, mantenendo la possibilità di accogliere successivamente i clienti in hotel. Inoltre, avendo deciso di mantenere la struttura aperta, l'imprenditrice ha fatto in modo di renderla un luogo sicuro in attesa che la tempesta passasse. L'attenzione verso gli ospiti ha determinato scelte volte a garantire anche un soggiorno piacevole in termini di servizi offerti. A disposizione dei clienti vi era sempre una macchina per il caffè ma, al raggiungimento di un numero minimo di ospiti, veniva riaperto il bar. Allo stesso modo, quando erano occupate venti camere, veniva aperto anche il ristorante per garantire la cena agli ospiti dell'hotel e talvolta anche a chi alloggiava altrove. Per quanto attiene alla politica di prezzo, l'imprenditrice ha volutamente applicato prezzi bassi per il soggiorno in hotel, non considerando opportuno approfittare dell'emergenza e della necessità delle persone di soggiornare in hotel. Questa scelta ha contribuito a sottolineare un approccio fortemente orientato all'accoglienza delle persone e all'esigenza di coltivare la speranza, piuttosto che al mero interesse economico. Tutto questo ha favorito la creazione di relazioni amichevoli e di fiducia con i clienti ospitati in hotel, che si sono mantenute nel tempo, anche dopo la fine dell'emergenza pandemica. Alcuni clienti stranieri in particolare, rimasti bloccati in Italia con l'esplosione della pandemia, hanno soggiornato per lunghi periodi nella struttura, acquisendo una confidenza ed un rapporto amichevole, con lo staff e con l'imprenditrice stessa, fuori dal comune, e sentendosi di fatto "a casa". Anche un soggetto esterno, come il fornitore di bevande da noi intervistato, ha percepito il senso di responsabilità e protezione che l'imprenditrice dimostrava nei confronti dei dipendenti ed il clima familiare che si era creato all'interno dell'hotel, paragonabile alla cura dedicata alla propria famiglia e alla propria casa. Quanto sopra esposto porta a concludere che il consolidamento del rapporto con gli stakeholder esterni e interni media il ruolo delle pressioni sociali dell'imprenditore nell'attivazione della resilienza d'impresa. La gestione della crisi pandemica ha lasciato un'eredità molto positiva legata alla percezione dell'importanza di valorizzare le persone e le relazioni umane. Infatti, come affermato dal Direttore Generale, il COVID-19 ha enfatizzato l'attenzione alle persone. A questo proposito, lo stesso ha specificato come la necessità di affrontare insieme situazioni difficili, pesanti e dolorose avesse portato naturalmente a rafforzare i legami e l'unione tra le persone favorendo la consapevolezza del fatto che comunque si deve andare avanti, spiegando così le radici della resilienza. Il rafforzamento delle relazioni all'interno dello staff e con i clienti ha creato benefici anche nel periodo post-pandemia, come è testimoniato dalla più rapida ripartenza dell'attività dell'hotel, rispetto ad altre strutture ricettive del territorio, alla conclusione del periodo pandemico.

Research limitations. *Questo studio presenta alcuni limiti. In primo luogo, il modello proposto si basa su un singolo caso studio, e ciò può limitare la possibilità di estendere i risultati. Ad esempio, mentre i nostri risultati indicano che eventi personali avversi possono aumentare la pressione sociale percepita dagli imprenditori ed i conseguenti comportamenti per gestire le situazioni di crisi, è possibile che in altri contesti la reazione possa essere invertita. In secondo luogo, abbiamo analizzato un'impresa familiare e la letteratura esistente evidenzia le caratteristiche uniche di tali imprese, in particolare la loro enfasi sull'unità e sulla ricchezza socio-emotiva. Di conseguenza, i nostri risultati sono altamente specifici del contesto; pertanto studi futuri potrebbero esaminare le differenze nel modo in cui le pressioni sociali vengono percepite, all'interno di imprese familiari e non. Questa ricerca sarebbe oltremodo utile per fornire indicazioni operative replicabili. Similmente, ulteriori casi studio potrebbero considerare settori di ambito non turistico e individuare ulteriori buone pratiche replicabili.*

Managerial implications. *La principale implicazione che questo studio offre ai manager è rappresentata dall'importanza evidenziata delle relazioni con gli stakeholders interni ed esterni. Poiché gli stakeholders possono fungere da rete di supporto nei momenti di crisi o cambiamento, contribuendo alla sopravvivenza del business, la capacità dei manager di alimentare e sviluppare nel tempo relazioni di fiducia e commitment con tali interlocutori sia esterni che interni, rappresenta una leva fondamentale per affrontare e superare situazioni di crisi, come quella pandemica.*

La seconda riguarda la relazione tra resilienza individuale e resilienza d'impresa. Il nostro studio sottolinea come la resilienza personale dell'imprenditore possa tradursi in una maggiore resilienza dell'impresa. Un aspetto fondamentale emerso è il ruolo delle relazioni con gli stakeholder, che possono fungere da rete di supporto nei momenti di crisi o cambiamento, contribuendo alla sopravvivenza del business.

La terza implicazione riguarda la relazione tra esperienze passate e capacità interpretativa. Le esperienze precedenti degli imprenditori aiutano a migliorare la loro capacità di interpretare situazioni complesse e di prendere decisioni più consapevoli e coerenti con le aspettative. Questo suggerisce che la formazione e la riflessione sulle esperienze passate possano essere strumenti preziosi per accrescere l'adattabilità e la visione strategica dell'impresa.

Originality of the paper. *Attraverso l'analisi del caso Four Points by Sheraton Catania è stato possibile ricostruire le determinanti della resilienza d'impresa. Un'evidenza della nostra analisi è il ruolo significativo degli eventi avversi nella vita personale nel plasmare la resilienza imprenditoriale; ciò corrobora quanto osservato da studi precedenti (Bernard, Barbosa, 2016; Chadwick, Raver, 2020). L'analisi del caso ha fatto emergere come gli eventi avversi della vita personale dell'imprenditrice, abbiano forgiato la sua attitudine verso comportamenti resilienti, che poi è stata manifestata anche nell'ambito delle scelte adottate per condurre l'impresa durante la crisi pandemica.*

La capacità di affrontare con coraggio e perseveranza tali eventi si è rivelata determinante nelle decisioni coraggiose che sono state messe in atto per affrontare la crisi legata alla pandemia, come quella di mantenere aperto l'hotel nonostante le incertezze economiche, dando priorità al benessere dei dipendenti. Se, da una parte, l'analisi ha mostrato che gli eventi avversi possono rappresentare una spinta ad affrontare le sfide e coltivare capacità di adattamento, dall'altra parte, i nostri risultati hanno evidenziato come la resilienza imprenditoriale sia una condizione necessaria, ma non sufficiente da sola a determinare la resilienza d'impresa. L'indagine ha consentito di notare come la necessità di fronteggiare momenti di crisi nella vita personale abbia accresciuto la sensibilità dell'imprenditrice verso le pressioni sociali, motivandola ad adottare strategie miranti a curare e rafforzare le relazioni con gli stakeholder sia interni che esterni all'impresa. Ciò d'altra parte si è rivelato particolarmente importante perché ha sollecitato, negli stakeholders, comportamenti che, basati sulla fiducia, sono stati orientati alla disponibilità e collaborazione verso l'impresa. Ciò ha contribuito collettivamente all'efficacia delle strategie di resilienza dell'impresa, consentendo una rapida ripresa delle operazioni d'impresa al termine dell'emergenza pandemica. Il nostro studio di caso sottolinea quindi il ruolo fondamentale della resilienza dell'imprenditore nel plasmare la capacità di resilienza di assorbimento di un'impresa e nello stabilire le basi per la sostenibilità a lungo termine (resilienza trasformativa).

Key words: *resilienza dell'impresa; resilienza dell'imprenditore; pressioni sociali; relazioni; stakeholders.*

Ricombinazione di conoscenza e esternalità spaziali nel contesto dell'Industria 4.0 europea

SAVERIO BARABUFFI[1] GIULIO FERRIGNO[2] GUIDO PIALLI[3] ANDREA PICCALUGA[4]

Abstract

L'articolo analizza il ruolo della ricombinazione di conoscenza delle imprese e degli spillover spaziali sulle tecnologie inerenti all'ambito di Industria 4.0 a livello di impresa. L'articolo analizza il ruolo delle conoscenze pregresse in materia di ICT delle imprese europee nel ricombinare coerentemente le conoscenze e nel brevettare le tecnologie inerenti all'ambito di Industria 4.0 e il ruolo degli spillover spaziali locali e interregionali. L'articolo utilizza un modello di regressione lineare a effetti fissi e un modello di regressione spaziale autoregressiva su 1521 imprese europee attive che hanno sviluppato brevetti I4.0 nel periodo 2011-2019. Scopriamo che le conoscenze pregresse in materia di ICT favoriscono la performance brevettuale delle imprese nelle tecnologie I4.0, mentre sono influenzate negativamente dalle esternalità spaziali interregionali.

Framing of the research. *Le tecnologie inerenti all'ambito di Industria 4.0 fanno riferimento alla crescente digitalizzazione, robotizzazione e automazione della fabbrica manifatturiera (Capello e Lenzi, 2021), sono diffuse tra i Paesi europei (Ciffolilli e Muscio, 2018) anche se la loro distribuzione rimane altamente disomogenea, con le capacità regionali che giocano un ruolo decisivo nel determinare se le regioni possono integrarsi con successo nelle nuove reti di produzione della conoscenza (Balland e Boschma, 2021). La rilevanza delle tecnologie inerenti all'ambito di Industria 4.0 nelle politiche industriali europee (Klingenberg et al., 2019; Reischauer, 2018) e il recente dibattito sulla sovranità tecnologica (Edler et al., 2023) hanno messo in luce la necessità di sviluppare competenze e capacità per sostenere sia la competitività nazionale che i processi di trasformazione. In quanto tale, le tecnologie inerenti all'ambito di Industria 4.0 possono essere considerate come lo sviluppo del sistema delle tecnologie dell'informazione e della comunicazione (TIC) (Nuvolari, 2019), sviluppo che è stato fondamentale per trasformare i sistemi socio-economici e favorire la crescita economica, attraverso l'incremento della produttività delle imprese (Hall, Lotti e Mairesse, 2013), e si è rivelato strumentale per lo sviluppo di tecnologie verdi (Corrocher e Ozman, 2020). Inoltre, la brevettazione delle TIC può innescare complementarità tra i diversi domini di utilizzo (Santoalha, Consoli e Castellacci, 2021) e complementarità tra le invenzioni e le applicazioni delle imprese (Frenken et al., 2012), portando alla ricombinazione delle conoscenze presenti all'interno delle imprese (Antonelli, Krafft e Quatraro, 2010) e alla diversificazione tecnologica (Montresor e Quatraro, 2017). Il concetto di ricombinazione è al centro di questo processo, in quanto l'innovazione non nasce in maniera isolata ma proviene dalla ricombinazione di conoscenze e tecnologie esistenti (Weitzman 1996, 1998). Ciò è in linea con la concezione più ampia degli studi sul ruolo della prossimità, in cui le nuove attività tecnologiche si basano sulle capacità esistenti e sulla base di conoscenze locali (Frenken e Boschma, 2007). Tuttavia, le ricerche precedenti non hanno studiato se e come la brevettazione delle TIC consenta alle imprese di ricombinare le conoscenze per sviluppare le tecnologie dell'Industria 4.0. Alcuni studiosi hanno studiato quali cluster di tecnologie inerenti all'ambito di Industria 4.0 rappresentano le GPT (tecnologie di uso generale) e la loro relazione con le tecnologie TIC, concentrandosi sull'analisi dei brevetti a livello di USPTO (Martinelli, Mina e Moggi; 2021; Lee e Lee, 2022). Altri studiosi hanno invece concentrato la loro analisi su dati a livello di impresa andando a studiare i cambiamenti organizzativi legati all'adozione di tecnologie inerenti all'ambito di Industria 4.0 (Cirillo et al., 2021) e la relazione positiva tra i brevetti di tecnologie inerenti all'ambito di Industria 4.0 e le performance delle imprese (Benassi et al., 2022) o analizzando soltanto specifiche tecnologie dell'Industria 4.0 (Igna e Venturini, 2023). Altri ancora hanno esaminato il legame tra TIC e Industria 4.0 tramite dati a livello regionale e i conseguenti effetti positivi di tecnologie inerenti all'ambito di Industria 4.0 sulla crescita economica regionale (Laffi e Boschma, 2021; Capello e Lenzi, 2023). Inoltre, il panorama dell'innovazione nelle regioni è caratterizzato da una distribuzione non uniforme, con le nuove conoscenze tecnologiche che tendono a localizzarsi all'interno di specifiche aree geografiche (Boschma, 2005). Le regioni possono essere viste come sistemi di*

attori che rafforzano le risorse locali, compresa la conoscenza, che può fluire attraverso i confini organizzativi a causa della vicinanza geografica (Cantner et al., 2010). Gli effetti delle esternalità tecnologiche sulla capacità tecnologica di ciascuna impresa derivano dalle attività di Ricerca e Sviluppo di altre imprese localizzate nella stessa area (Antonelli, 1994). Inoltre, la conoscenza è caratterizzata dalla capacità di diffondersi attraverso canali sia intenzionali che non intenzionali (Antonelli and Colombelli, 2017), le sue ricadute non sono necessariamente confinate ai confini regionali (Boschma, 2005). La conoscenza esterna diventa quindi un importante input complementare per la generazione di nuova conoscenza (Antonelli e Colombelli, 2015), dove le esternalità di conoscenza interregionali di aree limitrofe danno forma all'innovazione (Boschma et al., 2017) che può derivare da brevetti e attività di Ricerca e Sviluppo svolte in regioni adiacenti (Moreno et al., 2005; Boschma e Ter Wal, 2007; Filippetti e Zinilli, 2023). Corradini, Santini e Vecciolini (2021) dimostrano che la prossimità spaziale è un fattore trainante dei flussi di conoscenza di tecnologie inerenti all'ambito di Industria 4.0 tra le regioni europee a livello NUTS-2. Tuttavia, la dipendenza spaziale può esacerbare effetti negativi come la rivalità di mercato e la competizione per il vantaggio tecnologico tra le regioni (Montmartin et al., 2018), che possono ridurre la performance innovativa delle regioni circostanti (Drivas, 2021) e limitare le opportunità di innovazione all'interno delle industrie high-tech (Byun et al., 2021). Sulla base di queste considerazioni, rimane una lacuna nella comprensione dei meccanismi precisi attraverso i quali le conoscenze pregresse in ICT influenzano le performance brevettuali delle imprese europee. Mentre la ricerca esistente ha esplorato la geografia disomogenea dell'Industria 4.0 e il ruolo delle capacità regionali nel cambiamento tecnologico, rimane incerto se i cluster di tecnologie nell'ambito dell'Industria 4.0 favoriscano l'innovazione a livello di impresa. Per colmare queste lacune, questa ricerca esamina le seguenti domande: quali sono gli effetti della conoscenza pregressa in TIC e delle esternalità spaziali, sia locali che interregionali, nelle performance brevettuali delle imprese europee che sviluppano tecnologie nell'ambito dell'Industria 4.0?

Purpose of the paper. *Lo scopo dell'articolo è quello di analizzare il ruolo che hanno i brevetti in TIC delle imprese europee nello sviluppare brevetti di tecnologie inerenti all'ambito di Industria 4.0 e il ruolo delle esternalità spaziali all'interno del contesto imprenditoriale europeo. La letteratura si è concentrata nell'investigare il ruolo delle TIC nello sviluppo delle tecnologie inerenti all'ambito di Industria 4.0 andando ad analizzare brevetti in ambito europeo (Xiao e Boschma, 2023) e statunitense (Martinelli, Mina e Moggi; 2021; Lee e Lee, 2022) e analizzando le ricadute economiche delle tecnologie inerenti all'ambito di Industria 4.0 all'interno delle regioni NUTS2 europee (Laffi e Boschma, 2021; Capello e Lenzi, 2023), ma senza analizzare questo fenomeno a livello di impresa. Nello specifico sviluppiamo 4 ipotesi di ricerca. Le prime due ipotesi si concentrano sul ruolo della conoscenza tecnologica prodotta dall'impresa nel favorire tecnologie inerenti all'ambito di Industria 4.0 e nello specifico come la conoscenza tecnologica sviluppata in ambito TIC in quanto antecedente di queste tecnologie (Nuvolari, 2019) può favorire il loro sviluppo. La prima ipotesi prevede che le imprese che hanno sviluppato brevetti in TIC hanno una migliore performance brevettuale inerente all'ambito di Industria 4.0. La seconda ipotesi si concentra sul ruolo della specializzazione in TIC del portafoglio brevettuale nel migliorare le performance brevettuali inerente all'ambito di Industria 4.0.*

La terza e quarta ipotesi si concentrano sul ruolo delle esternalità spaziali sulla brevettazione di tecnologie inerenti all'ambito di Industria 4.0. Ci concentriamo sullo studio delle esternalità spaziali tra imprese in base alla loro ubicazione a livello di regione NUTS3. Nello specifico ci concentriamo sull'effetto delle esternalità spaziali all'interno della stessa regione NUTS3 e tra diverse regioni NUTS3. La terza ipotesi dell'articolo si concentra sull'effetto positivo sulla brevettazione di tecnologie inerenti all'ambito di Industria 4.0 delle esternalità spaziali per le imprese ubicate nella stessa regione NUTS3, mentre la quarta ipotesi prevede l'effetto negativo delle esternalità spaziali sulle tecnologie inerenti all'ambito di Industria 4.0.

Methodology. *Verifichiamo le argomentazioni teoriche utilizzando un modello di regressione lineare a effetti fissi e un modello di regressione spaziale autoregressiva su un campione di 1521 imprese europee distribuite tra i Paesi dell'UE-28 che hanno depositato brevetti inerenti all'ambito di Industria 4.0 presso l'Ufficio Brevetti Europeo (EPO) nel periodo 2011-2019. Abbiamo recuperato i brevetti di tecnologie inerenti all'ambito di Industria 4.0 dal database REGPAT dell'OECD EPO basandoci sulla strategia di ricerca sulle tecnologie di Industria 4.0 fornita da Martinelli, Mina e Moggi (2021). In primo luogo, abbiamo raccolto 8000 brevetti legati alle tecnologie inerenti all'ambito di Industria 4.0 applicati da 2334 numeri identificativi distinti del richiedente (ovvero "Person_id") nel periodo 2011-2019. Per affinare la ricerca e concentrarci sulle domande di brevetto presentate da aziende europee, abbiamo applicato tecniche di text mining per escludere le università, le fondazioni, le associazioni, le organizzazioni di ricerca pubbliche e gli istituti pubblici dal set di dati. Di conseguenza, abbiamo individuato 1521 identificatori unici raggruppati a livello di impresa (ovvero: OECD Harmonised Applicant Names - HAN_id) relativi alle imprese dell'UE-28 che hanno depositato 8021 brevetti inerenti a tecnologie in ambito di Industria I4.0 nel periodo 2011-2019.*

Per analizzare se i brevetti nel settore ICT consentono alle imprese europee di sviluppare e brevettare le tecnologie I4.0, raccogliamo i brevetti legati alle TIC depositati presso l'EPO prima del 2019 per le 1521 imprese dell'UE-28 che hanno depositato brevetti EPO legati a tecnologie di Industria 4.0 nel periodo 2011-2019. Abbiamo recuperato i brevetti EPO legati alle TIC utilizzando la strategia di ricerca fornita da Inaba e Squicciarini (2017). Abbiamo quindi creato una variabile binaria che assume il valore 1 se l'impresa ha sviluppato almeno un brevetto EPO TIC nei 5 anni precedenti, e 0 altrimenti. 835 imprese su 1521 hanno depositato un brevetto legato alle TIC, quindi per mitigare l'endogeneità dovuta alla self-selection nelle domande di brevetto legate alle TIC ricorriamo a una variabile strumentale e implementiamo una funzione di controllo. Per trovare un variabile strumentale adatta, calcoliamo la media del vantaggio tecnologico rivelato (RTA) standardizzato nelle TIC per ogni regione NUTS 3 confinante con la regione NUTS3 in cui hanno sede le

imprese. La variabile strumentale misura la specializzazione nelle TIC delle regioni NUTS 3 limitrofe alle imprese, che può indicare la presenza di distretti industriali TIC e che possono guidare la propensione delle imprese a brevettare in tecnologie legate alle TIC, ma non influenzare il termine di errore di ciascuna impresa.

Inoltre, all'interno delle 835 imprese che hanno depositato un brevetto legato alle TIC, calcoliamo misure di specializzazione del portafoglio brevettuale per poter analizzare il ruolo svolto dalla specializzazione in specifiche TIC nello sviluppare tecnologie inerenti all'ambito di Industria 4.0.

Per stimare gli effetti delle esternalità spaziali, calcoliamo misure di centralità di rete degli autovettori tramite le matrici di contiguità spaziale tra le imprese del campione. La centralità degli autovettori si basa sul concetto che un nodo (ad esempio, un'impresa) è più centrale se è collegato ad altri nodi importanti. Quindi il calcolo della centralità dell'autovettore su una matrice spaziale ci permette di comprendere l'effetto di agglomerazione dell'industria legato alle tecnologie in ambito di Industria 4.0. Calcoliamo la centralità di rete degli autovettori su due diverse matrici spaziali m×m che raccolgono se un'impresa j è confinante all'impresa i: 1) una matrice spaziale che assume il valore 1 quando un'impresa j è localizzata all'interno della stessa regione NUTS 3 dell'impresa i, e 0 altrimenti; e 2) una matrice spaziale che assume il valore 1 quando un'impresa j è localizzata in una regione NUTS 3 contigua all'impresa i, e 0 altrimenti. Dopo aver calcolato la centralità degli autovettori di ciascuna impresa in entrambe le matrici spaziali, si ottengono due matrici m×m dove l'elemento generico g_ij delle matrici raccoglie la centralità spaziale degli autovettori dell'impresa i con l'impresa j≠i. Per analizzare se le prestazioni brevettuali nelle tecnologie I4.0 sono influenzate dagli spillover spaziali localizzati e interregionali, calcoliamo l'interazione tra le matrici degli autovettori e il numero di brevetti I4.0 presentati dalle imprese j≠i negli anni precedenti. Per comprendere il fenomeno nella sua interezza, forniamo un'analisi dell'eterogeneità dei brevetti inerenti alle tecnologie in ambito di Industria 4.0 andando ad analizzare nello specifico l'effetto dei brevetti TIC sui brevetti in ambito di Intelligenza Artificiale, Cloud Computing, 3D printing, Internet of Things, Additive Manufacturing, and Big Data/Industrial Analytics. Inoltre, all'interno del modello di regressione lineare a effetti fissi e del modello di regressione spaziale autoregressiva introduciamo delle variabili di controllo, come lo stock di brevetti, l'ampiezza tecnologica del portafoglio brevettuale e il numero di inventori per poter introdurre delle misure che possono catturare la capacità di assorbimento di conoscenza da parte dell'impresa (Cohen e Levinthal, 1990).

Results. *Questo studio potrebbe portare a nuove considerazioni sul tema dello sviluppo delle tecnologie nell'ambito dell'Industria 4.0 a livello europeo, in quanto aver sviluppato tecnologie TIC a livello di impresa negli anni precedenti potrebbe comportare una migliore performance brevettuale nelle tecnologie di Industria 4.0. Inoltre, una maggiore specializzazione brevettuale in TIC potrebbe portare ad un ulteriore incremento delle performance brevettuali in tecnologie inerenti all'ambito di Industria 4.0. L'analisi di eterogeneità tecnologica andrebbe a dimostrare nello specifico quale tecnologia in ambito di Industria 4.0 beneficerebbe maggiormente delle conoscenze pregresse in TIC interne all'impresa. Inoltre, la dimensione geografica e l'agglomerazione di imprese potrebbe comportare un miglioramento delle performance brevettuali potendo beneficiare di esternalità spaziali di conoscenza (Boschma, 2005) nonostante questo effetto sia prevalentemente localizzato all'interno della singola regione NUTS3 comportando quindi esternalità negative di conoscenza tra regioni NUTS3 limitrofe, quindi limitando le opportunità di innovazione all'interno dell'Industria 4.0 europea (Byun et al., 2021).*

Research limitations. *Questo studio comporta alcune limitazioni. In primo luogo, si concentra su imprese fornitrici di tecnologia quindi i risultati non possono essere estesi alle imprese che adottano tecnologie nell'ambito dell'Industria 4.0. Inoltre, questo studio utilizza soltanto i brevetti depositati presso l'Ufficio Brevetti Europeo andando quindi a sottostimare l'effetto generato dalla brevettazione in uffici brevettuali nazionali. Allo stesso modo, i brevetti sono una misura ampiamente utilizzata dell'innovazione (Block et al., 2025; Nagaoka et al., 2010; Encaoua et al., 2006), ma potrebbero non cogliere appieno tutte le forme di attività innovativa, come i progressi tecnologici non brevettabili. La ricerca futura potrebbe incorporare molteplici uffici brevettuali e ulteriori misure di innovazione. Infine, il nostro studio va ad analizzare soltanto un'unica dimensione di trasmissione di conoscenza, ovvero quella geografica, mentre futuri lavori potrebbero approfondire il ruolo di esternalità di conoscenza provenienti da altre dimensioni, come quella tecnologica e quella inerente alle competenze.*

Managerial implications. *L'articolo ha importanti implicazioni per managers e imprenditori di imprese europee che vogliono investire nello sviluppo di tecnologie inerenti all'ambito di Industria 4.0. Da un lato, le imprese dovrebbero possedere conoscenze tecnologiche pregresse in TIC per poter avere migliori performance brevettuali di tecnologie inerenti all'ambito di Industria 4.0. Dall'altro lato l'ubicazione geografica comporta benefici allo sviluppo di queste tecnologie, potendo beneficiare delle esternalità spaziali di conoscenza. Questo risultato indica la presenza distretti industriali di tecnologie inerenti all'ambito di Industria 4.0 a livello europeo che permettono uno scambio di conoscenza tra le imprese fornitrici di queste specifiche tecnologie.*

Originality of the paper. *L'articolo contribuisce alla letteratura colmando un gap nella letteratura andando ad investigare il ruolo delle conoscenze tecnologiche in TIC presenti all'interno delle imprese europee nello sviluppare brevetti inerenti alle tecnologie nell'ambito dell'Industria 4.0, mentre studi precedenti hanno sviluppato analisi a livello brevettuale e regionale. Inoltre, contribuiamo alla letteratura inerente alle esternalità spaziali andando ad analizzare l'effetto di esternalità spaziali localizzate e interregionali a livello di impresa, mentre la letteratura precedente si è concentrato sul ruolo delle esternalità a livello di regionale NUTS2 e NUTS3.*

La diffusione della Marketing Automation tra gli e-tailer italiani: risultati da una cluster analysis

GIADA SALVIETTI[1] DANIO BERTI[2] SILVIA RANFAGNI[3]

Abstract

Il presente studio si propone di indagare il fenomeno della diffusione delle tecnologie di Marketing Automation tra gli e-tailer italiani, cercando di identificarne i diversi livelli di adozione. Sulla base di una review della letteratura è stata constatata l'assenza di scale validate che adottino la prospettiva aziendale e sono state identificate delle determinanti - sotto forma di variabili categoriche - successivamente testate attraverso una Latent Class Analysis. L'esito della ricerca, costruita su dati raccolti da 436 e-tailer italiani appartenenti a vari settori, identifica quattro cluster, ciascuno dei quali manifesta un differente livello di adozione della Marketing Automation nonché un diverso indirizzo strategico nel loro utilizzo, e pone le basi per futuri approfondimenti relativi alle determinanti dello status quo identificato.

Inquadramento della ricerca. *La Marketing Automation è un fenomeno di integrazione tecnologica attraverso una piattaforma software, che permette un arricchimento dell'esperienza del cliente, in varie fasi della sua customer journey. Nonostante non esista una definizione accademica condivisa della Marketing Automation, alcuni tra i suoi elementi sono condivisi all'unanimità, quali la compresenza di tool tecnologici e processi strategici interni all'impresa, orientati al conseguimento di obiettivi specifici (Buttle & Maklan, 2019) e l'orientamento ad una maggiore efficacia ed efficienza della gestione delle relazioni con il cliente attraverso molteplici canali (Biegel, 2009).*

Da un lato, guardando alla Marketing Automation da una prospettiva manageriale, questa offre la possibilità di gestire e replicare processi di marketing mantenendo un elevato livello di controllo contenendo i costi e riducendo i tempi di esecuzione, fino all'attivazione di processi e iniziative simultanee su più canali. La raccolta e l'analisi dei dati, inoltre, consente all'azienda di attivare un processo di apprendimento continuativo in merito ai propri clienti, attraverso un arricchimento progressivo dei loro profili, potendo al contempo correggere le iniziative di marketing future sulla base dello storico degli esiti (Buttle, 2009), Dall'altro lato, adottando la prospettiva del consumatore, l'introduzione di tecnologie di Marketing Automation, permette di migliorare la relazione con il proprio cliente, singola interazione dopo singola interazione e anche in real-time, riuscendo a costruire un rapporto di fiducia duraturo (Kantrowitz, 2014),

Uno dei fulcri della Marketing Automation è la possibilità di fornire automaticamente una personalizzazione del servizio offerto al cliente in logica one-to-one, per soddisfarne le esigenze specifiche (Jarvinen and Taiminen, 2016; Hanssens and Pauwels, 2016), Tale personalizzazione, su scala individuale, riguarda in primo luogo i contenuti condivisi con il cliente: infatti, messaggi pertinenti e personali aumentano la probabilità di essere aperti e consultati con attenzione, influenzandone quindi l'efficacia (Petty & Cacioppo, 1986), La personalizzazione può essere poi estesa anche ad altri aspetti del marketing mix, ad esempio nell'ottica di offrire promozioni personalizzate o suggerimenti di prodotto mirati a conseguire obiettivi di cross-selling o di up-selling (Changchien et al., 2004; Goshal et al., 2021).

Nonostante l'importanza della personalizzazione nella cura della relazione con il cliente, non esistono scale validate o altri metodi di misurazione oggettiva del livello di automazione adottato, per una diagnostica a livello aziendale. Tale aspetto, tuttavia, è estremamente rilevante, dal momento che ci sono vari aspetti sottostanti che determinano l'applicazione efficace della Marketing Automation. In tal senso, alcuni approcci hanno cercato di schematizzarne le principali funzionalità ed elementi costitutivi: ad esempio, Buttle e Maklan (2019), propongono una sintesi di 24 funzionalità riclassificabili in "funzioni di marketing", "processi interni abilitanti" e "marketing analytics", Mero et al. (2020) ne identificano cinque ambiti di applicazione: customer knowledge, sistema informativo di marketing, analitiche, change management e trasferimenti di conoscenza interdipartimentali.

Un'ulteriore schematizzazione, da noi proposta nel presente studio, guarda invece alle dimensioni-chiave che abilitano ciascuna fase di un processo di automazione.

In primo luogo, la Marketing Automation richiede un efficace sistema di identificazione di ciascun consumatore-utente e il tracciamento dei loro comportamenti online (es. pattern di navigazione sul sito e-commerce, metriche di web analytics) attraverso l'uso di cookies e indirizzi IP. Tale tracciamento, inoltre, è prolungato nel tempo, e può essere

esteso anche ad altre piattaforme o canali (es. integrazione con i social media), opportunità ulteriormente semplificate grazie all'emergere dell'intelligenza artificiale (Jarvinen e Taiminen, 2016).

La raccolta del dato costituisce pertanto la base fondamentale per le attività di Marketing Automation, che possono combinare due diversi approcci. L'approccio attivo è costituito da un'interazione diretta con il cliente, al quale viene rivolta una domanda esplicita per verificarne l'interesse verso un argomento o un servizio: ne sono esempi i contenuti interattivi collegati ad ulteriori link associati, oppure short surveys costituite da un'unica domanda. L'approccio passivo, invece, consiste nell'utilizzo di informazioni raccolte precedentemente, nel corso di visite o acquisti effettivi, ed è basato su un'analisi di tipo predittivo (Montgomery e Srinivasan, 2003),

Lo step successivo riguarda l'analisi del dato, che comprende le tecnologie utilizzate per l'analisi, la complessità delle analisi svolte, l'integrazione di dati raccolti anche tra molteplici canali, ed infine la definizione di criteri di segmentazione avanzati. A questa, e sulla base di questa, si sussegue poi la messa a punto dell'attività automatizzata, che può differire a seconda dell'obiettivo strategico e della fase del customer journey nel quale è collocata (es. dall'acquisizione al re-marketing al post-vendita) (Davenport and Phillips, 2016),

Date le numerose complessità emergenti per ciascuno di questi stadi, l'assunto su cui si fonda il presente studio è pertanto che esistano diverse modalità mediante le quali le aziende attuano le attività di Marketing Automation e che quelle in grado di concretizzarle in maniera consapevole, sfruttandone pienamente le potenzialità siano soltanto un numero ristretto. Si ipotizza, infatti, che non tutte le aziende siano in grado di predisporre un ciclo virtuoso dalla raccolta del dato alla messa a punto delle attività, operando con un raggio di azione più limitato: ad esempio, limitare le azioni automatizzate alla sfera della comunicazione senza riuscire a coltivare effettivamente una relazione con il consumatore. Altro aspetto che riteniamo estremamente rilevante in tal senso è il grado di controllo che l'azienda è in grado di esercitare sopra le attività di Marketing Automation, attraverso lo sviluppo di conoscenze e competenze interne rispetto all'outsourcing parziale o totale.

L'evoluzione delle tecnologie abilitanti per le attività di Marketing Automation sta rapidamente avanzando grazie all'intelligenza artificiale, che ha non soltanto migliorato l'ottimizzazione delle funzioni di marketing, ma ha modificato le preferenze dei consumatori relativamente alle esperienze d'acquisto nonché i loro processi decisionali (Langer e Landers, 2021), E' pertanto utile chiedersi quanto gli e-tailer siano oggi preparati ad accogliere questa nuova rivoluzione tecnologica sulla base del loro livello attuale di adozione delle tecnologie di Marketing Automation.

Obiettivo del paper. *Il lavoro tenterà di misurare il grado di adozione e di conoscenza delle soluzioni tecnologiche di Marketing Automation da parte degli e-tailer italiani attraverso la presenza di una serie di condizioni identificate tramite review della letteratura e consultazione con esperti dell'ambito. La fase iniziale del lavoro, qui presentata, identifica l'esistenza di emersi diversi gradi di adozione e consapevolezza nell'utilizzo delle tecnologie di Marketing Automation, distinguendo gli e-tailer italiani in cluster costruiti sulla profondità e ampiezza delle attività automatizzate.*

La ricerca, tuttora in fase di sviluppo, pone le basi per un ulteriore approfondimento mediante interviste qualitative a sotto-campioni rappresentativi di ciascuno dei cluster fin qui identificati, al fine di raccogliere ulteriori informazioni in merito a barriere e stimoli all'adozione delle tecnologie e pratiche di Marketing Automation.

Metodologia. *I dati sono stati raccolti mediante questionario online condotto su un campione rappresentativo di imprese italiane che vendono i propri prodotti online ai consumatori finalia, tramite marketplace o sito proprietario, tra i mesi di Marzo e Maggio 2024. E' stata adottata una metodologia CAWI (Computer-Aided Web Interview), con assistenti di ricerca a disposizione per rispondere ad eventuali dubbi e domande degli intervistati. Il campionamento è avvenuto su base probabilistica, attraverso campionamento stratificato per area geografica e settore, identificato tramite codice ATECO. Il questionario è composto da tre sezioni. La prima, di natura descrittiva, ha permesso di verificare la rappresentatività del campione oltre che di raccogliere dati utili alla profilazione dei partecipanti; in questa sede si è inoltre verificato che i rispondenti operassero in un mercato esclusivamente o prevalentemente B2C.*

La seconda sezione è stata invece dedicata alla raccolta di dati inerenti il sito e-commerce e la sua gestione (proprietà del sito / della piattaforma, tipologia e volumi di prodotti venduti, ecc), Inoltre, all'interno di questa sezione, è stato chiesto ai partecipanti di indicare le attività di marketing automatizzate al momento della risposta.

La terza e ultima sezione ha infine raccolto ulteriori dati relativi al modo in cui vengono svolte tali attività, al fine di determinare il livello effettivo di automazione. Gli argomenti affrontati includevano infatti: la raccolta e la gestione del dato di cliente, incluso il suo comportamento sul sito web; l'utilizzo di sistemi di segmentazione, semplici o avanzati; l'utilizzo di sistemi di lead generation; il grado di personalizzazione delle e-mail inviate; l'integrazione dei canali di comunicazione; ed infine la gestione interna o in outsourcing delle automazioni.

Data la natura esplorativa del lavoro, e le difficoltà già evidenziate nell'identificazione di una scala validata, sono state utilizzate prevalentemente variabili categoriche, impiegando domande a scelta singola o multipla, con l'esclusione di alcune scale single-item per chiedere l'auto-valutazione relativamente ad alcuni aspetti (es. la soddisfazione rispetto alle competenze interne all'azienda in termini di Marketing Automation), In considerazione di tale struttura, per l'analisi dei dati è stata svolta una Latent Class Analysis (di seguito LCA), La LCA è una tecnica statistica di clustering, ampiamente utilizzata nelle scienze sociali, per segmentare una popolazione controllando per la sua eterogeneità andando a classificarli in gruppi sulla base della probabilità di appartenenza (Haughton et al., 2009), Nella LCA i cluster, o sottogruppi, di casi vengono identificati in base alle variabili interne, che qualificano i segmenti latenti di casi all'interno della popolazione; la stima della probabilità di appartenenza ai segmenti può essere poi ulteriormente affinata inserendo ulteriori variabili indipendenti, o covariate.

Risultati. *Il campione è costituito da 436 imprese italiane, appartenenti a 35 settori differenti: tra questi, i più rappresentati sono abbigliamento (25,9%), alimentare (18% incluso il comparto delle bevande), oreficeria e accessori (8,3%) e cosmetica e prodotti di bellezza (8%), Le imprese partecipanti sono collocate per il 43,8% al Nord Italia, per il 29,1% al Centro e per il 26% al Sud e nelle isole. Si tratta per la maggior parte di piccole-medie imprese: il 44,3% impiega da 0 a 9 dipendenti e il 28% da 10 a 49 dipendenti; inoltre, il 41,3% ha un fatturato inferiore ai 2 milioni di euro annui e opera principalmente all'interno dei mercati locali (31,6%) o italiani (57,3%),*

Ulteriori dati di interesse riguardano l'attività di e-commerce svolta: il 61,9% utilizza piattaforme di E-Commerce proprietarie, mentre il 32,6% utilizza sia siti propri sia marketplace; solo il 3,2% opera invece esclusivamente sui marketplace e il 2,3% utilizza strumenti differenti, come ad esempio Google Shopping. Il 67,7% vende prodotti di propria produzione, monomarca (46,8%) o multibrand (20,9%); il 47,5%, invece, è un e-tailer puro e opera come rivenditore, prevalentemente con molteplici marche. Questa suddivisione si riflette anche nei numeri relativi ai prodotti: infatti, il 50,7% dei rispondenti rende disponibile sul proprio e-commerce una gamma inferiore a 500 prodotti; il 35,5% arriva alla soglia dei 10.000 e solo il 13,8% riesce a superarla.

La grande maggioranza degli e-commerce ha come target principale il mercato italiano (67%) o locale (14%); ad ogni modo, gli e-tailer dimostrano di sfruttare questo canale anche per attrarre ulteriori vendite dall'estero. Sono infatti il 64,4% coloro che segnalano quote di mercato in altri Paesi Europei ottenute grazie all'e-commerce, e il 34,8% quote extra-UE. Ciò emerge anche dalla struttura dell'e-commerce: il 58,3% dei siti, infatti, ha una versione in lingua Inglese e il 26,1% prevede ulteriori lingue europee (Francese, Spagnolo e/o Tedesco), L'82% dei rispondenti, ottiene inoltre un buon riscontro in termini di traffico, superando i 5.000 visitatori al mese.

Un ultimo dato riguarda il tempo trascorso dal lancio dell'e-commerce: il 58,5% dei partecipanti ha attivato il canale di vendita online da più di 5 anni, e il 20,2% da 3 a 5 anni; il 21,3%, invece, opera online da meno di 3 anni, dei quali il 3,9% ha iniziato con l'attività di e-commerce da meno di un anno al momento della risposta.

Guardando alle attività di marketing automatizzate, è stato chiesto ai rispondenti di indicare quanto da loro svolto, a partire da una lista individuata sulla base della letteratura e di casi pratici. Il dettaglio viene riportato in tabella 1: si può rilevare come, tendenzialmente, tutte le attività siano più o meno presidiate; vi sono però notevoli variazioni nel numero di attività svolte - e nelle combinazioni di attività. Ad esempio, il 33,2% dei rispondenti svolge solo una tra le attività di automazione proposte, mentre solo il 12,8% riesce ad attivarle tutte.

Tab. 1: Dettaglio delle attività di Marketing Automation svolte

ATTIVITA' DI MARKETING AUTOMATIZZATE	FREQUENZA	PERCENTUALE
Invio di mail di benvenuto	261	59,9
Messaggi post-vendita	225	51,6
Invio di mail per i carrelli abbandonati	213	48,9
Attività di remarketing	190	43,6
Suggerimenti di prodotti correlati	188	43,1
Promozioni personalizzate	172	39,4
Lead nurturing / raccolta di contatti	147	33,7
Altre attività	20	4,6

Fonte: nostra elaborazione.
Le risposte superano il 100% perché era possibile selezionare più attività.

Al fine di indagare ulteriormente tale variabilità, tenendo al contempo in considerazione la profondità dell'automazione per ciascuna delle attività svolte, si è proceduto ad una Latent Class Analysis. Nello specifico, le attività di Marketing Automation rappresentano le variabili interne (o "indicatori"); sono state poi inserite come variabili esterne (o "covariate") le dimensioni che, per ciascuna delle attività, ne determinano un utilizzo più o meno profondo, consapevole e autonomo. Tali variabili riguardano: il processo di raccolta e analisi del dato di cliente, i processi a supporto della comunicazione e della gestione del cliente, personalizzate o uniformate, l'integrazione automatizzata tra canali di marketing e i soggetti ai quali è affidata la gestione delle attività di Marketing Automation.

Il primo step dell'analisi LCA richiede l'identificazione del numero di cluster ottimale, attraverso una simulazione di più modelli alternativi con un numero diverso di cluster. Nel presente caso sono state prese in considerazione soluzioni con un numero di cluster variabili tra 2 e 6. Per determinare il numero ottimale di cluster, sono stati utilizzati e confrontati i criteri di adattamento del modello (AIC3, SABIC), dove il minimo valore di ciascun indice identifica la soluzione migliore (Yang e Yang, 2007), La tabella 2 riporta gli esiti del confronto, che ha portato a scegliere la soluzione con 4 cluster; tale soluzione è anche quella con il minor potenziale errore di classificazione (0,0961), Su quest'ultima è stata pertanto poi effettuata la profilazione relativamente sia alle variabili "indicatore" sia alle variabili indipendenti (riportata in Tabella 3), La tabella 3 riporta, per ciascun cluster, le probabilità condizionali associate ad ogni variabile, e permette l'interpretazione delle differenze tra profili attraverso una comparazione dei coefficienti per riga.

Tab. 2: Criteri di adattamento e scelta del modello ottimale

MODELLI CLUSTER	AIC3	SABIC
2-Cluster	820,96	860,99
3-Cluster	738,03	774,34
4-Cluster	723,09	761,26
5-Cluster	750,21	784,65
6-Cluster	783,69	814,41

Fonte: nostra elaborazione.

I quattro cluster così emergenti rappresentano pertanto altrettanti profili di e-tailer, ognuno dei quali adotta in modo diverso le tecnologie di Marketing Automation. Riordinando i cluster dal livello più alto al più basso di adozione, il Cluster 3 rappresenta sicuramente le imprese adottanti più esperte (27,4% del campione), Queste imprese svolgono il numero maggiore di attività diverse, impiegando l'automazione all'interno di molteplici processi di comunicazione e gestione della relazione con il cliente, lungo tutta la customer journey. Dimostrano di essere molto avanzati, ricorrendo all'automazione quasi totale per le funzioni più semplici, quali l'invio di email automatizzate, che sono però in grado di personalizzare, grazie a metodi altamente tecnologici di raccolta e analisi del dato. In tal senso, il Cluster 3 è quello che fa un utilizzo maggiore dell'intelligenza artificiale, anche a supporto dell'integrazione tra canali di marketing. Dal punto di vista della gestione di queste attività, le imprese di questo cluster si affidano maggiormente a fornitori e consulenti esterni, ma mantengono al contempo un ottimo livello di controllo interno.

Tanto il Cluster 1 quanto il Cluster 4 manifestano un buon livello di adozione delle tecnologie di automation, ma in direzioni diverse. Il Cluster 1 comprende imprese (33,4% del campione) che potremmo definire "solide": le attività automatizzate sono prevalentemente incentrate intorno all'atto della vendita (es. messaggi post-vendita, suggerimenti di prodotti correlati, promo personalizzate), Nonostante dispongano di una buona conoscenza del cliente attraverso la raccolta di dati di tracciamento, l'analisi del dato e il loro utilizzo rimane limitato (es. viene adottata una segmentazione non dinamica e basata principalmente su criteri demografici), E' inoltre il cluster che fa maggiormente ricorso al personale interno per la gestione delle attività automatizzate, con una struttura più tradizionale. Il Cluster 4, invece, rappresenta utenti che condividono un approccio più sperimentale alla Marketing Automation (6,9% del campione), Queste aziende cercano di utilizzare l'automazione in diversi momenti del customer journey (es. customer care, attività di re-marketing, ecc), e per conseguire obiettivi strategici diversi (dalla conclusione della vendita al supporto alla relazione all'acquisition), Tale approccio si combina, dal punto di vista della gestione, con un forte outsourcing, anche, integrale di queste attività a provider esperti.

Il Cluster 2, infine, costituito dal 32,2% del campione, rappresenta le imprese con un livello minimo di automation. L'utilizzo delle tecnologie di automazione è molto ridotto e circoscritto alle funzioni più semplici da gestire internamente;

come conseguenza, la raccolta del dato è molto limitata e la conoscenza così acquisita non viene sfruttata ai fini di personalizzare la relazione con il singolo cliente.

Limiti della ricerca. *Il presente lavoro non è esente da limitazioni, in primo luogo basandosi sul dichiarato degli intervistati; si è cercato comunque, in fase di campionamento e raccolta del dato, di contenere questo limite, rivolgendoci al principale decisore aziendale o al responsabile di funzione.*

Inoltre, come già anticipato, il lavoro costituisce un primo step di ricerca al quale seguirà uno studio qualitativo che andrà ad ampliare la comprensione del fenomeno, combinando la mappatura dei diversi gradi di adozione della Marketing Automation con un approccio interpretativo delle difficoltà da superare (soprattutto per coloro che hanno raggiunto un livello di adozione limitato o molto circoscritto) e dei potenziali supporti all'avanzamento tecnologico. La Latent Class Analysis, infatti, riesce a descrivere uno status quo, presentando una segmentazione del mercato e-tailing italiano, senza però poter fare luce su cosa abbia causato l'esistenza delle differenze identificate.

Riteniamo infatti di notevole interesse, ad esempio, comprendere quali sono i limiti percepiti dal Cluster 2 verso una maggiore adozione delle tecnologie, se la situazione corrente è dovuta ad una mancanza di consapevolezza rispetto alle opportunità che queste comportano oppure a difficoltà nel sostenere costi di avanzamento tecnologico o di acquisizione delle conoscenze necessarie.

Implicazioni manageriali. *L'adozione delle tecnologie di Marketing Automation costituisce di per sé un tema dalle forti implicazioni manageriali, in quanto capace di influenzare fortemente l'efficienza e la competitività delle imprese adottanti. Ciò diventa ancora più rilevante in un contesto nel quale l'Intelligenza Artificiale sta rapidamente evolvendo, dimostrandosi uno strumento estremamente flessibile da impiegare anche ai fini dell'automazione di varie attività. Report nazionali ed internazionali (si veda Zumstein et al., 2024) mostrano come le aziende, a livello globale, si stiano interessando all'uso dell'IA per attività di ottimizzazione, ma anche per fornire un'assistenza clienti personalizzata, fornire suggerimenti in ottica di up- o cross-selling, e lead identification e generation. Si prospetta pertanto un quadro nel quale gli early adopters consapevoli riusciranno ad acquisire un notevole vantaggio competitivo creando un forte divario dai propri competitors.*

A tale scopo, diventa pertanto necessario riuscire a sensibilizzare verso un rapido sviluppo tecnologico anche quelle imprese che rientrano in un utilizzo ancora limitato o tradizionale delle tecnologie di automazione, creando una consapevolezza anche strategica nei decisori aziendali. Dalla ricerca emerge infatti che, complessivamente, solo la metà delle imprese intervistate (48,6%) ha previsto corsi di formazione interni nell'ambito della Marketing Automation, e solo il 39% prevede di investire ulteriormente in questo ambito nel corso dell'anno successivo. Ciò è a maggior ragione più rilevante nel contesto italiano, caratterizzato da una notevole presenza di piccole e medie imprese, anche nell'ambito e-tailing.

Originalità del paper. *Il paper presenta un quadro del livello di adozione delle tecnologie di Marketing Automation nel contesto di e-tailing italiano proponendo un sistema di segmentazione tramite Latent Class Analysis, alla luce dell'assenza di scale strutturate volte a misurare il fenomeno. Dai risultati emerge la possibilità di identificare differenti cluster incentrati su macro-determinanti quali l'applicazione dei processi di automation alle attività di comunicazione in senso stretto rispetto alla gestione della relazione con il cliente; l'esistenza o l'assenza di processi ibridizzati, e scelte gestionali di presidio interno o di outsourcing.*

Parole chiave: *Marketing automation; e-tailing; Latent Class Analysis; clustering*

From IP Awareness to Strategic Valorization: bolstering IP capabilities of Italian SMEs through policy interventions

PAOLA BELINGHERI[1] ALESSIA POLI[2] MARIA ISABELLA LEONE[3]

Abstract

Intellectual Property (IP) management represents a crucial yet often underutilized strategic area for Small and Medium Enterprises (SMEs). Effective management of IP can foster innovation, bolster competitive advantage, and enhance financial sustainability. Nonetheless, SMEs, including Italian firms, frequently fail to fully leverage formal IP protections, thereby hindering their ability to derive value from their innovations. This study, in collaboration with the Italian Patent and Trademark Office (UIBM), investigates the obstacles and facilitators of IP management within Italian SMEs.

deficiencies in awareness, protection, management, and valorization of IP. Despite 58.4% of respondents rating their familiarity with IP as 'good' or 'excellent,' 77% lack a dedicated IP function, and dependence on external expertise remains widespread. Only 38.7% consistently consider obtaining formal and registered IP rights, with cost and administrative burden being primary barriers. Furthermore, strategic integration of IP is limited, with merely 25% of SMEs evaluating the economic value of their IP assets. As a result, formal commercialization through licensing or transactions are scarcely implemented.

Our findings underscore the necessity for targeted policy interventions aimed at bolstering IP capabilities among SMEs. Recommendations include expanding training programs, facilitating advisory services, and promoting collaborations between SMEs, larger firms, and research institutions. By addressing these structural weaknesses, SMEs can transform IP from a passive asset into a strategic driver of growth, competitiveness, and sustained innovation.

Theoretical Background

The role of IP management for SMEs

SMEs face significant liabilities with respect to larger firms. Among these are liabilities of smallness (Garagorri 2016), budgetary constraints and technical reliance on large firms that have more sizeable R&D budgets (Salami 2024), and greater vulnerability to risks such as supplier loss and industrial espionage (Clusel et al. 2013). Therefore, intellectual property (IP) management is an important strategy for small to medium-sized enterprises (SMEs) as it offers numerous benefits that can offset their liabilities and enhance their competitiveness, growth, and financial sustainability in the market, acting both through value creation and value capture mechanisms.

First, IP management plays a vital role in supporting innovation and research and development (R&D) activities within SMEs. By protecting their innovations through IP rights, SMEs can recoup their investments in R&D and fund further innovation (Taglialatela and Barontini 2024). This creates a cycle of continuous improvement and technological advancement (Le and Luong 2022; Chen 2022). Moreover, IP management can facilitate collaboration between SMEs and other entities, such as universities and research institutions, but also suppliers, partners and competitors, in an open innovation perspective (Brem, Nylund, and Hitchen 2017). For instance, licensing agreements may allow enable to access complementary resources and accelerate product development, further enhancing innovative capacity (Le and Luong 2022; Salajová, Kohnová, and Kopliku 2024, Kang 2023).

Effective IP management can also make SMEs more attractive to financial institutions, investors, and acquirers. A strong IP portfolio can serve as collateral for loans or to secure investments. This is particularly important for SMEs that may not have extensive physical assets but possess valuable intangible assets in the form of IP (Lima and Santos 2018; Kang 2023). Additionally, IP management can enhance the overall value of an SME, making it more appealing to potential acquirers or partners. This can lead to increased opportunities for mergers, acquisitions, and strategic alliances, further driving business growth (Ramesh, 2022) (Akimochkina et al., 2022). In this respect, it is also relevant to consider the role of IP in reducing risks for SMEs: by protecting their IP, SMEs can avoid costly legal disputes and

unauthorized use of their innovations. This protection not only saves financial resources but also safeguards the company's reputation and market position (Akimochkina, Rudakova, and Abramov 2022; Chen 2022).

From a more strategic perspective, aligning IP management with the overall business strategy is crucial for SMEs to maximize the value of their IP. By integrating IP management into their strategic planning, SMEs can identify and prioritize their most valuable IP assets, ensuring they are used effectively to achieve business objectives. This strategic alignment can lead to the creation and capture of long-term value for the company and its stakeholders (Lima and Santos 2018; Nikolova-Minkova 2023). Indeed, by leveraging IP rights such as patents, trademarks, and copyrights, SMEs can differentiate their products and services from those of their competitors, preventing competitors from replicating their unique offerings. This differentiation can lead to increased market share and customer loyalty, which are essential for sustained growth (Holgersson 2013; Akimochkina, Rudakova, and Abramov 2022; Chen 2022; Ramesh 2022; Nikolova-Minkova 2023). Furthermore, IP management can help SMEs adapt to emerging trends and technologies, ensuring that they remain at the forefront of innovation and technological advancement. This can lead to increased market share and improved profitability in the long run (Akimochkina, Rudakova, and Abramov 2022; Kang 2023). The increase in market share may also depend on the fact that IP management can facilitate market expansion: by licensing their IP, SMEs can enter new markets and reach a broader customer base. Additionally, IP can help SMEs overcome barriers to entry in foreign markets. A strong IP portfolio can serve as a valuable asset when negotiating partnerships or seeking investments, making it easier for SMEs to expand their operations internationally (Kang 2023).

Effectiveness of IP Management in SMEs

SMEs must undertake various activities to ensure successful IP management, which are often categorized into several stages in the literature.
of IP and the most effective methods for managing it (Holgersson 2013). This may include engaging in partnerships and networks, which can provide SMEs with additional resources and knowledge for managing their IP (Dereń and Skonieczny 2023).

The company's second step in the IP management process should be ***identifying the various forms of intellectual property*** *it possesses or could develop (Holgersson 2013; Nikolova-Minkova 2023). Once identified, the next step is to evaluate the value and potential of these IP assets. This assessment helps SMEs understand how their intellectual property can contribute to their overall business strategy and economic benefits. It involves analyzing the market potential and competitive advantage that the IP can provide and eventually tailoring business models around valuable IP (Dereń and Skonieczny 2023; Nikolova-Minkova 2023).*

After evaluating their IP, SMEs need to formulate a strategy for its ***protection****. This involves selecting suitable legal mechanisms, such as patents or trademarks, to secure their innovations, and deciding whether to implement formal or informal protection measures. The strategy should be in alignment with the overall business objectives and weigh the costs and benefits of various protection regimes (Dereń and Skonieczny 2023; Nikolova-Minkova 2023). Subsequently, the protection strategy must be executed by undertaking all necessary legal steps to safeguard the IP.*

Once protections are established, SMEs must consistently monitor the market for infringements and enforce their rights. This involves tracking competitors and ensuring their IP is not used without permission (Nikolova-Minkova 2023). Additionally, they should actively ***manage their portfolio****, deciding on the renewal of rights and their suitability for various commercialization strategies (OECD 2011).*

Once an IP management strategy is established and the necessary IP rights have been secured, SMEs should concentrate on effectively ***valorizing their IP rights****. This entails maximizing the value extraction from their IP for growth and competitive advantage (OECD 2011; Dereń and Skonieczny 2023). To achieve this, small companies can leverage strategic networking and open innovation principles to access complementary resources by leveraging their IP as a quality signal (Belingheri and Leone 2017; Salajová, Kohnová, and Kopliku 2024). These activities can enhance market reach, accelerate product development, and ultimately support SMEs in better leveraging their physical, organizational, and human capital resources to enhance value capture in the market (Salajová, Kohnová, and Kopliku 2024; Wang et al. 2025). Licensing is another channel through which SMEs can leverage their IP, generating additional returns while protecting core business interests (Goldheim et al. 2005).*

Finally, it is crucial for SMEs to periodically review their IP management strategy to remain responsive to market, technological, and business environment changes. This method ensures that the intellectual property remains pertinent and continues to offer a competitive advantage (Dereń and Skonieczny 2023; Nikolova-Minkova 2023).

The adoption of IP Management in SMEs

Notwithstanding these benefits, literature finds that SMEs systematically under-utilize IP. Evidence shows that only 9% of SMEs in Europe owns a registered industrial property right, such as a patent, a trademark or a registered design (EC Directorate-General for Internal Market, Industry, Entrepreneurship and SMEs 2021). As a result, SMEs often face significant challenges related to counterfeiting and the unauthorized use of their rights. According to the OECD, the United States, Switzerland and Italy are the top three countries whose SMEs have been most affected by counterfeiting (OECD and European Union Intellectual Property Office 2023). In addition, SMEs have been observed to restrict their

patent validity to their home country, thereby limiting the protection that patents afford and the value that can be extracted from them (Friesike et al. 2009).

SMEs struggle to fully capitalize on IP both due to a lack of knowledge of the benefits but also the high costs of obtaining and maintaining the IP rights (Holgersson 2013; Lima and Santos 2018). These aspects discourage SMEs from obtaining IP rights in the first place. SMEs also often struggle to navigate the complexities of the IP system, which can hinder their ability to protect and leverage their innovations (Holgersson 2013; Eppinger and Vladova 2013; Nikolova-Minkova 2023), limiting the value capture they can obtain from the IP. Indeed, SMEs prefer to use informal rights (such as trade secrets) rather than formal ones (such as patents, trademarks and design), primarily due to their familiarity and lower costs. This preference is particularly evident in smaller firms that may not have the resources to pursue formal IP protection (Kitching and Blackburn 1998).

Aim of the paper. *Although literature has clearly identified the different actions that SMEs should take to maximize the benefits obtained through sound IP management strategies and practices, there is a lack of empirical evidence on how SMEs are implementing the above-mentioned processes, and the key barriers that they experience in the different phases of the IP management process.*

This study, conducted in cooperation with the Italian Patent and Trademark Office (UIBM), aims to assess the level of knowledge and management practices regarding Intellectual Property (IP) among Italian SMEs in the above-mentioned dimensions. According to the European Investment Bank (2021), in 2021 Italy had around 4.3 million SMEs, making up 99.9% of the countries' registered firms, 95% of which were micro-enterprises employing fewer than 10 people. Together these contributed to 70% of Italy's gross value added, 80% of overall employment, and 53% of the country's exports.

The study focuses not only on the practices, but also on the underlying reasons, namely barriers, beliefs, or motivations for SMEs to pursue or not pursue IP management. Through this study, we aim to better inform policymakers on the potential interventions that can be successful in raising the maturity of SME's IP management practices, towards an effective use of IP for their competitiveness.

Methodology. *The research is based on a structured survey administered in two waves, the first between 2018 and 2020, and the second between 2021 and 2023, targeting a broad and diverse sample of non-overlapping SMEs. The first dataset consisted of 1,022 SMEs, while the second dataset consists of 3,082 SMEs. The respondents were identified and contacted through a structured selection process. The survey was administered by personnel from universities, public research institutions, and scientific hospitals as part of a UIBM-funded initiative to enhance university technology transfer offices.*

The data collection relied on both primary and secondary sources: Primary data were gathered through structured interviews using a standardized questionnaire, ensuring consistency and minimizing bias. The questionnaire was formatted as a non-editable Excel file, limiting the interviewer's influence on the questions. Secondary data was extracted from Orbis, providing additional insights into firms' financial performance, governance structures, and innovation-related investments.

The questionnaire was structured around four key dimensions of IP management, each one examined through a series of between 4 and 13 questions:

***Awareness**: Refers to the knowledge of relevant aspects of the IP discipline and the awareness of the competitive and strategic value of IP.*

***Protection**: Concerns the ways in which the company safeguards its IP (registered IP rights and/or informal IP such as trade secrets), as well as the adequacy of these tools in relation to the company's specific activities and the competitive environment in which it operates.*

***Management**: Assesses the resources and practices employed by the company in managing its IP portfolio, considering both an internal perspective (identifying relevant IP to protect and administrative management processes) and an external perspective (i.e., monitoring and enforcement).*

***Valorization**: Analyzes the overall management of the company's IP portfolio, focusing on its integration with the business strategy and the company's inclination to capitalize on commercial opportunities related to IP—not just from a defensive standpoint but also through an open and cooperative management approach.*

*Additionally, the **innovation propensity** of each SME was assessed through questions on R&D activities, in-house technological assets, and external collaborations.*

As longitudinal analysis was not possible due to the lack of overlap between the SMEs present in the two survey waves, our results focus on the second, more numerous datasets, offering also some comparisons with the first data collected in 2018-2020.

The 2021-2023 sample exhibited a regional imbalance, with higher participation from the regions of Lombardy, Emilia-Romagna, Campania, and Puglia. Overall, firms from southern Italy were underrepresented. Regarding firm size, the dataset comprised 44.6% micro-enterprises (<10 employees), 33.3% small enterprises (10-49 employees), 17.7% medium-sized firms (50-249 employees), and 4.4% larger firms (>250 employees).

In terms of industry composition, most respondents operated in manufacturing and services, with fewer firms engaged in software development. Regarding their competitive landscape. 41.3% of SMEs faced more than 10 direct competitors, while 17.4% reported 4 to 10 competitors, indicating a predominantly high-competition environment.

The survey also assessed innovation-related activities: while 69.5% of firms engaged in R&D, only 52.4% had dedicated internal R&D activities. Additionally, 78.6% of SMEs identified internal know-how as their main competitive advantage, surpassing R&D investments (27.5%) and proprietary technological assets (34.4%).

The study's next phase will incorporate inferential statistical approaches to identify links between business characteristics and IP practices, even though the major analyses conducted thus far have been descriptive—suitable for mapping trends in a large and diverse dataset. In particular, we intend to:

- *To determine whether firm-level factors (such as size, R&D intensity, and ownership structure) are predictive of better success across the four IP characteristics*
- *To investigate geographic differences in IP behavior, especially when comparing northern and southern regions, include regional fixed effects.*
- *To investigate whether businesses in high-tech industries exhibit more sophisticated IP valorization techniques, introduce sectoral dummy variables (manufacturing, services, and software).*
- *To see whether the influence of specific company attributes varies depending on the situation, look at interaction effects (size × sector, for example).*

These analyses aim to move beyond description to deliver a systematic, hypothesis-driven exploration of how structural and strategic factors shape IP management among Italian SMEs. Despite acknowledged limitations—such as the inability to conduct panel-based longitudinal analysis and the underrepresentation of some geographic areas—the richness of the dataset supports a wide range of robust analytical strategies.

Results. *The analysis provides important insights into the intellectual property (IP) management practices of Italian SMEs. IT is divided into the four dimensions of awareness, protection, management and valorization.*

Awareness

Despite 58.4% of respondents rating their familiarity with IP as 'excellent' or 'good', 77% of companies surveyed do not have dedicated IP staff or organizational units. This percentage has gotten worse compared to the prior survey, suggesting that internal IP management capabilities have declined. Businesses frequently look for outside expertise for IP knowledge; 81.9% of respondents report actively seeking out information on intellectual property issues, with 32.3% contacting law firms and 44,5% contacting specialized consultants as the top two information sources. Less frequently, are institutional sources like the Italian Patent and Trademark Office contacted by 23.8% of firms and local chambers of commerce by 22.7%. Internal R&D and legal teams are rarely considered to be the main sources of information about intellectual property. Only 12.2% of businesses mentioned their R&D managers and 12.1% mentioned their internal legal departments as their go-to source. Reliance on external expertise (e.g., law firms and consultants) remains high, whereas internal R&D and legal teams are seldom primary sources of IP knowledge. This points to an ongoing outsourcing of strategic IP knowledge, which may limit firms' ability to internalize and sustain innovation capabilities.

Therefore, although businesses acknowledge the value of intellectual property, they frequently lack systematic methods for handling it. Many businesses appear to lack a comprehensive IP management strategy, as evidenced by their heavy reliance on outside expertise and lack of dedicated IP staff. This disparity indicates that, to increase businesses' capacity to successfully safeguard and capitalize on their IP, more funding should be allocated to internal IP training and strategy development.

These findings suggest that awareness is often superficial—acknowledging the importance of IP without embedding it into daily operations. Future analysis will investigate whether firm size, sector, or past engagement with innovation policies predicts deeper organizational investment in IP knowledge.

Protection

The data collected shows that while companies report seeking out IP knowledge and performing internal innovation, their approach to legal protection remains inconsistent. Only 38.7% of companies reported that they regularly consider legal protection for their industrial property, a percentage that has remained stable compared to the previous survey period. The top IP rights obtained are trademarks that are reported by 48% of SMES, while 43% have patents or utility models and 43% report trade secrets.

The survey also examines the perceived advantages and disadvantages of legal protection. Among the advantages, 50.8% of respondents mentioned the company's reputation and credibility, 35.3% mentioned better business prospects, 29.1% mentioned more chances to collaborate with potential clients and business partners, 7.4% improved sales and profits, and 4.3% access to financing. On the other hand, around 26% of SMEs point out major obstacles to implementing legal protection measures. Cost (38.3%) and the administrative burden of protection measures (22.7%) are the most frequently mentioned deterrents, and both have grown considerably since the previous survey period. Moreover, 2.3% of companies report that IP registration didn't prevent infringement, 1.6% believe obtaining IP rights would have delayed their market entry, and 1.3% experienced high litigation costs with adverse outcomes.

Overall, while companies recognize the importance of protecting their intellectual property, many are still struggling to integrate effective protection mechanisms into their business strategies. The findings underscore the need for greater investment in resources and support to improve IP management and ensure that intellectual assets are protected according to a precise management strategy. More granular analysis will test whether perceived barriers are systematically higher among certain firm profiles (e.g., micro-enterprises, firms without prior policy engagement), allowing for better-targeted interventions.

Management

According to the findings, only 22.5% of businesses have internal resources specifically allocated to IP management, while the majority only use outside experts. A basic level of control that prioritizes registration and bureaucratic compliance over proactive protection and enforcement is the outcome of this severe lack of internal competence, which makes IP management especially complex and difficult.

In addition, preventive measure remain rudimentary: only 18% of businesses periodically invest resources in examining IP infringements, and 5.6% said they don't have any internal resources set aside for this purpose. Furthermore, there is still a lack of effective preventive methods against IP infringement. Although only 40.9% of businesses completely lack preventive measures, which is a slight improvement over 2021 (43%), many companies who actively report preventing infringement still rely on crude techniques such as business partner reports (25.7%), or customer complaints (16.5%). As a result, the percentage of companies that report having detected an IP infringement in the last 5 years is only 20%, and this very low level - not in line with previously mentioned estimates from the OECD - could in fact hide an overall ignorance of companies of imitations and infringements that are occurring.

While companies recognize the importance of IP management, their ability to implement effective strategies remains limited by resource constraints and a lack of internal expertise. Businesses that lack organized enforcement procedures are more vulnerable to infringement and less competitive on the market. To address these challenges, companies need to develop more structured IP management practices, invest in specialized personnel and implement comprehensive monitoring systems to protect their intellectual assets. The absence of structured enforcement strategies poses a systemic risk, especially as digital markets and global competition increase exposure to imitation. Planned regression analyses will test whether governance models, innovation intensity, or regional factors predict higher management capabilities.

Valorization

Although the value of formally protecting intellectual property through trademarks and patents is becoming more widely recognized, this recognition often doesn't translate into successful commercial exploitation. First, only 24% of respondents report having specific strategies to valorize their IP. Another 25% reports implementing generic strategies that also include an IP valorization component. Evaluation often happens when transactions are imminent (sale, licensing or funding needs) or for accounting purposes. According to the SMEs, when effectively designed and implemented, IP valorization strategies enhance commercial exploitation of innovation (12.9%), foster new business collaborations (10.4%), prevent imitation (10.1%), and generate direct revenue from licensing (5.5%), with other factors such as influencing technology trajectories, not infringing on others' IP, freedom-to-operate and preventing legal controversy. playing a marginal role.

A full 51% of the SMEs, instead, report having no strategy for IP valorization. In these cases, the belief that the expenses of IP registration and management outweigh the anticipated advantages is one of the biggest challenges. SMEs are deterred from investing in structured IP strategy as a result.

The lack of propensity in actively managing their IP portfolio is reflected also in the limited number of transactions reported involving patents, licenses, and other kinds of technology transfer, where 13% of firms report outgoing IP transactions mainly for financial gain and 24% report incoming IP transactions to acquire knowledge and expand their business (only a small minority for litigation purposes). These low percentages are a result of many SMEs' continued inability to incorporate IP management into their larger business plans.

Finally, the study highlights important weaknesses in strategic IP management. Few businesses routinely evaluate their intellectual property assets in connection to their posture in the market. Only a minority of companies, 14.7% regularly assess the coherence between their IP assets and the markets in which they operate. In addition, 35.8% of companies do not perform any valuation of their IP, while 36.8% perform only partial valuations. As a result, only 25.2% of companies surveyed are fully aware of the economic value of their IP, a figure that has improved only slightly compared to the previous survey.

The results point to the necessity of focused training programs to assist SMEs in incorporating IP into their entire business plan to enhance the economic exploitation of IP. The findings reinforce the need to frame IP as a ***dynamic business asset****, not a static legal instrument. Sectoral comparisons will be explored in the next phase to determine whether knowledge-intensive industries (e.g. software, biotech) exhibit systematically stronger valorization behavior.*

Complementary Analysis

Despite only covering around half of the sample, the secondary data analysis offers a more thorough insight of the businesses polled. According to the data, microbusinesses made up nearly half of the observed sample (44.6%), followed by small businesses (33.3%), medium-sized businesses (17.7%), and larger businesses (4.4%).

In line with previous literature, the significant relationship between business size and innovation capacity is one of the key conclusions. Bigger companies typically make greater R&D investments, amass more intangible assets, and incorporate industrial property into their business plans in a methodical manner. Their capacity to take advantage of economies of scale, enhance intellectual property protection, and lessen the risks connected with intangible investments is partly responsible for this.

The study also examines corporate governance frameworks and how they affect intellectual property management and innovation. Because more formal governance models make it easier to make decisions about risk management and

IP investments, firms with clear governance frameworks are more likely to engage in systematic evaluation of their IP portfolios to ensure alignment with market needs and business strategies.

Another important aspect explored in this section is the relationship between firm size and the awareness, protection, management and exploitation of IP rights. Findings suggest that larger firms not only register more IPRs, but also actively manage and exploit them for competitive advantage. In contrast, smaller firms often lack the financial resources and internal expertise to fully integrate IP rights into their business strategies. While some SMEs recognize the importance of IP, a large proportion still treat it as a passive asset rather than an active strategic tool.

The findings highlight the two problems that many SMEs face: a mismatch between the firms' absorptive capacities and the available assistance measures, as well as a lack of internal IP skills. Future policy design must take firm-side readiness into consideration, providing progressive, modular support mechanisms that scale with organizational maturity, since companies frequently lack the bandwidth to fully engage with complex IP systems.

Furthermore, especially for micro and small businesses, the gap between awareness and action necessitates training and integrated consulting services. Enhancing internal skills will facilitate more active valuation, cooperation, and strategic use of intellectual property in addition to increasing the use of formal protection.

Conclusions. *The results highlight both progress and continuing challenges. Compared to previous surveys, there has been a marked improvement in the general awareness of IP issues. Companies have increasingly turned to external resources and consultancy services to fill internal knowledge gaps. However, structural deficiencies remain, especially the lack of dedicated staff and integrated strategies for IP valorization. These weaknesses limit the effectiveness of protection measures and the economic benefits that companies can derive from their intellectual assets.*

A key observation is that while Italian enterprises show a growing inclination towards formal protection mechanisms, this does not always translate into effective commercial exploitation. Only a minority of SMEs actively develop strategies to manage their IP, as evidenced by the limited number of patent and licensing transactions, which remain marginal compared to their potential. Although incentives for protection and exploitation exist at the national and European level, they have limited effects due to a lack of awareness and know-how in SMEs.

Another critical issue is the perception of the costs associated with registering and managing formal IP. Many SMEs consider these costs to be too high in relation to the expected benefits, discouraging them from adopting comprehensive IP protection and valorization strategies. This challenge is particularly pronounced for micro and small enterprises, which operate with limited resources and must carefully allocate their budgets.

Research limitations. *A limitation of this study concerns the second analysis, the integration of interview data and secondary data on the sample. Specifically, size and financial information was obtained from Orbis by scraping company names. However, companies are more likely to be registered in Orbis if they are large. Thus, a larger percentage of small and medium-sized companies that made up the Orbis sample were excluded from the financial analysis. This will be addressed in further survey editions.*

Managerial implications. *This research provides a comprehensive, data-driven understanding of how Italian SMEs approach IP. The broad sample of 3,082 firms ensures robust generalizability, while the integration of primary and secondary data enhances analytical depth. The findings highlight key gaps in IP awareness and management, particularly among smaller firms, informing future policy recommendations for strengthening IP practices within SMEs.*

To address these challenges, the study recommends several key actions. First, expanding targeted training programs focused on IP management and valorization could improve SMEs' ability to integrate IP into their business models. Second, the introduction of personalized advisory services, such as the EUIPO's IP Scan model, would provide tailored guidance to optimize IP strategies. Third, fostering strategic cooperation between SMEs, large enterprises and research institutions could promote knowledge transfer and innovation through IP. Finally, the establishment of a permanent observatory on IP would allow continuous monitoring and evaluation of policies to ensure that they remain in line with evolving market needs.

Strengthening the IP culture in the Italian SME ecosystem requires a coordinated effort between institutions, companies and specialized consultants. The goal is to change the perception of IP from a mere defensive tool to a strategic asset that can drive competitiveness, innovation and long-term economic growth.

Originality of the paper. *This study offers a unique empirical analysis of IP management in Italian SMEs, integrating survey data from 3,082 firms with secondary financial insights. Unlike prior research, it identifies key barriers to IP valorization and provides actionable recommendations, bridging the gap between theoretical frameworks and real-world SME challenges in IP strategy.*

Key words: *Intellectual Property, SMEs, IP Management, Innovation, Competitiveness, IP Valorization*.

The Dynamic Role of Digital Orientation in Shaping SME Performance

LUDOVICA ANTENOZIO[1] PILAR MARQUES[2] ANDREA BIKFALVI[3]

Abstract

Nowadays, small and medium-sized enterprises (SMEs) are increasingly adopting digital orientation as a strategic approach to enhance competitiveness. While digital orientation is recognized for its potential to drive innovation and financial performance, empirical evidence, particularly for SMEs, remains fragmented and inconclusive yielding mixed results regarding the relationship between digital orientation and organizational performance. Using a panel of 250 SMEs for 10 years and a Generalized Method of Moments (GMM), this study aims to fill this gap by examining the effects of digital orientation on both financial and innovation performance in SMEs. Results reveal that there is an inverted U-shape relationship between digital orientation and financial performance, while a U-shape relationship is found with digital orientation and innovation performance. This study has several implications for both academics and SME managers.

Framing of the research. *Digital orientation, defined as a firm's proactive alignment and integration of digital technologies into its operations (Kindermann et al., 2021), has emerged in the current digital age as a pivotal strategic positioning that shapes how firms operate, utilize resources and develop capabilities, create value, and sustain competitive advantage (Ardito et al., 2021; Kindermann et al., 2021, 2024; Mishra et al., 2024; Ranjan, 2024). Digital orientation encompasses four interrelated dimensions - digital technology scope, digital capabilities, digital architecture configuration, and digital ecosystem coordination - that collectively enhance an organization's potential to innovate and remain resilient amid technological shifts (Kindermann et al., 2021, 2024; Quinton et al., 2018). Digital technology scope refers to the breadth and depth of technological tools adopted by a firm, including cloud computing, artificial intelligence, and data analytics, which enable SMEs to enhance their digital processes and competitiveness. Digital capabilities represent a firm's ability to leverage digital tools effectively, integrating new technologies into existing workflows to optimize productivity, efficiency, and innovation. Digital architecture configuration pertains to the structuring of IT infrastructure and systems within a firm to support digital processes, ensuring scalability, security, and interoperability. Digital ecosystem coordination involves the firm's ability to engage in collaborative digital networks, leveraging partnerships, supply chains, and digital platforms to enhance value creation and business expansion.*

For SMEs, adopting digital orientation is both critical and challenging for their survival and success (Ardito et al., 2021; Barragan et al., 2024; Ranjan, 2024). Unlike large enterprises, which often have dedicated resources for digital transformation, SMEs must navigate digitalization with limited financial and human capital (Park et al., 2020). This makes the strategic alignment of digital orientation crucial, as firms must carefully balance the benefits of digitalization with its associated costs and complexities. Through the lens of the resource-based view (Barney, 1991) and dynamic capabilities (Teece et al., 1997), digital orientation that is considered a valuable strategic asset enables SMEs to leverage digital assets and respond swiftly to changes (Bendig et al., 2023), reinforcing their competitive positioning (Kindermann et al., 2024). Specifically, digital orientation allows SMEs to strategically use digital resources across the organization to optimize internal processes (Li et al., 2023), enhance capabilities, and strengthen their competitive advantage (Barragan et al., 2024; Kindermann et al., 2021). This strategic orientation enables firms to foster new products and services more effectively, enhancing innovation (Ardito et al., 2021), and improving market responsiveness (Bendig et al., 2023; Maurer et al., 2023; Mishra et al., 2024). By leveraging digital orientation, firms achieve digital capabilities and competencies that lead to improved outcomes, offering opportunities to drive both innovation performance and financial performance (Kindermann et al., 2024; Quinton et al., 2018; Ranjan, 2024). Additionally, the ability to successfully implement and integrate these four dimensions is critical for SMEs aiming to remain competitive (Ranjan, 2024). The interplay among these elements determines how well an SME can shift from traditional business models to more digitally driven operations (Matarazzo et al., 2021), ensuring long-term sustainability and growth (Barragan et al., 2024).

DOI 10.7433/SRECP.SP.2025.01

Despite these potential benefits, the scholar understanding of digital orientation's impact in firms remains fragmented and underexplored, with existing research yielding inconclusive results for both innovation performance and financial performance, especially in SMEs. For example, Ranjan (2024) highlighted a positive link between digital orientation and innovation performance in Indian SMEs, while Nasiri et al. (2022) found no conclusive evidence on whether and how digital orientation enhances financial performance in Finnish firms. This inconsistency underscores a critical research gap regarding the strategic pathways through which digital orientation translates into financial and innovation success for SMEs (Ardito et al., 2021; Barragan et al., 2024; Ranjan, 2024).

Furthermore, while digital orientation offers SMEs the promise of increased adaptability and competitive advantage, the intrinsic characteristics of these firms may limit the sustained benefits of a high level of digital orientation (Barragan et al., 2024). As digital orientation intensifies, SMEs may face challenges associated with managing complex digital systems and maintaining flexibility (Kindermann et al., 2024). High levels of digital orientation often require specialized knowledge and capabilities (Li & Shao, 2023) that SMEs may lack, increasing dependency on external expertise and inflating costs. Additionally, coordinating the interrelated dimensions of digital orientation requires careful management; failure to do so may generate friction with ecosystem partners and customers, potentially leading to operational inefficiencies and diminished performance (Kindermann et al., 2021). Moreover, regarding innovation performance, overemphasis on digital orientation might lead to organizational inertia, where firms become overly reliant on existing digital systems and less capable of adopting new innovative practices.

These insights suggest that digital orientation may initially enhance performance up a certain point, where further increases in digital orientation may yield diminishing or negative performance for SMEs. For example, excessive investments in digital architecture and ecosystem coordination may tie up resources that could otherwise be directed toward core business functions, potentially leading to rigidity, reduced adaptability, and resource strain (Kindermann et al., 2024). Specifically, managing extensive digital ecosystems can create strategic misalignment integrating challenging new digital processes within the existing business models, potentially eroding both financial performance and innovation performance by diverting attention and resources away from core competencies and creating operational inefficiencies. Therefore, an inverted U-shaped relationship may better capture the effects of digital orientation on financial performance and innovation performance in SMEs.

Addressing this research gap, our study investigates the relationship between digital orientation, innovation performance and financial performance over time and accordingly, we posit:

***H1**: Digital orientation has a curvilinearly effect (inverted U-shape) on SMEs' innovation performance*

***H2**: Digital orientation has a curvilinearly effect (inverted U-shape) on SMEs' financial performance.*

By empirically testing these hypotheses, our study contributes to the literature by providing nuanced insights into the effects of digital orientation on SMEs' organizational performance. This research not only fills a relevant gap in the existing literature but also offers valuable implications for SME managers.

Purpose of the paper. *The objective of this paper is to explore the relationship between digital orientation and SME performance, considering both financial performance and innovation performance. Despite extensive literature on digitalization, the role of digital orientation in SMEs remains unclear, with contradictory findings. This study aims to address this gap by analyzing an original dataset of 250 Italian SMEs over a ten-year period (2013–2022) using a Generalized Method of Moments (GMM) model. A key motivation for this research lies in the growing necessity for SMEs to integrate digital technologies within their operations to remain competitive in an increasingly digital economy. While larger enterprises have the resources and strategic flexibility to adopt digital tools at scale, SMEs often struggle due to financial constraints, lack of technical expertise, and difficulties in managing digital transformation processes. Understanding how DO influences SME performance is crucial in helping managers make informed decisions about digital investments, ensuring that these investments are optimized for long-term success rather than leading to diminishing returns. Moreover, the study responds to the need for empirical validation of DO's impact on SME competitiveness. Many prior studies have focused on large firms, overlooking how SMEs navigate digital transformation differently. By focusing on a diverse sample of SMEs, this research provides a more granular understanding of DO's role in shaping financial and innovation outcomes, emphasizing the unique challenges and opportunities present in the SME context. Additionally, it offers practical insights for policymakers aiming to support SMEs in their digital adoption strategies, helping to bridge the gap between theoretical research and real-world applications. The empirical analysis will provide insights into the nonlinear relationship of digital orientation in the context of SMEs by aiming to advance existing research in three ways (i) by increasing the knowledge of digital orientation in SMEs, (ii) by constructing an original data panel by collecting variables with an innovative approach, Wayback machine tool and mission statement analysis. By contributing to both theory and practice, this paper aims to serve as a reference point for future studies exploring the evolving role of DO in SME success, ultimately guiding firms toward more effective digital transformation strategies that enhance performance without incurring unintended negative consequences.*

Methodology. *We constructed an ad hoc balanced panel dataset of 250 Italian SMEs over a ten-year period (2013–2022), resulting in 2.500 observations using probability-proportional-to-size-sampling to have a representative sample across Italy to ensure highly heterogeneity. The sample reflects the European and Italian context characterized by SMEs all over the country with a clear distinction across sector and enhance the external validity of our results to the EU countries. To do this we used different sources: AIDA Database, Crunchbase, SMEs' website with Wayback Machine tool and Italian Chambre of Commerce register for SMEs. These sources were used to extract both financial and innovation-related variables, ensuring a comprehensive assessment of SMEs' digital orientation and performance over time. The*

combination of structured financial data and unstructured textual data from company websites provides a robust basis for analyzing the impact of DO on SME performance. To ensure data accuracy, we employed a multi-step validation process, cross-referencing multiple sources to reduce the risk of missing or misclassified data. Additionally, we performed data cleaning and preprocessing to mitigate potential inconsistencies in reporting standards across different sources. The use of the Wayback Machine enabled us to track historical changes in SMEs' digital presence, allowing for a more dynamic measurement of DO variables. To ensure the academic rigour, SMEs are defined according to Europe 2002[4] and European Commission[5] definitions.

Digital orientation, the independent variable, was measured using the principal component analysis (PCA) of the four dimensions - digital technology scope, digital capabilities, digital architecture configuration, and digital ecosystem coordination. The analysis used content form the Italian Cambre of commerce register for SMEs, where descriptions of company activities were extracted and processed using MaxQDA software to identify the specific words[6] related to these dimensions. Each dimension was operationalized using keyword frequency analysis applied to textual data. To ensure robustness, the back translation method was applied, translating the words from English to Italian and vice-versa to add consistency. Innovation performance, the first dependent variable, was measured by the number of patents registered annually. Patent data were collected via an innovative method utilizing the Internet Archive's Wayback Machine and cross-validated with Crunchbase Pro. This measure captures both the quantity and quality of innovation output over time. Financial performance was assessed using Return on Sales (ROS), a widely accepted metric that reflects a firm's operational efficiency and profitability. ROS was calculated as the ratio of net income to total sales revenue, allowing for cross-sectional comparisons among SMEs in different industries. Additionally, we included several control variables – firm age measured by the natural logarithm of the number of years since the firm's founding, firm size measured by the total number of employees, total assets as a proxy for firm resources, included as a control for financial capacity, manufacturing industry measured by a dummy variable indicating whether the firm operates in the manufacturing sector (1 for the manufacturing industry, 0 otherwise), innovation intensity by a dummy variable based on industry-wide innovation benchmarks followed Peneder (2010) approach.

We employed the two-step Generalized Method of Moments (GMM) estimator to test our hypotheses, due to its ability to account for dynamic panel data structures, mitigating potential endogeneity issues by incorporating lagged dependent variables as instruments. This approach also addresses heteroskedasticity and autocorrelation, enhancing the reliability of coefficient estimates. Model specification tests, including the Hansen test for instrument validity and the Arellano-Bond (2) test for autocorrelation, confirmed the suitability of our empirical approach. To further validate our findings, we conducted robustness checks using alternative model specifications, including fixed-effects regression and random-effects models. These additional tests confirmed the stability of our results across different estimation techniques.

Results. *The results reveal no support for H1 showing a U-shaped relationship between digital orientation and innovation performance in SMEs. Higher levels of digital orientation initially correlate with decreased innovation performance, but after a threshold, digital orientation investments start to positively affect innovation performance. This suggests that early-stage digital investments may disrupt existing innovation structures, but over time, as SMEs refine their digital strategies, the benefits begin to start. The transition from initial inefficiencies to improved IP indicates that digital transformation requires an adaptation phase before delivering positive innovation outcomes. Conversely, we found an inverted U-shaped relationship between digital orientation and innovation performance, supporting H2. Initially, increasing digital orientation enhances financial performance, up a certain point after which the positive role of digital orientation for financial performance start to diminish. This finding highlights the need for SMEs to adopt a balanced digital strategy, ensuring that investments align with operational capacity and financial sustainability. These results underscore the complexity of DO's impact on SME performance, reinforcing the argument that digital adoption should be carefully managed to avoid inefficiencies. While moderate levels of DO yield substantial benefits, overcommitment to digital transformation without strategic alignment can erode performance, making it crucial for firms to evaluate the scalability and feasibility of their digital initiatives.*

Research limitations. *This study has several limitations. First, the sample is limited to Italian SMEs, which may restrict the generalizability of results to other geographical and economic contexts. While Italy offers a compelling setting due to the strong presence of SMEs in its economy, extending the analysis to SMEs in different countries would provide a more comprehensive understanding of how DO influences firm performance in varying institutional and market conditions. Future research could expand the scope to include SMEs from different European nations or global markets to assess whether similar curvilinear patterns hold in different economic environments. Second, the measurement of digital orientation relies on textual analysis of business information, which may not fully capture the depth of digital integration within firms. Third, despite controlling endogeneity using GMM, potential unobserved factors influencing digital orientation-performance relationships may still exist. Future research could examine how firm-specific characteristics, such as ownership structure, internationalization strategies, and sector-specific technological intensity,*

4 The category of micro, small and medium-sized enterprises (SMEs) is made up of enterprises which employ fewer than 250 people, and which have an annual turnover not exceeding EUR 50 million, and/or an annual balance sheet total not exceeding EUR 43 million, *"Commission Recommendation of 6 May 2003 concerning the definition of micro, small and medium-sized enterprises" https://ec.europa.eu/smes/*

5 https://ec.europa.eu/reg.innov.score.2023

6 See Kindermann (2021) for the list of the word and see Barragan (2024) for the step involved in this research approach

moderate the DO-performance link. Investigating these factors could enhance the digital transformation strategies tailored to different SME profiles.

Managerial implications. *This study contributes to the literature on strategic management and digital transformation by elucidating the non-linear effects of digital orientation on SMEs' performance. The U-shaped relationship with innovation performance supports the notion that initial digital orientation efforts might disrupt existing innovation processes, but sustained investment eventually leads to enhanced innovation capabilities. The inverted U-shaped relationship with financial performance suggests that while digital orientation can be a valuable strategic asset, overinvestment without adequate resource alignment may lead to inefficiencies. These findings underscore the importance of a balanced and strategic approach to digital orientation implementation in SMEs. Managers should recognize that while adopting digital technologies can drive performance gains, there is a critical inflection point beyond which additional investments may not yield proportional benefits and could strain limited resources. Moreover, given that digital orientation consists of multiple interrelated dimensions, managers must adopt a balanced approach when implementing digital strategies. Overinvesting in one dimension (e.g., digital architecture configuration) while neglecting others (e.g., digital ecosystem coordination) can lead to inefficiencies and suboptimal performance. Managers should focus on integrating all four dimensions holistically to maximize the synergies between technological infrastructure, digital skills, and external collaborations. To optimize both innovation and financial outcomes, SMEs should seek the alignment of digital orientation initiatives with organizational capabilities, to ensure an adequate resource allocation, and continuously monitor the impact of digital orientation on their performance. Additionally, SMEs should prioritize scalable digital solutions that offer flexibility without overburdening financial or human resources and they should leverage external partnerships and industry networks to mitigate the challenges associated with digital transformation. Collaboration with technology providers, industry consortia, and government initiatives can help SMEs access financial support, expertise, and shared digital infrastructure, reducing the costs and risks of digital adoption. Finally, policymakers play a crucial role in facilitating SME digitalization. Governments and industry associations should design targeted support programs that provide SMEs with access to funding, digital training, and technology consultancy services. Additionally, regulatory frameworks should be developed to ensure that SMEs can integrate digital tools without facing excessive compliance burdens.*

Originality of the paper. *This research offers three key contributions. First, it provides a novel perspective on digital orientation, demonstrating its curvilinear impact on SME performance—an area underexplored in existing literature. Unlike prior studies that assumed a linear relationship between digital transformation and performance, this paper highlights the nuanced dynamics that emerge when SMEs overcommit to digital investments, ultimately leading to inefficiencies and constraints. By adopting this perspective, the study challenges conventional assumptions and offers a more refined understanding of how SMEs should approach digitalization. Second, this research employs an innovative methodology to measure digital orientation, leveraging textual analysis and the Wayback Machine for longitudinal data collection. The use of textual data from SME websites, combined with PCA, allows for a more comprehensive measurement of DO compared to traditional survey-based approaches. This methodological advancement enhances the study's rigor and offers a replicable framework for future research seeking to analyze digital strategies in SMEs. Third, it addresses an empirical gap by analyzing a unique dataset of 250 SMEs over a decade, providing a robust longitudinal perspective on the interplay between digitalization and performance. Unlike cross-sectional studies that offer only a snapshot of digital adoption, this paper examines how DO influences firm outcomes over time, capturing long-term trends and their implications. The findings are particularly relevant for SMEs looking to develop sustainable digital strategies, as they highlight the importance of balancing digital investments to maximize performance without overextending limited resources. Additionally, these insights are valuable for academics and practitioners in navigating the digitalization challenges faced by SMEs.*

Key words: *Digital orientation, SMEs, performance, inverted U-shape, Resource based view, Dynamic capabilities.*

Digital Tools as Olympionic: Exploring the Real Golden Medal in SMEs Performance

LUDOVICA ANTENOZIO[1] FRANCESCO PAOLO APPIO[2]

Abstract

"In the Olympics, the difference between gold and silver is often a matter of milliseconds. Success is determined not only by raw talent but by strategic choices, preparation, and the ability to adapt under pressure".
Digitization offers SMEs a wide range of opportunities, but not all digital tools contribute equally to business success. While some serve as prerequisites for market presence, others can become key drivers of financial performance. This study aims to analyze the strategic role of three key digital tools -website, e-commerce, and social media- in determining SMEs' financial performance over time. Using an Olympics-inspired framework, we classify these digital tools into gold, silver, and bronze based on their impact on SME performance, validating this classification through an empirical analysis based on the Generalized Method of Moments (GMM). The results offer significant managerial implications, providing SMEs with strategic guidance to allocate digital investments effectively.

Framing of the research. *In the world of competitive sports, winning is not just about participation but about making the right strategic choices. The Olympic Games celebrate excellence, determination, and strategic choices that lead athletes to victory. Athletes who reach the Olympic podium fail by chance; they meticulously plan their training, optimize their performance, and make data-driven decisions to outperform their competitors. Similarly, small and medium-sized enterprises (SMEs) must navigate digital transformation with strategic precision and digital decisions to remain competitive in an increasingly digital economy (Bharadwaj et al., 2013). Just as athletes train for years to perfect their performance, SMEs must carefully integrate digital tools to achieve sustainable financial success (Cenamor et al., 2019; Park et al., 2020; Stieglitz & Heine, 2007; Urbano et al., 2024).*

In recent years, digitization has become a key component of business competitiveness, with many enterprises investing in digital tools to improve their performance (Bharadwaj et al., 2013; Nambisan et al., 2019). Digitalization offers SMEs a wide range of opportunities (Appio et al., 2021) but not all digital tools contribute equally to business success. Some serve as basic prerequisites for market presence (Thompson et al., 2013), while others act as key drivers of financial performance (Bhatti et al., 2024). This distinction is crucial because SMEs often face resource constraints forcing them to allocate investments wisely (Park et al., 2020). Firms must determine whether their digital strategies serve as a foundation or as a competitive advantage (Bharadwaj et al., 2013), and whether these strategies generate measurable financial benefits over time (Eller et al., 2020; Matt et al., 2015; Warnke et al., 2024).

However, while large enterprises have established resources and strategies to implement digitization, SMEs face unique challenges, including limited resources and more focused strategic decisions (Benitez et al., 2018; Park et al., 2020; Z. Zhang et al., 2022). Despite the increasing academic attention to digitization, there is still a gap in literature regarding the measurement and evaluation of the impact of different digital tools on SMEs and their performance (Skare et al., 2023). Additionally, researchers call for longitudinal analysis on such topic. Existing indices related to Europe's Digital Decade of European Commission, such as the Digital Economy and Society Index[3] (DESI) and the Digital Intensity Index[4] (DII), while providing a general picture of the level of digitization, do not adequately capture differences across industries, nor do they distinguish between the needs of B2B and B2C businesses as these indicators are at the national level. Researchers have used market indicators using them as proxies for firms and ask to consider firm- and industry-level SME indicators (Skare et al., 2023). They also do not consider the emerging role of innovative digital tools such as social media, which are becoming increasingly central to SMEs.

For innovative SMEs that are unable to pursue growth strategies due to the lack of resources (Benitez et al., 2018; Park et al., 2020; Z. Zhang et al., 2022), one of the main advantages of digital tools is that SMEs enable them to enhance internal communication, processes and access new market opportunities (Bharadwaj et al., 2013; Eller et al., 2020) and

reduce costs (Proksch et al., 2024). In this context, Website, e-commerce and social media are three different tools that serve and act differently (Lepore et al., 2023; Martínez-Caro et al., 2020; Warnke et al., 2024).

The website represents the essential foundation of SME's digital identity, enabling visibility and credibility in an online-driven economy (Thompson et al., 2013). However, having a website alone may not be sufficient to drive financial success. For that reason, e-commerce could be a helpful strategic expansion that allows SMEs to generate direct revenue by reaching customers beyond physical store limitations (Yeow et al., 2018). While potentially transformative, its effectiveness depends on industry dynamics and execution. The third element is social media, that have emerged as a critical component of digital strategy (F. Zhang & Zhu, 2021), offering SMEs versatile tools to allows the opportunity to conduct business strategically (Ainin et al., 2015; Mount & Martinez, 2014; Testa et al., 2020).

Just as Olympic athletes must make critical decisions about their training regimens, resource allocation, and competitive strategies to secure a place on the podium, SMEs must strategically select which digital tools to prioritize to achieve financial success. However, not all digital strategies lead to gold, and firms must determine whether their investments serve as true performance enhancers or merely baseline prerequisites for participation in the digital economy.

This study addresses the problem of identifying which digital tools actually represent a competitive advantage for SMEs by assessing their impact on business performance. The proposed model introduces an analogy with the Olympic Games, ranking digital strategies according to their ability to generate financial value over time.

Based on this recent literature, the study aims to answer the following questions:

RQ: "Which digital strategy-website, e-commerce, or social media-has the greatest impact on SMEs' financial performance?" and "How is the ranking of digital strategies based on their prevalence among top-performing SMEs confirmed by empirical results in the long run?"

This study aims to bridge that gap by analyzing how three key digital tools-website, e-commerce, and social media-influence SMEs' financial performance over time. Following an innovative approach, our study introduces an Olympic metaphor to rank these tools according to their impact on business performance, assigning them a "gold," "silver," or "bronze" according to their strategic effectiveness. Using longitudinal data on a sample of Italian SMEs from 2013 to 2022 and adopting a methodology based on the Generalized Method of Moments (GMM), our study not only provides a descriptive ranking of the most popular digital strategies among successful SMEs, but also empirically tests whether the perceived ranking correlates with long-term financial growth.

By applying an Olympic podium metaphor, this study provides SMEs with a strategic decision-making framework, enabling them to prioritize digital investments based on measurable outcomes rather than common industry assumptions.

Purpose of the paper. *The objective of this study is twofold. First, we want to create a classification of the most popular digital strategies among high-performing SMEs, identifying which among websites, e-commerce, and social media is most associated with business success. Second, we intend to empirically test whether this classification is indeed indicative of a causal relationship with financial growth in the long run.*

Our work contributes to the literature in three main ways: (i) the introduction of an innovative Olympics-inspired framework in which digital tools are ranked as gold, silver, and bronze based on their contribution to business growth, (ii) use an advanced methodology based on longitudinal data and the Generalized Method of Moments (GMM) to test the validity of the classification based on the DII European index, (iii) we offer practical implications for SME managers, helping them make informed decisions about which digital tools to adopt and which to invest in the most.

Methodology. *To evaluate the strategic effectiveness of digital investments in SMEs, this study employs a two-phase empirical approach that integrates descriptive performance ranking with econometric validation across a sample of Italian Innovative SMEs. This methodology allows us to first classify digital strategies based on their association with high-performing firms and then empirically test whether this ranking remains valid over time. Our analysis focuses on SMEs, where digital presence and customer engagement play a direct role in revenue generation. The dataset consists of longitudinal firm-level data from 2013 to 2022, collected from multiple sources: Digital Economy and Society Index (DESI) that provides country-level indicators on social media adoption, e-commerce penetration, and website presence. However, since DESI and DII operate at the national level, it does not capture firm-specific digitalization. To overcome this limitation, this study utilizes Wayback Machine archives to track the historical adoption of these digital tools at the firm level, ensuring that DESI-based indicators are transformed into company-specific measures. The Wayback Machine is employed to systematically extract and verify historical digital adoption data for each firm, allowing us to construct time-series variables for the website presence (whether and when a firm launched a website), e-commerce functionality (whether the website features an online store) and social media adoption (the presence of business-linked social media accounts over time). For the financial performance metrics, the study used Return on Sales (ROS) that is the primary dependent variable, sourced from AIDA database. Additional controls include ROA, firm size, industry classification, and investment intensity to ensure robust estimations. By integrating Wayback Machine data with DESI indicators, this study provides a firm-specific perspective on digital adoption, bridging the gap between macro-level digitalization trends and individual firm performance. The final dataset comprises 250 SMEs across multiple industries, ensuring a broad sectoral representation while controlling for industry-specific digital adoption trends.*

The first phase establishes an initial digital strategy ranking based on SMEs' financial performance. This is achieved through the following steps: Firms are ranked based on ROA (Return on assets) from highest to lowest over the 10-year period. A weighted performance score is assigned based on the ROA tercile classification. The final score accounts for

longitudinal consistency to mitigate the influence of outliers. Additionally, for each firm, we assess the presence of websites, e-commerce, and social media using Wayback machine for historical records.

We compute the prevalence of each digital strategy among high-performing SMEs to create an initial ranking: Gold to the most frequently adopted digital strategy among high-performing firms; silver to the second most prevalent strategy and finally Bronze to the least prevalent among top-performing SMEs. For the statistical validation of descriptive ranking the correlation analysis between digital adoption and financial performance was employed to establish preliminary relationships. Cluster analysis is applied to detect whether distinct performance groups emerge based on digital adoption patterns. This ranking serves as the basis for empirical validation, testing whether the "gold" strategy is truly the most effective in driving SME financial performance over time.

To test whether the initial descriptive ranking holds over time, we employ a Generalized Method of Moments (GMM) approach between each of the three indicators and financial performance, an econometric technique that accounts for dynamic panel data, endogeneity, and firm-specific heterogeneity.

Results. *Preliminary cluster analysis on SMEs over the period 2013-2022 provides interesting results regarding the hierarchy of adoption of digital tools and their evolution on the Olympic podium over time. Considering the entire 10-year period, the website emerges as the most popular digital strategy among SMEs, followed by social media, while e-commerce ranks third. However, a more detailed year-by-year analysis reveals a significant evolutionary dynamic, reflecting the process of SMEs adapting to technological changes and market pressures. These results challenge the assumption that universal digital adoption equates to financial success, emphasizing the importance of strategic prioritization over broad adoption. Through 2020, the website steadily maintains its position as the most adopted digital tool, confirming it as a key element of SMEs' online presence. E-commerce, initially in second place until 2014, begins to lose ground as of 2015, dropping to third place, while social media-which was the third choice until 2014-gains positions as of 2015, becoming the second most adopted tool. The most striking trend emerges in 2020, when social media overtakes the website, becoming the most popular digital tool among SMEs. This overtaking suggests a shift in the strategic priorities of companies, which are increasingly oriented toward direct and interactive channels of communication with the market, rather than a simple static online presence.*

These results are particularly relevant because they highlight the ability of SMEs to adapt to external inputs and the digital transformation required by the market and the target community. The increasing centrality of social media in the digital landscape of SMEs suggests that companies are meeting expectations for greater interaction, engagement and personalization in their relationship with customers. Moreover, the overtaking of social media over websites can be attributed to the rising of social commerce. Platforms like Instagram, Facebook and TikTok have integrated e-commerce functionalities, allowing SMEs to sell directly through social media, reducing their reliance on traditional e-commerce infrastructure and website and reinforcing social media as a key driver of digital strategy. In addition, the e-commerce decline after 2015 may be related to the increasing competition from large online sales platforms (e.g., Amazon), which have made it more difficult for SMEs to compete with direct channels with low cost.

However, when we analyze the effect of these digital strategies on financial performance, the picture becomes more complex. Preliminary results indicate that the website, while being the most adopted strategy for much of the period analyzed, does not have a significant impact on ROA (Return on Assets). This suggests that a simple online presence is not sufficient to generate measurable financial benefits. In contrast, social media shows a positive and statistically significant relationship with ROA, indicating that SMEs that actively adopt these platforms succeed in improving their financial performance.

These findings open new research perspectives and offer important strategic insights for SMEs. While website adoption remains a necessary foundation for digitization, financial effectiveness appears to be linked to more dynamic digital strategies, such as social media, that enable SMEs to make direct connections with the market, strengthen the brand, and increase customer engagement. The loss of relevance of e-commerce to social media also highlights how SMEs may be more inclined to use digital tools that require lower initial investments and provide a faster return on investment.

Research limitations. *Despite the fresh contribution of this study, there are some limitations intrinsic to its quantitative nature that need to be taken into consideration and may represent insights into future research developments. First, the study focuses on one country, but it is common to most empirical studies on SMEs. Second, we focus on 250 SMEs given the difficulty in gathering data. This is intrinsic to empirical studies, which consider small samples. Third, we acknowledge that other factors (e.g., corporate governance, industry-specific dynamics and organizational culture) may play a role in the relationship between digital tools and SMEs performance. Fourth, measuring digitization in SMEs presents a complex methodological challenge. Our study adopts an approach that combines different sources, including the Wayback Machine to track the historical presence of digital tools. However, this methodology may not fully capture the quality and actual use of these digital tools.*

Managerial implications. *This study introduces a new classification model that evaluates SMEs' digital strategies through an Olympic podium framework, offering a novel approach to assessing the effectiveness of digital adoption. By ranking website presence, e-commerce adoption, and social media usage in relation to financial performance, the study provides insights into how SMEs can strategically allocate digital resources rather than simply following industry trends.*

A key theoretical contribution of this research lies in testing the misalignment between perceived importance and actual financial impact. While some digital tools are widely adopted and often assumed to be critical for success,

empirical validation may reveal a different reality. This study bridges the gap between descriptive rankings, based on prevalence among high-performing firms, and econometric validation, which tests their true financial impact over time. Additionally, this research expands the literature on digital transformation in SMEs by integrating econometric modeling with strategic decision-making frameworks. Existing studies primarily focus on broad digitalization trends, yet few provide a structured framework for ranking digital strategies based on longitudinal financial outcomes. By applying a dynamic panel data approach (GMM), this study contributes a more rigorous, data-driven perspective on digital decision-making in SMEs.

From a managerial perspective, the findings of this study emphasize that SMEs should prioritize digital investments based on financial returns rather than simply adopting digital tools for market presence. While digitalization is often framed as a necessary step for business growth, not all digital strategies contribute equally to long-term financial performance. This research provides a data-driven approach to help SMEs determine which digital tools deliver tangible economic benefits rather than assuming that digital presence alone is sufficient.

In particular, the results suggest that e-commerce and social media strategies may yield higher financial benefits over time compared to websites alone. Although websites are considered a fundamental part of digital infrastructure, their impact on firm profitability may be less direct than interactive and revenue-generating digital tools. This challenges the conventional view that a strong website presence automatically translates into financial success and encourages SMEs to rethink their digital priorities.

Moreover, these findings have direct implications for policymakers. Given the increasing importance of social media as a key driver of SMEs performance, government initiatives and funding programs for digitalization should consider providing more targeted support. Current EU and national policies often focus on broad digital adoption, but future policies could be refined to support the strategic adoption of the most effective tools. For example, governments could support SMEs in identifying which digital tools offer the greatest returns on investment and avoid incentivizing indiscriminate digitization without a clear link to financial performance.

The Olympic-style framework proposed in this study serves as a decision-making tool that enables SMEs to allocate digital resources more effectively. By understanding which digital strategies drive financial performance, managers can optimize their digital investments, ensuring that limited resources are directed toward tools that offer the highest return on investment.

Originality of the paper. *This study stands out for its innovative approach to the analysis of SMEs' digital strategies, filling a significant gap in the literature on corporate digitalization. Much of the existing research focuses on large firms, using standardized digitalization metrics such as the Digital Economy and Society Index (DESI) and the Digital Intensity Index (DII), which, while providing a general overview, do not take into account the structural differences between SMEs and large firms, nor the specificities of the sector or the distinctions between B2B and B2C business models.*

The main contribution of this paper is twofold. First, we propose an Olympics-inspired classification framework that introduces a new way of assessing the effectiveness of digital strategies in SMEs. The use of the podium metaphor (gold, silver, bronze) allows us to overcome the limitations of conventional measurements, offering a clear hierarchy based on the actual financial impact of digital tools. This approach provides immediate operational guidance for SMEs, helping them identify the most effective digital strategies in an environment of limited resources. Second, our study uses a longitudinal analysis based on firm-specific data, overcoming the problem of sectoral heterogeneity and the macroeconomic approach typical of DESI- and DII-based studies. Through the integration of financial data from AIDA with historical digitization data extracted from the Wayback Machine, we offer a more accurate measurement of firm-level digital adoption, filling an important gap in the literature. In addition, the use of the Generalized Method of Moments (GMM) allows us to verify the robustness of the identified relationships, addressing the problem of endogeneity and ensuring more reliable results.

An additional element of originality lies in the consideration of the role of social media as an innovative digital intangible resource. While the traditional literature tends to focus on more established digital tools, such as websites and e-commerce, our study explores the contribution of social media not only as marketing tools, but also as strategic levers for SME growth. This broadens the understanding of the impact of digitization, highlighting how relatively new tools can become key elements for business success.

Finally, our work has important implications for policy makers and managers. The redefinition of digitization metrics suggested by the study invites institutions to develop more refined indicators that consider the specific realities of SMEs and their competitive environment. For managers, the proposed framework provides a strategic compass, helping them avoid ineffective digital investments and focus on tools that can truly generate value in the long run.

With these elements, our study not only contributes to enriching the literature on SME digitization but also offers a practical model for guiding businesses toward a more informed and effective adoption of digital technologies.

Key words: *Digitalization, SMEs, Digital strategy, Financial performance, Digital tools.*

Driving social impact through innovation: The strategic role of SMEs in B2B markets

ANGELA CARIDÀ[1] MARIA COLURCIO[2] JAQUELINE PELS[3] VANIA VIGOLO[4]

Abstract

Amid increasing pressure for firms to align with societal goals, small and medium-sized enterprises (SMEs) are emerging as underrecognized yet pivotal agents of social innovation. This study investigates how SMEs can embed social objectives into core B2B procurement strategies to promote inclusive economic development, particularly in informal-market contexts. Drawing on an action research case-Juntos Compras con 100% Impacto Social-the paper examines how SMEs, supported by intermediation structures, use social procurement to integrate marginalized producers into formal value chains. Findings reveal that SMEs intentionally reconfigure supply chains not as a response to compliance pressure, but as a strategic act of co-creating social and economic value. By reframing procurement as a socially innovative practice, this research contributes to corporate social innovation (CSI) theory, challenging assumptions of SME passivity and extending the role of procurement beyond transactional efficiency. The study offers practical insights for managers and policymakers on building equity-driven supply networks in emerging economies.

Framing of the research. *In recent years, firms have encountered growing pressure to align their operations with broader societal goals, reflecting an emerging consensus that enterprises, irrespective of size, must balance financial performance with contributions to social well-being (Morsing and Perrini, 2009; Porter and Kramer, 2011; Omowole et al., 2024). This shift, fueled by regulatory changes, rising stakeholder expectations, and voluntary commitments, has prompted firms to embed ethical and social considerations into their strategic frameworks (Morsing and Perrini, 2009). Within this context, small and medium-sized enterprises (SMEs) emerge as critical yet underexplored agents of social innovation, leveraging their economic weight and local embeddedness (Omowole et al., 2024; Stekelorum, 2020). In the European Union, SMEs constitute 99.8% of non-financial businesses, employ 88.7 million people, and average 57 per 1,000 inhabitants (Katsinis et al., 2024), while globally they account for 90% of firms, over half of employment, and up to 40% of GDP in emerging markets (OECD, 2023). Despite their pivotal role in economic development, scholarly focus has disproportionately favored large corporations' capacities for corporate social responsibility (CSR) and corporate social innovation (CSI) due to their resource advantages (Dionisio and de Vargas, 2020; Mirvis et al., 2016), sidelining SMEs' unique strengths-agility, local responsiveness, and grassroots engagement (Dionisio and de Vargas, 2020; Omowole et al., 2024). This gap is particularly pronounced in low-income economies, where informal markets dominate and SMEs' proximity to informal sellers positions them to bridge formal and informal systems, yielding significant social value (Pels et al., 2022; Omowole et al., 2024). Yet, their potential remains under-theorized, marking a critical oversight in management and innovation literature (Saebi et al., 2019; Mongelli and Rullani, 2024).*

Purpose of the paper. *This paper investigates how SMEs can overcome inherent constraints-such as limited financial resources, managerial capacity, and institutional support (Katsinis et al., 2024; Luetkenhorst, 2004)-to drive social innovation through strategic engagement in B2B markets. By integrating social objectives into core strategies, SMEs can foster innovation that not only enhances differentiation, value creation, and sustainability but also stabilizes local economies, promoting social cohesion, legal protections, labor rights, and inclusive growth (Barraket and Loosemore, 2018; Mongelli and Rullani, 2024; Omowole et al., 2024). Central to this inquiry is social procurement, a form of social innovation that reframes purchasing as a strategic tool for social impact beyond transactional exchange (Barraket, 2019; Meqdadi et al., 2020). The study examines Juntos Compras con 100% Impacto Social (Juntos), a commercial intermediary connecting formal businesses with informal vendors through inclusive procurement (Pels, 2024). This case elucidates how SMEs can embed social goals into B2B supply chains, particularly in informal-market contexts, leveraging procurement to catalyze economic formalization and societal transformation (Stekelorum, 2020). By extending existing literature, this research offers a fresh perspective on SMEs as drivers of innovation with enduring societal impact.*

Social Innovation in the Realm of SMEs. *Scholars have probed social innovation through eclectic theoretical frames, merging economic and sociological insights to dissect its emergence within systemic contexts (Cajaiba-Santana, 2014; Moulaert et al., 2017; Pol and Ville, 2009). Institutional and structuration theories illuminate how social innovation integrates into formal systems, propelled by public, private, or civil society actors (Cajaiba-Santana, 2014; Herrera, 2015; Haxeltine et al., 2016; Moulaert et al., 2017, 2019). Defined as the design and deployment of novel ideas, practices, or offerings to meet unmet social needs, enhance welfare, and spur transformative change (Caulier-Grice et al., 2012; Howaldt et al., 2021; Moulaert and MacCallum, 2019; Pol and Ville, 2009), social innovation targets structural inequities-especially for marginalized groups-with scalability across micro, meso, and macro domains (Cunha and Benneworth, 2020; Grimm et al., 2013). It transcends temporary fixes, fostering systemic shifts through deliberate collaboration, recalibrating power, resources, and community agency (Cajaiba-Santana, 2014; Caridà et al., 2022; Haxeltine et al., 2016; Pel et al., 2020).*

Within the for-profit sphere, CSI melds market logic with societal gain (Dionisio and de Vargas, 2020; Herrera, 2015; Mirvis et al., 2016; Morsy et al., 2024), demanding dual value-social and commercial-via innovative design or supply chain realignment to tap underserved markets (Szegedi et al., 2016). Embedding CSI hinges on an innovation-driven culture, where intrapreneurs catalyze collaboration and actionable outcomes aligned with strategy (Dionisio and de Vargas, 2020; Herrera, 2015; Szegedi et al., 2016). Positioned as a strategic asset, CSI harnesses firm resources-knowledge, skills, R&D-to co-create sustainable solutions, yielding revenue and competitive advantage (Dionisio and de Vargas, 2020; Mirvis et al., 2016). Yet, CSI's institutionalization in SMEs remains underexplored (Dionisio and de Vargas, 2020; Hoogendoorn et al., 2015; Spence, 2016; Wickert et al., 2016), with research fixating on CSR as a reactive, philanthropy-centric response, detached from strategic intent (Morsing and Perrini, 2009; Ortiz-Avram et al., 2018; Yang et al., 2024; Mirvis et al., 2016).

Addressing this lacuna, this study probes SMEs' strategic capacity for social innovation, spotlighting supply chains as a potent yet underutilized arena. In B2B contexts, SMEs grapple with buyer-imposed social and environmental mandates despite resource scarcity (Baden et al., 2009; Stekelorum, 2020), yet their nodal position empowers upstream and downstream influence, amplifying impact potential. Stekelorum (2020) delineates four CSR roles: adopters reactively comply, exploiting agility; blockers resist due to constraints or doubt; generators proactively cultivate trust-based supplier links; and transmitters relay expectations informally. Though illuminating, this frames SMEs as passive or interstitial, sidelining their agency as innovation drivers. This paper reframes SMEs as strategic agent of social value, leveraging social procurement-a practice recasting purchasing as a conduit for societal gain (Barraket, 2019; Meqdadi et al., 2020)-to reshape supply chains sustainably.

Social Procurement as a Social Innovation Practice. *Social procurement emerges as a form of social innovation, reframing procurement as a strategic lever to redress inequities and create value (Barraket, 2019; Meehan and Bryde, 2011; Meqdadi et al., 2020). It harnesses purchasing power to pursue social missions alongside profit, often via sourcing from social enterprises or minority firms-entities owned by those hindered by systemic barriers like capital scarcity or discrimination (Dacin et al., 2010; Blount and Li, 2021; Loosemore et al., 2021). By fueling demand for for-benefit entities, it aligns markets with societal aims, transcending transactional scope (Barraket, 2019; Barraket and Loosemore, 2018; Loosemore, 2016), notably in informal economies where it drives inclusion through jobs and community uplift (Jaroenwanit et al., 2022).*

Implementation demands rethinking norms, forging ties with SMEs and marginalized suppliers to diversify, not streamline, supply bases-fostering equity and formal integration (Meqdadi et al., 2020; Loosemore et al., 2021). Studies underscore its potential-e.g., equitable hiring in construction (Loosemore et al., 2020; 2022)-and drivers like institutional pressures (Razmdoost and Alinaghian, 2024), but flag obstacles: adaptation costs, fragmentation, and skill deficits (Loosemore et al., 2020). Success hinges on governance and "social procurement champions"-actors bridging profit and purpose as visionaries or pragmatists (Loosemore et al., 2022).

Intermediaries amplify this dynamic. Goduscheit et al. (2021) cast them as brokers spanning network voids, while Barraket (2019) outlines their roles: linking actors, rallying engagement, honing skills, championing fields, and legitimizing efforts. These adaptive functions-co-constructed, not static-tackle asymmetries and institutionalize social procurement (Barraket, 2019). Pels (2024) reinforces this, advocating sustained, trust-driven intermediation over fleeting fixes, attuned to marginalized producers' realities. This study harnesses these perspectives to probe how SMEs wield social procurement to forge systemic social value in supply chains.

Methodology. *This study employs action research, blending theoretical inquiry with empirical intervention to generate knowledge and transform practice within complex, multi-actor contexts (Howaldt and Kopp, 2012; Avison et al., 1999; Bradbury and Reason, 2008). Ideally suited to social innovation scholarship, this approach enables a detailed investigation of SMEs' engagement in inclusive procurement within B2B markets. The research is anchored in JUNTOS Compras con 100% Impacto Social, a non-digital marketplace initiative launched by the Inclusive Business Think Tank (ENI) at Universidad Torcuato Di Tella. Developed through iterative cycles of theory-building, practical application, and reflexive learning (Pels, 2024), this initiative reflects a sustained interplay between academic insight and field dynamics, guided by a research team deeply embedded in its evolution.*

Data were drawn from diverse qualitative sources, including internal project records, operational reports, training materials, and recorded stakeholder narratives. Analyzed through an interpretive lens, the study foregrounds the experiences and sensemaking of entrepreneurial actors-particularly SMEs-within the JUNTOS ecosystem. Participant perspectives serve as primary empirical evidence, systematically contextualized and critically examined to uncover

patterns in the enactment of social procurement. This participatory, reflexive methodology aligns with action research's core principles, rooting findings in the lived realities of the initiative's stakeholders.

Juntos Compras con 100% Impacto Social. *Launched in 2018 by the Inclusive Business Think Tank (ENI) at Universidad Torcuato Di Tella, Juntos Compras con 100% Impacto Social (Juntos) is a structured commercial intermediation initiative rooted in action research, designed to tackle economic informality in emerging markets (ENI Di Tella, 2024a). It addresses barriers that hinder marginalized producers' access to formal business-to-business (B2B) markets, promoting equitable trade, local economic development, and inclusive growth through sustainable procurement (Pels et al., 2022). Juntos connects three key actors: Organizational Producers (OPs), SMEs, and supporting institutions. OPs-associative entities like cooperatives or foundations-comprise socially excluded individuals (e.g., unemployed, ex-prisoners, vulnerable groups) across eight sectors, including textiles and gastronomy (ENI Di Tella, 2024b). Though technically adept, OPs often lack managerial expertise and market access (Pels et al., 2022). SMEs, as formal market players, seek socially responsible procurement but face resource constraints, regulatory complexities, and challenges in sourcing reliable informal suppliers (ENI Di Tella, 2024a). Supporting institutions-industry associations, chambers of commerce, and public agencies like the Government of Buenos Aires-enhance SME engagement and institutionalize inclusive practices through capacity-building and policy pilots (ENI Di Tella, 2024b; ITC, 2024).*

Juntos operates via a six-stage intermediation process (Figure 1) that aligns OPs' capabilities with SMEs' procurement needs (ENI Di Tella, 2024a). It begins with selecting OPs based on legal status, production capacity, and market fit, followed by assessing SME requirements (e.g., specifications, volumes, timelines). Matching OPs to SMEs precedes a detailed proposal outlining pricing, social impact, and logistics. Subsequent stages manage payments, production, and delivery, ensuring quality and concluding with transaction documentation and intermediary commission (ENI Di Tella, 2024a). This process bridges social and cultural capital for OPs-offering market connections and skills-while providing SMEs a low-risk pathway to inclusive procurement (ENI Di Tella, 2024b; Barraket, 2019). Since 2018, Juntos has scaled from 4 to 37 OPs (over 700 individuals) and 3 to 45 SME clients, diversifying into eight sectors and enabling year-round sales through cross-selling (Pels, 2024). As a "one-stop shop" for social procurement, it mitigates seasonal income volatility for OPs and integrates them into formal B2B markets, delivering sustained economic and social value (ENI Di Tella, 2024b; Pels, 2024).

Fig. 1: Operational Process of JUNTOS Purchases with 100% Social Impact

Source Guía JUNTOS - Compras y Ventas con 100% Impacto Social (ENI Di Tella, 2024a)

Results. *The following lines explain how SMEs, operating within the framework of the JUNTOS model, contribute to advancing social impact in B2B markets by adopting social procurement as a deliberate social innovation practice. Through this approach, SMEs systematically embed social objectives into their core business operations and strategically reconfigure their supply chains to support inclusive development outcomes.*

As reported through quotations from entrepreneurs affiliated with JUNTOS, featured in reports and video materials (ENI Di Tella, 2024a, b), SMEs' engagement in social procurement practices is neither incidental nor driven by external pressure from larger corporations, as commonly emphasized in the literature on SME compliance with CSR standards (Baden et al., 2009; Stekelorum, 2020). Instead, SMEs intentionally replace existing suppliers with OPs, transforming procurement into a value-driven practice that simultaneously addresses both social and economic objectives. This intentional shift is underscored the founder, who emphasizes: "It is very important to note that the companies we target already have regular suppliers, and our initiative proposes replacing them" (ENI Di Tella, 2024b).

For SMEs, replacing their existing supply chains, as further emphasized by Alberto Patrón, CEO of Condor Technologies, represents a clear departure from conventional CSR models, which are often confined to charitable or philanthropic initiatives. Instead, it reflects a proactive commitment to social procurement as a strategic mechanism for achieving tangible social impact.

"I was one of the first clients, and I remain deeply grateful because JUNTOS created something we needed, even if we didn't realize it at the time (…) We're now a certified B Corporation, focused on impact, but we started doing this before we even knew what triple impact meant. It came from intuition, a desire to be proud of what we do, to win awards, yes, but also to be satisfied with how we do it and how we treat our people. We wanted to know what impact we could have on the community (…) We wanted to help, but often these initiatives can feel like charity. What JUNTOS brings is different: this is not charity, this is mutual value creation! I help someone, and they help me, everyone wins" (Alberto Patrón, CEO of Condor Technologies - ENI Di Tella, 2024b).

Similarly, Alberto García, CEO of Martha Loustau S.A., explained his company's decision to join JUNTOS:

"For a small company like ours, engaging in corporate social responsibility in a systematic way is not easy. (…) Through JUNTOS, we are able to make purchases with social impact, aligned with the Sustainable Development Goals. (…) With the high levels of marginalization in our society, it is impossible to envision a truly sustainable economy. (…) These stark realities compel all of us, as economic actors, to take responsibility for such a complex problem. The people at JUNTOS give us the opportunity and make it easier to contribute our small part" (ENI Di Tella, 2024b).

Diego Lieppe, ViaBana-Grido franchisor, described the decision to engage in social procurement as a natural extension of their core values: "Our mission and vision, the desire to support and empower entrepreneurs, aligned perfectly with purchasing with social impact, so it felt spiritually natural for us" (ENI Di Tella, 2024b).

Unlike multinational corporations, whose procurement systems often exclude informal producers (Barraket, 2019; Meqdadi et al., 2020) due to large-scale requirements, complex compliance procedures, and delayed payment terms, SMEs exhibit operational characteristics that make them more effective enablers of integration for OPs into formal markets. Specifically, SMEs' demand for smaller, customized orders, combined with agile decision-making and limited bureaucratic overhead, supports the development of flexible and adaptive procurement relationships that align with the capacities and constraints of OPs. Within the JUNTOS model, these SME-specific advantages are further enhanced by structured intermediation, which facilitates essential formal procurement processes (including invoicing, delivery scheduling, and payment coordination) on behalf of OPs. This arrangement allows SMEs to pursue socially impactful procurement without incurring additional transactional burdens, thereby lowering the barriers to inclusive supply chain engagement.

Crucially, SMEs also play a direct role in overcoming a key obstacle for OPs, such as the lack of financial resources to acquire raw materials and initiate production. By providing advance payments, typically covering 50 percent of the order value, SMEs enable OPs to begin production in a timely manner, ensuring order fulfilment and supporting their integration into formal economic transactions (ENI Di Tella, 2024a). Rather than perceiving this financial flexibility as a risk, SMEs frame it as a strategic opportunity to generate social value alongside commercial returns, thereby actively contributing to the formalization and economic empowerment of marginalized producers. This intentional strategic orientation is further demonstrated by SMEs' acceptance of the intermediary commission, which has not posed operational challenges or been perceived as a financial burden (ENI Di Tella, 2024a). Its integration into transactions underscores both the financial viability of the model and the trust-based governance that sustains SME-OP collaborations within JUNTOS. As Jaqueline Pels affirms, "Without the trust of our clients, no operation would have been possible, and without the trust of our allies, who enabled us to reach more clients, none of this would have happened" (ENI Di Tella, 2024b).

This trust also shapes SMEs' perception of the intermediary itself, which is not regarded as a cost within the JUNTOS ecosystem, as noted by Jaqueline Pels and further evidenced by the project results presented in the previous section (ENI Di Tella, 2024b). Indeed, SMEs consider it a facilitator of efficient and socially impactful procurement, enabling the seamless integration of social objectives into core business operations. As Alberto Patrón, CEO of Condor Technologies, states, "JUNTOS helped us realize the intention we already had of making purchases with impact. Today, they handle the entire process for us. I recommend it as an opportunity for companies seeking to achieve triple impact" (ENI Di Tella, 2024a). This perspective diverges from much of the literature on CSR and SMEs, which frequently characterizes intermediaries as an added cost and identifies cost-related concerns more broadly as significant barriers that limit SMEs' engagement in socially responsible practices. However, it aligns with the literature on social procurement, particularly with insights on the pivotal role of social procurement champions, who act as boundary-spanners by effectively bridging the gap between commercial imperatives and social purpose (Loosemore et al., 2022).

Through sustained engagement, SMEs actively foster the income stability, product diversification, and growth of OPs, thereby extending their role beyond mere transactional interactions. This tangible impact is substantiated by project metrics, with JUNTOS reporting annual growth rates exceeding 100 percent in both the number of participating OPs and SME clients (Pels, 2024; ENI Di Tella, 2024b). These outcomes have supported the gradual integration and scaling of informal producers within formal supply chains. Moreover, SMEs' involvement, made possible through the intermediation of JUNTOS, helps to bridge what is often referred to as the "market habitus gap," which denotes the cultural and operational disjunction between informal producers and formal buyers (Pels et al., 2022). This is reflected in the words of Martin Luna from Cooperativa Esquina Libertad, who observes: "for us, JUNTOS means the opportunity to access a different type of market that we are not accustomed to or with which we have experienced difficulties, such as the private sector (…)" (ENI Di Tella, 2024a).

Collectively, these actions underscore the pivotal role SMEs play in enabling the integration and growth of OPs within formal markets, not merely as purchasers but as co-creators of inclusive value chains. By combining operational agility

with a deliberate commitment to social procurement, SMEs help overcome structural barriers that typically exclude marginalized producers from formal economic participation.

This finding highlights the transformative potential of SMEs to advance inclusive and sustainable supply chains when supported by intermediation structures that align procurement processes with social impact objectives. Within the JUNTOS ecosystem, procurement evolves from a transactional activity into a strategic mechanism for creating mutual value, where SMEs embed social objectives into core business functions. In doing so, they exemplify the principles of CSI, moving beyond traditional CSR to actively foster the formalization and empowerment of OPs (Dionisio and de Vargas, 2020; Mirvis et al., 2016). Through this lens, SMEs emerge not as passive adopters of responsible practices, but as dynamic agents of social change, reshaping market access, redistributing opportunities, and contributing to more equitable and resilient economic systems.

Research limitations. *While this study provides robust insights into SMEs' role in social procurement, its scope is bounded by several limitations inherent to its design and context. First, the reliance on Juntos Compras con 100% Impacto Social as a single case, situated in Argentina's informal-market context, limits generalizability to other regions or economic settings where SMEs and informal producers face differing structural constraints (ENI Di Tella, 2024a, b; Pels, 2024). The action research methodology, though apt for generating contextual depth and practical insights (Howaldt and Kopp, 2012; Bradbury and Reason, 2008), restricts comparative analysis across multiple cases or quantitative validation of findings, potentially narrowing the scope of causal inference. Second, the qualitative data-drawn from project records, reports, and stakeholder narratives (ENI Di Tella, 2024a)-foregrounds participant sensemaking but lacks longitudinal tracking to assess the durability of SMEs' social procurement practices or their impact over time. Third, the study's focus on SMEs' strategic engagement overlooks potential heterogeneity within the SME category (e.g., size, sector, or resource endowments), which may influence their capacity to adopt inclusive procurement (Katsinis et al., 2024; Luetkenhorst, 2004). Finally, while Juntos's intermediary role is pivotal, the analysis does not fully explore external factors-such as market volatility or regulatory shifts-beyond the Government of Buenos Aires' support (ENI Di Tella, 2024b), which could constrain scalability. These limitations suggest avenues for future research to broaden the empirical and theoretical reach of SME-driven social innovation.*

Implications (for managers and policymakers). *This study unveils social procurement as a strategic fulcrum for SME managers, shifting it from operational routine to a catalyst for innovation and market distinction (ENI Di Tella, 2024a, b). Embedding social value into procurement not only sharpens competitive positioning amid rising ethical and stakeholder pressures but also fortifies legitimacy and trust, aligning SMEs with purpose-driven paradigms (Pels, 2024). Far from a peripheral act, this approach-as modeled by Juntos-enhances resilience in turbulent contexts (Dionisio and de Vargas, 2020). SMEs' local roots, agility, and relational governance uniquely equip them to engage marginalized producers, transforming proximity into a strategic edge (Pels et al., 2022). Managers should thus nurture an innovation-oriented ethos, channel resources into inclusive supply chains, and partner with intermediaries like Juntos to streamline complexity and amplify impact, positioning SMEs as trailblazers in sustainable value creation.*

This research positions SME-led social procurement as a vital market-driven bridge between informal and formal economies, offering policymakers a pathway to alleviate poverty and foster inclusion in low-income settings (ENI Di Tella, 2024a, b). Beyond public-sector mandates (Loosemore et al., 2020; 2022), it elevates SMEs as linchpins of economic transformation, urging policy to transcend state-centric contracting. Interventions must dismantle barriers-transaction costs, resource gaps-empowering both SMEs and informal producers (Pels et al., 2022). Juntos worked with the Government of Buenos Aires and developed capacity-building actions and tools (ENI Di Tella, 2024a, b). This project, exemplifies collaborative governance that amplifies private initiative without overriding it. This partnership model bears normative heft, aligning procurement with decent work (SDG 8), responsible production (SDG 12), and equity (SDG 10), advancing justice in exclusionary contexts (Pels, 2024). Policymakers should thus pivot from regulatory constraints to enabling ecosystems-via intermediary backing, SME incentives, and streamlined regulations-cementing inclusive procurement as a pillar of systemic change (SDG 17).

Originality of the paper. *This study advances management scholarship by reframing SMEs as proactive drivers of social innovation through social procurement, a perspective underexplored in prior literature dominated by large-firm CSR and CSI narratives (Dionisio and de Vargas, 2020; Mirvis et al., 2016). Where prior studies often depict SMEs as resource-constrained or reactive in B2B contexts (Baden et al., 2009; Stekelorum, 2020), this manuscript foregrounds their proactive agency, harnessing agility and local ties to craft inclusive supply chains (Pels et al., 2022). Its originality stems from the empirical anchor of Juntos Compras con 100% Impacto Social, a meticulously documented case that integrates action research with real-world impact, connecting formal SMEs to informal producers in Argentina (Pels, 2024; ENI Di Tella, 2024a, b). Departing from CSR's philanthropy-centric lens (Morsing and Perrini, 2009; Ortiz-Avram et al., 2018), it positions social procurement as a dual-value engine-economic and social-uniquely suited to informal-market settings. By weaving together the "market habitus gap" (Pels et al., 2022) and trust-based intermediation (Loosemore et al., 2022), this paper offers a fresh synthesis of social innovation and supply chain dynamics, delivering actionable insights for managers and policymakers that extend beyond existing theoretical boundaries (Saebi et al., 2019; Mongelli and Rullani, 2024).*

Key words: *social innovation, social procurement, SMEs, informal market, supply chain, JUNTOS*

Green and digital-driven Innovation Ecosystems: an exploratory text analysis of Smart Specialization Strategies

VALENTINA MALLAMACI[1] MELITA NICOTRA[2]

Abstract

The paper aims to compare Regional Innovation Ecosystems in Italy, in relations to their sensitivity and propensity towards green and digital issues and also towards the strengthening of their ecosystem. Regional innovation ecosystems represent unique local areas and important platforms for the creation, absorption and diffusion of knowledge, stimulating the innovation process and competitiveness of firms, regions and countries. To this aim, we develop a text analysis of the Smart Specialization Strategy (S3) of each Italian Region. S3 are customized regional strategies addressed to increase their growth and competitive advantage in certain areas of specialization where they hold significant potential, in order that financial interventions can be concentrated there. The present research offers a novel methodological approach based on an exploratory text-based comparative analysis of policy design that uncovers strategic patterns between regional innovation ecosystems undergoing digital and green transitions. It is a preliminary effort to explore how green and digital strategies are designed within such ecosystems, and it is a first step for a future measure of impacts and effectiveness of S3 initiatives on green and digital issues.

Framing of the research. *Regional innovation ecosystems represent unique local areas and important platforms for the creation, absorption and diffusion of knowledge, stimulating the innovation process and competitiveness of firms, regions and countries (Nicotra, 2019; Boschma and Iammarino, 2009; Malmberg and Maskell, 2002). In recent times, the emergence of environmental and social concerns, as well as government demands, has led to the development of innovation ecosystems promoting green and digital innovation, using digital technology and implementing environmental management techniques (Demirel & Kesidou, 2018).*

To strengthen their role, in the last years, the European Union (EU) has adopted a Smart Specialization Strategy (S3), introducing "customized" interventions on regional economic development (Foray, 2015; Barca et al., 2012; McCann & Ortega-Argilés, 2016). It is a strategy that support regions in increasing their growth potential and competitive advantage by helping them identify and strenghen certain areas of specialisation where they hold significant potential, concentrating there financial intewrventions (Camagni et al. 2014; Balland et al., 2019). Such process of identifying the potential of each Regional innovation ecosystems lies on the process of "entrepreneurial discovery" and also on the development of a system of governance involving multistakeholder mechanisms to set strategic priorities and systems of intervention. Hence, regional innovation ecosystems, in Europe, design their development strategy with the aim of fostering the specialisation in such sectors where they possess existing assets, so their most promising areas (McCann & Ortega-Argilés, 2016; Foray, 2015; Fedeli et al., 2019) and within the principles of 'diversified specialisation' (Farhauer and Kröll, 2012). Such european strategy has been implemented for the first time during the EU programming period 2014-2020 and now from 2021-2027. Smart specialisation has become the backbone of the EU Cohesion Policy, as every EU region had to submit S3 strategies in order to be eligible for EU funding.

The national thematic areas are divided into 12 Regional Specialization Areas: Aerospace; Agrifood; Blue Growth; Green chemistry; Design, Creativity, Made in Italy; Energy; Smart factory; Sustainable mobility; Health; Smart, Secure & Inclusive Communities; Technologies for living environments; Technologies for cultural heritage. The evolution of these areas is in line with the National Research Program (PNR) 2021-2027 which is made up of six large thematic areas, directly connected to the UN Agenda 2030: Health; Humanistic culture, Creativity, Social transformations, Inclusion society; Security for social systems; Computer Science, Industry, Aerospace; Climate, Energy, Sustainable Mobility; Sustainable Technologies, Agri-food, Natural and Environmental Resources.

Purpose of the paper. *The purpose of the paper is to compare Regional Innovation Ecosystems in Italy in relations to their sensitivity and propensity towards green and digitalizations themes. We develop an exploratory text-based comparative analysis of Smart Specialization Strategy of each Italian Region. Italian innovation ecosystem and their Smart Specialization Strategies have been already studied (Iacobucci and Guzzini, 2016; Gianelle et al. 2019; Crescenzi et al.2018). However, all such studies are centred on the first EU programming period 2014-2020. In relation to this*

second program, a concrete picture of regional S3 still not emerge, also because there is still no complete data on this. Moreover, previous studies have generally highlighted the challenges and shortcomings of S3 in Italy, especially in regions with weaker institutional frameworks, where the strategic selection and alignment of priorities remain problematic (Iacobucci and Guzzini, 2016; Gianelle et al., 2019; Crescenzi et al. 2018). Otherwise, the present work aims to perform an exploratory analysis of key features present on S3 strategies in relation to digital and green transition. The focus is on the prevalence of different policy objectives within and across regions, and so the breadth of specialisations per region and the coincidence of specialisations across regions. Clusterization of Italian innovation ecosystems, arising from the analysis, allow to perform future studies on effectiveness and impact of each strategy.

Methodology. *This section describes the procedure employed to analyze each regional Smart Specialization Strategies (S3), as contained in the Smart Specialisation Community of Practice (S3 CoP), the new platform to get informed about data for the period 2021-2027. The analysis is developed by Python-based text processing. First, we install required libraries ensuring that all dependencies needed for PDF text extraction, text processing, and visualization are met. Installing spaCy provides essential language models tailored to Italian, enabling more advanced natural language processing features such as part-of-speech (POS) tagging and lemmatization. To refine our text analysis and exclude context-irrelevant words, we expand Nltk-baseline set of stop words with a custom list which includes words deemed semantically uninformative or overly frequent to reduce noise in subsequent analyses compared to domain-specific terms that are truly indicative of the strategic directions in S3 documents.*

To facilitate thematic categorization in the word cloud, we define a dictionary that assigns color codes to different categories to enable a more intuitive color-based thematic reading of the word cloud.
For instance, "category1" in red includes: "innov", "digital*", "tecnolog*", "soluzioni innovative", "svilup*"; "category2" in green: "verde", "green", "ambient*", "sostenibil*", "circular*", "transiz*"; "category3" in blue: "ecosistem*". If no category is matched, the word defaults to black.*

For each file PDF, PyPDF2 library reads and parses pages, concatenating text into a single string. A safeguard checks whether the file is empty before extraction. For each token, we apply a range of filters to remove punctuation, numeric values, and non-alphabetic tokens. We then check if token's lemma (rather than the token's raw text) is in the set of combined stop words or if it matches certain undesired POS tags (e.g., VERB, AUX, PRON). Excluding these parts of speech is to focus on substantive keywords rather than verbs, conjunctions, or other grammatical items. We eliminate tokens whose length is less than or equal to five characters, except for specific exceptions like "verde" and "green," which are contextually significant. By performing these steps, we obtain a cleaned list of terms that are more relevant to the strategic focus of each region's S3.
Once a set of cleaned tokens is produced, we aggregate their frequencies and the entire process is repeated for each file.

After generating a global frequency distribution, we are interested in counting specific keywords ("verde", "green", "soluzioni innovative", "coesione") and prefixes ("sostenibil", "circular*", "transizion*", "digital*", "ambient*", "innov*", "svilup*", "tecnolog*", "ecosistem*"), representing them in a specific bar chart.*

Next step "compare_word_counts(word_counts_list, top_n=20)" addresses the need to compare the 20 most frequent terms appearing in all files. It then sorts them by their total frequency across files, helping highlight terms of truly overarching importance in the strategies of various regions and displaying them in a bar chart. After this analysis, next algorithm is used to visualize aggregated terms in a word cloud. We filter out terms whose frequency is below a specified threshold (min_frequency=10) to preserve clarity and readability. We generate a word cloud for each S3 document, highlighting region-specific emphases, and then an overall word-cloud by summing up counts across all documents, offering a macro-level perspective on which terms dominate national S3 discourse. We also generate a specific word-cloud to anlyze the main terms co-occurring near "ecosistem", specifically noting the first 20 words that appear most frequently in association with that term which is a key-focus for our research on innovation ecosystems.*

Furthermore, global n-grams (bigrams and trigrams) are generated, with top 10 for each n-gram size displayed graphically and a cosine similarity matrix is computed from TF-IDF vectors of each document, shown through a heatmap.

Finally, a custom function aggregates frequencies of the three categories to identify the predominant one in each region by comparing absolute counts, computes each category's share as a percentage of the total tokens, and presents a stacked bar chart that illustrates, for each region, the relative proportions of each category.

After data standardization, the code performs a K-Means clustering with two clusters (x-axis representing "category1" for digital topic and y-axis representing "category2" for green topic) to group each regional S3 strategy based on its terms' frequencies in these two categories and a scatter plot is generated with each region positioned at its (Digital, Green) coordinates.

Results. *The aggregated outcomes across all 21 regional S3 documents reveal both striking commonalities and notable region-specific priorities.*

*In **Abruzzo**'s S3, "sviluppo" (173) is dominant, followed by "innovazione" (161) and "tecnologia" (102), associable to "digitalizzazione" (30), reflecting region's core commitment to growth through modern solutions. Nonetheless, keywords as "competenza" (58), "transizione" (42), and "governance" (38) underscore a focus on building human capital, overseeing structural shifts, and guiding policy effectively. The additional presence of "mobilità" (38) and "trasporto" (37) hints at targeted improvements in transport and connectivity, while "competitività" (34), "turismo" (33), and "investimento" (33) demonstrate awareness of both external market pressures and internal potential for economic diversification. Abruzzo also addresses cooperations (24) and stakeholder engagement (29), as the importance*

of academic and corporate collaboration ("università", 26; "azienda", 29). These combined elements suggest an overall strategy aimed at balancing infrastructural, technological, and collaborative aspects of regional development.

***Bolzano**'s S3 features a very high count of "innovazione" (369), "sviluppo" (240) and "tecnologia" (158), marking a technology-driven agenda. In line with local sustainability goals, "energia" (109) appears frequently, and "lavoro" (96) signals the region's attention to employment dynamics within innovative economic sectors. "Università" (81), "industria" (74), "competenza" (60), and "digitalizzazione" (59) indicate an interplay between academic research, industrial ecosystems, and the cultivation of specialized skills. Interestingly, "mobilità" (59), "cambiamento" (52), "edificio" (50), and "sostenibilità" (46) hint at Bolzano's concern with building efficiency, forward-looking transport policies, and environmental transitions. "Research" (59), "creazione" (55), and "immagine" (54) strengthen the view that new ideas, branding strategies, and the creation of innovative opportunities form a cornerstone of Bolzano's development model.*

*Moving to **Basilicata**'s S3, "innovazione" (801), "sviluppo" (637), and "tecnologia" (447) dominate the vocabulary, highlighting also this region's robust focus on fostering modern industries and technological ecosystems. Terms like "territorio" (239) and "energia" (212) show that local resources, geographic identity, and energy production figure prominently in Basilicata's vision. The high frequency of "cluster" (206), "impatto" (179), and "risorsa" (176) underscores a multifaceted strategy to create and expand innovation clusters, monitor social or environmental impacts, and leverage available assets. Meanwhile, "patrimonio" (153), "ecosistema" (131), and "infrastruttura" (129) further reveal a commitment to cultural heritage, interconnected innovation networks, and robust foundational systems. Lastly, "crescita" (119), "sostenibilità" (118), and "cambiamento" (115) confirm that Basilicata's plan revolves around sustainable growth, balancing transformative processes with overarching environmental and social considerations.*

*In **Calabria**'s S3, "innovazione" (157), "tecnologia" (149), and "sviluppo" (140) again occupy the top positions. Alongside this institutional focus ("governance", 44; cooperazione", 36; "politica", 35), words as "risorsa" (53) and "economia" (52) highlight the need to harness local economic opportunities, whereas "impatto" (32), "energia" (30), and "turismo" (30) hint at concerns with environmental outcomes and tourism potential. The interest in "competenza" (29), "sostenibilità" (28), "infrastruttura" and "sicurezza" (26) underscores a comprehensive plan oriented toward building skill sets, protecting the environment, and improving the foundations that support technological and economic development, even related to tourism.*

***Campania**'s S3 features high counts of "innovazione" (249) and "sviluppo" (172), with "tecnologia" (79), "investimento" (75), and "cluster" (74) also significant. The emphasis on "ecosistema" (74), "transizione" (63), "industria" (45), "ambiente" (42), "trasporto" (40) reveals a balanced interest in building innovation ecosystems and environmentally conscientious transitions. References to "politica" (42), "conoscenza" (40) mirror Campania's concern for policy frameworks, knowledge sharing, and human capital.*

*In **Emilia-Romagna**'s S3, "innovazione" (516) and "sviluppo" (327) appear alongside "tecnologia" (213), "competenza" (170), and "territorio" (157), illuminating the region's traditional leadership in advanced manufacturing and research organizations. The prominence of "infrastruttura" (154), "lavoro" (147), and "risorsa" (121) showcases an ecosystem that fosters workforce development, invests in physical and digital infrastructures, and leverages natural and organizational resources. Words such as "cambiamento" (113), "ecosistema" (112), "politica" (104), "formazione" and "conoscenza" (101-83), "industria" (87), "transizione" (75) confirm a comprehensive approach that merges technological change with ecosystemic thinking and policy support.*

*In **Friuli Venezia Giulia**'s S3, "sviluppo" (511) and "innovazione" (379) remain highly significant, as "lavoro" (254) and "tecnologia" (191). The region's emphasis on "territorio" (179), "competenza" (124), and "cambiamento" (114) underscores a dual preoccupation with localized needs and transformative processes. The frequencies of "cluster" (113), "formazione" (113), and "collaborazione" (80) further reflect a strong orientation toward networked innovation and skill-building, complemented by references to "transizione" (76), "sostenibilità" (74), and "investimento" (71).*

*In **Lazio**'s S3 "sviluppo" (391), "tecnologia" (269) and "innovazione" (171), "investimento" (168) and "economia" (158) also rank high, reflecting an explicit focus on financing new projects and strengthening the broader economic framework. A noticeable emphasis on "sicurezza" (102), "industria" (99), and "energia" (96) points to policy directions that balance industrial priorities, energy supply, and public security or data protection. "Patrimonio" (88), "risorsa" (80), and "mercato" (63) showcase Lazio's interest in capitalizing on cultural, material, and market assets, whereas "competenza" (62) with "università" (52), "green" (56), and "digitalizzazione" (55), "ambiente" (54), "filiera" (53) denote a move toward more ecological and digital integrated skill sets.*

***Liguria**'s S3 features "innovazione" (199) and "sviluppo" (194) again as top terms, followed by "tecnologia" (172) and "territorio" (131). The region's distinct emphasis on "sicurezza" (66), "digitalizzazione" (47), "industria" (46), "internet" (40) indicates a concern with risk management and digital transformations. Terms like "ambiente" (46), "formazione" (42), "trasporto" (42), "crescita" (42), "trasporto" (42), "'competenza" (40), "investimento" (39), "'energia" (39), "infrastruttura" (37), "collaborazione" (36) attest to Liguria's attention to sustainable development, skill-building, and transportation networks in a territory constrained by coastal geography.*

***Lombardia**'s S3 circles back to "sviluppo" (222), "innovazione" (207), and "tecnologia" (154), but more distinctive is the strong presence of "ecosistema" (102), "territorio" (86), and "cluster" (52), consistent with Lombardia's dynamic industrial fabric and collaborative research communities. The mention of "cittadino" (61), "sicurezza" (51),*

"sostenibilità" (41), "politica" (40), "transizione" (36) and "energia" (33) adds a societal dimension, confirming that technological progress is framed within a citizen-focused and policy-guided approach to modernization.

***Marche**'s S3 favors "innovazione" (262) and "sviluppo" (167), while "mercato" (92), "tecnologia" (90), and "competenza" (80) reveal a keen focus on market integration and skill enhancement. The prominence of "sostegno" (65), "economia" (57), "persona" (55) and "salute" (52) suggests an approach that values social dimensions and direct support mechanisms, with "industria" (54), "investimento" (52), "scienza" (42), "formazione" (44), "cultura" (41), "trasformazione" (43), "ecosistema" (42) and "competitività" (40) further highlighting the region's intent to align industrial growth with comprehensive education and collaborative innovation systems.*

***Molise**'s S3 sets forth "sviluppo" (170) and "innovazione" (145) alongside "territorio" (89) and "investimento" (60), indicating an evolving environment that looks to attract capital and nurture locally embedded growth. "Università" (47), "industria" (46), "competenza" (39) hint that academic-industrial partnerships are formally steered through governance frameworks, while "economia" (40), "crescita" (37), and "transizione" (36) reflect both a commitment to economic expansion and recognition of structural transformations.*

***Piemonte**'s S3 presents "innovazione" (346), "sviluppo" (233), and "tecnologia" (174) as foundational. The presence of "competenza" (89), "investimento" (73), "trasporto" (72), and "economia" (68) indicates a broad strategy touching on human resources, capital infusions, mobility infrastructures, and overall economic health. Additional words as "territorio" (67), "transizione" (66), "crescita" (64), "mobilità" (60), and "impatto" (54), "collaborazione" (52), "salute" (52), "politica" (52), "industria" (52), "risorsa" (51), "lavoro" (49), "manifattura" (43) reinforce the notion of a forward-looking agenda that balances environmental, social, and industrial effects in the region.*

*In **Puglia**'s S3 "innovazione" (348), "tecnologia" (258), and "sviluppo" (247) tie in closely with "filiera" (237), "salute" (203) and "industria" (190), illustrating a pronounced interest in integrated supply chains. "Economia" (174), "competenza" (173), "crescita" (125), "opportunità" (97), "investimento" (94), "ambiente" (91) and "formazione" (86) confirm the significance of industrial competitiveness and specialized skill sets, while "cambiamento" (79), "mercato" (78), and "distretto" (77) highlight the variety of modernization pathways and clustered sectoral organizations.*

***Sardegna**'s S3 again underscores "sviluppo" (292), "innovazione" (264), and "tecnologia" (135) but stands out for giving importance to "territorio" (102), "formazione" (82), "energia" (80), "azienda" (75), and "competenza" (74). "Università" (69), "investimento" (69), "risorsa" (67), "mercato" (63), "turismo" (54), "ambiente" (53) and "politica" (53) reflect a multi-pronged approach aiming at human capital development, energy initiatives, and tourism, underpinned by regional policies and stakeholder collaboration.*

***Sicilia**'s S3 leads with "tecnologia" (368), "innovazione" (339), and "sviluppo" (332), but also highlights "risorsa" (113), "ambiente" (108), and "competenza" (92). These choices underscore the interplay among technological upgrades, resource utilization (including environmental resources), and skill development. Words as "energia" (78), "sostegno" (75), "territorio" (70), "lavoro" (66), "infrastruttura" (51), "policy" (50) and "amministrazione" (50) indicate that Sicilia is marrying infrastructural improvements with supportive governance measures. Meanwhile, "scienza" (64), "transizione" (57), "governance" (56), and "conoscenza" (52) confirm how transitions - both digital and ecological - are anchored in robust administrative structures and knowledge-building processes.*

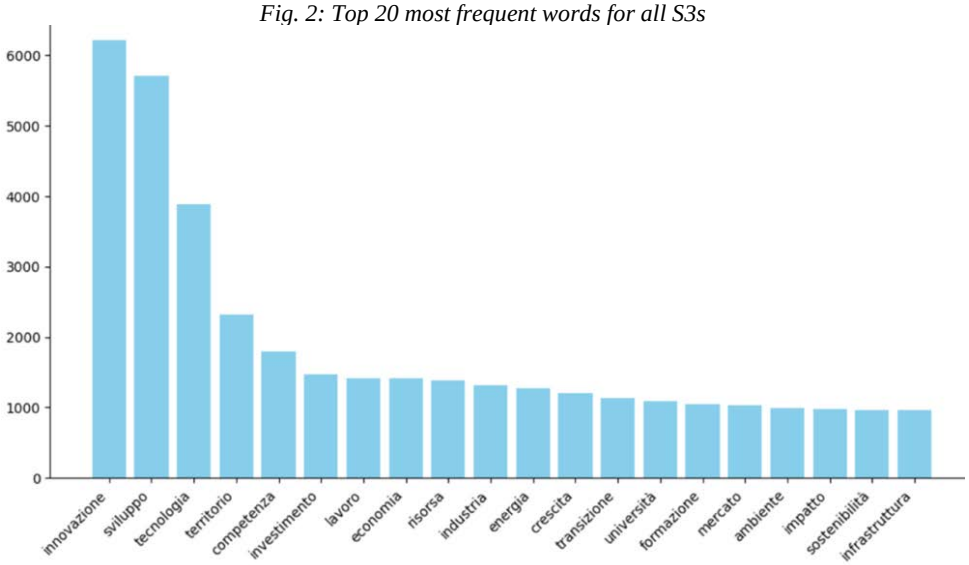
***Toscana**'s S3 underscores "sviluppo" (355), "innovazione" (336), and "tecnologia" (305), with a distinctive prominence of "università" (204), "opportunità" (198) and "territorio" (188), highlighting the synergy between academic research and economic openings. The high frequencies of "competenza" (144), "investimento" (144), and "transizione" (142) place workforce qualification and transitional processes at the heart of Toscana's policy design. Concurrently, "sostegno" (139), "laboratorio" (128), and "formazione" (115) togheter with "distretto" (108), "trasferimento" (107), "azienda" (105) and topic words as "scienza" (101), "salute" (81), "economia" (81) amplify this agenda of creating supportive ecosystems, research labs, and skill-building pathways in collaboration with industry and academia.*

***Trento**'s S3 emphasizes "sviluppo" (344), "innovazione" (312), "territorio" (214) and "tecnologia" (157) combining advanced technology with place-based identities. "Energia" (92), "sostenibilità" (90), and "lavoro" (90) highlight the region's convergence on sustainable energy solutions and job creation. "Risorsa" (87), "industria" (86), "competenza" (76), and "collaborazione" (70) confirm the significance of industrial partnerships, the development of specialized skills, and collaborative innovation. Parallel threads appear in "crescita" (68), "investimento" (67), "ambiente" (65), and "salute" (61), suggesting a balanced concern for growth, funding, environmental stewardship, and healthcare solutions.*

***Umbria**'s S3 features "innovazione" (279), "tecnologia" (180), and "sviluppo" (168), with comparatively high occurrences of "competenza" (110), "transizione" (70), "risorsa" (64), and "rafforzamento" (58). "Opportunità" (53), "territorio" (53), "politica" (51), and "sostenibilità" (49) rounds out a vision of sustainable, policy-driven development that leverages territorial strengths. Additionally, "investimento" (48), "collaborazione" (40), "azienda" (39) and "cambiamento" (39) point to a multi-actor approach fostering adaptability and constructive transformation.*

*In **Valle d'Aosta**'s S3, "sviluppo" (162), "territorio" (132), and "innovazione" (115) appear together with "tecnologia" (115), "montagna" (59), and "lavoro" (52), making clear that an alpine context strongly shapes strategy. The interplay among "popolazione" (52), "economia" (45), "politica" (44), and "ambiente" (43) reveals a nuanced vision in which demographic, political, and environmental factors converge. The region likewise values training and*

partnerships, as shown by "formazione" (42), "cooperazione" (38), "conoscenza" (37), and "digitalizzazione" (36) but also a specific interest in sector as "energia" (36) and "agricoltura" (35).



*Finally, **Veneto**'s S3 includes "innovazione" (246) and "sviluppo" (224) at the top, alongside "territorio" (214) and "competenza" (172), highlighting that localized development and skill-building are cornerstones of strategic planning. "Transizione" (140), "tecnologia" (119), and "investimento" (115) frame Veneto's path to modernization, while "lavoro" (100), "conoscenza" (95), and "mercato" (92) speak to the diffusion of expertise and market expansion. The frequent references to "crescita" (77), "risorsa" (73), "risultato" (71), "trasformazione" (66), "digitalizzazione" (64), "formazione" (64) and "collaborazione" (61) further articulate Veneto's ambitions to unite resource management with tangible outcomes underpinned by cooperative efforts.*

At the national level (Fig.1, 2), terms as "sviluppo", "innovazione" and "tecnologia" emerge as foundational concepts in all documents, albeit with differing levels of intensity. In regions such as Basilicata and Emilia-Romagna, these words reach some of the highest frequencies, reflecting robust industrial or research-based ecosystems. In others - Calabria, Molise, Liguria - the absolute frequencies are smaller, yet the relative weight of similar concepts remains consistent. Likewise, the notion of "energia" appears strongly in Bolzano, Basilicata, and Lazio but is comparatively less emphasized in other regions. "Territorio" consistently ranks among the most common words in nearly all documents, underscoring how place-based development, local assets, and territorial cohesion serve as core components of the S3 approach throughout Italy. "Competenza" and "investimento" follow closely, reflecting the interplay between place-based development, skill-building, and financial resourcing. Words like "lavoro", "economia", "risorsa", "industria", "impatto", "mercato", "sostenibilità", "infrastruttura" are also widely distributed, confirming that employment, economic growth, resource management, and industrial modernization are recurrent themes. "Crescita", "transizione", "ambiente", "università" and "formazione" reveal the systemic orientation toward continuous adaptation - be it digital, environmental, or skill-based.

Fig. 1: Overall word-cloud of regional S3s

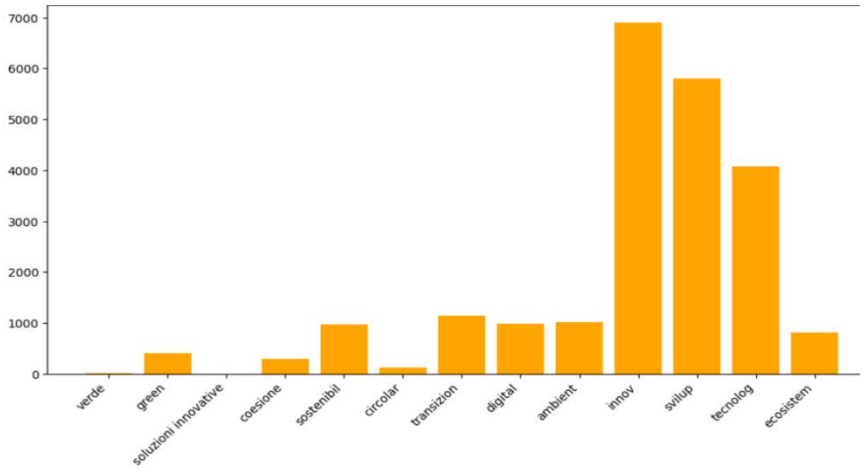


Fig. 2: Top 20 most frequent words for all S3s

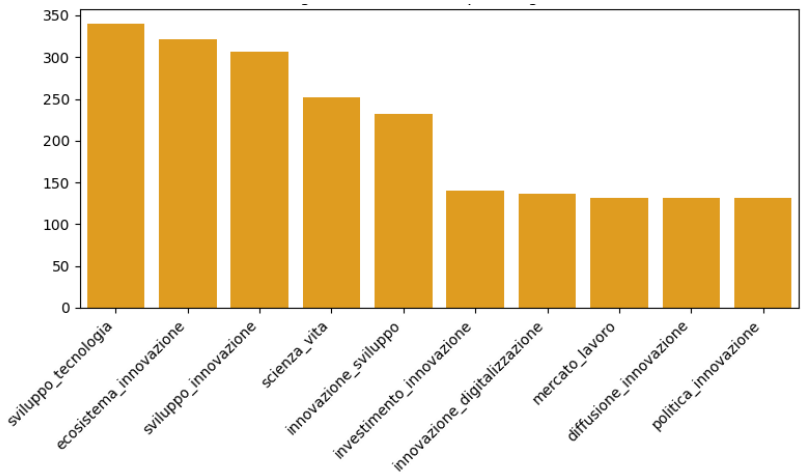
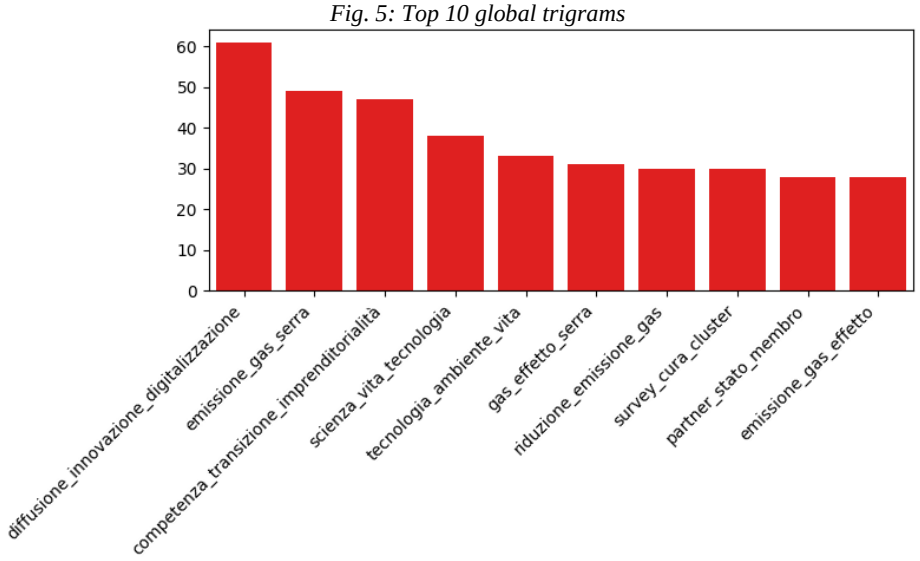


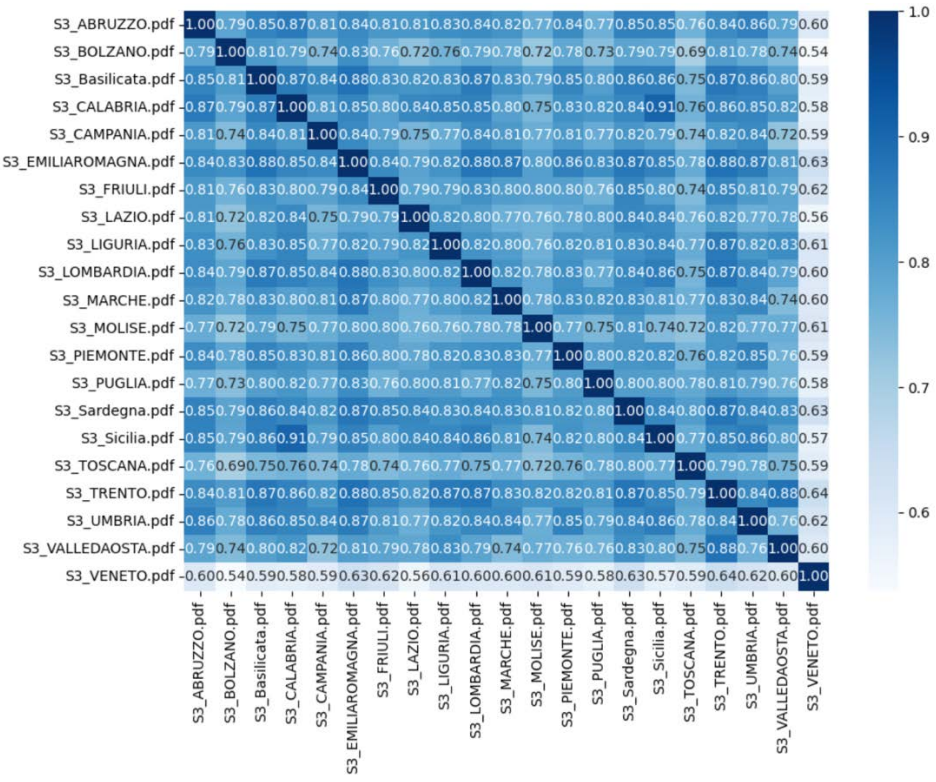
Analyzing specific terms (Fig. 3) likewise demonstrates that environmental sustainability, digital transitions, and ecosystem-based approaches increasingly shape policy discourse, albeit with varying intensity. Turning to specific frequencies, "verde" and "green" have notable, though relatively modest, presences across most documents. "Sostenibil" appears frequently, reaching values as high as 119 (Basilicata) or 90 (Trento). This underscores a common thread of environmental awareness. "Circolar*" varies widely, from minimal occurrences to relatively higher instances in Puglia, Friuli, and Toscana, indicating certain areas are more engaged in circular economy discussions. "Transizion*" also attracts attention, with peaks in Toscana (144) and Veneto (140). Meanwhile, "digital" commonly occurs in reference to digitalization strategies and is particularly high in Friuli (55), Puglia (70), and Toscana (78) together with the top-term "innov*". By contrast, "ecosistem*" is strongly represented in Lombardy (103), Emilia-Romagna (112), and Basilicata (133), showing the specific interest in building interconnected innovation ecosystems in these regions.*

Fig. 3: Frequency of specific words and prefixes for all S3s



The bigram analysis (Fig. 4) provides further insight into how these concepts interconnect. Pairs such as ("sviluppo_tecnologia", 340), ("ecosistema_innovazione", 321), ("sviluppo_innovazione", 306-232) demonstrate the relevance of development with technology and ecosystem-based approaches with innovation policies. Other bigrams like ("investimento_innovazione"), ("innovazione_digitalizzazione") and ("politica_innovazione") highlight how governance structures are pivotal in directing and financing innovation-driven agendas and further underline how modernization and digital adoption frequently follow direct investment.

Fig. 4: Top 10 global bigrams

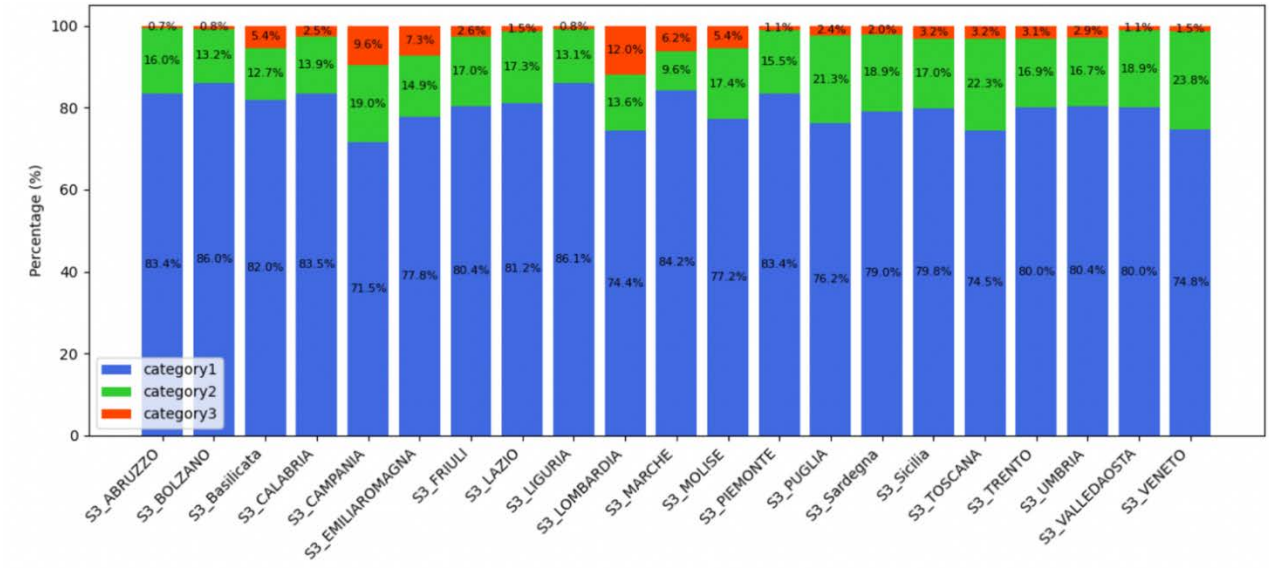


Trigram findings (Fig. 5) as ("diffusione_innovazione_digitalizzazione", 61) indicates that digitalization is not merely an isolated concept but is framed as part of an innovation diffusion process. Terms relating to emissions, greenhouse gases, and environmental care, ("emission_gas_serra"), ("gas_effetto_serra"), ("riduzione_emissione_gas"), ("emission_gas_effetto"), reveal that certain regions include detailed discussions on climate change mitigation strategies. The trigram ("competenza_transizione_imprenditorialità") highlights the synergy between skill-building, transitional policy frameworks, and entrepreneurship, a pattern that indicates a recognized need to support new ventures and entrepreneurial ecosystems during technological or ecological transitions.

Fig. 5: Top 10 global trigrams

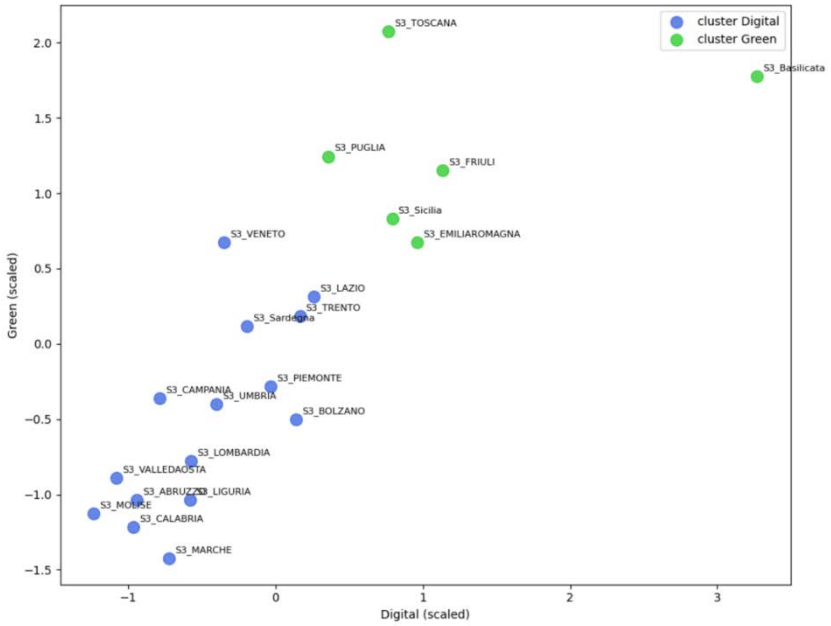
The cosine similarity matrix (Fig. 6) compares each regional document by analyzing how closely the distributions of terms resemble one another. When two regions share similar strategic priorities, they score higher in cosine similarity. This typically means that their S3s align semantically, employing common keywords in comparable proportions. Regions emphasizing highly specialized domains tend to display lower similarity, underlining the diversity of Italy's regional approaches even within a shared national framework.

Fig. 6: S3 Cosine Similarity Matrix



The following word-cloud (Fig. 7) highlights that "ecosistema" functions as a crucial idea, linking diverse themes throughout all S3s. The significant top 20 co-occurring terms as "innovazione," "sviluppo", "tecnologia", "salute", "ambiente" and "biodiversità" underscores the focus on the interplay between technological advancement, sustainable development, and environmental issues. Terms like "risorsa", "collaborazione" and "competenza" imply an expansive emphasis on resource management, collaboration, and skill development. "Transizione", "evoluzione", "cambiamento", "rete", and "rafforzamento" signify a continuous endeavor to modify structures and regulations for the development of more resilient and progressive ecosystems.

Fig. 7: Main co-occurring terms with "ecosystem"



The stacked bar chart (Fig. 8) provides a quick overview of how each region's S3 document balances the three categories of keywords; the relative height of each color segment indicates how dominant that category's terms are in the text. "Category1" (blue) occupies the largest portion, indicating a predominant occurrence of digital terms, while "category2" (green) for green terms has smaller shares and "category3" (red) related to "ecosistem" is minimal but transversal to all regions even if differently exploited.

Fig. 8: Percentage distribution of each category in S3s

K-Means clusterization, after standard-scaling (Fig. 9), indicates that the majority of regions are categorized into the Digital cluster, signifying a more significant number of keywords linked to digital transformation, while a smaller group is categorized inside the Green cluster, signifying a weaker focus on sustainability-related terminology.

Fig. 9: S3s Clustering with K-Means

Research limitations. *The current analysis is a preliminary effort to explore how green and digital strategies are employed within innovation ecosystems. It refers to an Italian context only, for which the results cannot be generalized to different national or European scenarios. Further, S3 documents may have been constrained by several factors, e.g., political imperatives, administrative practices, or other regional limitations, in their ability to capture the textual contents of these strategies, hence potentially influencing the precision and comprehensiveness of the established strategic goals.*

Furthermore, it is essential to understand that strategic design does not necessarily lead to effective implementation. As a result, the strategies identified may differ significantly from actions on the ground, and this study cannot report on the measurable impacts or effectiveness of these S3 initiatives.

Managerial implications. *These insights from the exploratory analysis provide useful information to policymakers by letting them understand the size of their own country's entrepreneurial ecosystems up close, as well as by sharing information on how critical environmental and technological aspects are decisive for entrepreneurship. A detailed comparative perspective makes it easier for policymakers to benchmark their approaches against other region's practices to discern similarites and differences. Through this comparative work, new collaborative opportunities and best practices of effective policies at the local level emerge, identifying models that can be applied to similar territorial areas. For companies it can represents a basis for strategic investment decisions by demonstrating which territories are already aligned with their business models. Moreover, enterprises can use such information to synchronize their strategies with their reference innovation ecosystems better.*

Originality of the paper. *Due to its relatively recent introduction, the effectiveness of Smart Specialisation Strategies (S3) for the period 2021-2027 applications has not been extensively studied, yet academic interest is gradually climbing. While there has been some academic work on previous S3 strategies, to the extent of our knowledge, no systematic assessment has been carried out regarding the level of focus of these S3 strategies and its correlation with the distinctive local economic contexts of the various regions, especially in the perspective of Italy regarding the EU programming period 2021-2027. Hence, the research offers a novel methodological approach based on an exploratory text-based comparative analysis of policy design that uncovers strategic patterns between regional innovation ecosystems undergoing digital and green transitions.*

Key words: *Regional Innovation Ecosystems; Smart Specialization Strategies; Green transition; Digitalization.*

Paradoxes of Public Service Ecosystems: The Case of Digital Pharmaceuticals

STEFANIA MANETTI[1] ORLANDO TROISI[2]

Abstract

This study investigates the paradoxical tensions inherent in digitally transforming Public Service Ecosystems (PSEs), focusing on highly regulated sectors such as digital pharmaceuticals. While PSEs promote co-creation, adaptability, and stakeholder integration, they remain constrained by bureaucratic oversight, regulatory frameworks, and institutional rigidity, generating tensions that cannot be resolved but must be continuously managed. As digital transformation accelerates, these contradictions become more pronounced, requiring new governance approaches that enable multi-actor collaboration while maintaining regulatory compliance and public trust. The digital pharmaceuticals ecosystem, characterized by a shift from a "solo investigator" model to a multi-actor governance structure, provides a relevant empirical setting to investigate how paradoxes shape governance, value co-creation, and service transformation in digital public services.

Using a qualitative case study approach, this study integrates documentary analysis and in-depth interviews with key stakeholders, including regulators, healthcare professionals, technology providers, patient advocacy representatives, and policymakers.

The findings reveal four major paradoxes that emerge at different governance levels, influencing institutional decision-making, service evolution, and actor interactions: (i) User Engagement (Sequentiality vs. Simultaneity): the tension between traditional regulatory gatekeeping and new, multi-channel engagement strategies that accelerate market access; (ii) Data Governance (Data Sharing vs. Data Retention): the contradiction between the need for collaborative data sharing to drive innovation and the strategic withholding of proprietary data to maintain competitive advantages; (iii) Product/Service Lifecycle (Velocity vs. Stability): the misalignment between fast-paced digital innovation cycles and risk-averse, stability-oriented regulatory frameworks that govern approval processes; (iv) Innovation Governance (Stability vs. Reopening): the challenge of managing continuously evolving digital pharmaceuticals, which require ongoing compliance adaptation rather than a one-time regulatory approval. These paradoxes highlight the challenges of balancing control with flexibility, competition with cooperation, and regulatory stability with continuous service evolution. They underscore the need for governance models that do not seek to eliminate contradictions but instead enable actors to manage them dynamically. By revealing how paradoxes shape governance decisions and institutional adaptation, the study advances a paradox-informed approach to digital PSE management, where public and private stakeholders must strategically navigate competing logics rather than resolve them outright.

This research contributes to public management, service research, and digital governance studies by demonstrating that paradoxes in digital PSEs are not transient anomalies but intrinsic structural features requiring ongoing negotiation. The findings emphasize the importance of hybrid governance models, adaptive regulatory mechanisms, and multi-stakeholder collaboration in managing tensions effectively. Future research should explore how paradoxes manifest in different digital PSEs, such as agri-food industry, smart cities, and digital education, using comparative or longitudinal approaches to assess how governance models evolve over time. By positioning paradoxes as fundamental features of digital public service transformation, this study lays the groundwork for future research on paradox-responsive governance models, advancing theoretical and practical understanding of institutional adaptation in multi-actor service ecosystems.

Framing of the research. *The research is theoretically grounded in the Public Service Ecosystem (PSE) framework, employing paradox theory as a conceptual lens to examine the inherent tensions and contradictions that shape governance, innovation, and service co-creation within digitally transforming public services.*

The PSE framework has emerged as a critical perspective in public management and service research, integrating institutional, service, and individual levels of public service delivery (Osborne et al., 2022). Rooted in Service-Dominant Logic (Vargo & Lusch, 2016), it moves beyond hierarchical and dyadic models, emphasizing multi-actor, co-creative interactions at micro, meso, and macro levels that shape public value (Trischler et al., 2023; Troisi et al., 2023a). PSEs conceptualize public services as complex, interdependent systems, where public and private actors, civil society, and

DOI 10.7433/SRECP.SP.2025.01

service users co-create value through resource integration and institutional interactions (Trischler & Charles, 2019). This approach extends Public Service Logic by shifting from a service delivery model to a dynamic network perspective, recognizing public service interactions as evolving within participatory and adaptive governance structures (Osborne, Nasi, & Powell, 2021; Petrescu, 2019).

While the PSE framework advances co-creation and adaptability, it simultaneously introduces paradoxical tensions between stakeholder integration and institutional rigidity (Osborne et al., 2022; Trischler et al., 2023). Digital transformation has further intensified this paradox by enhancing service integration and user-centric co-creation while simultaneously reinforcing bureaucratic constraints, regulatory compliance, and administrative complexity (Troisi et al., 2023b; Akaka & Vargo, 2014; Lindgren et al., 2019; Ciasullo et al., 2018). This duality - where digitalization fosters flexibility yet amplifies institutional rigidities - forces public service organizations to balance competing logics of innovation and control, efficiency and equity, openness and compliance (Walker, Milne, & Weinberg, 2019). Understanding these paradoxes is essential to reconceptualizing how governance models and co-creation processes evolve within digital PSEs, requiring adaptive regulatory frameworks that navigate, rather than eliminate, these tensions (Osborne et al., 2022).

The paradox provides an original theoretical lens to analyze the persistent and interdependent tensions that shape organizational and institutional dynamics (Smith & Lewis, 2011). Paradoxes are defined as contradictory yet interrelated elements that exist simultaneously and persist over time, creating tensions that cannot be fully resolved but must be continuously managed (Lewis, 2000). This key characteristic distinguishes paradoxes from dilemmas, which involve a choice between two competing alternatives where resolution is possible through trade-offs (Schad et al., 2016). While dilemmas are addressed by prioritizing one alternative over another, paradoxes require a "both-and" approach that embraces competing logics simultaneously, fostering long-term adaptability and organizational sustainability (Putnam, Fairhurst, & Banghart, 2016). Unlike private organizations, which often navigate dilemmas through strategic prioritization, public sector organizations operate in environments where conflicting demands, e.g., efficiency vs. equity, innovation vs. compliance, or centralization vs. decentralization, must be managed rather than resolved (Osborne et al., 2022). This persistent "tug-of-war" between opposing imperatives makes paradox theory particularly relevant for understanding the complexity of PSEs in the era of digital transformation.

The application of paradox theory to public administration research has revealed that bureaucratic and post-bureaucratic models do not simply replace one another but rather coexist in a dynamic, paradoxical relationship (Ingaggiati et al., 2024). Bureaucracy, characterized by hierarchical control, standardization, and compliance, often clashes with post-bureaucratic governance, which emphasizes flexibility, co-creation, and participatory decision-making (Torfing et al., 2020). This creates paradoxical tensions, as public organizations must balance regulatory stability with the need for innovation and responsiveness (Hood & Peters, 2004). A recent systematic review of paradoxes in public administration (Ingaggiati et al., 2024) identifies three overarching categories of paradoxes in public administration:

- *Plurality Paradoxes - Resulting from the multiplicity of actors, goals, and institutional layers in public administration. Public organizations must balance top-down governance with bottom-up participatory approaches while ensuring that diverse stakeholders contribute to service co-creation without compromising institutional coherence.*
- *Change Paradoxes - Reflecting the tension between stability and transformation. Public organizations are required to innovate and adapt to emerging societal needs (e.g., digital transformation, sustainability), yet they must operate within highly institutionalized, rule-based frameworks that resist change.*
- *Scarcity Paradoxes - Emerging from the trade-offs required in resource allocation, as public services must optimize efficiency while maintaining accessibility, equity, and quality under budget constraints.*

These paradoxes are not mere contradictions but deeply embedded tensions that shape how public services are structured, delivered, and governed.

Purpose of the paper. *The Public Service Ecosystem (PSE) framework has gained prominence in public administration and service research for its multi-actor, co-creative perspective on public service delivery. However, despite its conceptual advancements, existing literature has yet to fully account for the persistent tensions and contradictions that emerge as public services undergo digital transformation. While PSE theory emphasizes adaptive governance, stakeholder integration, and value co-creation, it remains constrained by institutional and regulatory boundaries, which often generate structural paradoxes that are not easily reconciled.*

Similarly, paradox theory has been widely applied in organizational studies to analyze how actors navigate contradictory yet interdependent logics within institutions. However, its application to digitally transforming PSEs remains underexplored, particularly in relation to how bureaucratic stability and regulatory oversight interact with market-driven service evolution, digital innovation, and multi-actor governance structures. Existing studies have primarily framed governance challenges in public service contexts as dilemmas to be solved through strategic trade-offs, rather than persistent paradoxes that require continuous negotiation and institutional adaptation.

This study bridges these theoretical gaps by integrating paradox theory with the PSE framework to investigate how paradoxical tensions shape governance, value co-creation, and service transformation in digitally evolving PSEs. Focusing on the digital pharmaceuticals sector-characterized by a fundamental shift from a "solo investigator" model to a multi-actor governance structure involving regulators, researchers, healthcare professionals, patients, and technology providers operating under competing institutional logics (Carrera et al., 2023)-the study positions the paradox-informed framework as theoretically transferable to other digitally transforming PSEs. This sector exemplifies

the tensions and opportunities triggered by digital transformation in regulated service environments, where co-creation and innovation are increasingly entangled with regulatory compliance and bureaucratic control (Carrera et al., 2024).

Complex ecosystems such as smart cities and digital education share key features of PSEs, including multi-actor configurations, institutional embeddedness, and service co-creation dynamics (Osborne et al., 2022; Trischler & Charles, 2019). These sectors also grapple with enduring tensions-between agility and accountability, personalization and standardization, innovation and compliance-that closely mirror the paradoxes identified in healthcare. Rather than temporary dilemmas, such tensions are structural and must be continuously negotiated. Applying a paradox lens facilitates a "both-and" perspective, revealing how conflicting institutional logics co-exist and shape governance and service transformation across digital PSEs (Ingaggiati et al., 2024). By analyzing the digital pharmaceuticals ecosystem as a paradigmatic case of digital PSEs, this study seeks to address the following research question: Which paradoxes emerge in digital PSEs?

Methodology. *This study employs a qualitative case study approach* (*Yin, 2018) to explore the paradoxical tensions shaping governance, value co-creation, and institutional adaptation in digitally transforming Public Service Ecosystems (PSEs), with a focus on digital pharmaceuticals. The digital pharmaceuticals ecosystem was theoretically and empirically selected based on its relevance to the research question, as well as being an instrumental case due to its alignment with the institutional and governance dynamics typical of digitally transforming PSEs. Positioned at the intersection of stringent regulatory frameworks and rapid technological advancement, it offers a paradigmatic context in which paradoxes - particularly those involving co-creation, compliance, and innovation - become highly visible. Importantly, as smart cities and digital education, where multi-actor governance, public-private interdependence, and institutional embeddedness converge (Trischler & Charles, 2019; Osborne et al., 2022).*

Data collection followed a triangulated approach, beginning with a documentary analysis of regulatory filings, clinical trial protocols, and policy guidelines to map the institutional constraints and governance mechanisms shaping the sector. This phase was followed by five in-depth semi-structured interviews with key stakeholders, including private and for-profit technology providers, regulators, public healthcare professionals (also acting as key opinion leaders), representatives from patient advocacy associations, and public policymakers. The interview protocol was designed using paradox theory, allowing for a structured investigation of how actors perceive, navigate, and manage paradoxical tensions within the ecosystem.

Data analysis employed a structured thematic coding process. Initial open coding was applied to identify recurring concepts from stakeholder narratives, which were subsequently refined into higher-level categories via axial coding. This process was guided by paradox theory to reveal underlying paradox poles (e.g., control vs. flexibility). Coding was performed manually to ensure data traceability and analytical depth. Regular review sessions with the senior co-author supported iterative codebook refinement, ensuring consistency and enhancing methodological transparency and rigor throughout the analysis.

Following Yin's principle of analytic generalization, findings were developed to inform broader theoretical insights beyond the digital pharmaceuticals case. The identified paradoxes were abstracted into transferable themes relevant to other digitally transforming PSEs. Transferability was supported through rich contextual description and theory-driven interpretation, enabling practitioners and researchers to assess applicability across comparable PSE contexts. This reinforces the study's external validity by connecting case-specific dynamics to wider governance and co-creation challenges, offering transferable understanding for other public service domains undergoing digital transformation and facing comparable governance complexities.

Results. *This section presents the findings of our empirical analysis, which aimed to investigate the types of paradoxes emerging within Public Service Ecosystems (PSEs), with a specific focus on how they are reshaped by next-generation digital transformation. Drawing on the classification proposed by Ingaggiati et al. (2024), our study highlights how paradoxes identified in traditional public administration are exacerbated or reconfigured within digitally transforming PSEs, due to their distinctive service logic orientation, which, in contrast to broader ecosystems, is often driven by private sector innovation yet remains embedded in public regulatory constraints. The results, shown in Table 1, reveal four major paradoxes that characterize the governance, value co-creation, and institutional dynamics of digital pharmaceuticals, each occurring at different levels of the ecosystem and reflecting distinct tensions between actors.*

As shown in Table 1, the "Implications for PSE" column demonstrates that each identified paradox extends beyond the digital pharmaceuticals case and is structurally embedded in digitally transforming Public Service Ecosystems. The tensions-such as sequential vs. simultaneous user engagement, data sharing vs. retention, and innovation velocity vs. regulatory stability-are emblematic of broader governance dilemmas across sectors. Similar patterns appear in smart cities and digital education, where actors must balance agility with compliance and openness with control. These recurring contradictions are not isolated, but deeply rooted in the institutional fabric of digital PSEs (Osborne et al., 2022; Trischler & Charles, 2019; Ingaggiati et al., 2024). As such, the findings substantiate the analytical transferability of our paradox-informed framework to other complex, multi-actor public service contexts.

Table 1. Paradox poles identified according to the level where occur.

Paradox Pole	Level of Occurrence	Tension Type	Key Actors Involved	Implications for PSE
#1. User Engagement: Sequentiality vs. Simultaneity	Service Delivery Level	Control vs. Flexibility	Regulators, Digital Pharmaceuticals Developers, Healthcare Providers	Challenges traditional regulatory gatekeeping, leading to multi-channel engagement strategies
#2. Data Governance: Data Sharing vs. Data Retention	Network Governance Level	Competition vs. Cooperation	Regulators, Public and Private Data Holders, Healthcare Providers	Reveals the strategic retention of data within co-opetitive ecosystems, requiring adaptive data-sharing policies
#3. Product/Service Lifecycle: Velocity vs. Stability	Institutional Level	Risk Propensity vs. Risk Aversion	Regulators, Technology Developers, Investors, International Competitors	Exposes the misalignment between regulatory stability and the rapid iteration cycles of digital health technologies
#4. Innovation Governance: Stability vs. Reopening	Institutional & Ecosystem Level	Standardization vs. Adaptability	Regulators, Research Institutions, Public Health Agencies, Industry Partners	Highlights the perpetual renegotiation of governance frameworks due to ongoing technological evolution and ecosystem transformations

Paradox Pole #1 - User Engagement: Sequentiality vs. Simultaneity

Public Service Ecosystems (PSEs) traditionally follow a sequential model where regulatory bodies act as gatekeepers, controlling access to pharmaceuticals and medical innovations. This ensures compliance and patient safety but slows innovation. However, digital pharmaceuticals disrupt this process by enabling simultaneous user engagement before regulatory approval. Technology firms, patient advocacy groups, and venture capital investors increasingly interact with users to collect real-world data, refine business models, and accelerate commercialization. While regulators attempt to reinforce compliance barriers, private actors often navigate these restrictions through alternative mechanisms such as real-world evidence studies. This paradox underscores a shifting power dynamic, where public-sector authority is increasingly challenged by private-sector actors leveraging digital affordances.

"[..] We can't wait for each bureaucratic gate to open when new tools let us involve patients and doctors simultaneously to accelerate access [..]" (Patient Advocacy Representative, 2024).

Paradox Pole #2 - Data Sharing vs. Data Retention

At the network governance level, digital PSEs experience a fundamental tension between collaboration and competition in data governance. While regulators, public health agencies, and private firms acknowledge the necessity of data sharing for innovation and patient outcomes, actors also strategically retain critical datasets to maintain competitive advantages. Open data policies exist, yet in practice, each stakeholder selectively withholds proprietary insights-non-profits to preserve credibility, private firms to protect market position, and public agencies to prioritize regulatory oversight. This paradox is not a flaw but an intrinsic feature of digital PSEs, where data asymmetry shapes power structures and innovation trajectories. Effective governance must acknowledge this reality and develop mechanisms that balance selective transparency with cooperative exchange.

"[..] There is a constant tension. Everyone agrees sharing is beneficial, yet they worry that opening up will weaken their competitive edge [..]" (Regulator, 2024).

Paradox Pole #3 - Product/Service Lifecycle: Velocity vs. Stability

The institutional governance of digital pharmaceuticals reveals a clash between the rapid innovation cycles of digital health technologies and the slow, risk-averse nature of regulatory frameworks. Traditional drug approval processes are lengthy and stability-oriented, ensuring safety and compliance before commercialization. However, digital pharmaceuticals-especially those incorporating Artificial Intelligence (AI) and real-time software updates-evolve continuously, demanding faster regulatory adaptation. While conditional approvals and post-market surveillance exist, institutional inertia and legal complexities often impede commercialization, delaying access to life-enhancing innovations. This paradox highlights the misalignment between regulatory stability and the agility required in digital health ecosystems, creating friction between public oversight and market-driven technological evolution.

"Our platform can roll out improvements monthly. [..] We want to move fast and iterate, yet we are held back by a regulatory framework designed for a much slower pace." (Technology Provider, 2024).

Paradox Pole #4 - Stability vs. Reopening

At the ecosystem level, digital pharmaceuticals challenge the traditional linear innovation model, which assumes regulatory approval as a fixed milestone. Instead, these technologies undergo continuous updates, expansions, and refinements, requiring repeated reassessments of compliance, governance, and stakeholder roles. Unlike conventional drugs, which maintain stable clinical applications, digital pharmaceuticals function as dynamic service platforms, evolving with algorithmic modifications, new data inputs, and extended functionalities. This paradox reflects a persistent interplay between regulatory standardization and technological adaptability, where governance structures must constantly renegotiate service boundaries. Rather than reaching a definitive regulatory endpoint, digital pharmaceuticals remain in iterative evolution, necessitating adaptive regulatory frameworks that balance innovation with accountability and safety.

"With traditional medications, approval is a one-time milestone. We need a stable regulatory framework that can adapt to constant innovation [..]it is a sort of real balancing act" (Healthcare Professional, 2024).

Research limitations. *This study does present some limitations. The analysis is based on a single empirical context (i.e., digital pharmaceuticals), which, although the theoretical framing and analysis, it is worthy to extend to other sectors. Future research should explore how paradoxes manifest in different public service domains, such as agri-food industry, smart cities, and education. Additionally, the study employs qualitative in-depth interviews, offering rich, contextualized insights but limiting broader applicability. Further investigations could adopt quantitative methods, cross-case comparisons, or longitudinal analyses to examine how paradoxes evolve over time and across institutional settings.*

Managerial implications. *The findings underscore the need for adaptive governance strategies that enable public and private actors to effectively navigate paradoxical tensions in digitally transforming Public Service Ecosystems (PSEs). Rather than enforcing rigid regulatory frameworks, policymakers should embrace more flexible, hybrid governance models that balance bureaucratic oversight with innovation facilitation. Addressing paradoxes such as user engagement, data governance, lifecycle velocity, and innovation stability requires rethinking policy instruments, fostering cross-sectoral dialogue, and integrating modular regulatory approaches that allow for iterative adaptation without compromising compliance and public trust. Public administrators and industry leaders must acknowledge that paradoxes are not temporary obstacles but enduring characteristics of digital PSEs, necessitating continuous negotiation, institutional reflexivity, and collaborative problem-solving across stakeholders.*

Originality of the paper. *This study offers a novel contribution by theoretically applying paradox theory to the analysis of digitally transforming Public Service Ecosystems (PSEs), an area that remains underexplored in both public administration and service research. While existing literature has largely conceptualized regulatory challenges and innovation constraints as trade-offs to be balanced, this paper reframes these tensions as persistent paradoxes that are not meant to be resolved but rather continuously navigated through adaptive governance mechanisms and institutional negotiation. Unlike previous studies that have treated bureaucratic constraints and service innovation as competing forces, this paper demonstrates how they coexist in a dynamic, paradoxical relationship, shaping governance, value co-creation, and institutional adaptation in digital PSEs. The four paradoxes identified, which are related to user engagement, data governance, product lifecycle, and innovation governance, illustrate that PSEs are structurally defined by contradictory yet interdependent logics that demand flexible, multi-actor governance models rather than rigid policy prescriptions. By empirically investigating how these paradoxes manifest in digital pharmaceuticals, the study extends the theoretical discourse on paradox-informed governance in public service contexts, showing that institutional rigidity and technological dynamism are not mutually exclusive but rather shape one another through iterative adaptation. This insight challenges linear, resolution-based approaches to governance and introduces a more nuanced perspective that acknowledges paradoxes as enduring and constitutive features of digital public service transformation.*
Additionally, this research contributes to the theoretical advancements of PSE theory by demonstrating that service logic within digital PSEs is uniquely shaped by paradoxical tensions that emerge at multiple governance levels. The findings reveal that service co-creation in digital PSEs differs from broader ecosystems due to its entanglement with bureaucratic oversight, regulatory adaptation, and institutionalized stakeholder interdependencies. This perspective refines existing PSE scholarship by emphasizing the necessity of paradox-responsive governance models that account for the fluidity of service interactions, the evolving role of public and private actors, and the persistent negotiation between institutional control and market-driven transformation.

By positioning paradoxes as fundamental characteristics of digital public service evolution, this study lays the groundwork for future research on how paradox theory can inform governance innovation in regulated PSEs, contributing to ongoing debates in public management, service innovation, and institutional theory. Through this approach, the study moves beyond traditional regulatory frameworks and calls for the development of governance models that embrace, rather than attempt to suppress, paradoxical tensions in digital public services.

Key words: *paradox; public service ecosystem; digital transformation; governance; digital pharmaceuticals.*

The power of diversity: How female leadership drives innovation and performance in SMEs and Deep Tech

NICOLETTA BURATTI[1] ELVIRA TIZIANA LA ROCCA[2] VALERIA SCHIFILLITI[3]
FRANCESCO VITELLARO[4]

Abstract

Gender diversity in top management teams (TMTs) is increasingly recognised as a strategic factor influencing firm performance, particularly in innovation-driven environments. While extensive research has examined the relationship between female leadership and corporate outcomes in large firms, the impact of gender diversity within small and medium-sized enterprises (SMEs) remains underexplored. This study aims to fill this gap by analysing how gender diversity in TMTs affects firm performance in innovative SMEs, focusing on the moderating role of innovation. Using a dataset of 2,323 Italian innovative SMEs operating between 2015 and 2023, this research employs a quantitative approach to assess the relationship between gender diversity, firm performance, and innovation. Specifically, the study investigates whether the presence of female managers enhances firm performance and whether this effect is amplified in highly innovative firms. Additionally, it explores the role of gender diversity in deep tech firms, where long-term investment and high technological uncertainty create unique leadership challenges. This study is among the first to examine the intersection of gender diversity, innovation, and firm performance within SMEs and the emerging deep tech sector. The expected findings suggest that gender-diverse TMTs contribute positively to firm performance, with a more substantial effect in innovation-intensive environments. The study provides new insights for managers, policymakers, and investors, emphasising the importance of fostering inclusive leadership to drive competitiveness and sustainable growth.

Key words: *Gender Diversity, Top Management Teams, Innovation, Firm Performance, SMEs, Deep Tech.*

Framing of the research. *Female representation in senior management remains limited, with women holding only 29% of executive positions globally (Grant Thornton, 2022). Significant regional disparities persist, with female executives accounting for 36% of leadership roles in Europe but only 16% in the Middle East and North Africa (Hanna et al., 2023). This ongoing underrepresentation emphasises the gap between the recognised strategic value of gender diversity in corporate governance and performance and its actual integration into leadership structures (Lewellyn & Muller-Kahle 2020; Achkar & Bouri, 2021). In today's increasingly complex and dynamic business environment, diverse leadership teams are widely recognised as strategic assets that drive innovation, enhance adaptability, and improve decision-making effectiveness (Hambrick & Mason, 1984; Nielsen & Huse, 2010; Jones et al. 2020). In particular, gender diversity within Top Management Teams (TMTs) has garnered growing scholarly attention for its potential to strengthen organisational outcomes by incorporating a broader range of perspectives, cognitive skills, and leadership styles (Post & Byron, 2015; Li et al. 2016)*

Managerial and social theories have long demonstrated the significance of diverse leadership team composition within organisations, particularly the inclusion of women. Upper Echelons Theory posits that senior executives' characteristics, values, and experiences shape how firms identify opportunities, manage risks, and allocate resources (Hambrick & Mason, 1984). Within this framework, gender diversity enhances decision-making by introducing a broader range of viewpoints and problem-solving approaches, mitigating groupthink, and fostering innovation (Carter, Simkins, & Simpson, 2003). Diverse leadership teams are better equipped to anticipate market trends, respond to emerging challenges, and develop sustainable long-term strategies. Social Role Theory (Eagly, 1987) adds that women often exhibit leadership styles characterised by collaboration, empathy, and transformational behaviours-qualities that complement the traditionally risk-oriented and competitive styles more frequently associated with male leaders (Post & Byron, 2015). This balance fosters a more inclusive decision-making environment, encouraging considering a broader range of perspectives and ultimately leading to more effective strategic outcomes. However, the Critical Mass Theory posits that

a minimum threshold of woman representation in leadership is needed to fully realise the benefits of diversity (Kanter, 1977). When women make up only a tiny fraction of leadership teams, as is the case today, their influence is often limited by tokenism and entrenched power structures. In contrast, Resource Dependence Theory argues that leadership teams should reflect the external environment and key stakeholders to respond effectively to market demands (Pfeffer & Salancik, 1978; Russo & Fouts, 1997). Accordingly, firms with gender-diverse leadership may be better equipped to understand and address the expectations of their diverse customer base, investors, and regulatory bodies, thereby strengthening stakeholder relationships and enhancing corporate reputation. These theories assert that gender diversity in TMTs is not merely a social or ethical issue but a strategic advantage that enhances long-term corporate competitiveness. Organisations with diverse leadership teams are better equipped to navigate contemporary business challenges and capitalise on emerging opportunities in an increasingly competitive global market.

Over the past decades, empirical research has consistently reinforced this perspective, demonstrating the positive impact of gender-diverse leadership on firm performance. In the early 2000s, Singh et al. (2001) examine women's challenges and opportunities in leadership roles within top UK corporate boards. Their findings suggest that the role of gender diversity extends beyond fostering a more inclusive leadership culture, as it also strengthens corporate governance and decision-making. Other studies have identified a positive correlation between gender diversity in leadership and firm performance, particularly in industries that rely on innovation and adaptability, where the broader perspectives and open-mindedness associated with female leadership can provide a competitive advantage (Smith et al., 2006; Campbell & Mínguez-Vera, 2008; Dezső & Ross, 2012). Post and Byron (2015) reinforced this link, associating female representation on the board with improved financial performance, particularly in countries with strong gender equality norms. They attribute this effect to enhanced inclusivity and collaboration, strengthening internal decision-making and aligning corporate strategies with broader societal values, including gender equity. More recent studies provide a more nuanced understanding of the impact of gender diversity in leadership. Low et al. (2015) emphasise that its impact varies depending on external factors such as industry competitiveness and technological intensity. Arvanitis et al. (2022) report that the effects of gender diversity on firm performance depend on factors such as company size and industry. Similarly, Dwivedi and Paolella (2023) examine the cross-level effects of women's representation in senior management, highlighting that while gender diversity initiatives drive visible change, their impact varies across organisational levels.

Beyond economic and financial performance, gender diversity is a key driver of organisational innovation. This is particularly relevant for firms managing substantial intellectual property portfolios, where diverse leadership fosters creativity, promotes inclusive problem-solving, and enhances organisational learning (Torchia et al., 2011). Innovation has been recognised as a crucial moderator that strengthens the positive relationship between gender diversity and organisational outcomes (Østergaard, Timmermans, & Kristinsson, 2011; Díaz-García, González-Moreno, & Sáez-Martínez, 2013). From this perspective, Dezső and Ross (2012) demonstrate that female representation in senior leadership amplifies the positive impact of R&D intensity on firm performance. Similarly, Joecks et al. (2013) found that companies with female executives invest 20% more in R&D, driving greater product innovation and long-term growth. Gender-diverse TMTs effectively bridge innovative strategies with execution and resource allocation, facilitating the introduction of radical innovations while enhancing the value maximisation of intellectual property portfolios (Díaz-García et al., 2013; Cropley & Cropley, 2017). More recently, several empirical studies have demonstrated that incorporating diverse perspectives in TMTs and fostering collaborative approaches that integrate varied competencies and experiences in senior roles enhance innovation processes (Williams & Habersetzer, 2018; Sarto et al., 2019; Lee & Chung, 2021). Terjesen et al. (2016) suggest that these effects are particularly pronounced in high-tech and knowledge-intensive industries. In this context, firms with substantial patent portfolios benefit from diverse leadership, particularly when women hold significant positions, as their presence has been shown to positively influence innovation and ultimately enhance overall firm performance (Saggese & Sarto, 2019; Manita et al., 2020; Saggese et al., 2021).

This positive effect is expected to be even more pronounced in deep tech companies with strong ties to scientific research and advanced technological innovation (Adiguzel & Sonmez Cakir, 2020). These firms develop radical solutions in artificial intelligence, biotechnology, robotics, quantum physics, and nanotechnology. Rather than merely enhancing existing products and services, deep tech companies introduce disruptive innovations with the potential to transform entire markets and address some of the most pressing global challenges. Sustainability plays a central role in deep tech, as many of these technologies are designed to tackle global issues, particularly climate change and public health, through innovations that promote sustainable development. In this context, diversity in leadership teams is essential for fostering creativity and enabling more comprehensive and innovative decision-making processes. It enhances firms' ability to navigate the complexities of technological and market challenges while facilitating identifying unexplored market opportunities-one of the primary challenges deep tech companies faces. Moreover, gender diversity in TMTs could enable these firms to integrate rigorous scientific approaches with effective commercialisation strategies, leveraging a stronger ethical and social orientation to foster more responsible and inclusive business models. This, in turn, could enhance corporate reputation and attract long-term investors, a crucial factor for deep tech firms that require extended technology maturation periods and substantial funding.

Purpose of the paper. *Despite extensive research highlighting the benefits of gender diversity, significant gaps remain in understanding its impact on firm performance, particularly in industries driven by technological innovation. While existing studies suggest that gender-diverse TMTs contribute to enhanced decision-making, innovation, and overall organisational performance, the interplay between gender diversity, innovation intensity, and firm performance remains*

underexplored. Moreover, to the best of our knowledge, no prior research has examined these relationships within the emerging deep tech sector where scientific advancement, technological disruption, and long-term sustainability challenges make leadership composition particularly crucial.

This study seeks to address this gap by empirically investigating the impact of gender diversity in TMTs on the financial performance of innovative SMEs, specifically focusing on the moderating role of innovation. In particular, it examines whether gender-diverse TMTs enhance the performance of these type of companies and whether this effect is more pronounced in deep tech firms than other industries, given their high research intensity and stronger emphasis on sustainability.

To achieve this, the study tests the following hypotheses:

***H1**: Gender diversity in TMTs has a positive effect on firm performance.*
***H2**: Innovation positively moderates the relationship between gender diversity in TMTs and firm performance.*
***H3**: The moderating effect of innovation on the relationship between gender diversity in TMTs and firm performance is more significant in deep tech firms.*

By empirically validating these hypotheses, this paper aims to offer new theoretical and managerial insights into the role of gender diversity in innovation-intensive contexts. It contributes to the broader debate on corporate governance and organisational performance while providing specific implications for firms operating at the intersection of science, technology, and commercialisation.

Methodology. *Our study conducts a quantitative analysis based on a sample of 2,323 Italian innovative SMEs operating in non-financial sectors, extracted from the AIDA database by Bureau van Dijk (BVD). The choice to focus on Italian innovative SMEs is motivated by several academic and contextual factors.*

First, SMEs play a crucial role in economic development and technological innovation, particularly in European economies, where they represent a significant share of employment and value creation. Unlike large corporations, SMEs often exhibit greater organisational flexibility and a more substantial capacity for rapid innovation, making them an ideal setting to examine the impact of gender diversity in TMTs on firm performance.

Second, Italy has a dynamic and rapidly growing ecosystem of innovative SMEs, particularly in high-tech and deep tech sectors such as artificial intelligence and robotics. This growth is further supported by various national projects financed under the National Recovery and Resilience Plan (PNRR), which aim to foster the development of these technologies and their related ecosystems.

Third, Italy provides a relevant context for studying the role of gender diversity in leadership. Despite advancements in gender equality policies, female representation in executive roles remains relatively low compared to other European countries. Investigating gender diversity within Italian innovative SMEs allows a better understanding of how leadership composition influences performance in a setting where structural barriers to female leadership persist.

We employ an unbalanced panel dataset covering 2015 to 2023, comprising 4,609 observations. To test our first hypothesis (H1), we use the following model:

$$Firm\ performance = f\ (Female\ management, controls)\ [1]$$

The dependent variable, firm performance, is measured using return on assets (ROA), defined as the ratio of EBIT to total assets. ROA is a widely used indicator of firm performance, providing insights into the profitability of a company's core operations. The key explanatory variable in model [1] is Female management, which represents the proportion of women in managerial positions, calculated as the ratio of female managers to the total number of managers in the company. All these data were extracted from the AIDA database.

To examine our second hypothesis (H2), we extend the previous model by incorporating an interaction term to assess the moderating role of innovation:

$$Firm\ performance = f\ (Female\ management, Patent\ Portfolio\ Value, Female\ management \times Patent\ Portfolio\ Value, controls)\ [2]$$

In model [2], we investigate whether innovation influences the relationship between gender diversity in management and firm performance. Specifically, we introduce the interaction term Female management × Patent Portfolio Value to test the moderating effect of innovation, as proposed in H2. The variable Patent Portfolio Value is the ratio of the total value of a firm's patent portfolio (sourced from the Orbis IP database) to total assets (sourced from the AIDA database). This measure captures the firm's investment in intellectual property, indicating its innovation capacity. We include several control variables for innovation, financial structure, and managerial characteristics. To assess a company's commitment to innovation, we use Market Attractiveness and Technical Quality from the Orbis IP database, which capture the competitive landscape and the level of innovation embedded in a firm's intellectual property. Financial capacity is also considered, as it influences a firm's ability to invest in strategic initiatives, including innovation. Leverage, measured as interest-bearing debt relative to total assets, reflects a company's reliance on external financing. Cash Holding, expressed

as the ratio of liquidity to total assets, indicates the availability of internal financial resources. Tangibility, the ratio of tangible assets to total assets, provides insight into the firm's ability to offer collateral. These data were gathered from the AIDA database. To account for structural differences, we control firm size, calculated as the natural logarithm of total assets, and firm age, measured as the natural logarithm of the number of years since the company's foundation plus one. These variables serve as proxies for reputation and operational track record. Additionally, we include year and industry dummies to control for temporal and sector-specific effects.

To test our third hypothesis (H3), we examine whether the moderating effect of innovation on the relationship between gender diversity and firm performance is stronger in deep tech firms. The extended model is formulated as follows:

Firm performance = f (Female management, Patent Portfolio Value, Deep Tech, Female management × Patent Portfolio Value, Female management × Deep Tech, Patent Portfolio Value × Deep Tech, controls) [3]

To define the Deep Tech dummy variable, we use an ad hoc database provided by InfoCamere, which contains extensive descriptive and qualitative information on innovative Italian SMEs. This dataset includes details on each firm's development stage, target markets, technological specialisation, and other business characteristics. Integrating this information into our study required a systematic data matching and consolidation for all 2,323 SMEs in our sample. Deep tech firms were identified using a machine learning approach to process large volumes of structured and unstructured data. The system was trained through iterative processes, refining its accuracy over multiple runs. The classification was based on key factors that define deep tech firms. These include their involvement in advanced technological fields such as artificial intelligence, robotics, biotechnology, and quantum computing, as well as their reliance on proprietary technologies and high research intensity. The model also analysed company descriptions, incorporating deep tech-related keywords to improve classification accuracy. To ensure the reliability of the classifications, we performed sample-based validation tests. This approach allows us to assess whether gender diversity in TMTs and innovation intensity have a more significant impact on firm performance in deep tech companies than other innovative SMEs. By differentiating between innovative SMEs, which develop new products and services across various sectors, and deep tech SMEs, which rely on breakthrough scientific advancements, the study offers a clearer understanding of how leadership diversity impacts firm performance in distinct innovation-driven contexts.

Results. *As this study is still a work in progress, the statistical analyses to thoroughly test the three hypotheses have not yet been completed. However, we can outline the expected results based on existing literature and preliminary insights.*

For the first hypothesis (H1), we anticipate a positive relationship between gender diversity in TMTs and firm performance, suggesting that a higher presence of women in management contributes to better business outcomes. Prior empirical studies have consistently shown that gender-diverse leadership enhances decision-making, fosters innovation, and improves overall organisational effectiveness.

Regarding the second hypothesis (H2), we expect Patent Portfolio Value to moderate the relationship between Female management and firm performance positively. This would indicate that firms with a strong patent portfolio benefit even more from gender-diverse leadership, as innovation-driven environments tend to thrive on diverse perspectives and inclusive decision-making processes. While high patent intensity can introduce financial and strategic challenges, gender-diverse leadership will likely mitigate these issues, leading to stronger firm performance.

The third hypothesis (H3) presents more uncertainty, exploring an area with limited academic attention. While we expect the interaction between Female management and Patent Portfolio Value to be significant in deep tech firms, the magnitude and direction of this effect remain less predictable. Deep tech firms operate under unique conditions that may influence the role of gender diversity differently from that of other innovative SMEs.

These expected results highlight the potential strategic value of gender diversity in leadership, particularly in innovation-intensive firms. The final analysis will validate these relationships empirically, offering new insights into the intersection of gender diversity, innovation, and firm performance.

Research limitations. *This study focuses on Italian innovative SMEs operating within a specific civil law context, which may limit the generalizability of the findings to firms in different institutional and cultural settings. Legal frameworks, corporate governance structures, and cultural attitudes toward gender diversity vary across countries, potentially shaping the relationship between female leadership and firm performance. A cross-country analysis could provide deeper insights into how these institutional differences influence the dynamics examined in this research.*

Another limitation is the reliance on patent portfolio value as a proxy for innovation. While patents represent a significant dimension of technological advancement, they do not capture other forms of innovation, such as process improvements, product development, or business model innovation. Future research could integrate alternative innovation metrics to gain a more comprehensive perspective on how gender diversity interacts with different innovation strategies.

The choice of SMEs as the focus of this study presents both strengths and limitations. SMEs play a critical role in economic development and innovation, particularly in European economies, where they drive employment and technological advancements. However, compared to large corporations, SMEs typically have fewer formalised structures, more constrained financial resources, and a greater dependence on the strategic vision of a small leadership team. These characteristics may amplify or diminish the effects of gender diversity in ways that are not directly comparable to larger

firms. Future research could explore whether similar dynamics hold in larger organisations with more complex governance structures and hierarchical decision-making processes.

Finally, the classification of deep tech firms, while based on a rigorous machine learning approach, may require further refinement. Although the model incorporates multiple criteria to define deep tech firms, additional validation through expert evaluation or alternative classification techniques could enhance its accuracy.

Managerial implications. *If confirmed, this study's findings suggest that gender diversity in leadership strategically enhances firm performance, particularly in innovation-driven environments. A more significant presence of women in TMTs could lead to more inclusive decision-making processes, improved problem-solving, and greater adaptability to market changes. Companies should consider implementing leadership development programs, mentorship initiatives, and targeted recruitment strategies to promote diversity and ensure that women have greater access to senior roles.*

TMTs could benefit from fostering an organisational culture that supports inclusive leadership. The potential positive impact of gender-diverse leadership on innovation suggests that firms investing heavily in research and development and intellectual property development might benefit more from increasing female representation in management. In such contexts, diverse leadership could enhance knowledge integration and facilitate more effective innovation strategies, ultimately improving firm performance.

These considerations are particularly critical for deep tech firms, a rapidly growing and high-risk sector with breakthrough scientific advancements, long development cycles, and high capital intensity. The presence of women in TMTs could enhance the strategic resilience of these firms by improving risk management, fostering more balanced decision-making, and strengthening adaptability in an uncertain business environment. Given that deep tech companies often operate at the intersection of technological innovation and long-term sustainability goals, female leadership may also play a crucial role in ensuring that innovation aligns with broader ethical, social, and environmental considerations. Additionally, women in leadership positions may bring a heightened sensitivity to sustainability-related challenges, reinforcing deep tech firms' ability to develop solutions that address pressing global issues such as climate change, healthcare innovation, and resource efficiency. This aligns with the broader objectives of deep tech firms, which are often designed to create transformative societal impact.

Policymakers and industry stakeholders should also consider how regulatory frameworks could support gender diversity in leadership. If gender diversity enhances firm performance, targeted incentives, corporate governance guidelines, or sustainability-related policies could encourage a more balanced representation of women in decision-making roles. Investors focusing on sustainability and responsible corporate governance may also consider these findings when assessing firm potential, reinforcing the business case for diversity in leadership, particularly in high-tech and deep tech sectors.

Finally, the expected findings are particularly relevant given that SMEs represent most businesses in Italy and Europe and account for the largest share of employment. Promoting gender diversity in SME leadership would enhance firm performance and generate broader socioeconomic benefits, particularly for women in the workforce. Ensuring more excellent female representation in decision-making could foster more equitable career progression opportunities, reducing gender disparities in employment and leadership positions

Originality of the paper. *This study makes a significant contribution to the literature on gender diversity by being the first to examine its impact on firm performance in the context of innovative SMEs while also considering the moderating role of innovation. Existing research has predominantly focused on large corporations, overlooking SMEs, which operate under distinct conditions, such as resource constraints and a greater reliance on strategic agility. By addressing this gap, the study highlights the critical role of leadership composition in sustaining competitive advantage in dynamic, innovation-driven markets.*

Moreover, this research is the first to explore the intersection of gender diversity, innovation, and firm performance within the deep tech sector. Deep tech firms, characterised by their reliance on breakthrough scientific discoveries, long development cycles, and substantial investment horizons, face heightened technological and financial uncertainty. In this context, leadership diversity may be even more crucial in fostering radical innovation, strengthening risk management, and ensuring the successful commercialisation of advanced technologies. Unlike traditional high-tech firms, deep tech enterprises require strategic leadership to navigate complex ecosystems, balance long-term research goals with commercial viability, and drive sustainable innovation.

By addressing a previously unexplored research gap, this study provides a novel perspective on how gender-diverse leadership influences firm outcomes, particularly in sectors that depend on technological advancement and long-term strategic decision-making. It establishes a foundation for future research on gender diversity in technology-intensive industries. It offers new insights into how inclusive leadership structures can enhance innovation capacity, mitigate risks, and support sustainable growth in firms at the forefront of scientific and technological progress.

No Women No Innovation?
The Effect of Women on Boards on Patent Activity in SMEs

FRANCESCA PASCALE[1] SAVERIO BARABUFFI[2] GIULIO FERRIGNO[3] ANDREA PICCALUGA[4]

Abstract

Women directors are often perceived as more risk-averse than men counterparts, potentially compromising firm's innovative performance. Contrasting studies reveal instead an improvement in the decision-making process due to greater diversity on board. Consequently, how is innovation influenced by women representation on boardrooms? Limited empirical research exists on investigating the influence of women on board (WOB) on innovative performance of SMEs. Using a longitudinal dataset of innovative Italian SMEs, our study examines whether innovative SMEs lead by women exhibit any substantial differences in innovative performance compared to male-led innovative SMEs. Our findings potentially reveal significant differences in innovation between the two groups, highlighting the need for more caution in providing general subsidies to spur innovation, by shifting the focus to alternative rewards based on measurable innovative contributions of firms, rather than remaining anchored to general passive tax subsidies to innovation.

Framing of the research. *In recent decades, academics and practitioners have strongly debated the role of women on boards, attracting increasing attention of policy makers. Several countries (e.g., Spain, Italy, Norway, California and many others) have consequently introduced laws to guarantee a more balanced and fair composition of corporate boards (Greene et al., 2020; Smulowitz et al., 2025). Besides social equality consequences, these political interventions also positively influence the value maximization of the firm. Value maximization literature states that more women on boards positively impact firm value through a better decision-making process (Griffin et al., 2021), influencing monitoring and resource provision (Hillman and Dalziel, 2003). Nevertheless, frequently women are placed into board positions due to tokenism (King et al., 2010; Yoder and Sinnet, 1985; Kanter, 1977), without actually having an impact on firm's management, or they are welcomed on board during crisis periods and high-risk situations, commonly called "glass cliff" situation (Ryan and Haslam, 2007, 2005). Additionally, female board members often perceive a lower status, and they are less valued as a group member (Vial et al., 2016; Duguid et al., 2012).*

An important strand of literature investigates the influence of women board membership on innovation outputs, but there is no common agreement on whether this influence is positive or negative (Smulowitz et al., 2025). Some studies state that women are more risk-averse negatively influencing the level of innovation in the firm (e.g., Nelson, 2015; Faccio et al., 2016). Empirical research has shown that on average women choose options with fewer financial risks than male counterparts (Sapienza et al., 2009; Byrnes et al., 1999; Jianakoplos and Bernasek, 1998). Additionally, women often see their position as more precarious than the one of their male counterparts, amplifying their risk-averse approach (Glass and Cook, 2020; Smith et al., 2019; Vial et al., 2016; Smulowitz et al., 2025) Other works provide opposite results mainly focusing on the improvement of decision-making process given by the gender diversity on the board that results in more innovation (Smulowitz and Smulowitz, 2024; Hemmert et al., 2022; Griffin et al., 2021; Vafaei et al., 2021; Cumming et al., 2015; Adams and Ferreira, 2009). Heterogeneity in boards spurs broader perspectives which allow the management to be involved in in-depth conversations and find various alternatives (Rao and Tilt, 2015; Van Knippenberg et al., 2004; Watson et al., 1998; Robinson and Dechant, 1997).

Smulowitz et al. (2025) investigate this controversial situation by shedding light on big firms. Specifically, they empirically demonstrate that women on board can be both more risk averse, but also more innovative, depending on the firms' performance relative to aspirations (PRA) (Chen and Miller, 2007; Eggers and Suh, 2019; Greve, 2003). This research seems to overcome the debate on the impact of women on board on innovation of big firms, however, are those results valid also for SMEs? A recent study from Teruel and Segarra-Blasco (2017) confirms that the size of the firm exerts a moderating role between gender diversity in boardrooms and innovation, highlighting a greater difficulty for SMEs in capturing advantages from gender diversity during the innovation process, compared to large firms. However,

no studies specifically focus on small and medium enterprises to understand the impact of women on board on innovation. We aim to investigate the impact of women on board on innovation in SMEs, contributing to filling the gap in the literature.

To address this gap, we will focus on the Italian context as Italy is characterized by a widespread SMEs ecosystem. Specifically, about 80% of the workforce is employed in small and medium enterprises (Cucino et al., 2024; ISTAT, 2023). Additionally, the Italian Ministry of Development (MISE, 2020) significantly focuses on firms transitioning towards Industry 4.0, initiating various interventions to spur digitalization and innovation among firms. Consequently, Italy is a strong empirical setting to validate our hypotheses and provide significant contributions to the literature (Martinelli et al., 2021).

Purpose of the paper. *The present work aims to investigate the impact of women board membership on innovative performance of small and medium enterprises (SMEs). While past research has focused on the role of women on corporate boards in large firms, in relation to firm innovation, there remains a gap in understanding how these dynamics works for SMEs. Existing literature presents conflicting perspectives, where some works argue that women's risk aversion hinders innovation, while others highlight their contribution to enhance decision-making processes that foster innovation. A recent study from Smulowitz et al. (2025) suggest that the relationship between women on board and innovation relates to firms' performance relative to aspirations (PRA), solving the debate for large firms. This study aims to extend the empirical investigation by exploring whether similar effects hold for SMEs, contributing to the broader understanding of gender diversity's role in corporate governance and innovation within smaller enterprises.*

Methodology. *We build a unique dataset collecting information from the Italian Chamber of Commerce database, Aida-BvD database, and Orbis IP. The Italian Chamber of Commerce database is a national institution responsible for validating all companies' administrative and legal requirements. The law requires that all innovative SMEs must register in a specific section of the Italian Chamber of Commerce's register and provide information regarding board composition. From this dataset, we obtain about 3,000 innovative SMEs in Italy founded between the 2013 and the 2023. Among this, 2190 have a majority of women in their boards. Moreover, to collect financial information, since the Italian Chamber of Commerce does not provide this kind of information, we employ the Aida database provided by Bureau van Dijk (BvD). By merging data from both sources, we collect comprehensive financial information on 1,937 innovative SMEs. Finally, we collect patent data employing Orbis IP. As such, we are able to conduct our empirical analysis on a comprehensive sample of 1,937 SMEs consisting of non-financial information (such as board composition information, location, industry, and so on), financial information (like revenues, profitability measures, etc.), patent information (regarding quantity, scope, citations, IPS and CPC).*

We will test our hypotheses by employing a difference in difference approach followed by a propensity score matching method. The difference in difference (Diff-in-Diff) is a widely spread methodology (Zambelli et al., 2024; Potì and Wang, 2023; Becalli et al., 2023; Srivastav and Vallascas, 2022) adopted to compare a treated group and a control group. Specifically, the Diff-in-Diff methodology estimates the effect of a specific treatment by comparing the changes in outcomes over time between the two groups of treated and control observations (Zambelli et al., 2024). Both groups will be evaluated before and after the treatment. We aim to compare the treated group of innovative SMEs with the majority of board components represented by women, and the control group of innovative SMEs with the majority of man in the board. Our treatment effect is, indeed, represented by having a majority of women on board, while our outcome is the number of patents the firm has licensed. Moreover, consistently with past literature, our model will include control variables, described as follows: (1) whether the SME operates in a high-tech industry or not (Messeni Petruzzelli et al., 2022), (2) the SME's age (Kelly & Amburgey, 1991), (3) the SME's size (Arbore & Ordanini, 2006; Horváth & Szabó, 2019), (4) the SME's potential and realized absorptive capacity (i.e., the R&D expenses on total revenue (Cassetta et al., 2020; Zahra & George, 2002), and (5) the digital skills of the SME's human resources (measured as the percentage of employees with a STEM degree (Agostini & Filippini, 2019; Eller et al., 2020; Giotopoulos et al., 2017; Horváth & Szabó, 2019). We will extend our model by employing a propensity score matching (PSM) methodology (in line with Zambelli et al., 2024; Ayadi et al., 2021; Casu et al., 2013; Caliendo and Kopeining, 2008). The PSM is a statistical methodology commonly used to estimate causal treatment effects in non-randomized environments. To perform this method, we will identify the treatment, which is to have the majority of board components represented by women, a group of treated observations, and a control group (Casu et al., 2013; Rosenbaum and Rubin, 1983). Applying this research strategy we will be able to rigorously identifying the impact of women on board on innovation of SMEs, significantly contributing to the literature.

Results. *The study will potentially reveal key insights into the relationship between women board representation and innovation in SMEs, measured by the number of patents licensed. Based on prior literature and theoretical perspectives, several possible outcomes may emerge. However, we expect that the presence of women on board in SMEs positively impact innovation processes, enhancing decision-making quality, resource allocation, and strategic vision. This would be reflected in a greater number of licensed patents, particularly in firms operating in high-tech industries, where diverse perspectives may drive creativity and problem-solving. Another possible result is that female board representation does not significantly influence innovation in SMEs (e.g., Audretsch et al., 2022), suggesting that other factors, such as firm size, industry, and absorptive capacity (Zahra and George, 2002), play a more dominant role in driving patenting activity. We could also expect a negative relationship between women on board and innovation, demonstrating that Smulowitz et al. (2025) results do not hold for SMEs, and reopening the debate and providing interesting insights for deepening the field.*

Research limitations. *Despite its strong contributions to the academic field, the present study could present some limitations. First, the study focuses exclusively on the Italian innovative SMEs, which may limit the applicability of findings to other countries with different regulatory environments, cultural attitudes toward gender diversity, and innovation ecosystems. Future research could explore similar dynamics in other contexts to validate the results. Second, the study uses a dummy variable to indicate whether the majority of board members are woman, but this not accurately capture the actual influence of female directors. On the same vein, patents are a widely used measure of innovation (Block et al., 2025; Nagaoka et al., 2010; Encaoua et al., 2006), but they may not fully capture all forms of innovative activity, like non-patentable technological advancements. Future research could incorporate additional measures of female influence and innovation.*

Managerial implications. *This study has several important implications for managers and entrepreneurs seeking to foster innovation and improve corporate governance in SMEs. If the study finds a positive relationship between women on board and innovation, SMEs managers or entrepreneurs should start actively promoting gender diversity in board composition, leading to more balanced decision-making and enhanced vision and culture of innovation. If, on the contrary, the impact on innovation is negative due to the higher level of risk aversion, managers should moderate risk exposure of the firm mitigating this effect.*

Originality of the paper. *This research contributes to the literature by addressing a significant gap in the field, investigating the impact of women board representation on innovation within small and medium enterprises. While previous studies have extensively addressed this relationship in large corporations, limited attention has been given to SMEs. However, SMEs play a crucial role in economic growth and technological advancements, especially in Europe. For example, Italy counts a significant presence of small and medium enterprises, which employ about 80% of the national workforce (ISTAT, 2023). This empirical reality supports the importance of our findings for the entrepreneurial ecosystem. Additionally, by integrating data from the Italian chamber of commerce, Aida-BvD, and Orbis IP, this study constructs a unique dataset that combines board compositions, financial information, and patent data. This allows for a more rigorous analysis of the relationship between women on board and innovation in SMEs.*

Key words: *Women on Board; Gender; Patent; Innovation*

"E-Sports and social innovation: promoting resilience, inclusion, and social capital in the digital age"

BEATRICE FRATANGELI[1] FRANCESCA VICENTINI[2] GIORGIO PORTALURI[3] RITA MURA[4]

Abstract

This study investigates the potential of E-Sports as instruments for social innovation, emphasizing their capacity to foster personal resilience, social inclusion, and the development of social capital within digital communities. Sports, by their very nature, are innovative, as they continuously adapt, evolve, and transform in response to social, political, and technological shifts (Ratten & Ferreira, 2016). In an era marked by rapid digitalization and the transformation of social dynamics, E-Sports have emerged not only as a global entertainment phenomenon but also as an ecosystem that offers educational, professional, and personal growth opportunities. Their accessibility and global reach make them particularly effective in engaging populations that are often excluded from traditional sports or social participation.

This paper explores the role of E-Sports in promoting digital resilience, defined as the ability to confront challenges and adapt to competitive and ever-changing environments. It also examines how E-Sports foster social inclusion by breaking down geographical, economic, and cultural barriers, enabling interaction among individuals from diverse social backgrounds and genders. Furthermore, the study highlights the contribution of E-Sports to building social capital through the creation of supportive and collaborative networks within digital communities.

A critical consideration in the E-Sports sector is the concept of responsible innovation. While digitalization offers numerous opportunities, it also introduces risks such as gaming addiction, mental health issues, privacy violations, and discrimination. Responsible innovation is essential to addressing these challenges and ensuring that E-Sports can grow in a sustainable and positive manner, benefiting both individuals and society at large.

By leveraging the unique characteristics of E-Sports, this research aims to demonstrate how they can serve as powerful tools for social innovation, promoting resilience, inclusion, and community building in the digital age.

Research Framework. *In the context of increasing digitalization, E-Sports have emerged as a global phenomenon that not only redefines digital entertainment but also plays a significant role in shaping new social dynamics. E-Sports, or electronic sports, refer to competitive video gaming (Jenny et al., 2017) and have gained immense popularity worldwide. Some argue that the term E-Sports specifically denotes a high level of competitive gaming, characterized by professional players and elite tournaments that demand substantial time, dedication, training, and coaching. Many scholars (e.g., Funk, Pizzo, & Baker, 2018; Jenny et al., 2017; Jonasson & Thiborg, 2010; Thiel & John, 2019; Witkowski, 2012) agree that E-Sports share enough similarities with traditional sports to be considered "real sports." However, others contend that E-Sports do not fit the conventional definitions of sports (Drewe, 2003; Hallmann & Giel, 2018; Parry, 2019). Heere (2018) argues that regardless of their classification, E-Sports should be studied by sports scholars because they represent a recreational activity that is increasingly adopting the characteristics of modern organized sports.*

Historically, the Olympic Movement has been hesitant to embrace E-Sports, as their structures, culture, and certain game titles were not aligned with the value-based ethics of the Olympics. However, the International Olympic Committee has found a way to engage with E-Sports through sports simulation games that incorporate a physical dimension, aligning with its values and strategic priorities (Abanazir, 2022). Within globally connected E-Sports platforms, the sense of community and belonging remains central to the values and principles guiding the creation of online spaces (Hayday et al., 2021). E-Sports offer numerous opportunities to promote developmental outcomes and support inclusivity goals (Hayday & Collison, 2020; Hayday et al., 2022; Martoncik, 2015; Trepte et al., 2012). Their ability to bring individuals and communities together presents unique opportunities for social innovation. Platforms like Twitch and YouTube Gaming create virtual spaces where players can interact and socialize, overcoming geographical and cultural barriers. This social dimension of E-Sports contributes to the development of digital skills and fosters social inclusion.

Critics of E-Sports often highlight the lack of physical activity, arguing that they are not as healthy as traditional sports. While it is true that most E-Sports do not involve physical exertion, engaging in E-Sports can still offer significant health benefits, particularly in terms of social and mental well-being. Playing online with peers opens up new possibilities for digital friendships and communities. In other words, gaming and E-Sports provide many young people with a sense of belonging and acceptance among like-minded peers, which is crucial for ensuring a high quality of life. This aspect of E-Sports underscores their potential to contribute positively to the social and mental health of participants, even in the absence of physical activity.

Objective of the Paper. *The aim of this paper is to explore how E-Sports can serve as tools for social innovation, promoting resilience, inclusion, and social capital, thereby contributing to digital and social well-being. This analysis is structured around three key dimensions:*

1. *Digital resilience and adaptability: participation in E-Sports can foster the development of coping strategies, adaptability, and stress management in competitive environments. By engaging in E-Sports, individuals enhance their digital skills and psychological well-being, as they navigate challenges and build resilience. Well-being, a sense of belonging, social integration, and happiness are critical components of an individual's overall health. While the relationship between E-Sports, well-being, and mental health remains underexplored, some international studies suggest that playing E-Sports can offer mental health benefits, such as stress relief and the formation of digital friendships and virtual communities (Martoncik, 2015). Beyond physical activity, many of the health-related arguments that justify financial support for traditional sports also apply to E-Sports. For example, E-Sports can promote social inclusion in ways like traditional sports, providing young people with opportunities for connection and personal growth.*
2. *Social inclusion and digital accessibility: E-Sports offer inclusive platforms for traditionally marginalized groups, enabling equitable access to educational, professional, and social opportunities in the digital realm. For instance, in Italy, the Paralympic Committee has partnered with E-Sports to develop virtual sports as tools for inclusion and social integration. However, challenges related to gender representation persist. Gender inequality, equity, and empowerment have long been central issues, as highlighted by Saavedra (2009, p. 124): "Gender emerges at the intersection between the physical and the social, and it is precisely here that sport also resides." Addressing gender inequalities requires a focus on both the physical and social dimensions of participation. In terms of gender equality, E-Sports have already begun to support initiatives aimed at closing the gender gap. For example, in 2019, Riot Games collaborated with Girls Who Code, an international nonprofit organization dedicated to empowering women in technology and E-Sports (Huyer & Sikoska, 2003; Riot Games, 2022).*
3. *Social capital and community building: E-Sports facilitate the formation of social networks based on trust, collaboration, and mutual support. These networks contribute to the creation of inclusive and resilient communities, strengthening social capital and cohesion. The global nature of E-Sports allows players to form bonds that transcend geographical barriers, fostering a sense of global community. Platforms like Discord, co-founded by Jason Citron, have been instrumental in connecting players worldwide, creating spaces for mutual support and cultural exchange. Organizations such as the Global E-Sports Federation work to promote the sustainable development of E-Sports, building networks that reinforce social capital on an international scale. Additionally, E-Sports platforms have advanced opportunities for people with disabilities (Special Effect, 2023), as cognitive ability often plays a more significant role than physical ability in many gaming titles. This focus on accessibility allows E-Sports to engage a broader audience, including sports enthusiasts, non-traditional sports communities, and hard-to-reach populations.*

While certain features in gaming, such as player IDs, voice communication, and in-game chat, can still lead to instances of discrimination, the digital nature of E-Sports offers players a degree of relief from the real-world stigmas they might face in physical settings. These stigmas, often deeply ingrained in society, are less pronounced in online spaces, where inherent markers of gender, age, religion, or language are not immediately visible. As a result, digital platforms can provide a more inclusive environment compared to the physical world, where such characteristics frequently lead to exclusion and discrimination.

Traditional sports often face limitations due to their physical nature, which can prevent diverse groups-such as men and women, young and old, or disabled and non-disabled individuals-from competing together. In contrast, E-Sports are inherently gender-neutral, as they rely less on physical ability and more on cognitive and strategic skills. This reduced physical component means that participation in E-Sports has the potential to transcend traditional gender stereotypes and disparities (Kim, 2017). In theory, this could allow for true gender equality in competitions, where individuals of all genders could compete on the same team, moving beyond the traditional male vs. male or female vs. female formats. However, real-world gender stigmas have influenced the adoption and diversity of participation in E-Sports (Ruvalcaba et al., 2018; Taylor, 2017), leading to a significant lack of female representation at both grassroots and competitive levels (Hilbert, 2019).

Despite these challenges, the E-Sports industry is making strides toward greater inclusivity. Efforts to boost female participation are gaining momentum, with initiatives aimed at improving diversity and empowering women to address the hypermasculinity often prevalent in the industry (Associated Press, 2019; Riot Games, 2022; Women in Games, 2022). The dynamic and evolving nature of E-Sports presents a unique opportunity to foster inclusivity and support development programs that encourage broader participation. By addressing existing barriers and providing targeted support for female players, the industry can work toward a future where gender equality is fully realized, not only in E-Sports but also in traditional sports.

In summary, while E-Sports still face challenges related to discrimination and gender representation, their digital nature offers a unique platform for fostering inclusivity. By leveraging this potential and implementing initiatives to support diversity, the E-Sports industry can pave the way for a more equitable future in both digital and traditional sports.

Methodology. *The methodological approach of this study employs a multi-faceted strategy to ensure a comprehensive understanding of E-Sports as tools for social innovation. This approach includes:*

1. *Literature review: the first phase aimed at establishing the theoretical foundation of the study. Sources include academic journals, policy reports, and grey literature focusing on the themes of social innovation, inclusion, and e-sports. This review enables the identification of key concepts and frameworks, guiding the empirical stages that follow.*
2. *Case Study analysis: the second phase involves a qualitative case study drawn from the ongoing project "E-Well: E-sports between resilience, inclusion, and social capital." The selected case focuses on a grassroots e-sports initiative that actively promotes inclusive values. Data for the case study are collected through direct observation of events and analysis of project documentation. This component aims to provide in-depth insights into how inclusive strategies are operationalized within real-world e-sports settings.*
3. *Structured questionnaires: the third phase incorporates a quantitative approach through the deployment of a structured questionnaire to various professionals within the E-Sports sector, including athletes, coaches, and mental coaches. The questionnaire is designed to gather data on:*
   - *Health status: with a focus on both physical and mental well-being, this section aims to assess the health impacts of participating in or working within the E-Sports industry.*
   - *Resilience: a dedicated section explores the strategies employed by professionals to cope with the challenges and pressures associated with competitive gaming. This includes stress management techniques, adaptability, and coping mechanisms.*
   - *E-Sports consumption: this section investigates participants' habits and engagement with E-Sports competitions, including their frequency of participation, viewing habits, and overall involvement in the E-Sports ecosystem.*

   This phase supports the generalizability of findings and allows for cross-sectional analysis.

By combining these methods, the study employs methodological triangulation, integrating both qualitative and quantitative data to provide a robust and nuanced analysis. The literature review informs the construction of the case study and the survey; the case study offers contextual depth; and the survey provides measurable insights. Together, they align with the research objectives and ensure a coherent and focused methodological approach. This approach ensures a holistic understanding of the role of E-Sports in promoting social innovation, resilience, inclusion, and social capital, while also addressing the health and well-being of those involved in the industry. The triangulation of data sources enhances the reliability and validity of the findings, offering a comprehensive perspective on the potential of E-Sports as a force for positive social change.

Expected Results. *We expect the results to show that e-sports initiatives designed with inclusive objectives-such as gender diversity, accessibility for people with disabilities, and engagement of socially disadvantaged groups-lead to measurable social innovation outcomes. Specifically, the questionnaire survey is anticipated to reveal:*

- *A statistically significant increase in participants' sense of social inclusion and digital competence.*
- *Positive correlations between inclusive event design (e.g., diversity policies, inclusive communication, team support structures) and reported improvements in community belonging.*
- *Increased levels of perceived self-efficacy, particularly among participants from marginalized groups.*

From the case study, we expect to identify:

- *Organizational practices that facilitate inclusive participation, such as mentorship programs, accessible technologies, and non-competitive formats.*
- *Narratives and testimonials that demonstrate empowerment, social engagement, and perceived resilience as direct outcomes of participation.*

These results will contribute to a deeper understanding of how E-Sports can promote digital and social well-being, offering insights into their potential as platforms for positive social change.

Research Limitations. *While this study aims to provide valuable insights, it is important to acknowledge its limitations:*

1. *Availability of empirical data: the research may be constrained by the limited availability of empirical data on E-Sports and their social impact. Much of the existing literature is still emerging, and there may be gaps in data related to specific demographics or regions.*
2. *Need for longitudinal studies: the long-term impact of E-Sports on social innovation, resilience, and inclusion is not yet fully understood. Longitudinal studies are needed to assess how these effects evolve over time and to determine the sustainability of E-Sports as tools for social change.*
3. *Rapid evolution of the sector: the E-Sports industry is evolving at a rapid pace, with new technologies, platforms, and trends emerging frequently. This dynamic nature may require frequent updates to the collected information and could limit the generalizability of the findings over time.*

Additionally, it is important to note that this study is a work-in-progress. At the time of writing, the results of the questionnaire administered as part of this research are not yet available. These results, which will provide further empirical evidence and refine the conclusions drawn in this paper, are expected to be presented during the conference where this study will be discussed.

By acknowledging these limitations, the research aims to provide a balanced perspective on the potential of E-Sports while encouraging further exploration and study in this rapidly growing field.

Managerial Implications

From a theoretical perspective, this study extends existing frameworks in social innovation and sport management by exploring the under-researched intersection between digital competition and inclusive value creation. It contributes to the literature on social innovation by positioning e-sports not merely as entertainment or economic drivers, but as potential instruments for generating social capital and enhancing community resilience. The research also expands theories of inclusive innovation by demonstrating how non-traditional sporting environments - such as virtual competitions - can activate participatory processes and empower marginalized groups. Moreover, it informs sport governance theory by highlighting the need for adaptive regulatory models that embrace digital formats and promote equity within emerging competitive domains.

Managerially, the study identifies concrete pathways through which organizations can harness the social potential of e-sports to advance inclusion and sustainability goals. In particular:

1. *Promoting social awareness campaigns: E-sports events and streaming platforms can be integrated into communication strategies to raise awareness on issues such as diversity, equity, and mental health. Organizations can co-create content with players and influencers to reach broad, engaged audiences.*
2. *Designing inclusive virtual environments: NGOs, public institutions, and civic groups can collaborate with game developers and tournament organizers to ensure that virtual spaces are safe, accessible, and intentionally inclusive. These environments offer opportunities for participation and socialization for young people and marginalized communities.*
3. *Strategic branding and marketing: E-sports present a valuable context for companies seeking to build a progressive brand identity. Sponsorships, partnerships, and the development of branded experiences in the gaming ecosystem allow firms to engage a digitally native demographic while reinforcing their commitment to social values.*
4. *Employee development and internal innovation: internally, e-sports can serve as innovative tools for training and team building. Gaming-based interventions can enhance soft skills such as strategic thinking, collaboration, and stress management, fostering more cohesive and adaptive work environments.*
5. *Business model innovation: by embedding e-sports within broader corporate social responsibility (CSR) and sustainability strategies, organizations can reconfigure their value propositions. This approach not only improves social impact but also strengthens stakeholder engagement and supports long-term resilience in fast-evolving markets.*

The adoption of eSports-related strategies not only enables organizations to maximize their social impact but also to innovate their business models, contributing to the creation of a more sustainable and inclusive digital ecosystem. The study contributes to both academic discourse and managerial practice by framing e-sports as dynamic arenas for social experimentation and inclusive transformation. It encourages researchers and practitioners alike to reimagine digital competition as a meaningful space for innovation with tangible societal benefits.

Originality of the Paper. *This study offers an innovative perspective on eSports, considering their potential as tools for social innovation rather than mere forms of entertainment. By recognizing and leveraging this potential, it is possible to harness eSports to promote a more inclusive and socially responsible digital future.*

The ACT Model: A Literature Review on the Role of Influencer Marketing in Digital Environments with a Focus on Food and Beverage

PIERLUIGI PASSARO[1] ALESSANDRO GIANNATTASIO[2] LORENZO SAPONARO[3]
CESARE AMATULLI[4] MARCO PICHIERRI[5]

Abstract

This research examines the role of influencer marketing in the digital environment, focusing on the food and beverage sector through a literature review. Specifically, the authors introduce the ACT framework (Attractive, Connection, Trend), a theoretical model that explains how human and virtual influencers attract consumers by creating emotional connections and, consequently, generating new consumption trends. In particular, articles focusing on the role of influencer marketing in digital environments, with a specific emphasis on the food and beverage sector, were identified, selected, and included via Scopus and Scholar, following the PRISMA approach. Results identified three main research areas, related to: Attraction, Connection, and Trend. Overall, results reveal that while users tend to perceive virtual influencers similarly to human ones, awareness of their artificial nature can create a sense of detachment from reality, finally impacting consumer behavior. This study, through the ACT model, provides preliminary analysis of the role of influencer marketing in digital environments, with a focus on the food and beverage sector. Furthermore, it offers valuable insights for both academic research and digital marketing strategies in the food and beverage industry.

Research framework and purpose. *Social media has become a main communication modality in the 21st century, enabling individuals to express our belief, ideas and manner in an absolute new way. This modality have also a huge impact on companies, which have realized that without a correct plan and social media strategy they have no chance to stand out in the rapidly changing digital environment. This change made companies and marketing experts increasingly attentive to the value of advertising and the opportunity to exert influence on multiple platforms (Juska., 2022). Influencer marketing is defined as a new form of marketing that consists of activities aimed at identifying and building relationships with subjects with a strong influence on their following (Wong, 2014). According to Gammoudi et al. (2022, p. 144), "an influencer is someone who entices an influence to do the same action, make the same decision, or change their behavior".*

Therefore, influencers are particular users who, by virtue of their recognized expertise and massive visibility, are able to amplify messages and opinions by influencing other users (Gomez, 2019). This ability is a direct consequence of the reputation that these subjects have built and which pushes the audience to place trust in them (Heyymann, 2011). In light of the reliability and credibility they benefit from, influencers represent a relevant of communication channel between companies and users. Wong (2023) states that "social media have radically changed the balance of power between consumers and brands, because they allow recommendations from customers, playing a fundamental role in maturing the purchase decision."

Virtual Influencers, like avatars, are digital characters, completely computer-generated, created to interact with the public on social media. Indeed, they are managed by experts and digital agencies that help brands to reach desirable target groups effectively through their digital personalities (Audrezet & Koles, 2023). The term influencer marketing was coined by Brown and Hayes (2008, p. 12) to depict "an interaction-driven marketing tactic that uses the influencers' (e.g., key opinion leaders, celebrities and vloggers) characteristics (e.g. personality) to create eye-catching content, drawing their followers' attention and engagement, shaping their purchasing decisions" (Deng et al., 2021, p. 685). With millions of internet users browsing social media platforms for entertainment, inspiration, and product recommendations daily, it is no surprise that marketers are harnessing the power of social media's most recognizable faces for promotion (Rathod et al., 2023).

Importantly, the credibility of virtual influencers and the parasocial connections they may generate can play a crucial role in the perception of brands (Melnychuk et al., 2023). The effectiveness of their advertising campaigns is closely linked to their ability to appear credible and human. However, significant challenges arise regarding the perception of authenticity of these influencers, which deserve special attention (Ma & Li, 2024). In this context, empathy becomes a key factor in interacting with digital avatars, compared to traditional influencers (Kim & Park, 2024).

In the ever-evolving marketing landscape, innovative strategies for leveraging virtual avatars in promotional campaigns are beginning to take shape. It's crucial to determine which virtual influencers wield the most impact in digital marketing and how they stack up against their human counterparts in terms of brand strategy and control (Audrezet and Koles, 2023). Additionally, the emergence of regulatory challenges surrounding virtual influencers is becoming an increasingly important topic (Sands et al., 2022). It is worth to notice that young consumers often assess human influencers through the lenses of credibility, authenticity, and engagement (Tsen and Cheng, 2021). This highlights the vital role of empathy in fostering deeper connections with real influencers compared to virtual ones (Mirowska and Arsenyan, 2023).

Interestingly, human influencers frequently perpetuate gender stereotypes, and audience perceptions can vary dramatically based on these portrayals (Lee and Yuan, 2023). Therefore, it is essential to devise effective strategies for identifying the most fitting human influencers in the realm of digital marketing (Gammoudi et al., 2022).

A thorough comparison between human and virtual influencers is necessary to determine which figure offers greater advantages for brands. Moreover, incorporating personal narratives and compelling visual content can significantly enhance community engagement. Ultimately, a well-defined online identity plays a key role in boosting audience interaction (Nash, 2023).

Influencer marketing represents an increasingly widespread and effective promotion strategy also in the restaurant sector and for all those who deal with food. This form of marketing offers an opportunity to improve a business and reach a large and "hungry" audience for culinary content. One of the main advantages of influencer marketing for restaurateurs, for example, is the possibility of expanding the visibility of their restaurant or product brand. In practice, influencers with a large following can promote a restaurant or a product through creative and engaging content. Their photos, videos or reviews can attract the attention of a large audience of potential customers, who could be inspired to visit the restaurant.

In order to better understand the possible effectiveness of influencers (virtual and human) in digital marketing, we propose a classification of the literature into three main research areas: Attractiveness, Connection, Trend. The study organizes and synthesizes some of the existing knowledge on influencer marketing in digital environments, with a specific focus on the food and beverage sector. Through a literature review, we adopt a two-pronged approach: a) we identify the main research themes and dynamics that characterize digital influencing in the sector, distinguishing between human and virtual influencers, and b) we develop the ACT Model, a framework that structures the literature into three key dimensions: Attractive, Connection and Trend. This model provides an innovative key to understanding how both types of influencers attract audiences, stimulate engagement and spread new trends in consumer behavior. Furthermore, the review includes some comparative studies analyzing the differences between human and virtual influencers, in an attempt to offer a more comprehensive view of the phenomenon. The ACT Model tries to contribute to summarize existing research but also provides a useful theoretical basis for future studies, providing practical insights for companies and digital marketing professionals in the food & beverage sector.

Methodology. *For this study, a literature review was carried on the basis of the PRISMA methodological approach (Moher et al., 2015), which allowed for a critical analysis of the literature following a structured process divided into four stages: identification, screening, eligibility and inclusion.*

Identification. Via Scopus and Scholar two of the most important academic databases for bibliographic research (Paschou et al., 2020), we identified studies consistent with our research goals. A sample list of selected keywords included terms such as "influencers" and "digital marketing" combined with keywords related to application domains, such as "virtual environmental", "food", and "beverage". After defining the final set of keywords, we conducted a series of queries by combining the selected terms based on database-mining criteria, aiming to extract the most relevant articles for a comprehensive state-of-the-art analysis. An example of a query used was: Title-Abs (("influencers" and "digital environmental) and ("influencer marketing" or "food" or "beverage")) and pubyear > "2020" and <"2024" and (limit-to (doctype, "ar") or limit-to (doctype, "cp")) and (limit-to (language, "English")))

Screening. A data cleaning analysis was carried out, discarding all articles and journals that did not meet some criteria, e.g. non-peer-reviewed journals or with a low impact factor. We selected 18 manuscripts, published between 2020 and 2024, excluding one because it was not available. The selected timeline was chosen to ensure the relevance and actuality of the results, as 2020 represents a key year for the development of influencer marketing (Lou et al., 2020). In fact, partly due to the COVID-19 pandemic, the market value of influencer marketing grew from $1.7 billion in 2016 to $9.7 billion in 2020.

Eligibility and Inclusion. The abstracts of the articles were examined to select those relevant to the topic of the influencers (virtual and human) in digital environments, with a focus on the food & beverage sector. For each selected article, we drafted summary sheets that defined and summarized: objective of the study, methodology, main findings, key theoretical constructs. This approach made it possible to structure and classify the literature, thus facilitating comparison between studies and offering a clear view of the state of art.

We applied thematic coding to organize the selected articles within the ACT framework (Attraction, Connection, and Trend). The coding was initially carried out by one researcher following well-defined criteria, with subsequent collaborative reviews involving co-authors to ensure the overall consistency and clarity of the classification.

Results. *The analysis of the paper led to the creation of a research framework, that is the "ACT model", which offers a classification of the existing literature on influencer marketing in the virtual environment, with a specific focus on the food and beverage industry. Firstly, we underlined the distinction between human and virtual influencers, then we distinguished and organized the literature into three key thematic areas, reflecting a dynamic and interconnected process: 1. Attraction, 2. Connection, 3. Trend (see Table 1).*

Table 1. The ACT model (a summary of the analyzed literature)

Virtual influencers	*Human influencers*
Attraction	
• *Melnychuk et al., 2023 - The role of credibility of the virtual influencers and parasocial connections.* • *Ma & Li, 2024 - Humanization of virtual influencers and its impact on brand perception.* • *Kim & Park, 2024 - The advertising effectiveness of virtual influencers depends on their credibility and humanization.* • *Sands et al., 2022 - Challenges related to the perceived authenticity of virtual influencers.* *Mirowska & Arsenyan, 2023 - The role of empathy in interactions with virtual versus human influencers.*	• *Tsen & Cheng, 2021 - Young consumers evaluate human influencers based on credibility, authenticity, and interaction.* • *Mirowska & Arsenyan, 2023 - The role of empathy in engagement with human versus virtual influencers.* • *Lee & Yuan, 2023 - Human influencers replicate gender stereotypes, and audience perception varies based on these representations.*
Connection	
• *Gammoudi et al., 2022 - Identifying the most effective virtual influencers in digital marketing.* • *Audrezet & Koles, 2023 - Comparison between virtual and human influencers in terms of brand strategy and control.* • *Sands et al., 2022 - Regulatory challenges and the governance of virtual influencers.*	• *Gammoudi et al., 2022 - Strategies for identifying the most effective human influencers in digital marketing.* • *Audrezet & Koles, 2023 - Comparison between human and virtual influencers to determine which is more effective for the brand.* • *Suh, 2020 - Personal narratives and visual content enhance community engagement.* • *Nash, 2023 - A strong IT identity leads to greater audience engagement.*
Trend	
• *Allal-Cherif et al., 2024 - Virtual influencers are perceived as authentic, which increases engagement with their target audience.* • *Kim & Park, 2023 - The attractiveness of virtual influencers can influence imitation desire and purchase intention.* • *Yang et al., 2023 - The influence of virtual influencers in corporate social responsibility (CSR) campaigns.* *Ham et al., 2024 - The role of the positive emotions expressed by virtual influencers*	• *Deng et al., 2022 - Human influencers in the food & beverage sector influence consumer behavior based on audience segmentation.* • *Sokolova et al., 2024 - Human influencers in the food sector promote home cooking and healthier eating habits.* • *Yildirim, 2024 - Green women influencers shape sustainable consumption choices through storytelling and authenticity.*

<u>Attraction</u>. The importance of credibility and humanization of virtual influencers plays a crucial role in how consumers perceive brands (Ma & Li, 2024) and are attracted by them. The effectiveness of advertising based on influencers may depend on the authenticity and ability of such influencers to create an emotional connection with the audience (Kim & Park, 2024). However, some challenges also arise regarding the perception of authenticity of virtual influencers (Sands et al, 2022). Indeed, it is crucial to consider how empathy affects online interactions especially when compared to those with human influencers (Mirowska & Arsenyan, 2023). Moreover, young consumers are more likely to evaluate human influencers based on criteria such as credibility, authenticity and level of interaction (Tsen & Cheng, 2021). It is also interesting to note that human influencers tend to reproduce certain gender stereotypes and the public's perception of them may change in relation to these representations (Lee & Yuan, 2023). Finally, empathy certainly plays a fundamental role in terms of engagement, with both human and virtual influencers (Mirowska & Arsenyan, 2023).

<u>Connection</u>. The literature emphasizes the relevance of connecting with the online audience by identifying the most effective virtual influencers in the digital marketing landscape (Gammoudi et al., 2022). Importantly, however, current studies consider the comparison between virtual and human influencers, especially in relation to brand strategies and control (Audrezet & Koles, 2023). Interestingly, some findings show that personal stories and well-curated visual content can increase community engagement (Suh, 2020) and that a strong digital identity contributes to greater audience engagement (Nash, 2023). Moreover, some scholars have underlined the regulatory challenges and the need for a regulation for virtual influencers (Sands et al., 2022).

<u>Trend.</u> Virtual influencers may also have a significant impact on consumer behavior (Allal-Cherif et al., 2024), thus impacting market and consumption trends. Indeed, their attractiveness can stimulate the desire for imitation and influence purchase intentions (Kim & Park, 2023). Furthermore, the role of virtual influencers also extends to corporate social responsibility (CSR) campaigns, where they may have great impact (Yang et al., 2023). Ham and colleagues (2024) highlighted that, in general, virtual influencers who express positive emotions, such as happiness, are able to increase follower engagement and more strongly influence consumer behavior, thus impacting positive lifestyles in the food sector.

Findings also show that human influencers may impact consumer behavior based on audience segmentation, thus highlighting the importance of correct targeting choices (Deng et al., 2022). The literature also underlines that human influencers in the food sector can actively promote home cooking and healthier lifestyles (Sokolova et al., 2024). In particular, female influencers committed to sustainability, known as green women influencers, modulate consumer choices through authentic storytelling practices, guiding the public towards more responsible and conscious decisions (Yildirim, 2024).

However, although the literature on the role of influencer marketing offers many valuable contributions, there are still several areas that remain underexplored. In particular, the impact of cultural context on the effectiveness of influencers is a topic that has not been widely studied, as are the legal and regulatory implications related to the use of virtual influencers in the food and beverage sector. The ACT Model can serve as a structured framework for future research in these areas, providing useful insights into how attraction, connection, and trend-creation dynamics may differ across cultures or be influenced by specific regulations. Additionally, the model can support studies that examine the ethical and social implications of employing virtual influencers in sensitive sectors such as food marketing.

Research limitations. *The research project still has some limitations. Currently, one limitation is represented by the sample size due to the relatively short period considered, thus future studies could extend the number of papers by considering wider time ranges. Furthermore, the present study had explorative goals, and the adopted methodology (a literature review) didn't allow us to identify clear and relevant relationship among the variables. Therefore, future studies rather than having a generic focus may concentrate on specific aspects.*

Managerial implications. *From a theoretical perspective, this paper contributes to the literature on influencer marketing with a focus on the food and beverage sector, by providing the ACT framework, which helps scholars to identify themes for future research. It offers a classification organizing the literature in three interrelated topics (Attraction, Connection and Trend), helping scholars in having a more unitary view of the state of art on the specific research field. From a practical point of view, the ACT framework may help companies and managers to identify digital marketing strategies to adopt. Indeed, virtual and human influencers may be used by companies in terms of brand strategies, promotional campaigns, launch of new products or services on the market (Audrezet & Koles, 2023). Moreover, influencers may be employed as communication tools, thus they act as bridge between companies and consumers, which in turn are influenced in terms of purchase intention (Wong, 2014). This study also provides insights for food and beverage companies, which may leverage these findings to communicate advantages of their offerings through influencers.*

In this sense, a hypothetical application of the ACT Model could involve a restaurant brand aiming to promote a new concept of a "virtual dining experience." Following the model's dimensions, the brand might initially collaborate with virtual or human influencers to spark curiosity and position itself as an innovator in the sector (Attraction). Next, it could organize interactive digital events or live sessions where influencers engage directly with the audience, strengthening emotional bonds and customer loyalty (Connection). Finally, by leveraging the generated content and engagement, the company could help launch or reinforce a market trend linked to "phygital dining," blending physical and digital experiences (Trend). This example illustrates how the ACT Model can assist companies in developing integrated strategies that align with specific objectives across the different stages of the digital marketing process. Nevertheless, while this practical application is promising, it is important to note that the ACT Model is currently the result of literature-based analysis, and its implementation could provide a valuable opportunity for empirical validation.

Originality of the paper. *This study offers an innovative perspective on influencer marketing in digital environments, with a specific focus on the food and beverage field. Through the development of the ACT model, our study offers an integrated perspective on the role of human and virtual influencers, which the literature tends to analyze separately. Specifically, the ACT model proposes a dual classification. The first distinguishes the literature based on the type of influencer (human or virtual); the second categorizes studies into three key research areas (Attraction, Connection, and Trend), which help to understand how influencers attract audiences, build connections, and influence consumer behavior.*

However, in addition to offering this dual classification, the innovative aspect of the ACT Model lies in its analysis of psychological dimensions (such as credibility and empathy), which provide a clear understanding of the dynamics and impact of influencer marketing on consumer behavior and the creation of market trends. Moreover, the three pillars of the theoretical model (Attraction, Connection, and Trend) were not defined arbitrarily but emerged inductively from a thematic analysis of the literature, representing the most recurring patterns identified in recent studies. More specifically, these three dimensions were identified through thematic coding of the selected studies, which consistently highlighted factors related to attraction (credibility, visual appeal), connection (engagement, empathy), and trend creation (behavioral change, market impact). This demonstrates that the ACT framework is grounded in empirical patterns and does not merely represent a theoretical abstraction.

At the end, the ACT Model thus provides a basis for the development of future research and may represent a practical tool for food and beverage companies that need to understand the different potentialities behind influencer marketing strategies.

Managing Complexity in New Product Development: A Framework for Assessing and Mitigating Over Featuring

SILVIA TEDESCHI[1] GIACOMO MARZI[2]

Abstract

The tendency to develop products and services that exceed user needs, market demands, and organizational resources is recognized as one of the top 10 risks contributing to New Product Development (NPD) failures. This phenomenon, commonly referred to as Over-Featuring (OVF), describes the tendency to introduce excessive or unnecessary features into a product or service during the NPD process. As a result, the process may suffer from scope creep, where the project's scope expands beyond its initial plan, and feature creep, where additional functionalities are continuously added during development. It can also lead to reduced usability, quality issues, feature fatigue, overdesign, overspecification, and poor project performance.

Despite its critical implications for NPD, OVF has received limited academic attention, with a lack of empirical studies and the absence of robust tools to measure and manage its impact.

This research aims to address these gaps by first conducting an experimental study to investigate and demonstrate how OVF manifests, analyzing the key actors involved: customers and firms, and their interactions. Once the evolution of the phenomenon is thoroughly assessed, the next step will be the development of a framework and practical tools to support evidence-based decision-making in the NPD process.

Framing of the research. *The impact of Over-Featuring (OVF) is significant, with organizations such as NASA recognizing it as a major risk in development projects. OVF spans multiple fields, including innovation management, R&D, engineering, and design, and can emerge at any stage of product development when a product exceeds user needs, market demands, or a firm's available resources. This phenomenon contradicts established design principles such as KISS (Keep It Simple, Stupid) and Occam's Razor, which advocate for simplicity and efficiency.*

Existing literature provides numerous studies aimed at identifying the potential causes (antecedents) and corresponding consequences (outcomes) of OVF (Marzi, 2022). Several studies highlight the significant role of human behaviour and cognitive biases among managers and developers, such as the endowment effect, IKEA effect, and I-designed-it-myself effect (Shmueli et al., 2015), all of which reflect the willingness to develop the "best possible product" (Belvedere et al., 2013). In addition, the fuzzy front end and the uncertainty inherent in the NPD process amplify the problem of OVF. This uncertainty makes it difficult to accurately understand customer needs and requirements, often leading developers to adopt a "leave all option open" strategy to accommodate potential future product adjustments and modifications (Gillier, 2015; Marzi, 2022).

On the other hand, extensive analyses have examined the outcomes of OVF, notably Feature Fatigue, described as "the tendency to overwhelm consumers by including too many features in products" (Thompson et al., 2005). Other critical outcomes include quality issues, unmet customer expectations, budget overruns, project delays, and loss of strategic focus (Marzi, 2022).

The existing literature demonstrates that the OVF presents significant risks for both customers and firms. For firms specifically, this often results in higher costs, decreased revenues, and delays that can adversely affect time to market. Despite these important implications, existing studies often treat these phenomena as independent and separate elements, overlooking the intrinsic complexity of OVF, which arises from the simultaneous interaction of multiple causes and their effects.

The lens of analysis proposed in this research offers a more detailed and integrated framework for understanding the OVF phenomenon by examining it in two distinct domains: the firm and the customer.

On the customer side, two macro-temporal phases can be distinguished (Thompson et al., 2005):

- *Before Product Use: in this phase, customers often associate greater number of features with better performance, leading to a preference for products with extensive functionalities, regardless of other decisional variables. Capability is prioritized over usability before-use.*
- *After Product Use: in this phase, customers realise that excessive features can hinder usability, leading to frustration and potential non-repurchase. Usability becomes more significant than capability post-use.*

Conference Proceedings
ISBN 978-88-94-7136-7-1
DOI 10.7433/SRECP.SP.2025.01

On the firm side, the identified macro-temporal phases are as follows:

- *Fuzzy Front-End: this phase is characterized by high uncertainty which complicates the identification of customer needs and requirements, leading to strategies that increase unnecessary features.*
- *Development and Launch Phase: during this phase, features added in the fuzzy front-end often result in scope creep, project delays, and budget overruns (Marzi, 2022).*

Among the outcomes of OVF, feature fatigue is the phenomenon that appears to have the greatest impact on the end customer and requires further exploration in this study. In the relevant studies and experiments by Thompson et al., 2005, the trade-off between usability and capability is primarily analysed, along with how the weight assigned to these two variables changes before and after product use, demonstrating that capability is prioritised over usability before use, and vice versa after use.

Referring back to the two hemispheres mentioned at the beginning of this article, the firm side and the customer side, and analysing experimental study by Thompson et al., 2005, it appears that the focus is primarily on estimating the optimal number of features from the customer side, without considering the firm side. Specifically, how do project costs, timelines, and scope vary in relation to the number of features?

Understanding this analytical framework is crucial, as customers and firms are the two key actors in the OVF phenomenon. Although their interests may appear divergent, both parties are driven by an initial desire to achieve the "best possible product." However, this pursuit results in consequences that adversely affect them in different ways, leading them to reconsider their choices when it may already be too late.

Purpose of the paper. *The increasing complexity of products and services in modern markets poses significant challenges for firms seeking to balance innovation, customer satisfaction, and operational efficiency. This study investigates Over-Featuring (OVF), considering that, although firms and customers have different perspectives on what constitutes the "best possible product", both are driven by the intention to maximize value, often leading to unintended consequences.*

If we were to allow customers the possibility to freely configure their products with all the features they think they want, there would be a high probability that they would choose the maximum number of features available to them. However, if we were to ask them after using the product how many of those features are truly useful, what features provide real added value, and if there are any features they would like to eliminate because they lead to fatigue and make the product less user-friendly, they would likely indicate that if they could reconfigure their product now, they would not choose some of the features they had selected before. (Thompson et al., 2005, Jain, S., 2019, Rust, R.T., et al. 2006). This suggests that customer experience significantly influences perceptions of product features over time. Understanding how initial expectations shift post-use is crucial in addressing the nuances of OVF (Rahman, M., 2009). As a result, we posit the following hypothesis:

Hypothesis 1: The optimal number of features from a customer perspective decreases negatively after product use.

Hypothesis 2: The decrease in the optimal number of features is due to the presence of too many features in a product, leading to fatigue and poor usability.

The competitive pressure in modern markets compels firms to continuously innovate and enhance their product offerings. However, as Buschmann (2010) highlights, this drive can lead to "featuritis", where companies add excessive features in an attempt to meet customer expectations. This approach often overlooks quality and usability issues, resulting in products that may impress but fail to deliver an optimal user experience.

Similarly, Elliott (2007) discusses the challenge of "feature creep," where the continuous addition of features complicates products and detracts from their practicality. While diversifying features can seem advantageous, it risks overwhelming customers with unnecessary options (Buschmann, F., 2009, Buschmann, F., 2010, Elliott, B., 2007). In light of this, we propose:

Hypothesis 3: Firms tend to add more features than necessary with the goal of meeting customer expectations, focusing more on impressing them with a large number of innovative features rather than addressing potential quality defects and usability issues that may arise.

Firms often overestimate the value of additional features due to cognitive biases and market uncertainty, leading to detrimental effects on product development. Bjarnason et al. (2012) investigate this phenomenon in large-scale software engineering, highlighting that overscoping, where firms add more features than necessary, can arise from misjudgments regarding stakeholder needs and expectations. The authors argue that cognitive biases, such as optimism bias, can cloud decision-makers' assessments, causing them to perceive additional features as more beneficial than they truly are, ultimately resulting in wasted resources and potential project failures.

In a complementary study, Shmueli, O., et al., (2015) examine the behavioral dynamics behind over-requirement in software development projects. Their experimental findings reveal that decision-makers frequently exhibit overconfidence in the value of added features, driven by the uncertainty of market demands and competitive pressures. This tendency not only distorts feature prioritization but also diverts attention from addressing existing quality defects and usability challenges. Thus, we propose:

Hypothesis 4: Firms tend to overestimate the value of additional features due to cognitive biases and market uncertainty.

To effectively address the challenges of Over-Featuring (OVF) in new product development (NPD), it is essential to consider the role of decision-support tools that leverage empirical data. These tools are crucial for enhancing the efficiency and effectiveness of NPD processes, as they provide valuable insights that enable firms to make informed decisions regarding feature selection. By utilizing data-driven approaches, companies can better align their offerings with customer needs and navigate the complexities of modern markets. Furthermore, various frameworks and methodologies facilitate the optimization of product development efforts, highlighting the importance of empirical data in mitigating risks associated with feature overload (Töytäri, P., et al.,. 2018). Thus, we posit:

Hypothesis 5: Decision-support tools based on empirical data can mitigate OVF by optimizing feature selection during NPD.

The objective of this research is to bridge the gap between firm-driven and customer-driven decision-making in NPD by providing a structured framework for managing feature selection. To achieve this, the study integrates theoretical insights and empirical analysis and is structured around an experimental investigation involving both customers and firms, followed by an analysis of their interactions to assess the OVF phenomenon.

Considering the hypotheses defined earlier, we aim to test these hypotheses through our investigation, guided by the following research questions:

1. *What is the optimal number of features in terms of the trade-off between capability and usability for the consumer? How can it also be optimal in terms of costs, timelines, and scope within the NPD project? How can it be aligned with project performance and optimisation?*
2. *In what way is the optimal number of features that are advantageous from a market perspective a function of the antecedents identified on the firm side?*
3. *What is the key to planning and defining an NPD process that, while adhering to project boundaries, generates an output with the exact number of features optimal for the market and the firm?*

The answers to these questions represent the objective of the experimental study, which is to leverage frameworks from strategic management, behavioral decision theory, and operations management to examine the interplay between these perspectives. By integrating insights from these fields, the research contributes to the growing body of literature on product innovation, behavioral decision-making, and operations management by providing a holistic view of OVF and its implications. Through this experimental study involving both firms and customers, the findings will offer actionable insights to optimize feature selection and enhance NPD efficiency.

Methodology. *The methodology of this research is based on an experimental study designed to examine the interplay between the two key actors: the customer and the firm. It is structured into five distinct research streams to understand the complexities inherent in the phenomenon of OVF during the NPD process. These research streams are structured as follows:*

- *Study 1 - Customer Side: Before Use*
  This study aims to simulate customer behavior before product use. The primary goal is to determine the optimal number of features from the customer's perspective. The expected outcome includes identifying not only the ideal number of features but also which specific features are added during product configuration to best align with consumer preferences and expected utility before use.
- *Study 2 - Customer Side: After Use*
  This study aims to simulate customer behavior after product use by assessing user performance in completing tasks with different demo versions of the product having varying numbers of features. Participants will interact with these different versions, allowing for an evaluation of their post-use preferences. The expected outcome includes usability ratings among the different product configurations to provide insights about how direct experience influences consumer perception of the optimal number of features.
- *Study 3 - Firm Side*
  This study involves managers and software developers to simulate firm behavior during the NPD process. Setting the project boundaries such as time, budget, and scope, managers and developers will be asked to configure the product they believe is best, as they would within their teams during the NPD process. The expected outcome is the best product configuration from the firm's perspective.
- *Study 4 - Bridging the Gap: Aligning Customer Preferences with Firm Decisions*
  Building on the results of the first three studies, this final study aims to determine the optimal number of features from the customer perspective by balancing before-use expectations (Study 1) and after-use evaluations (Study 2), as well as the ideal product configuration. This product configuration will then be compared with the product configuration obtained in the Study 3 from the firm's perspective, allowing us to assess the alignment between organizational decisions and consumer preferences, and evaluate how closely the firm's designed configuration in Study 3 matches the consumer-driven optimal configuration. This matching analysis will be crucial for understanding the gap between the choices of the two key actors. Following the hypothesis that there will be a mismatch, this analysis will help

investigate the antecedents that lead developers to add additional features that customers perceive as lacking real value.

- *Study 5 - Comprehensive Final Assessment*

  To investigate the antecedents, a further planned research step involves presenting the results of the fourth study to the managers and developers who participated in study three.

This presentation aims to assess the underlying reasons that drive them to add certain features, specifically, those that are not selected by customers even in the most optimal configuration, in order to identify and define a recurring error pattern: what are the most recurrent antecedents that lead to product configurations misaligned with market choices? Conversely, it also aims to understand the motivations behind the inclusion of high-value features that align with the best configuration, thereby establishing a reference pattern for effective decision-making.

Additionally, the study will explore how their choices might change when they are informed about customer preferences and behavior, demonstrating the practical relevance of the tool being developed. Based on the evidence obtained, this methodological approach contributes to the overarching objective of this research: the development of a framework and practical tools that support evidence-based decision-making in the NPD process.

Participants will be recruited using purposive sampling tailored to the specific needs of each study.

For consumer-oriented studies (Studies 1 and 2), participants will be recruited via institutional mailing lists or distributed at scale through networks and social media, targeting adult users with familiarity or potential interest in the product domain (e.g., digital tools or apps).

For firm-oriented studies (Studies 3 and 5), participants will be professionals actively involved in product development, such as software developers, product managers, and innovation leads, recruited through professional networks, innovation-oriented organizations, or online platforms such as Prolific, using filters to ensure relevant industry experience.

An overview of the five research streams is presented below:

Study	*Focus*	*Linked Hypothesis*	*Participants*	*Data to be Collected*
1	*Customer (Before Use)*	*H1*	*consumers*	*Feature selection and perceived utility before use*
2	*Customer (After Use)*	*H1, H2*	*consumers*	*Usability ratings, task performance, feature valuation post-use*
3	*Firm Perspective*	*H3, H4*	*firm participants*	*Feature selection rationale, configuration choices*
4	*Customer-Firm Alignment*	*H1-H4*	*n/a (prior data)*	*Alignment gap, feature match/mismatch*
5	*Antecedents of Misalignment*	*H4, H5*	*Same as Study 3*	*Reflections on past decisions, attitude changes post-feedback*

Results. *As the data collection process is scheduled for the near future, results are not yet available. Below, we present a list of well-supported hypotheses that are intended for empirical testing:*

Hypothesis 1: The optimal number of features from a customer perspective decreases negatively after product use.

Hypothesis 2: The decrease in the optimal number of features is due to the presence of too many features in a product, leading to fatigue and poor usability.

Hypothesis 3: Firms tend to add more features than necessary with the goal of meeting customer expectations, focusing more on impressing them with a large number of innovative features rather than addressing potential quality defects and usability issues that may arise.

Hypothesis 4: Firms tend to overestimate the value of additional features due to cognitive biases and market uncertainty.

Hypothesis 5: Decision-support tools based on empirical data can mitigate OVF by optimizing feature selection during NPD.

The findings from the experiment will provide the theoretical foundation for the development of the proposed tool.

As outlined in the "Study 5 - Comprehensive Final Assessment" section, the goal is to identify recurring patterns, both effective patterns and error patterns, and use them to build an algorithm. This algorithm will act as a real-time alert system, warning project managers and developers when their decisions align with patterns associated with a rising risk of OVF.

In practical terms, and in line with the insights of Bianchi et al., 2020 for managing NPD through a hybrid approach, this tool will be developed to function within a hybrid Stage-Gate and Agile framework. Specifically, at each iteration of the Agile cycle, when previously selected features are reassessed, the tool will serve as a feedback mechanism to improve alignment with market needs.

The process will unfold as follows:

Concept Phase: At the initial stage, all selected features will be identified, and each must be linked to the specific requirement it addresses. At this point, the tool will generate a set of targeted questions designed to assess whether the

decision-making process is influenced by the same behavioral drivers that, in previous cases, led to suboptimal choices. These questions will challenge assumptions and provide a structured way to assess the likelihood of falling into an error pattern (the risk level of OVF). Some example question can be:

"Are we adding this feature based on validated customer needs and real data, or is it just an assumption?" Or "Does this feature directly address a current requirement, or are we keeping it on the table for potential future needs?"

In this way each feature will be assigned an OVF risk level, alongside its planned cost, time investment, and scope.

Iterative Refinement: During subsequent sprints, teams will reassess each feature based on feedback, deciding whether to keep, improve, or eliminate it, taking into consideration also the previously established OVF risk level. This assessment will involve further questioning, such as why a feature should be retained, improved, or eliminated continuously updating the OVF risk level. This iterative questioning will help refine the product while continuously updating the project's history.

A key strength of this tool will be its integration of AI-driven learning, allowing it to store data over time and tailor its recommendations to the specific characteristics of the firm. However, while the tool aims to prevent misalignment and feature overload, it will also be designed to recognize when breaking away from existing customer requirements is necessary for disruptive innovation. As Verganti, 2017 highlights, people are not seen as "bags" of needs (negativities) that must be fulfilled, but as reservoirs of aspirations (positivities) that constantly evolve to maintain fit with the chancìge environment. So true innovation often challenges what customers think they want, as their preferences are inherently shaped by past experiences. If a feature is introduced with the explicit reasoning that it represents a disruptive innovation, rather than a mere response to past demand, the tool should not automatically classify it as a risk or negative pattern. Instead, it should help teams assess whether the feature has the potential to redefine customer expectations, rather than just conforming to them.

By embedding this tool into the NPD process, the aim is to provide project teams with a data-driven decision support system, minimizing the risks of misalignment while enabling strategic, market-responsive, and innovation-driven product development.

Research limitations. *The experimental study will be conducted through interactions with consumers and firms, focusing on the analysis of features within a web application. By centering the investigation on a software application, the study is constrained by its specific focus on this sector, specifically examining the dynamics of feature selection within this realm.*

The findings are based on the particular context of software applications, which may limit the generalizability of the results to other product categories or industries. While the insights gained from this research can be invaluable for developing user-centered applications, they may not necessarily apply to different contexts, such as hardware products or services.

Additionally, the reliance on a specific type of application and user demographic could introduce biases, necessitating further validation in diverse software environments. Future research should explore longitudinal studies that track the evolution of Over-Featuring (OVF) over time, especially as user feedback and market demands shift. Understanding how OVF manifests in various types of applications will provide a more nuanced perspective on its impact and inform strategies for effective feature selection.

Furthermore, the experimental design relies on the assumptions and behaviors of users interacting with specific software applications. Additional studies across different user groups and application types will be essential to comprehensively assess the effectiveness of the proposed mitigation strategies for OVF.

Managerial implications. *Understanding OVF can help managers refine their feature selection process, aligning product development with customer needs while optimizing resource allocation. By leveraging empirical data and structured decision-making tools, firms can improve project efficiency and market success.*

Particularly, within the context of software applications, by refining the feature selection process, managers can align product development more closely with customer needs while optimizing resource allocation. The proposed evidence-based decision-making tool offers a structured approach to mitigate the risks associated with OVF, providing several key benefits for management:

- *Data-Driven Insights: By utilizing empirical data and structured decision-making tools, managers can make informed choices regarding feature inclusion. The tool's algorithm identifies recurring patterns, both effective and erroneous, allowing project teams to discern which features align with market demands and which may contribute to OVF. This enhances the decision-making process, ultimately leading to more successful product outcomes.*
- *Real-Time Feedback Mechanism: The tool functions within a hybrid Stage-Gate and Agile framework, providing real-time feedback at each iteration of the Agile cycle. This continuous reassessment of features ensures that project teams remain responsive to evolving customer needs and market dynamics, fostering an agile approach to product development that minimizes the risk of misalignment.*
- *Risk Assessment: Each feature is assigned an OVF risk level based on targeted questions that challenge assumptions about customer needs. This structured risk assessment enables managers to prioritize features based on their potential impact, allowing for more strategic resource allocation and ensuring that development efforts are focused on features that deliver genuine value to customers.*

- *Iterative Refinement and Learning: The iterative nature of the decision-making process encourages teams to continually reassess and refine features based on user feedback. This not only enhances product quality but also creates a culture of learning within the organization, where insights from past experiences inform future decisions.*
- *Encouraging Disruptive Innovation: While the tool aims to prevent misalignment and feature overload, it also recognizes the importance of innovation. By providing a framework that distinguishes between incremental improvements and disruptive innovations, managers can make strategic decisions about when to introduce features that may challenge existing customer expectations. This approach aligns with the notion that true innovation involves redefining customer needs rather than merely fulfilling them.*
- *Customizable Solutions: The integration of AI-driven learning allows the tool to adapt to the specific characteristics of each firm, tailoring its recommendations to fit unique organizational contexts. This adaptability ensures that the tool remains relevant and effective as market conditions and customer preferences evolve.*

In conclusion, by embedding this evidence-based decision-making tool into the new product development (NPD) process, managers are equipped with a robust system that minimizes the risks of misalignment while facilitating strategic, market-responsive, and innovation-driven product development. This approach not only enhances operational efficiency but also positions firms to better meet the needs of their customers in a competitive landscape.

Originality of the paper. *This study significantly contributes to the literature on new product development (NPD) by systematically analyzing OVF within the context of software applications. Unlike previous research that often addresses isolated aspects of product complexity, this work adopts a holistic perspective that integrates both user and developer viewpoints.*

By examining the interplay between user expectations and development strategies, this study highlights the multifaceted nature of OVF and its implications for the development of software applications. It provides a comprehensive framework that identifies the factors contributing to OVF and outlines actionable strategies that developers can employ to mitigate its impact.

The originality of this research lies in its focus on empirical evidence and practical solutions tailored to the unique challenges of software development. By leveraging real-world data from applications, this study establishes a robust foundation for its recommendations, bridging the gap between theoretical insights and practical application. This contribution is particularly relevant in today's rapidly evolving digital landscape, where innovative solutions are essential for optimizing user experiences and enhancing the effectiveness of applications.

Key words: *Over-Featuring; New Product Development; Decision-Making; Feature Fatigue; Product Complexity.*

Technological Characteristics and Technological Competition. A Patent Portfolio Perspective on Inventions' Non-use

GABRIEL FRANCESCHINI[1] PAOLA GIURI[2]

Abstract

More than forty percent of patented inventions remain unused, a finding that has been consistently observed across empirical studies and in different contexts (Giuri et al., 2007; Walsh et al., 2016). The phenomenon has attracted attention in competition policies and strategic management and the economics of innovation literature. Scholars have explored the antecedents of non-use at the invention level (Walsh et al., 2016; Torrisi et al., 2016; Cappelli et al., 2023). We align with this line of research and explore the relationship between technological characteristics, technological competition, and invention non-use and its subcategories. While previous research has assumed that one or a few patents mirror a firm's innovation management strategy, the necessity to understand patent strategies from the portfolio perspective has already been highlighted by Blind et al. (2006; 2009) and recently reinforced by Cappelli et al. (2023). Therefore, we exploit and leverage the complete patent portfolio of a leading multinational company in the material processing industry and capture interdependencies between a set of explanatory mechanisms and strategic non-use. Based on a survey of 303 company inventions, combined with rich primary and secondary data, we propose a preliminary analysis toward the understanding of novel patterns of patent non-use. Our findings show that, while technical attributes and technological rivalry do matter when considering unused inventions, classical indicators of value/importance and intra-organizational factors also significantly relate to patent non-use and its typologies. The paper continues with managerial implications and suggests intriguing developments for the current work and patent non-use scholarship.

Framing of the research. *In many industries, patents serve as the most important form of appropriation mechanisms and represent crucial resources for creating and securing competitive advantage (Markman et al., 2004). Patent literature, along with the patent system, has largely focused on technological commercialization, often seen as the pinnacle of a firm's competitiveness and value creation (Cohen et al., 2002; Blind et al., 2009). However, the motivations for patenting can vary, extending beyond traditional commercialization objectives to include blocking competitors, preventing imitation, and enhancing a firm's reputation (Blind et al., 2006; Giuri et al., 2007). In this context, Somaya (2012) emphasized the role of patent strategies, describing them as a set of resource allocation decisions and logics related to the management of patents. From this perspective, unused patents are also considered within the definition of patent strategies. Literature has discussed strategic non-use, referring to patented inventions that are not directly used to prevent imitation for commercial purposes but still serve a strategic role as powerful tools in technological competition (Torrisi et al., 2016; Walsh et al., 20216; Corsino et al. 2018; Cappelli et al., 2023). Existing literature has empirically investigated invention-level non-use and identified various categories of unused patents. For example, Torrisi et al. (2016) distinguished between commercial use, strategic non-use, and sleeping patents - those filed for reasons other than commercial or blocking competitors. Meanwhile, Walsh et al. (2016) developed a taxonomy of twelve reasons for non-use, later aggregated into three types: prospective non-use, preemptive non-use, and failed patents. Recently, Cappelli et al. (2023), drawing on the RBV and appropriability literatures, classified strategic non-use into play strategy and fence strategy, respectively referring to patents filed for cross-licensing and those filed to block competitors. In our work, we will adopt Walsh et al. (2016)'s classification and refer to non-used inventions as those that are neither commercially utilized nor licensed, preemptive patents are those unused inventions that maintain monopoly or bargaining power over potential competitors, prospective patents are those that are unused but could still potentially be commercialized. Finally, failed patents are those inventions that have experienced technological or market obsolescence, resulting in low value.*

Extant literature has tested numerous classical indicators of invention's value and importance on the relationship with patented inventions' non-use. Scholarly production has already found significant correlation between a series of standard patent variables - like grant, family size, scope - and inventions' introduction to market, as well as citation flows and strategic non-use (Wagner & Wakeman, 2016; Corsino et al., 2018). Blind et al. (2006; 2009) from their side, proposed that patent portfolios that show technological core, and technological valuable bases are more likely to be associated with offensive and defensive blocking patent strategies. Both Torrisi et al. (2016) and Walsh et al. (2016)

DOI 10.7433/SRECP.SP.2025.01

found significant results on the positive influence of technical value and unused inventions. We align to this line of inquiry and explore the technological attributes that lead to non-use at the invention level. First, we focus of technological scope, a concept introduced by Lerner (1994), which has already been linked to overall firms' value and invention value (Gambardella et al., 2007), but never to patent non-use. Second, we take the concept of proximity to the core-business, building on Cappelli et al. (2023), who found that the moderating role of proximity to core technologies in technological competition leads to a significant higher likelihood of building patent fences. Finally, in line with the literature on firm's experimentation and search, we concentrate on inventions' uniqueness, conceptualized as inventions that show a combination of components that have never appeared before and suggest that unique inventions might be related to longer and more uncertain paths of search (Vinokurava & Kapoor, 2020). By incorporating these variables, we aim to uncover the technical attributes of patents that shed light on patent non-use and firms' technological search strategies.

Inventions' attributes alone are insufficient to explain patent non-use. Indeed, when considering a viable patent strategy, firms take into account multiple factors, encompassing technological and industrial environment, as well as institutional, appropriability conditions and competition (Ceccagnoli 2009; Somaya, 2012). Interestingly, technological competition has already emerged as one of the explanatory factors of patent non-use. For example, Walsh et al. (2016) have proposed a more aggregated measure of competition at the industrial level, finding that the number of competitors in the industry increases the rates of preemptive patents. By their side, Cappelli and Colleagues (2023), have offered a more perceptional dimension of rivalry, based on the inventors' that were experiencing competition from many external parties and that was associated with a significant increase in the probability of adopting a play strategy and decrease in the likelihood of adopting fence strategy. Finally, Torrisi et al. (2016) focused on the number of competitors in the same technological field and the competition that the firm reports during the research process leading to the patent. In the former case, they discovered a significant relationship with patent fences. We focus on the rivalry within the technological area, as technical competition goes beyond organizational rivalry to include competition between technologies. Patents capture knowledge and inventive efforts, providing insight into an organization's search strategies. In this context, patenting - and its use or non-use - represents a process of technical experimentation and learning, influenced by both the invention's characteristics and competitive pressures from external technologies in the same domain (Somaya, 2012; Arts et al., 2013).

To summarize, analyzing patent non-use at the invention level has been a common theme in existing research (Arora & Athreye, 2016). Previous studies have mainly focused on patent use through large-scale surveys (Cohen et al., 2000; Giuri et al., 2007). However, as Cappelli et al. (2023) point out, patent strategy involves balancing complex and often conflicting costs, risks, and benefits, making it unlikely that a single patent - or even a few - can fully reflect an organization's overall patent portfolio strategy. Blind et al. (2009) previously analyzed surveys from hundreds of German companies, shedding light on the motives behind patenting and offering an aggregated firm-level portfolio perspective on the phenomenon. Our study adopts a single-firm perspective, analyzing the full firm's patent portfolio in detail and exploring patent non-use at the invention level. By applying the categories proposed by Walsh et al. (2016), we link them to the technological content of patents and the competitive pressures they face within their technological environment. Our goal is to examine whether these factors are significantly associated with patent non-use as part of the firm's broader IP management and search strategies.

Purpose of the paper. *The purpose of this work is to examine the relationship between technological characteristics, technological competition and non-used patented inventions and their typologies from the perspective of the complete patent portfolio of a multinational enterprise. By doing so, we address the limitation highlighted by Cappelli et al. (2023), who argued that focusing on a single patent application rather than an entire patent portfolio may not fully capture an organization's overall strategy. While a single patent can serve as a proxy for an organization's inventive strategy decisions - an approach already adopted in various studies - the assumption remains strong, necessitating a more granular analysis of the phenomenon. Accordingly, we formalize the following research question: How do the technological characteristics of inventions and technological competition relate to their use and non-use, and its subcategories? By answering this question, we aim to deepen the understanding of patent portfolio management and investigate how both internal factors - such as the technological attributes of inventions - and external factors - such as competitive pressures in the technological area - may influence subsequent usage or non-use.*

We expect that both the technical characteristics of inventions and the level of technological competition in their respective fields will show significant correlations and differences between used and non-used groups. Regarding technological characteristics, we focus on three key aspects. First, we examine the number of technologies an invention incorporates as a proxy for technological scope. Prior literature suggests that patents covering a broader range of technologies are more likely to be used (Lerner, 1994; Gambardella et al., 2007; Wagner & Wakeman, 2016), so we expect a positive correlation and higher mean values for used patents compared to unused ones. Second, we analyze the core-technology ratio, which reflects how closely an invention aligns with the firm's main technological area. If firms patent around their core business to create protective barriers (Blind et al., 2009; Cappelli et al., 2023), we expect that non-used patents will show a positive correlation and higher core-technology ratio than used ones. Third, we consider the uniqueness of an invention's technological combination. More unique inventions may require longer development cycles before practical application, suggesting that unused patents will exhibit a positive correlation and higher mean uniqueness scores compared to used ones (Vinokurava & Kapoor, 2020).

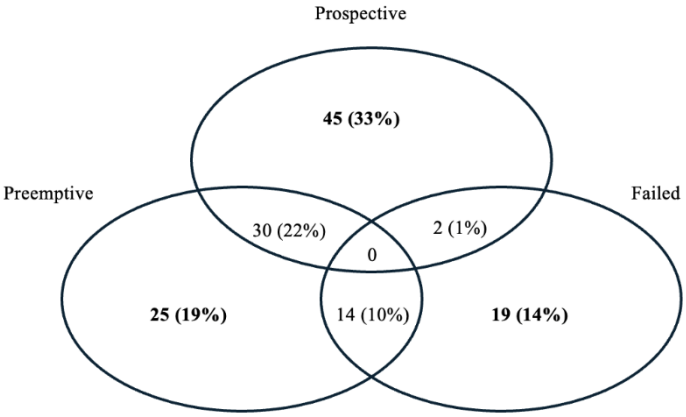
For technological competition, we assess four indicators. The first is the number of competitors in a given technical area in the year of the invention. The second and third indicators measure technological concentration, based on the

share of patents held by the top one and top four players in the technical field and year. We expect that non-used inventions will show higher technical concentration and a positive correlation with technological rivalry variables. Lastly, we examine whether the invention belongs to a technological class with relatively few patents. A lower number of patents in a given area could indicate reduced competition, leading us to expect a negative correlation and lower mean values for non-used patents, as firms may prefer entering less congested areas with commercialized inventions (Gambardella et al., 2007; Arts et al., 2013).

We also anticipate varied associations across different types of non-use. Specifically, we expect prospective inventions to show a positive correlation and higher average number of technologies, as broader technological scope may require more time for adoption. We hypothesize that prospective non-use will display a lower core-technology ratio and higher uniqueness average scores, showing negative and positive correlations, respectively. Failed inventions may exhibit higher technological breadth, a greater core-technology ratio, and more unique technological combinations. Regarding technological competition, we expect that preemptive and failed patents will significantly correlate with competitive pressure, showing higher mean values compared to prospective patents, as firms may use preemptive non-use to block competitors or abandon patents in highly crowded areas.

In the following sections, we present our methodology and the results of the ongoing analysis. The remainder of this short paper discusses contributions and limitations.

Methodology. *We utilize a unique dataset that provides detailed information on a multinational firm's full patent portfolio, consisting of 1,156 patents filed between 2000 and June 2021. Initially, we conducted a survey with the managers and technical staff of the company's business units to gather data on the use and non-use of inventions. Our final sample includes 303 patent families, specifically those that were active - not abandoned by the focal company - at the time of the survey (June 2021). We surveyed 18 employees of the company - technical and product managers, directors, and some inventors - across 14 different business units. We asked questions regarding the perceived importance of the patents and the reasons for their non-use. As a result, we obtained complete information on 135 non-used patented inventions, which we linked to other dimensions recorded in the company's databases since 2016, such as technologies, business-unit information, and other patent bibliographic data. We then linked each patent to other archival sources, such as PATSTAT (2023), to create patent indicators based on various dimensions. The company's internal database employs different patent identification keys compared to publicly available databases, and for many observations, we could not find a direct match. Therefore, we manually cleaned and matched each patent, conducting thorough checks using multiple sources like ESPACENET and Q-PAT to track their history. We were unable to find correspondence for 3% of the surveyed inventions (11 out of 303). All patents were also merged with other internal datasets, like information on business units and patent renewal costs. Patent costs were calculated in collaboration with patent managers using data from patent office websites. The methodology developed for assessing the annual costs of maintaining a patent family has since been adopted by the company to guide detailed discussions on whether to renew inventions based on these costs. The second mechanism, technological competition, was captured by examining all players in the industry and their patented inventions from 2000 to 2022. To sample industry firms, we triangulated observations from three sources: the most comprehensive online encyclopedia of industry information, exhibitors from the most important biennial sector-specific fair, and the list of competitors monitored by the focal firm. We then reconstructed their business groups over time, which led us to identify 472 organizations active in the sector during the study period. We retrieved patents from these companies using PATSTAT (2023), resulting in a longitudinal dataset of over 10,000 inventions from 294 companies. Finally, we calculated measures of technological competition based on IPC classes in the same year as the focal firm's inventions. To summarize, the final dataset, along with the variables, is the result of primary and secondary data collected from different sources: a) the organization's internal database, which is divided into bibliographic and business-unit information and matched together; b) renewal costs data, which provides renewal and fee information; c) the survey on use and reasons for non-use of inventions; and d) PATSTAT2023, which provides archival patent data, joined with information from the focal company and all patenting firms within the industry.*



Additionally, we took part in the firm's annual patent renewal meetings with each business unit, where decisions were made regarding which patents were in use or not, the reasons behind their status, and which should be maintained. This experience provided key insights into the decision-making processes behind patent strategy formulation. Additionally, we engaged in ongoing discussions with patent managers and innovation directors, further deepening our understanding of how patent strategies contribute to the company's overall strategy. Due to non-disclosure agreements, we cannot provide detailed data from the interviews and renewal meetings. However, the insights gathered have been incorporated into our quantitative analysis, and where possible, we will include anecdotal evidence and justifications based on our field notes.

The focal company is a leading player in the material processing machinery industry, a manufacturing sector characterized by complex technologies where the incentives to protect intangible resources may differ from contexts where patents are discrete or from environments with different appropriability conditions (Cohen et al., 2000; Ceccagnoli, 2009). In this industry, inventions are mostly incremental and cumulative, but monitoring competitors' technical moves is a key element in formulating technological strategies, as patent competition is intense. Studying the categories of non-use in this industry provides a unique perspective, as this context has not been explored in innovation management and economics literature. Moreover, patent strategies and dynamics in this field may differ from those in fast-paced industries, such as pharmaceuticals or high-tech sectors (Cohen et al., 2002; Markman et al., 2004).

We examine the phenomenon at the invention level, treating patent per family, consistent with both prior literature (Dechezlepretre et al., 2017) and the firm's internal patent portfolio management strategy. Patent non-use is the primary outcome variable, taking a value of 1 if the patented invention is not used (i.e., not exploited for any commercial purpose), and 0 otherwise. The types of non-use are also operationalized as dummy variables, with mutually exclusive categories. Respondents could choose from fifteen non-use reasons, three more with respect to the original taxonomy from Walsh et al. (2016). These reasons were then aggregated into three main categories: preemptive, prospective, and failed patented inventions. A value of 1 is assigned if the main reason for non-use falls into one of these categories, and 0 otherwise. Technological characteristics variables were created based on primary data provided by the company. These variables include: count number of the invention's technologies (patent scope); core technology ratio, ranging from 0 to 1, with higher values indicating a larger share of core technologies within the total; and uniqueness, which takes a value of 1 if the invention presents a unique combination of technologies, and 0 otherwise. Each of the technological characteristic variables has an equivalent based on 4-digit IPC classes (Lerner, 1994; Squicciarini et al., 2013). For technological competition, the number of competitors counts the number of players active in a 4-digit IPC class in the year the invention was introduced (Torrisi et al., 2016). The remaining competition-related indicators are inspired by the work of Gambardella et al. (2007) and include two concentration ratios. These ratios measure the concentration of inventions among the top 1 and top 4 patentees in a given 4-digit IPC class for the year of invention. Values closer to 1 indicate that patent activity in that technological class is mostly in the hands of few players. We also included a set of classical patent value/importance indicators: granted invention, a dummy variable taking a value of 1 if the invention was granted; and family size, which counts the number of patent offices where the invention was applied for and extended (Dechezlepretre et al., 2017). These variables were derived from both primary and secondary data. Perceived patent importance is a variable available only for unused inventions, meaning that distributions and t-tests are computed solely for the subcategories of non-used inventions. Despite this limitation, we included it in the analysis as it provides valuable insight and serves as an alternative and robust measure of invention importance from the patentees' perspective. Additionally, we included variables related to the renewal process, as these are considered signals of the invention's value (Squicciarini et al., 2013). Finally, intra-organizational structure variables were calculated at the business-unit level, since business units are responsible for funding and managing their patents and they can influence inventions' non-use. For instance, we created a dummy for core business units that takes value 1 for the core business unit.

Results. *We created a comprehensive set of descriptive statistics, correlation matrices, and mean equality tests. The analysis is ongoing, and in the next steps, we plan to integrate the current work into inferential methods. In line with previous literature, we intend to use probit or logit regression models for binary use/non-use classification and multinomial probit or logit regression models for non-use categories (Torrisi et al., 2016; Walsh et al., 2016), depending on normality assumptions. These models will allow us to estimate the likelihood that an invention falls into the non-used category (or one of its subcategories) given our explanatory variables. In the figure below, we provide an initial overview of the distributions of unused inventions. Figure 1 presents the Venn diagram of patent invention non-use types. Percentages were computed based on the total number of unused inventions (135, 100%), considering all three reasons for non-use and possible co-occurrences between categories. In line with previous studies, unused inventions represent about 40% of the total portfolio. Similar to earlier research, prospective inventions are the most frequent category, followed by preemptive inventions and the co-occurrence of these two types, suggesting that strategic non-use is a dominant motive among unused inventions. Conversely, the percentage of failed patents is smaller, even when compared to earlier studies, which suggested that non-used patents could range between 30% and 50%. This highlights that the company tends to prioritize patents that are actively exploited, either for commercial purposes or for strategic non-use.*

Fig. 1: Venn Diagram of Invention Non-Use Types. (N = 135, 100%)

Digging deeper into the correlation and t-test results, we find several significant associations and differences in the average characteristics of used and non-used patents, as well as among different types of non-use. Used patents tend to exhibit higher average values than non-used patents across multiple measures of patent value and importance, such as granted status (0.43 for used vs. 0.30 for non-used, $p < 0.05$), family size (2.76 vs. 2.24, $p < 0.05$), and number of invention

renewals (15.76 vs. 9.43, p < 0.01). These differences suggest that used patents tend to have higher proxies of value/importance, aligning with the idea that firms prioritize protecting and developing inventions that are eventually commercialized. All of these variables significantly and negatively correlate with unused inventions. Among technological characteristics, non-used patents have a significantly higher core technology ratio than used ones (0.29 vs. 0.19, p = 0.02). Among the non-use types, failed patents have the highest core technology ratio (mean diff. -0.23, p < 0.01), suggesting that failed inventions might be more concentrated in areas where the firm is primarily focused. The average number of technologies incorporated in an invention does not differ significantly between used and non-used patents, but failed patents have a considerably higher mean number of technologies (mean diff. -0.30, p < 0.05) than the other non-use categories combined. This may suggest that patents with broader technological scope are more likely to be found among failed inventions rather than preemptive or prospective non-use, possibly because integrating multiple technologies successfully is more challenging, as evidenced by a positive and significant correlation (r = 0.171, p < 0.05). For technological competition, there is no significant difference in the mean number of competitors in the technological class-year between used and non-used patents (6.56 vs. 7.23, p = 0.57), and no significant correlation has been found. Technological concentration, as measured by the CR1 and CR4 indexes, does not show significant differences in most cases, apart from the mean of the CR1 index IPC4-year for preemptive patents, which, contrary to expectations, has a lower mean and a negative correlation at the 0.1 significance level. Failed inventions display slightly higher concentration values, though these differences do not reach the conventional significance threshold of 0.05. Some findings deviate from initial expectations. The average uniqueness of technological combinations does not significantly differ between used and non-used patents (0.05 vs. 0.02, p = 0.23), and it is not significantly correlated, neither between used and unused inventions nor across types of non-use. This may not support the hypothesis that more unique inventions would be associated with the non-use category, particularly in the case of prospective patents. However, perceived importance, which is available only for non-used patents, exhibits a significant mean difference across non-use types. Prospective inventions are assigned a notably higher perceived importance score (mean diff. -1.24, p < 0.01) compared to preemptive and failed patents. This suggests that prospective inventions, despite being unused, are rated as highly valuable, possibly due to expectations of future exploitation. It may indicate that prospective patents are more likely to be retained for strategic purposes rather than preemptively blocked or discarded as failed inventions. Organizational-structure factors also exhibit differences, such as core-business, which positively relates to failed inventions (r = 0.170, p < 0.001). Overall, the findings suggest that technological characteristics and competitive conditions play a crucial role in patent non-use. Some variables, such as proximity to the core and the presence of few competitors in the technological area, may have a significant impact on non-use and its subcategories. Moreover, used patents consistently show higher mean values across most importance/value indicators, as well as positive and strongly significant correlations, reinforcing the idea that firms primarily pursue a commercial strategy with their patents.

Research limitations. *First and foremost, this study does not provide direct evidence of the impact between the explanatory variables and the non-use phenomenon. Instead, it presents correlations and parametric tests on means, offering only an initial insight into significant associations and differences that may warrant further investigation. Therefore, we believe a relevant next step in this work would be to apply inferential methods to understand how the identified variables might influence the likelihood of non-use and its typologies.*

Second, this study examines strategic patenting from the perspective of a single firm within the materials processing machinery industry. While this focus offers a detailed view of patenting practices within this specific context and presents a unique approach to patent non-use, it also has limitations in terms of generalizability.

Moreover, the non-use survey data were collected at a single point in time, providing a static representation of patent use and non-use. However, patent use and non-use are dynamic processes that evolve over time in response to internal changes and shifting external technological pressures. Future research could build on our study by considering the dynamic nature of patenting decisions.

Although this study connects and advances existing literature, additional avenues could be explored to understand the underlying drivers of patent non-use or deepen the analysis of technological competition and its role in shaping strategic patenting decisions, such as investigating its moderating role. We plan to incorporate these ideas in the next steps of the work.

Managerial implications. *The study findings provide valuable insights for managers, particularly for those in firms with similar incumbency positions within mature industrial sectors. Patents are invaluable assets that can provide competitive advantage and financial value. However, they also come with significant costs, alongside continuous pressure from management to reduce inefficiencies. In this context, it becomes crucial to systematize non-use and differentiate between strategic non-use and low-value inventions. We argue that firms facing comparable technological and competitive pressures may encounter similar challenges in managing their patent portfolios. While the results are specific to the company studied, managers in other firms, particularly those in industries with similar technological regimes, could benefit from understanding the factors that influence the strategic use and non-use of patents. This study provides a data-driven approach for assessing patent portfolio management distributions. Additionally, our work builds on previous literature in the patent non-use space, advancing it by incorporating new reasons for non-use and original variables with rigorous analysis. By offering a more comprehensive view of patent use and non-use, our study equips managers with the tools to make informed decisions about a balanced IPR strategy. Ultimately, it highlights that non-*

used patents should not be seen as merely low-value failed inventions, but can serve as crucial strategic instruments to be leveraged both today and in the future.

Originality of the paper. *To date, available literature has primarily focused on single or few patented inventions within a firm's entire patent portfolio, which may not fully capture a firm's overall patent strategy or the strategic decisions behind non-use. We address this gap by providing an in-depth analysis of the entire patent portfolio of a leading organization in an original context such the materials processing machinery industry. Moreover, limited research explores the complex interdependencies between patent non-use, technological characteristics, and technological competition. We unpack these factors and connect them to different types of non-use, demonstrating how both technological attributes and competitive pressures can explain use, strategic non-use, and failed inventions. In addition, we explore how patent non-use may reflect broader organizational search strategies and learning processes, shedding light on how firms approach IPR management and resource allocation. Finally, we examine the perceived importance of patents, highlighting differences between used and non-used patents and offering valuable insights for innovation management decisions.*

Key words: *patent non-use; strategic non-use; technical characteristics; technological competition; invention value/importance; patent portfolio management*

Employees' autonomy in data-driven decision-making: an empirical analysis of Italian firms

LORENA M. D'AGOSTINO[1] MARCO CORSINO[2] MIRIAM TOMASUOLO[3] SALVATORE TORRISI[4]

Abstract

Digital transformation (DT) has steadily permeated industries and markets, becoming increasingly pervasive. DT spurs a fundamental shift in corporate decision-making, moving from intuition and heuristics to an analytical, data-driven decision-making (DDD) approach. While several studies uncover a positive relationship between DDD and firm performance, a comprehensive understanding of the drivers underpinning the systematic and effective use of data in decision-making is still lacking. Earlier research pointed out the role of factors such as the adoption of new digital technologies, the implementation of structured management practices, and the investment in complementary assets like human capital. This short paper contributes to this line of inquiry by exploring how different types of work autonomy favor the effective use of DDD, especially when DDD is used to promote innovation. Our study reports the findings of an ongoing research project that investigates the adoption of DDD among firms operating in Lombardy, one of the most industrialized and innovative Italian regions. Preliminary results suggest that firms adopting an innovation-oriented DDD are more likely to grant a higher level of strategic autonomy to their workers compared with firms adopting DDD for other goals, such as increasing efficiency.

Framing of the research. *Digital Transformation (DT) refers to a profound organizational change associated with the widespread use of digital technologies (Hanelt et al. 2021). A distinguishing aspect of DT is the increased availability and effective use of data, which can reshape decision-making processes. Traditionally, managers and workers relied on intuitions and gut feeling, but DT facilitates a shift toward a data-driven decision-making (DDD) approach, where real-time data is accessed and utilized for more informed decisions (Capo et al. 2022; Brynjolfsson and McElheran, 2016a). In this context, data can be used to identify emerging market trends, craft strategies, optimize operations, monitor financial performance, and drive innovation (Davenport et al., 2021). Ultimately, the adoption of a DDD approach can lead to significant improvements in firm performance (Sleep et al., 2022; Krafft et al., 2021; Davenport et al., 2021; Brynjolfsson and McElheran, 2016a).*

Several factors affect the rate of DDD adoption (Brynjolfsson and McElheran, 2016a; Sleep et al., 2022; Bar-Gill et al., 2024). First, firm size (both in terms of employment and belonging to a group) strongly predicts DDD, consistent with economies of scale. Second, ICT adoption is significantly associated with DDD, as it provides firms with the technical infrastructure needed to store and process data. Third, higher levels of formal education favor an effective use of data (Brynjolfsson and McElheran, 2016a) and affect the probability of adopting a DDD approach. Moreover, the adoption of structured management practices (e.g., performance-based monitoring, evaluation, compensation, and incentives) also affects a DDD approach (Brynjolfsson and McElheran, 2016a). Moreover, previous studies found evidence of complementarities between ICT, investments in human capital, and structured management practices (Brynjolfsson and McElheran, 2016b).

In addition to such potential complements, Sleep et al., 2022 suggest that the business knowledge perspective (i.e. IT or marketing oriented) may influence firm's DDD, with the IT-oriented perspective having a direct and positive effect on DDD and the marketing perspective none. Moreover, they find that the DDD approach enhances innovation and financial performance, highlighting the role of DDD in innovation-oriented firms.

The literature on DT has also discussed the role of workers' autonomy and decentralization of authority within organizations (Bloom et al., 2014; Dixon et al., 2021). Digital technologies can foster employee creativity, enable workers to solve a wide range of problems, and favor the implementation of new ideas (Oldham and Da Silva, 2015). Consequently, the adoption of IT can enhance workers' autonomy, leading to a more decentralized decision-making system (Bloom et al., 2014). At the same time, technologies such as robotics may reduce the need for managers to monitor

workers' activities closely. However, depending on the tasks, robotics may require greater centralization or greater decentralization of decision-making authorities (Dixon et al. 2021); in particular, human resource-related decisions such as training are decentralized from managers to nonmanagerial employees, while the choice of production technology is centralized from managers to business owners and corporate headquarters. The existence of contrasting effects may also influence the relationship between DDD and the level of work autonomy. For example, Brynjolfsson and McElheran (2016b) conjecture that the "use of joint decision-making between managers and frontline workers could conceivably substitute for DDD" (p. 21). Nonetheless, they do not find any empirical evidence supporting such a negative correlation.

Given these complexities, it is crucial to further investigate whether DDD is associated with lower or higher levels of autonomy. This paper contributes to this discussion by presenting empirical evidence that underscore the importance of considering work autonomy as a multidimensional construct when assessing its relationship with the adoption of a DDD approach.

Purpose of the paper. *This study empirically investigates how different types and varying levels of work autonomy covary with the adoption of DDD, along with a few organizational factors like firm size (both employment and multi-unit business), business sectors, the level of employees' education, the endowment of ICTs. Our interest in work autonomy is motivated by its recognized importance in innovative and entrepreneurial activities. Autonomy, described as "the freedom granted to individuals and teams who can exercise their creativity and champion promising ideas" (Lumpkin and Dess 1996, p. 140), is a key dimension of entrepreneurial orientation, defined as "an approach to decision making that draws on entrepreneurial skills and capabilities" (Lumpkin et al. 2009: 48).*

Consistent with previous research (Bar-Gill et al., 2024; Brynjolfsson and McElheran, 2016a; Sleep et al., 2022), we conceptualize DDD as a multidimensional construct comprising four key dimensions: i) the availability of data to support decision making within the organization; ii) the extent to which the organization leverages the available data in the decision making process; iii) the extent to which the organization collects data on key performance indicators (KPIs); iv) the extent to which the organization uses the available data to pursue innovation activities. By combining these four dimensions, we define two distinct, yet interdependent, concepts of DDD: 1) DDD that supports decision-making across various functions of the firm (e.g., operations, finance, human resources); 2) DDD tailored to innovation activities.

The literature about job design and the entrepreneurship literature both describe autonomy as a multidimensional construct and distinguish structural autonomy from strategic or goal autonomy (Lumpkin et al. 2009). The former refers to discretion in the means of problem solving (e.g., work hours, work procedures, time to complete a task) within given resource constraints (Bailyn 1985). The latter reflects "the independent action of an individual or a team in bringing forth an idea or a vision and carrying it through to completion" (Lumpkin and Dess 1996, p. 140). This distinction is significant, as prior research suggests that structural autonomy is primarily linked with job satisfaction and reduces employees' incentive to leave their organization (Marvel et al. 2007), whereas a high level of strategic autonomy to be positively associated with strategic effectiveness (Haas 2010).

Building on this evidence, we explore whether the adoption of a DDD approach is associated with the granting of structural and strategic autonomy within organizations. This relationship may arise for at least two reasons. First, strategic autonomy enables individuals and teams to participate in higher-level decision-making, allowing them to explore business opportunities outside the established chain of command and current corporate strategy (Burgelman 1983). Second, firms that engage in explorative search to navigate rapid changes in their competitive environment often grant strategic autonomy to individual employees or teams (McGrath 2001). In both cases, strategic autonomy requires greater reliance on data availability and their extensive use to monitor the achievement of organization-wide objectives.

Methodology. *We conducted an original survey of firms located in the Lombardy region, Italy. The data collection was conducted between April and June 2024. The sample came from two sources. The first is based on a dataset of about 2,500 firms provided by the internship and job placement office of the University of Milano-Bicocca. The firms were contacted by the office with a link to the survey. The response rate was about 10% (about 250 responses). The second data source came from an independent poll company, which collected data through the CATI method on an initial sample of 1392 firms; 246 companies responded to the survey (with a response rate of 18%). We received complete responses from a total of 423 companies: due to missing values in some of the variables used in this analysis, the working sample comprises 324 observations. Survey data were matched with firm data from the AIDA business database. The survey covers a wide range of information regarding firm characteristics, labor force composition, data-related practices, ICT adoption, managerial and organizational practices, and economic and innovation performance. We construct two indicators of DDD. The first one (i.e., DDD-KPI) is designed following Brynjolfsson and McElheran (2016a, 2016b, 2019) and Bar-Gill et al. (2024) and builds on three components: availability of data to support decision-making, actual use of data for decision-making, and intensity of performance monitoring measured by the number of KPIs monitored.*

- *Availability of data goes from none=0 to complete availability=4. In our sample, 35% of firms reported a high or complete availability of data (responses in the top two categories).*
- *Use of data to make decisions goes from no=0 to complete=4. 32% of our sample use data heavily or entirely (responses in the top two categories).*
- *The use of key performance indicators (KPIs). Our index goes from 0 to 7. It represents the sum of the number of KPIs monitored by the firm - patents, time to market, productivity, client response time, customer satisfaction, profitability,*

and revenue growth rate. Overall, the mean value in our sample is 2.4 KPIs monitored. Only 13% of our sample firms monitor more than 5[5] KPIs.

The second indicator of DDD (i.e., DDD-innovation) is based on Sleep et al. (2022), which includes data availability and use of data, and the use of data for innovation activities:

- *Type of activity influenced by data analytics. We distinguished innovation activities (product innovation, process innovation, or organizational innovation) from operational activity (customer relationship management - CRM, and supply chain management - SCM). 61% of the sample uses data to perform innovation activities, whereas 41% use data for the CRM or the SMC. 28% of firms declare that they use data to perform both innovation and CRM/SCM activities.*

Based on the measures discussed above, we construct the two indicators of DDD, as follows. The DDD-KPI indicator is a categorical variable that ranges from 0 to 2, where 0 denotes firms which report low levels of availability of data (from 0 to 2), low levels of use of data (from 0 to 2), and those that report a number of KPI monitored below the median (i.e., 2). DDD-KPI takes the value of 2 when a firm reports a high level of data availability (top two categories), a high level of data use (top two categories), and a number of KPIs monitored greater than the median. For all the intermediate cases, DDD-KPI takes the value of 1. Overall, 22.53% of the respondents are classified in the maximum level of DDD-KPI indicator, while 26.54% falls in the lowest one. The remaining 50.93% of observations accrue to the intermediate category.

Similarly, DDD-innovation is a categorical variable that goes from 0 to 2, where 0 denotes firms which report low levels of data availability (from 0 to 2), low levels of data use (from 0 to 2), and those firms that do not use data to perform any innovation activities. DDD-innovation takes the value of 2 when a firm reports high level of data availability (top two categories), high level of use of data (top two categories), and those that use data to perform any innovation activities. For all the intermediate cases, DDD-innovation takes the value of 1. Overall, 26.23% of firms are classified in the maximum level of DDD-innovation indicator, while 19.75% falls in the lowest one. The remaining 54.01% of observations accrue to the intermediate category.

We first focus on factors related to DDD that were considered relevant in previous empirical studies, namely firm size (employment and multi-unit establishment), sector, human capital, and ICT adoption. To assess possible economies of scale in adoption, we distinguish between micro and small enterprises (less than 50 employees), medium-sized enterprises (less than 250 employees) and large firms. We also consider whether the firm is part of a group or not, as measure of size. The firms belong to 9 economic sectors (ATECO letters): manufacturing, other industries, commerce, transport, tourism, business services (ICT and scientific activities), business services (others), credit and insurance, others sectors. Since the effective use of data may depend on higher levels of formal education, we also consider the level of human capital proxied by the percentage of employees with a bachelor's degree or higher. Finally, the ICT index is the sum of the following eleven types of ICT services and applications adopted: internet use, company web site, use of social networks, multimedia sharing platforms, e-Commerce, Enterprise Resource Planning, Customer Relationship Management, Data Lake, Data analytics, Cloud Computing Services, and AI.

To inspect whether a decentralization system (higher level of workers autonomy) plays a role in DDD adoption, we distinguish structural autonomy from strategic autonomy. Based on 5 items of a survey question, employees' structural autonomy captures the degree of autonomy in planning and performing the work, whereas strategic autonomy captures the degree of autonomy in taking decisions, participating in the decision-making process, and defining job tasks. Each item ranges from 0 (never) to 4 (always), and the two variables are computed as the average values of items. The sample level of structural autonomy is 2.48, whereas that of strategic autonomy is 2.09.

Results. *Tables 1-3 shows the cross-tabulation of the two DDD indicators with size in terms of employment, whether they are single or multi-unit establishments, and sector, respectively, while tables 4-5 present the summary statistics of human capital, ICT and autonomy by each level of the DDD indicators. In terms of size (tab. 1), the rate of the highest level of DDD adoption (value equals 2) increases with firm size in both indicators, confirming previous evidence regarding the importance of economies of scale in the DDD adoption. Tab. 2 shows the distribution for single firm (single unit) and firms belong to a group (multi-unit). Coherent with size, also belonging to a larger group is correlated to higher level of DDD, in both indicators. With regard to sectors (tab. 3), the rate of the highest level of DDD adoption vary across subdivisions, with commerce, business services (ICT and scientific activities) and credit and insurance with the higher percentage of DDD firms in both indicators. In particular, firms in credit and insurance shows the highest percentage, both when we consider the DDD-KPI indicator (i.e. 46.5%) and the DDD-innovation indicator (i.e. 65.38%). This aligns with the fact that this sector has long been at the forefront of data utilization and modeling (e.g. for credit risk assessment).*

Tab. 4 (left-side) shows that firms in the highest category of the DDD indicators have a greater percentage of university-degree workers (58% for DDD-KPI and 56% for DDD-innovation), as expected. Tab. 4 (right-side) shows that the average number of ICT adopted when firms are in the highest category of the DDD indicators is more than 6, which is the highest mean among the three possible levels for both indicators.

[5] 5 KPI monitored is the threshold used by Brynjolfsson and McElheran (2016) and by Bar-Gill et al. (2024).

Tab. 1: DDD indicators by size

	DDD-KPI				DDD-innovation			
Size	0	1	2	Total	0	1	2	Total

Tab. 5 shows preliminary and descriptive results concerning the role of workers' autonomy regarding DDD. We distinguish between structural and strategic autonomy. On the one hand, structural autonomy allows employees to manage their work within well-defined tasks. On the other hand, strategic autonomy allows agents to enter and to participate in the corporate decision-making process. As shown in Tab. 5, the average value of both structural and strategic autonomy is the highest for level 2 of DDD, confirming that the most advanced approach to decision-making is correlated to larger workers' autonomy. In addition, we can note when moving from the lowest to the highest category of DDD, the growth rate of strategic autonomy is higher than the growth rate of structural autonomy for both indicators. Indeed, it is notable in the case of DDD-innovation, i.e. 17% for structural autonomy and 37.8% for strategic autonomy. When moving from the lowest to the highest category of the DDD-KPI, the difference in the growth rate of strategic and structural autonomy is less sharp (35.5% versus 30.5%). This suggests that strategic autonomy is particularly important to a decision-making process oriented to innovation.

Research limitations. *We identify some potential limitations of the study. First, since the investigation is on going, the current study provides only a very preliminary and descriptive analysis, which prevents from establishing multiple influencing factors and quantifying relations. In addition, the analysis considers few factors related to DDD, but other important elements could be relevant, such as manager/employee trust, work satisfaction, and employee motivation that could affect innovation and performance in a DDD firm. Second, the research is based on cross-sectional data, making difficult to identify possible lagged relations or dynamics. The preliminary analysis indicates that using DDD to manage innovation activities is associated to a greater growth rate of strategic autonomy compared with the growth rate of structural autonomy. This result suggests a correlation between DDD used to innovation activities and a decentralization of the decision-making. To determine the direction of this association is difficult to establish with the current setting. It can be the case that digital technologies used to promote innovation can stimulate the adoption of more autonomy-oriented managerial practices, or can be the case that in a more decentralised system the costs to implement a DDD approach is lower, since the workforce reports higher level of competences and abilities in comparison to system characterized by a more hierarchical structure of decision-making. Further investigation is needed to inspect causality. Third, the data concerns firms located in Lombardy, which limits the generality of our results. Future studies could collect data from firms located in Italy or even in other countries to identify relevant differences affecting the findings.*

Managerial implication. *This study benefits managers in several ways. First, we find evidence of the difference in the rate of DDD adoption between large and small firms, and across economic sectors. This result indicates a possible long-term implication for the capacity of small firms and certain sector to adapt to the DT. Managers of these firms have to be aware of the importance of co-factors of DDD in order to promote the development of a data-driven approach. Second, our results indicate that organizations using a DDD approach to promote innovative activities may invest in a more decentralization decision-making. This implies modifying managerial practices leading to higher workers strategic autonomy. Indeed, the mere access to data is not enough to extract economic value. Managerial and organizational capabilities and changes are needed to translate information into innovative business strategies (Ciampi et al., 2021). Our study wants to enrich the existing knowledge on managerial and organizational changes needed to proper manage DDD.*

Originality of the paper. *The current study contributes to the existing evidence in several ways. First, we collect new and original data. Therefore, we can confirm the existing evidence on DDD phenomenon by using a primary data from firms located in Lombardy, region of Italy. The data collected cover a wide range of information, allowing us to control for a great number of features. Our findings suggest the importance of firm- and industries-specific factors that contributes to better understanding the adoption of DDD.*

Second, previous researches have examined the relationships between DDD and structured managerial practices (Capo et al. 2022; Brynjolfsson and McElheran, 2016a), others have proved the positive effect of DDD on innovation and firm's performance (Krafft et al., 2021; Davenport et al., 2021; Brynjolfsson and McElheran, 2016a); the most have indicated potential co-factors related to DDD (Capo et al. 2022; Brynjolfsson and McElheran, 2016a). However, they have not specially examined all these relationships considering different business knowledge perspective, nor they have addressed the role of workers' autonomy. To address this gap, our study investigates the role of workers' autonomy

considering separately DDD innovation-oriented from more general DDD. As expected, the role of workers' strategic autonomy seems to be central in predict DDD approach under innovation perspective.

Key words*: Digital Transformation; Data-Driven Decision-Making; Strategic Autonomy; Information and Communication Technologies*

Medical Doctors' Entrepreneurial Intention Through Organizational Support to Innovation and Collaboration Propensity

ANDREA SESTINO[1] ALFREDO D'ANGELO[2]

Abstract

Building on the Theory of Planned Behavior (TPB) and the Theory of Reasoned Action (TRA), this paper examines the relationship between medical doctors' (MDs) entrepreneurial attitudes (EA) and their entrepreneurial intention (EI). Based on a sample of MDs involved in the G-STeP project at the research-led "Agostino Gemelli" hospital in Rome, results show that MDs' attitude toward entrepreneurship positively drives their intentions to enterprise. Such an effect is explained by the MDs' perception of support to innovation within the organization. However, such an effect is moderated by MDs' propensity to collaborate. Thus, for higher levels of MDs' collaboration propensity the effect is magnified. This means that, for MDs that show high levels collaboration propensity, the perceived role of organizational support for innovation is more important than their individual EA to explain potential EI. Specifically, at low levels of MDs' collaboration propensity, there is a negative effect on EI. These findings underline the need for an individual collaborative attitude alongside the presence of an organizational culture that supports innovation to foster entrepreneurship among MDs in a research-led hospital.

Keywords: *medical doctors;* entrepreneurship*; innovation;* entrepreneurial intention*; organizational support to innovation;* collaboration propensity

Framing the research. *Entrepreneurship is becoming increasingly relevant in healthcare, as medical doctors (MDs) are expected to engage in innovation-driven initiatives to improve service delivery, patients' outcomes, and organizational efficiency (Battle et al., 2022; Lega et al., 2013). However, the transition from patients' care centricity to entrepreneurship remains underexplored. While prior research on entrepreneurial behavior emphasizes the role of individual differences (e.g., personality traits, beliefs, and predispositions) (Covin et al., 2020) and organizational ecosystems (Carlos & Hiatt, 2022), little attention has been paid to how these factors interact in a healthcare setting usually characterized by goals different from enterprises.*

Previous literature acknowledges the role of organizational culture oriented to innovation as a key determinant of entrepreneurial action, influencing how professionals perceive autonomy, risk, shaping their attitudes within their workplace (Bhatti et al., 2020; Schein, 2010). A culture that fosters autonomy and initiative may serve as a critical enabler of entrepreneurial behavior especially when dealing with innovations (Ahmetoglu et al., 2018). When MDs operate in an environment that values innovation and intrapreneurship, they are more likely to translate their attitudes into concrete initiatives (Sabherwal & Jeyaraj, 2015). Coherently, recent research conducted in an academic intrapreneurship (precisely, an University Medical Centre similar to the one we used as a research setting), shed light – among the other, e.g., external collaborations, time availability, and so on - the critical on the role of organizational support for MDs in fostering innovative entrepreneurship as key enabler of innovation (Burkholder & Hulsink, 2022).

Organizational culture often influences entrepreneurial behavior indirectly, by shaping perceptions of innovation support-that is, the degree to which medical professionals feel encouraged to develop and implement new ideas (Rosenbusch et al., 2011). Previous research suggests that organizations with strong innovation policies are more likely to stimulate entrepreneurial activity, encouraging innovation strategies (Sestino, Gastaldi & Leoni, 2024). In healthcare, this could translate into providing MDs with resources, training, and structural support measures that facilitate entrepreneurial actions.

Despite the positive role of organizational support to innovation, its effects on entrepreneurial intention could be influenced by MDs' individual characteristics, such as innovation tendency, openness to change and further personality traits (Marcati et al., 2008). Individual difference related to MDs' collaboration propensity, for example, could drive the development of entrepreneurial solutions thanks to the possibility MDs have to leverage on social capital from a professional network (Caprara et al., 2012) that brings benefits from peer knowledge, collective problem-solving and shared risk-taking to the table of new entrepreneurial initiatives (Ketchen et al., 2007). This could be particularly interesting for healthcare settings where the "core" of the activities focusses on patients' care rather than

entrepreneurship. Research on opportunity exploitation suggests that individuals with lower collaborative tendencies often struggle to transform innovative ideas into actionable business opportunities, as they lack the social reinforcement needed to navigate complex organizational and regulatory environments (Dacin et al., 2011). This is particularly relevant in healthcare, where entrepreneurial initiatives require multidisciplinary coordination, access to institutional networks, and regulatory compliance (Wildenet al., 2018).

Purpose of the paper. *Building on the Theory of Planned Behavior (TPB) and the Theory of Reasoned Action (TRA), this study examines the mechanisms through which MDs' entrepreneurial attitudes shape intentions in a healthcare corporate entrepreneurship setting such as that of the* the G-STeP project at the "Agostino Gemelli" research-led hospital in Rome. *By integrating theoretical insights from organizational behavior, innovation management, and healthcare entrepreneurship literature, we developed three hypotheses. First, we predict that MDs' entrepreneurial attitude positively influences their behavioral intention. Second, we propose that such an effect is explained (mediated) by their perceived organizational support to innovation. Third, we predict that such an effect is moderated by individual MDs' higher (vs. lower) collaboration propensity.*

In line with TRA, where intentions are shaped by individual beliefs, we suggest that an organization's commitment to fostering innovation and collaboration significantly enhances the translation of entrepreneurial attitudes into intentions, and in turn on real actions (behaviours).

Fig. 1: Proposed framework

Methodology. *Based on the above* we predict, *this study employs a survey-based experimental design to investigate how entrepreneurial attitudes (X) influence entrepreneurial intention (Y) among MDs, considering the mediating roles of the perceived support to innovation from the organization (Me), and the moderating role of MDs' collaboration propensity (Mo).*

Participants were medical doctors working in a research-led hospital, and working on a specific project called "Gemelli Science and Technology Park" (hereafter, G-STeP) that is aimed at building a research infrastructure at Policlinico Universitario Agostino Gemelli IRCCS, providing cutting-edge technological services through over 20 Core Facilities. It supports scientific projects by offering advanced data analysis, AI solutions, and innovation-driven research tools. 180 MDs were asked to complete a self-reported questionnaire assessing their entrepreneurial attitudes, perceived organizational culture, innovation support, and entrepreneurial intention. In total, 72 MDs completed the survey, but 69 responses were retained for analysis after data cleaning (because of incomplete responses).

Prior to assessing their entrepreneurial intention, participants responded to validated measures of their collaboration-seeking behavior, hypothesized as a moderator, assessed through items adapted from Caprara et colleagues (2012) (e.g., "I actively seek opportunities to collaborate with colleagues", "Working in a team enhances my ability to innovate"). Then, we asked them to assess entrepreneurial attitude and perceived support to innovation, drawn from previous studies. The measurement items for entrepreneurial attitude were adapted from Covin et al. (2020) (e.g., "I have a positive attitude toward starting new ventures", "I consider entrepreneurship as a viable career path"). The perceived organizational support to innovation has been measured by using items from Sabherwal & Jeyaraj (2015) (e.g., "My organization provides adequate training for digital transformation", "Adopting new technologies is a priority for my organization"). After completing these sections, participants were asked to rate their entrepreneurial intention, measured using items from Ajzen & Fishbein (2000) (e.g., "I intend to develop new projects within my organization", "I plan to take a leadership role in innovative initiatives"). All responses were collected using a 5-point Likert scale (1 = "Strongly Disagree" to 5 = "Strongly Agree"). Socio-demographic variables (e.g., age, gender, specialization, income level) were recorded to account for potential covariates in the analysis.

Results. *The analysis has been conducted by employing the moderated mediation model (Model 14) of the SPSS Macro Process (Hayes, 2018) to assess the relationships between attitudes toward entrepreneurship (EA) settled as the independent variable X, perceived support to innovation acting as a mediator Me, MDs' collaboration propensity acting as a moderator (mean-centered), and entrepreneurial intentions (EI), as the dependent final variable Y.*

Results of our statistical analysis indicate that EA has a significant direct effect on EI among medical doctors (b = 0.334, p = 0.013). Moreover, EA positively influences the perception MDs have of the organizational support to innovation (b = 0.296, p = 0.040). The perceived support to innovation also positively affects EI (b = 1.056, p = 0.0146), confirming that the perception of organizational support for innovation explains medical doctors' EI.

MDs' collaboration propensity significantly moderates this relationship (b = 0.269, p = 0.011), with a higher level of collaboration strengthening the positive impact of organizational support to innovation on EI. By closely looking at this

interaction, such an overall effect is neutral at lower levels of MD's collaboration propensity because the effect is non-significant. Importantly, it starts to become significant and positive at higher levels of collaboration propensity (b= .223; p= .006). Overall, these findings suggest that MDs with an entrepreneurial mindset are more likely to engage in entrepreneurial activities, especially when they perceive organizational support for innovation. However, this effect is stronger when MDs have a high propensity to collaborate, as collaboration enhances the positive impact of perceived innovation support on entrepreneurial intentions.

Originality of the paper. *This study offers a novel perspective on MDs' entrepreneurship, challenging the assumption that individual attitudes alone foster entrepreneurial intention. While prior research highlights the role of organizational culture and innovation support in shaping entrepreneurial behavior, little attention has been given to how these factors interact within healthcare settings. By demonstrating that, beside organizational innovation support, collaboration-seeking behavior plays a crucial moderating role (aligning with Yoda, 2015), this paper provides fresh insights into why some MDs can translate their entrepreneurial attitudes into action while others do not. The findings contribute to a better comprehension of entrepreneurship in healthcare, emphasizing that organizational innovation efforts find in MDs with a strong collaborative propensity an effective vehicle for entrepreneurship. Findings from our study must be interpreted in the light of the peculiar research context (i.e., in a clinical, hospital setting) where the focus is by nature on patients' care. In this setting, "non-core-business" initiatives may be encouraged and supported by the organization. However, the level of MDs' collaboration propensity may result of key importance in explaining entrepreneurial intention. We believe that this is due to the fact that, in their normal course of activities, MDs are accustomed to leveraging a wide professional network (Caprara et al., 2012) to peer knowledge, collective problem-solving and shared risk-taking (Ketchen et al., 2007). They are particularly relevant in entrepreneurship as well. Therefore, despite the MDs' primary focus would remain on patients' care, their acknowledgement of social capital reported in their collaborative propensity is an important asset for giving birth to entrepreneurial ventures.*

Managerial implications. *Healthcare organizations aiming to foster entrepreneurial engagement among MDs must go beyond the simple attitude measures and acknowledge the unique setting where patient care remains the primary focus. Results of our on-field study suggest that MDs' perceived organizational support to innovation, and collaboration-seeking propensity are crucial in determining whether MDs translate their entrepreneurial attitudes into concrete initiatives. Important managerial implications emerge from this research. First, in a research-led hospital aiming at developing an entrepreneurial culture, fostering a collaborative work environment should be prioritized over simply providing resources. Medical doctors operate in highly specialized and organized structures where decision-making is often fragmented across departments. In such an environment, even when financial or technological resources are available, they may not be enough to drive entrepreneurial action. Doctors tend to rely on team-based collaboration, experience and perspectives sharing, and interdisciplinary support rather than on individual incentives. To enhance entrepreneurship, hospitals and research institutions should facilitate cross-functional interaction between medical doctors, healthcare managers, and technology experts. Encouraging structured initiatives such as innovation teams, joint problem-solving workshops, and mentorship networks can create an ecosystem where entrepreneurial ideas can emerge and be sustained over time. Second, organizations must redefine how innovation support is structured in a healthcare corporate setting. Unlike other industries, where access to funding, technology, and training may directly enhance entrepreneurial outcomes, in healthcare, the role of collaboration is even more critical. Medical doctors with a low openness to collaboration, may not fully utilize available innovation resources, whereas those who actively engage in team-based initiatives are more likely to leverage organizational support for new ventures. A more context-sensitive approach to innovation support is needed-one that prioritizes co-creation spaces, cross-disciplinary research units, and team-based innovation challenges over individualized incentives. Hospitals should integrate structured interprofessional collaborations, where specialists from different fields work together on innovation projects, ensuring that new ideas are not just conceptualized but also implemented effectively.*

Research limitations. *This study is not exempt from some limitations that should be acknowledged. Since the data collection has been conducted by leveraging on medical doctors' participating at the G-STeP project at the research-led "Agostino Gemelli" hospital in Rome, the sample size is relatively small, with data collected from only 69 medical doctors. This may limit the generalizability of the findings. Moreover, while the study explores the moderating role of collaboration propensity, it does not account for other potential individual or contextual factors (e.g., risk aversion, leadership support, or regulatory constraints) that may also influence entrepreneurial intentions, and thus further development should include such factors as well. Finally, the study focuses on a specific healthcare context, that since its peculiarities, and by considering the gap in the current literature has been chosen as a research setting. However, in such a setting where entrepreneurship may not be the primary professional objective of medical doctors, making it necessary to interpret results within this specific professional and organizational setting.*

Retrovation for Sustainability: a Categorization with Cases from the Agrofood Industry

AMIR MAGHSSUDIPOUR[1] SILVIA RITA SEDITA[2] LORENZO GUERRINI[3]

Abstract

Retrovation, or retro-innovation, refers to the revival and reinterpretation of historical practices, products, and technologies which lead to a proper innovation. Rather than mere replication, retrovation requires a critical infusion of innovation to adapt past elements to modern needs and challenges. This paper explores the concept of retrovation within the agrofood industry, highlighting its potential as a sustainability-driven innovation strategy. Despite its conceptual relevance, retrovation remains underexplored in academic literature and lacks a systematic framework for its application. Through an extensive literature review, on the one hand, this study presents the state of the art of this concept; on the other hand, it proposes a categorization of retrovation into three types working on cases from the agrifood industry: (1) innovative use of historical materials and machinery, (2) innovation of past techniques, and (3) innovative adoption of past techniques. Case studies-including the reintroduction of ancient grains, modernization of traditional food processing methods, and optimization of historical winemaking techniques-demonstrate how retrovation fosters sustainability by integrating past knowledge with contemporary advancements. The findings emphasize the role of retrovation in sustainable innovation, in entrepreneurial opportunity, and in policy development. This study provides a structured framework for retrovation and offers managerial insights for industries seeking to merge tradition with modern sustainability goals, by means of innovation.

Framing of the research. *The concept of retrovation, also known as retro-innovation, has gained some attention in recent years as an alternative innovation paradigm that integrates historical knowledge with contemporary advancements (Suominen & Sivula, 2016; Sedita, 2024). Retrovation focuses on reviving and reinterpreting forgotten practices, products, ideas, and technologies that have experienced disruption or discontinuity over time. However, rather than mere replication, retrovation requires a critical infusion of innovation to adapt past elements to modern needs and challenges (Stuiver, 2006). By drawing upon different typologies of knowledge rooted in the past, retrovation offers original and potentially transformative solutions to contemporary problems.*

In the current global discourse on sustainability, retrovation presents an intriguing opportunity. Many historical practices and products were inherently sustainable, often due to constraints on resources or reliance on local economies and traditions (Crespi Gomes et al., 2025). However, despite its conceptual potential, retrovation remains largely underexplored in both academic literature and practical applications. While prior studies have broadly discussed retrovation (Greidanus, 2022), there is a notable absence of a systematic framework that categorizes its application, particularly within the context of sustainability. This gap in structured understanding limits the potential for practical implementation and scalability.

Retrovation represents a fusion of past and present, where historical knowledge and traditional practices are revitalized to meet contemporary challenges. This concept spans multiple domains, from agriculture to business models, fostering sustainability, resilience, and efficiency. Theoretical perspectives on retrovation have evolved over time, with Zagata et al. (2020) conceptualizing it as the mobilization of historical knowledge for modern problem-solving. Suddaby and Laasch (2020) explore its role in ethical management, arguing that re-engaging with past practices can lead to responsible business solutions. Greidanus (2022) builds on these insights by proposing a theoretical model linking retro-innovation to contemporary innovation strategies.

The agrofood industry provides an exemplary case for examining retrovation due to its deep-rooted connection with both tradition and innovation (Zagata et al., 2020). By analyzing historical food production methods, processing techniques, and material usage, retrovation can provide a structured framework for sustainable innovation. Agriculture has been a key arena for retrovation, where traditional techniques are being reimagined for sustainability. Stuiver (2006) explores how historical farming methods can challenge existing agricultural paradigms. Kilis et al. (2022) investigate farmer-led retrovation in Latvia, with a focus on biological pest control and direct marketing strategies. González and Picazo (2024) highlight the role of retrovation in sustaining agropecuary farms in the Extremaduran Dehesa. León-Bravo

DOI 10.7433/SRECP.SP.2025.01

et al. (2019) differentiate between retro and forward-looking innovations in the food industry, underscoring their significance in improving food quality and sustainability. Svensson et al. (2023) further examine how alternative food production methods contribute to preserving biocultural heritage. Retrovation has emerged as a strategic tool in sustainable development and business models. Sedita (2024) links retrovation to responsible innovation, emphasizing its role in addressing global challenges. Garre (2022) provides a case study on small-scale organic farming in Northern Italy, demonstrating how draft animal farming can be a sustainable retrovation. Gomes et al. (2025) explore the application of retrovation in circular economy practices within the apparel industry.

Beyond agriculture, retrovation is reshaping consumer products and industrial practices. For example, Olšiaková (2020) examines consumer preferences for retroinnovative wood products, suggesting a growing market interest in sustainable and traditionally inspired goods. Arrese (2016) discusses the reintroduction of paywalls in journalism as a business strategy rooted in retrovation. Liopa-Tsakalidi (2025) explores biodynamic agriculture, where traditional farming wisdom is integrated with modern smart technologies to enhance sustainability. Thus, retrovation presents a compelling approach to innovation, offering a bridge between tradition and modernity. Its relevance spans agriculture, sustainability, business, and consumer markets, providing valuable insights for industries seeking sustainable and historically informed solutions.

Purpose of the paper. *Despite its conceptual potential, retrovation remains largely underexplored in both academic literature and practical applications. While prior studies have broadly discussed retrovation (Greidanus, 2022), there is a notable absence of a systematic framework that categorizes its application, particularly within the context of sustainability. This gap in structured understanding limits the potential for practical implementation and scalability. This paper seeks to address the existing gap in research by proposing a systematic categorization of retrovation and demonstrating its practical applications within the agrofood industry. After having conducted an extensive literature review to establish the state of the art on the concept of retrovation, and to identify critical gaps in the literature, the main purpose of the paper is to propose a categorization of retrovation based on its functions within the agrofood sector. Rather than preemptively defining these categories, the study will develop them through an in-depth analysis of how retrovation manifests in different contexts, illustrating the innovative adaptation of historical practices and materials for contemporary sustainability challenges.*

The agrofood industry provides an exemplary case for examining retrovation due to its deep-rooted connection with both tradition and innovation (Zagata et al., 2020). By analyzing historical food production methods, processing techniques, and material usage, retrovation can provide a structured framework for sustainable innovation and development.

The literature review process is structured in two phases. First, a systematic search is conducted in ISI Web of Knowledge using the keywords "retrovation" and "retro-innovation". However, recognizing that retrovation remains an emerging concept and is not always explicitly labeled as such, the second phase expands the scope by identifying relevant cases within the agrofood sector. Some scholarly works may describe instances of retrovation without using the term explicitly, particularly in discussions on sustainability, traditional practices, and the revival of historical methods in modern food production. To address this limitation, the study adopts an inclusive approach, analyzing cases that align with the conceptual framework of retrovation, even if they do not explicitly reference the term.

Following this literature review, the study identifies functional categories of retrovation based on patterns observed in its application within the agrofood sector. By systematically analyzing how historical knowledge and traditional methods are reintegrated into contemporary agricultural and food production systems, the study derives an evidence-based categorization framework (and a set of related practical examples). This categorization enables a structured understanding of retrovation's role in innovation, highlighting how past practices are selectively reintroduced and adapted to address modern sustainability challenges.

Results. *Retrovation manifests in various ways, including the innovative reuse of historical materials and machinery, the modern adaptation of traditional techniques, and the re-exploration of past methods for contemporary applications. Specifically, three main categories emerged:*

Reviving Historical Materials and Machinery through Innovation. One of the most significant aspects of retrovation is the resurgence of traditional materials, now cultivated and processed using cutting-edge technologies. The food and agriculture sectors provide compelling examples of this trend. Ancient grains, which once formed the backbone of historical diets, have been reintroduced into modern agricultural systems. Crops such as einkorn, emmer, and spelt, historically cultivated for their resilience and nutritional properties, have regained popularity due to their health benefits and ability to thrive in sustainable farming practices (Guerrini, 2019). Through advanced genomic selection techniques, scientists and agronomists have improved their yield and resistance, making these heritage grains viable for large-scale production. Similarly, historical machinery has been revived and enhanced to integrate modern precision and efficiency. Traditional forked kneading machines, once a staple of artisanal bread-making, have been adapted with automated process control systems to maintain consistency while preserving the unique textural qualities of historical bread formulations (Parenti et al., 2013). This fusion of old and new ensures that time-honored culinary practices remain relevant in industrial food production. A parallel movement can be observed in viticulture, where forgotten grape varieties, once overshadowed by commercially dominant breeds, are being rediscovered. These historical grape strains offer unique organoleptic properties and greater resilience to climate change, making them invaluable in contemporary winemaking. Advanced microvinification techniques now allow winemakers to experiment with small batches of these rare grapes, reintroducing flavors that had nearly disappeared from the market (Allegro et al., 2023).

Modernizing Traditional Techniques. Beyond materials and machinery, retrovation thrives in the refinement of historical food processing techniques. A prime example is the adaptation of the alveograph technique, originally developed to measure gluten strength in wheat flour. While this method remains a cornerstone of baking science, modern technology has introduced automated solutions that enhance scalability, reduce human error, and provide real-time quality control feedback (Cappelli et al., 2018). This allows large-scale bakeries to maintain artisanal quality while meeting industrial demands. Artisanal cheese-making has also inspired technological advancements. Historically, cheesemakers relied on sensory experience-touch, smell, and taste-to determine when curds were ready for the next processing stage. Today, biosensors and spectroscopic analysis can replicate these intuitive judgments with greater precision, ensuring consistency while preserving traditional production methods. These innovations ensure that the nuances of terroir and traditional craftsmanship remain integral to the final product, even as production scales up.

Reinventing Historical Methods for Contemporary Applications. Retrovation does not merely involve preserving the past; it also includes reinterpreting and optimizing old methods for modern needs. The Governo all'uso toscano (GUT) winemaking technique, a Tuscan method that predates modern fermentation control, has seen a resurgence thanks to biotechnological advancements. This process, which involves adding dried grapes to fermenting wine to enhance flavor and stability, has been revisited with improved microbial control strategies and fermentation modeling, allowing winemakers to harness its benefits while maintaining quality consistency (Guerrini et al., 2020). Similarly, the rediscovery of ancient fermentation techniques has led to breakthroughs in sustainable food production. Historical preservation methods, such as lacto-fermentation, were once used primarily for food storage but are now being studied for their probiotic benefits and potential role in reducing food waste. By applying controlled environmental conditions and advanced microbial profiling, food scientists are optimizing these traditional methods to enhance both nutrition and sustainability in modern diets.

Retrovation exemplifies the balance between cultural preservation and technological progress. By breathing new life into historical materials, machinery, and techniques, industries can create innovative, sustainable, and high-quality products that honor the past while addressing the demands of the present. As technology continues to evolve, the practice of retrovation will likely expand beyond food and winemaking into other domains, including textiles, construction, and medicine, proving that sometimes, looking backward is the best way to move forward.

Research limitations. *While this study provides valuable insights into retrovation and its applications, it has some limitations. First, the analysis is primarily qualitative, and further quantitative research is needed to assess the economic and environmental impact of retrovation. Second, the study focuses on the agrofood industry, limiting its generalizability to other sectors. Future research should explore retrovation in industries such as fashion, construction, and manufacturing. Third, the cases analyzed are regionally specific, and broader cross-cultural studies could offer a more comprehensive understanding of retrovation's global potential.*

Originality of the paper. *This paper makes several original contributions to the study of retrovation and its intersection with sustainability and innovation. First, it develops a structured framework that systematically categorizes retrovation, providing a much-needed theoretical foundation for understanding its diverse applications. While previous studies have acknowledged retrovation as an emerging phenomenon, there has been a lack of a clear and organized classification that highlights its different forms and functionalities. By addressing this gap, this study not only enhances conceptual clarity but also facilitates a more structured analysis of how historical knowledge and traditional methods can be leveraged for modern problem-solving.*

Another key contribution of this paper is its empirical foundation, which is built upon the identification of real-world cases from the agrofood sector. Through a rigorous examination of the ways in which historical agricultural and food production practices have been reintegrated into contemporary sustainability strategies, this research sheds light on the mechanisms that drive retrovation in practice. These case studies provide concrete examples of how retro-innovative approaches have been successfully implemented, demonstrating their viability and scalability in addressing pressing environmental and economic challenges. Unlike general discussions on sustainability and heritage-based innovation, this study systematically links retrovation to practical applications, offering valuable insights for businesses, policymakers, and sustainability practitioners.

Furthermore, this research underscores the untapped potential of retrovation as a strategic tool for sustainable development. By analyzing the intersection of past knowledge and modern advancements, this study challenges the dominant narrative that innovation must always and only be forward-looking, instead highlighting the value of looking backward to move forward. In doing so, it repositions retrovation as a dynamic and forward-thinking strategy rather than a nostalgic return to the past. The study also advances the academic discourse on sustainable innovation by demonstrating how retrovation can complement contemporary technological advancements, thereby fostering new business models and production strategies that are both resource-efficient and socially responsible.

By offering a systematic framework, presenting novel empirical cases, and positioning retrovation as a viable mechanism for responsible innovation, this paper makes a significant contribution to both academic research and industry practice. It provides a foundation for future studies to build upon, encouraging further exploration of retrovation across different industries beyond the agrofood sector. Additionally, it offers actionable insights for businesses seeking to integrate traditional knowledge into modern sustainability strategies, thereby strengthening the role of retrovation in shaping resilient and environmentally conscious innovation pathways. Specifically, the findings of this study offer significant insights for managers, entrepreneurs, and policymakers. For each of the three identified categories of

retrovation, specific managerial implications can be derived. For instance, in the case of 'Reviving Historical Materials and Machinery', companies can invest in the revival of traditional crops or tools as a strategy to differentiate their products and align with consumer demand for authenticity and sustainability. For 'Modernizing Traditional Techniques', firms can adopt hybrid technological-artisanal production processes that leverage tradition while ensuring scalability and quality control. In the 'Reinventing Historical Methods' category, businesses can explore new market segments by recontextualizing ancient practices to meet modern values such as health, circularity, or resilience. Policymakers, in turn, can design incentive schemes and regulatory frameworks that facilitate the integration of retrovative practices, especially in sectors with strong cultural or environmental impact. Ultimately, this study emphasizes the strategic role of retrovation in business model innovation, offering pathways for sustainable and historically grounded competitive advantage.

Key words: *retrovation; innovation; sustainability; agrofood sector*

The Link Between Humane Entrepreneurship and International Competitiveness: An Explorative Analysis of Key Dimensions

MARTINA TOMASETIG[1] MARIA ROSITA CAGNINA[2] MARIA CHIARVESIO[3] FATIMA DAHBI[4] ANDREA MORETTI[5]

Abstract

Understanding the factors that shape firms' international competitiveness has become increasingly important in a rapidly evolving global economy. Among emerging business paradigms, Humane Entrepreneurship (HumEnt) has gained attention for integrating ethical, sustainable, and human-centric principles into business strategies. This study examines the extent to which HumEnt contributes to firms' international competitive advantage by focusing on its three core dimensions: entrepreneurial orientation (EO), sustainability orientation (SO), and human resource orientation (HRO). Adopting a quantitative approach, we analyze data from a sample of 120 international Italian firms to assess how these pillars influence their global market competitiveness. Our preliminary findings indicate that HRO has a statistically significant positive association with multiple dimensions of international competitiveness, including profitability of international operations, sales volumes, and overall performance. Meanwhile, EO and SO exhibit more variable effects. These results suggest that firms prioritizing employee well-being, development, and ethical labor practices tend to experience enhanced competitive outcomes in global markets. Furthermore, we find that a holistic integration of all three HumEnt dimensions can generate a synergistic effect, enhancing firms' international market share and reputation. This work adds to existing academic research by clarifying the intersection of HumEnt and International Business studies, while offering managers actionable insights on leveraging HumEnt as a strategic tool for global success.

Framing of the research. *The contemporary business environment is characterized by evolving expectations, requiring corporations to move beyond traditional profit-driven models and address pressing societal and environmental challenges (Ghauri et al. 2021). The increasing complexity of global issues, including climate change, social inequality, and environmental degradation, has prompted a reassessment of corporate roles and governance (Parente et al. 2021; Zhao et al. 2024). As these challenges become more pronounced, there is a growing recognition that dominant economic systems require reevaluation (Mazzucato 2018). While capitalism has historically generated wealth and driven economic progress, it has also contributed to environmental and social dilemmas, leading to critical debates on how " reimagining" it to serve broader societal goals (Henderson 2021).*

Businesses are often perceived as both contributors to and potential solvers of these global challenges (Porter and Kramer 2018). Consequently, corporations are increasingly expected to adopt substantive measures to enhance societal and planetary well-being (Ghauri et al. 2021; Zhao et al. 2024). This shift has heightened the emphasis on sustainability, ethical conduct, and corporate social responsibility (CSR), calling for innovative business paradigms that integrate economic objectives with broader societal concerns. Scholars argue that these challenges can be addressed within the capitalistic framework by embracing socially responsible and generative business practices (Mayer 2021). Purpose-driven companies, which incorporate social concerns, long-term orientation, and local environmental considerations into their value propositions, are becoming key agents of change (Muñoz et al. 2018; Mayer 2021; George et al. 2023).

Building upon this perspective, Humane Entrepreneurship (HumEnt) has emerged as a promising framework that combines entrepreneurial strategies with a robust commitment to social, environmental, and human-centric values (Parente et al. 2018). Unlike conventional models, HumEnt prioritizes a balanced approach that ensures value distribution to employees, stakeholders, and society at large (Kim et al. 2018). Its foundational pillars - Entrepreneurial Orientation (EO), Sustainability Orientation (SO), and Human Resource Orientation (HRO) (Parente et al. 2021) - provide both a theoretical and practical basis for firms to innovate and compete globally while simultaneously addressing

modern business imperatives. By embedding ethical considerations and sustainable practices within the firms' core business, HumEnt enhances managerial decision-making, employee engagement, and long-term business growth (Kim et al. 2021).

In recent years, HumEnt has gained prominence as a holistic model (Bae et al. 2018; Kim et al. 2018; Parente et al. 2021; Vesci et al. 2023). By fostering an entrepreneurial mindset that creates value for shareholders while prioritizing employees, communities, and the environment (El Tarabishy et al. 2022; Vesci et al. 2023), HumEnt challenges the traditional notion of profit maximization. Instead, it shifts the focus toward sustainable growth and societal well-being (Parente et al. 2018).

HumEnt expands on established business frameworks including entrepreneurial orientation (Covin and Slevin 1989; Covin et al. 2006; Covin and Lumpkin 2011), sustainability (Kuckertz and Wagner 2010; Roxas and Coetzer 2012; Muñoz and Dimov 2015), and human resources literature (Kim et al. 2018), introducing a more integrated strategic approach. These elements collectively form the foundation for Humane Entrepreneurial Orientation (HEO) (Parente et al. 2021), which prioritizes the human aspect of operations (Kim et al. 2021; Parente et al. 2021).

Recognizing firms as powerful instruments for societal transformation (Henderson 2021), HumEnt draws from CSR, EO, and servant leadership, placing social value creation at the core of business strategy (Parente et al. 2021). Rather than viewing ethical and socially responsible practices as regulatory burdens or compliance costs, HumEnt frames them as strategic requirements that can drive long-term business success (Aspelund 2017; Landowska et al. 2020).

Despite its theoretical promise, the implications of HumEnt for firms' international performance remain unexplored. A notable gap exists in understanding how these principles influence international competitiveness, which can be defined as a firm's ability to achieve superior performance relative to competitors in global markets (Cerrato and Depperu 2011). International competitiveness is a multidimensional construct that includes both traditional performance metrics, such as innovation and cost efficiency (Hult 2012), and intangible factors, including reputation, brand equity, and stakeholder trust (Cerrato and Depperu 2011). While existing research has extensively examined conventional strategies for global success, there is limited insight into how purpose-driven, humane enterprises navigate international markets. This gap underlines the need for investigation into how HumEnt principles shape firms' international competitiveness, particularly in balancing ethical commitments with market-driven requirements (Aspelund 2017).

International competitiveness is increasingly influenced by non-economic factors, such as sustainability and ethical conduct (Hult 2012; Chabowski et al. 2023). Humane Entrepreneurship Oriented companies can leverage societal values as a competitive advantage, fostering innovation (Vesci et al. 2023) and strengthening stakeholder trust (Kim et al. 2018; Landowska et al. 2020). By integrating HumEnt principles into their international strategies, firms can enhance regulatory compliance, risk management, and brand differentiation (Parente et al. 2018; Chabowski et al. 2023; Zhao et al. 2024). However, challenges such as increased operational costs and navigating diverse regulatory environments must be carefully addressed (Chakrabarty and Wang 2012).

The rising importance of ethical practices in global business indicates that integrating HEO into internationalization strategies could play a crucial role in enhancing competitiveness and improving overall performance (Vesci et al. 2023). As businesses continue to navigate the complexities of an unpredictable global market, the HumEnt framework may offer a valuable approach, as it enables organizations to identify and leverage new opportunities for innovation, ensuring sustained growth. It could foster empowerment and excellence, providing a strategic advantage for firms as they expand their presence and drive success in global markets (Bae et al. 2018).

Purpose of the paper. *This study seeks to investigate the influence of the three fundamental dimensions of HumEnt (Parente et al. 2021)- EO, SO, and HRO - on firms' international competitiveness. Specifically, we aim to address the following research question: To what extent do EO, SO, and HRO influence international market success for firms? Our research focuses on an analysis of 120 international manufacturing firms, examining their strategic behaviors and competitive outcomes; at this stage of the research, the analysis is still exploratory. Particularly we will investigate the relationship between HumEnt factors and various measures of international performance and international competitiveness (e.g., market share, sales volumes, sales growth, profitability, expansion of product offerings, firm reputation, overall international performance) (Gerschewski et al. 2015; Donbesuur et al. 2020) analyzing the likelihood of firms achieving higher performance levels.*

By analyzing this relationship, we focus on filling the existing research gap and providing a novel understanding of the topic under scrutiny, building empirical evidence and insights on how to leverage HumEnt as a strategic tool for improving organizations' international competitive positioning and performance.

Methodology. *The primary data was collected within the PRIN project funded by the Italian Ministry of University and Research. To ensure a rigorous data collection process, we employed a structured survey administered to a comprehensive group of Italian firms, including Best Place to Work 2023 firms, Eco-Management and Audit Scheme (EMAS) certified firms, B-corporations, companies listed on the Italian Stock Exchange, Euronext Growth companies, and innovative SMEs, as classified under Italian regulations. By including these categories, we created a sample that effectively represented the breadth of the Italian business landscape, encompassing a wide range of industries and organizational structures. The survey was conducted using an email-based approach between December 2024 and February 2025. This method was preferred for its efficiency and accessibility, allowing us to gather responses from a wide array of Italian companies.*

A total of 230 fully completed questionnaires were obtained. However, our study specifically focused on firms engaged in international activities and their performance in global markets. Therefore, we filtered responses considering only

companies that had fully completed the survey section on international competitiveness and performance. To maintain data integrity and avoid bias in our results, we excluded questionnaires with missing or incomplete data before proceeding with the analysis, obtaining a final sample of 120 firms.

The data collection was designed to assess multiple dimensions of international business competitiveness. International performance measures were adapted from Donbesuur et al. (2020) and Gerschewski et al. (2015). To examine HumEnt, we employed specific measures adapted from Vesci et al. (2024). These items were designed to cover all the key dimensions of HumEnt and were measured on a 7-point Likert scale (Table 1).

To ensure robust analysis, a multi-step approach was applied, including descriptive statistics, factor analysis, and correlation analysis. First, the distribution of key variables was analyzed. Second, we performed an Exploratory Factor Analysis (EFA) to extract underlying factors from the HumEnt measures. Finally, given the characteristics of the variables, Spearman's rank correlation was computed to explore the relationship between the HumEnt factors and international competitiveness indicators. Additionally, we engaged in preliminary regression modeling of the data to gain initial insights into the factors influencing international competitiveness.

Tab. 1: Variables Description

	Measurement Item	***Description***	***Unit***
HumEnt			
- EO	*In general, my company places a strong emphasis on the marketing of products and services vs innovation, R&D, and technological leadership (EO1)* *When facing competition my company typically tries to avoid competitive clashes, preferring a "live-and-let-live" posture vs adopts a highly competitive stance, regardless of what competitors do (EO2)* *In decision-making situations involving uncertainty, my company typically adopts a cautious, wait-and-see posture to minimize the probability of making costly decisions vs typically adopts a bold, aggressive posture to maximize the probability of exploiting potential opportunities (EO3)*	Likert Scale from 1 (commercialization) to 7 (innovation) (Adapted from Covin and Slevin 1989) Likert Scale from 1 (live-and let-live posture) to 7 (competitive stance) (Adapted from Covin and Slevin 1989) Likert Scale from 1 (wait-and-see posture) to 7 (aggressive posture) (Adapted from Covin and Slevin 1989)	Scale (1-7)
- SO	*My firm carries out actions that contribute to building a better society or, in general, to improving its territory (SO1)* *My firm engages in actions to protect or restore the natural environment (SO2)*	Likert Scale from 1 (strongly disagree) to 7 (strongly agree) (Adapted from Muñoz and Dimov 2015)	Scale (1-7)
- HRO	*My company is empathetic to the difficulties and needs of its employees (HRO1)* *My company does not discriminate against any of its employees based on gender, race, religion, role, etc. (HRO2)* *My company carries out actions that contribute to developing the skills and knowledge of its employees (HRO3)* *My company offers its employees the concrete opportunity to support it in carrying out tasks and actions, including through delegation (HRO4)*	Likert Scale from 1 (strongly disagree) to 7 (strongly agree) (Adapted from Kim et al. 2018, 2021)	Scale (1-7)
International Competitiveness	*Market share in international markets (IC1)* *International sales volumes (IC2)* *International sales growth (IC3)* *International profitability (IC4)* *Overall international performance (IC5)* *Overall results obtained in international markets (IC6)* *The international market share has increased (IC7)* *The number of products offered abroad has increased (IC8)* *The presence in strategic markets/countries has improved (IC9)* *The company's reputation in international markets has improved (IC10)* *The company's competitiveness in international markets has improved (IC11)*	Likert Scale from 1 (not at all good) to 7 (excellent) (Adapted from Donbesuur et al. 2020) Likert Scale from 1 (strongly disagree) to 7 (strongly agree) (Adapted from Gerschewski et al. 2015)	Scale (1-7) Scale (1-7)

Preliminary Results and Future Steps. *Preliminary results include descriptive statistics about the data, EFA to identify underlying dimensions of HumEnt, correlation analysis to examine relationships between these dimensions and measures of international competitiveness, and preliminary regression modeling.*

Prior to conducting the main analyses, the distribution of the variables was examined to understand the data's basic characteristics. To deeply understand the underlying structure of HumEnt, an EFA was conducted on the nine items designed to measure its dimensions. The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy was calculated to

assess the suitability of the data for factor analysis. Its overall value was 0.73, with individual items ranging from 0.60 to 0.79, exceeding the commonly accepted threshold of 0.60. This result indicates that the sample was adequate for factor analysis. To determine the number of factors to extract, both the eigenvalue criterion and the scree plot were used. The eigenvalues for the first three factors were >1, indicating that they explain a meaningful amount of variance and justify their retention based on the Kaiser criterion. The scree plot visually corroborated this, suggesting a three-factor solution. Parallel analysis also supported the extraction of three factors. Following this preliminary assessment, a factor analysis with a Promax rotation was performed, specifying a three-factor solution. The results of the EFA revealed a clear factor structure (Table 2).

Tab. 2: Factor Matrix

Item	***Factor 1***	***Factor 2***	***Factor 3***
HRO1	0.61		
HRO2	0.51		
HRO3	0.78		
HRO4	1.04	-0.35	
SO1		1.03	
SO2		0.65	
EO2			0.76
EO3			0.62
Eigenvalue	2.36	1.82	1.04
% of variance explained	26	20	12

Factor 1, labeled as HRO, is characterized by high loading on the four human resource items, which relate to employee treatment, skill development, and empowerment. Factor 2, labeled SO, is identified by high loadings on sustainability-related items, which assess action contributing to a better society and environmental protection. Factor 3, labeled EO, presents high loadings on items measuring the company's competitive stance and posture towards uncertainty. Notably, item EO1, emphasizing marketing vs innovation orientation, did not exhibit a strong loading on any of the identified factors.

To further determine the adequacy of the EFA, a chi-square test was conducted. The result was a chi-square statistic of 21.42 with 12 degrees of freedom (p=0.045). While the p-value is marginally significant, several points support the adoption of a three-factor model. First, the identified factors are theoretically sound (Parente et al. 2021) and readily interpretable. Second, the model explains a reasonable amount of variance (58%), demonstrating practical significance by capturing a substantial proportion of the data availability. Adding more factors would likely increase complexity without contributing substantially to the model's explanatory power or interpretability. The factor scores derived from the EFA were saved as continuous measures of HRO, SO, and EO for use in subsequent analyses.

To explore the relationship between the HumEnt dimensions and the measures of international competitiveness. Spearman's rank correlation coefficients were calculated. This non-parametric method was chosen due to the ordinal nature of the international competitiveness variables. Correlations were calculated between the original HumEnt items (EO1 to EO3, SO1 to SO2, HRO1 to HRO4) and international competitiveness measures (IC1 to IC11), as well as between the factor scores (Factor1, Factor2, Factor 3) and the same international competitiveness measures. The correlation matrix for the original HumEnt items revealed several significant relationships with the international competitiveness measures. Items related to HRO generally showed more frequent and stronger positive correlations with international competitiveness indicators compared to the EO and SO items.

The correlation matrix using factor scores also revealed some significant relationships (Table 3). First, we were able to confirm the results of the EFA, looking into the correlation of factors. Then we examined the correlation of single factors with international competitiveness measures as coded above. Factor 1, HRO, showed statistically significant positive correlations with almost all the measures of international competitiveness except for IC8, IC9, and IC11. Factor 2, SO, exhibited a statistically significant negative correlation with international profitability (IC4). This can be attributed to the additional costs associated with implementing sustainability practices, which may initially outweigh the financial benefits. Factor 3, EO, showed few statistically significant correlations with overall results obtained in the markets (IC6) and the international market share (IC7).

Preliminary regression analyses were conducted to explore the predictive capacity of the HumEnt dimensions (Factor1, Factor2, Factor3) on the measures of international competitiveness. Given the ordinal nature of the dependent variables, ordered logistic regression models were employed. The results suggest that HRO (Factor 1) has a statistically significant positive relationship with all the international competitiveness dimensions. EO (Factor 3) appears to positively influence the measures of overall results obtained in international markets (IC6), the international market share (IC7), the presence in strategic markets (IC9), and the company's reputation (IC10). The SO dimension (Factor 2) was less consistent with significant impacts solely on international market share (IC7), the number of products offered (IC8), and the firm's reputation (IC10).

It is noteworthy that for both company reputation (IC10) and market share (IC7), a combined significant positive effect of all three factors was observed. This suggests a synergistic effect when all three HumEnt dimensions are

integrated, which can also be viewed in the coefficients observed. Although regression data are preliminary, this supports the idea that the three dimensions enhance each other.

Tab. 3: Correlation Matrix of Factor Scores and International Competitiveness Measures

Item	***Factor 1***	***Factor 2***	***Factor 3***
IC1	*0.24***	*-0.11*	*0.12*
IC2	*0.19**	*-0.09*	*0.11*
IC3	*0.26***	*-0.09*	*0.13*
IC4	*0.24***	*-0.18**	*0.13*
IC5	*0.25***	*-0.13*	*0.11*
IC6	*0.23**	*-0.09*	*0.20**
IC7	*0.19**	*0.03*	*0.23**
IC8	*0.15*	*0.03*	*0.08*
IC9	*0.10*	*0.07*	*0.13*
IC10	*0.33****	*0.01*	*0.14*
IC11	*0.17*	*0.03*	*0.08*

**p < 0.05, **p < 0.01, ***p<0.001*

This analysis is explorative and at an initial phase. Future steps will include the development of punctual hypotheses to be tested, the development of a more comprehensive framework, and the test of the relationship further supported by robustness tests to guarantee the validity of the results.

Research limitations. *The study presents a contribution to understanding the relationship between HumEnt and international competitiveness. However, some limitations should be acknowledged. First, while the EFA adopted in this research provides a promising insight into the underlying structure of HumEnt dimensions, it may have introduced potential biases due to the choice of factor extraction and rotation. Alternative classification methods, including clustering techniques, could further validate and refine these findings.*

Second, the preliminary nature of the analysis necessitates caution when drawing conclusions, as further validation is required to confirm the robustness of the proposed relationship.

Third, the study relies on self-reported survey data, which may introduce response bias, as participants might overstate their firm's commitment to HumEnt principles or their international success. Future research could incorporate further performance metrics or external assessments to complement self-reported data.

Finally, the study in its current form does not account for potential industry-specific variations in how firms implement HumEnt principles. Sectoral differences could influence the relative importance of EO, SO, and HRO in different business environments. Addressing these aspects could provide a more granular understanding of the role of HumEnt in shaping international competitiveness.

Managerial implications. *The findings of the research provide valuable managerial insights for firms aiming to strengthen their international competitiveness through HumEnt practices. The results highlight the critical role of HRO in enhancing firms' global positioning, suggesting that prioritizing employee well-being, ethical labor practices, and talent development can yield competitive advantages in international markets. Therefore, managers should invest in human capital strategies that foster employee engagement, innovation, and loyalty, which can contribute to long-term profitability and market success.*

Additionally, while EO and SO exhibit more variable effects, their integration into business strategy remains essential. Managers should adopt a balanced approach that combines risk-taking and innovation with ethical and sustainable practices, ensuring that competitive advantages are both profit-driven and socially responsible. Today firms are required to navigate the challenges of increased operational costs and regulatory complexities associated with these practices. However, proactive regulatory compliance and strategic partnerships with stakeholders could mitigate these risks and enhance brand reputation. This integrated approach allows firms to build a resilient and ethically sound foundation for international success.

In this context, a holistic view of HumEnt, where the effects of EO, SO, and HRO are leveraged collectively, is required. Businesses that embed these principles into their international operations could achieve differentiation and stakeholder trust, positioning themselves favorably in an increasingly competitive global market.

Originality of the paper. *This research offers a novel contribution to the intersection of HumEnt and international competitiveness, filling a significant gap in the existing literature. From this point of view, we contribute both to entrepreneurship and international business research. While prior studies have extensively examined factors influencing firms' global success, the integration of ethical, sustainable, and human-centric business paradigms into international strategies has remained unexplored. By analyzing the impact of EO, SO, and HRO on international performance, the study aims to introduce a comprehensive and multidimensional framework able to advance the understanding of how firms can align competitive strategies with moral imperatives.*

Finally, the current work demonstrates the paramount importance of HRO in contemporary business, challenging the traditional perspectives that focus on innovation and aggressive strategic postures over ethical considerations (Donbesuur et al. 2020). Prioritizing employee well-being and development emerges not only as a moral requirement but as a strategic advantage, serving as a catalyst for innovation and market differentiation.

Overall, this research offers valuable insights for scholars and practitioners interested in understanding and implementing humane, sustainable business models, particularly in light of increasing corporate accountability and social consciousness.

Key words: *Humane Entrepreneurship; Entrepreneurial Orientation; Sustainability Orientation; Human Resource Orientation; International Competitiveness; Sustainability*

Cultural perspectives on leadership effectiveness. A comparative study between Italy and South Korea

CINZIA DESSÌ[1] JESSICA LAMPIS[2] ANNALISA SUCCA[3]

Abstract

This study explores the impact of differentiation of self on effective leadership across diverse cultural settings, specifically contrasting individualistic and collectivistic societies. Grounded in Hofstede's cultural dimensions framework and Bowen's family systems theory, the research underscores the necessity for leaders to balance personal autonomy with relational connectedness. In individualistic cultures, leadership is characterized by a focus on independence, innovation, and personal responsibility, whereas in collectivistic cultures, it emphasizes group cohesion and adherence to hierarchical norms. The study examines leadership behaviors shaped by the differentiation of self in two distinct cultural contexts: Italy, representing a Mediterranean individualistic society, and South Korea, rooted in Confucian collectivism. Using a sample of young adults from both countries, the research investigates how differentiation of self influences leadership effectiveness across cultural boundaries. These findings offer valuable contributions to intercultural leadership and psychology, enhancing understanding of leadership dynamics in an increasingly globalized organizational environment.

Framing of the research. *Leadership has long been a subject of scholarly investigation, yet its conceptualization and expression remain deeply embedded within cultural contexts. One crucial factor influencing leadership effectiveness is the differentiation of self (DoS), which refers to an individual's ability to maintain a personal identity while engaging meaningfully with others. This construct is particularly relevant in examining the intersection of personality traits, cultural dimensions, and leadership effectiveness. Given that DoS is inherently shaped by cultural influences, it plays a pivotal role in determining how individuals develop leadership competencies within their societies.*

Bowen's family systems theory (1978) provides a foundational framework for understanding emotional processes and family dynamics across generations, positioning DoS as a key component (Lee & Johnson, 2017). Scholars regard DoS as a fundamental developmental process, as individuals must learn to balance personal autonomy with their capacity for meaningful relationships ((Knerr & Bartle-Haring, 2010). This balance is particularly significant in leadership, as it equips individuals to uphold their integrity while fostering positive interpersonal relationships within organizational settings.

According to Bowen's model, DoS consists of two interrelated dimensions: intrapsychic and interpersonal. The intrapsychic dimension pertains to the ability to regulate emotions and reason effectively, allowing individuals to process their emotional experiences without becoming overwhelmed. A crucial aspect of this dimension is maintaining an "I-position," which enables leaders to remain composed in conflicts, engage in rational problem-solving rather than emotional reactivity, and avoid impulsive decision-making under stress. On the other hand, the interpersonal dimension involves cultivating close emotional connections while preserving individual autonomy. This capacity enables leaders to maintain intimacy without resorting to maladaptive coping mechanisms such as emotional fusion (excessive entanglement) or emotional distancing, which serves as an anxiety-regulation strategy through psychological or physical withdrawal (Bowen, 1978; Hermans, 2001; Kerr & Bowen, 1988).

Research within the Global Leadership and Organizational Behavior Effectiveness (GLOBE) project has reinforced the notion that leadership is culturally contingent, demonstrating that perceptions of leadership effectiveness differ across cultural settings (House, 2004; Javidan et al., 2004). A key question within this research domain is whether certain leadership traits and behaviors are universally valued or if they are significantly shaped by cultural norms and expectations (Javidan et al., 2004). This perspective underscores the relevance of DoS in leadership studies, as it provides an analytical lens for exploring how cultural contexts shape leadership development and expectations.

At an individual level, leadership effectiveness is often linked to relational and collaborative skills, emotional intelligence, and social perception. Implicit leadership theory suggests that the label of "leader" serves as a cognitive

category used to distinguish individuals as leaders or non-leaders (Calder, 1977; Lord et al., 1986). This classification is influenced by various personal and contextual factors, including personality traits and early life experiences (Hunt et al., 1990). DoS plays a crucial role in this process, as leaders with a high level of differentiation are better equipped to handle interpersonal complexities, regulate emotional responses, and maintain clarity under pressure.

Personality traits such as extraversion, agreeableness, conscientiousness, openness, and neuroticism have been extensively linked to leadership effectiveness, shaping the way leaders interact and exert influence (Antonopoulou et al., 2019; Gkintoni et al., 2022). Moreover, psychological characteristics such as self-esteem, perception control, risk-taking propensity, trust, forgiveness, and reciprocity also contribute to leadership behaviors (Kandler et al., 2014). A high level of DoS enhances the ability to balance these traits, fostering adaptability, resilience, and strategic interpersonal engagement, which are essential for effective leadership across diverse cultural contexts.

Purpose of the paper. *Leadership effectiveness is a fundamental determinant of organizational success, and recent advancements in research have increasingly integrated cognitive science to examine the psychological mechanisms underpinning leadership. A significant development in this area is the concept of Implicit Leadership Theories (ILTs), which explain how individuals form leadership perceptions based on personal experiences, socialization, and environmental influences (Korukonda & Hunt, 1989). These cognitive frameworks shape how leaders are evaluated, distinguishing effective leadership from ineffective leadership. Hunt et al. (1990) demonstrated that leadership prototypes emerge through interactions between individual, organizational, and environmental factors, suggesting that leadership effectiveness depends on the degree to which a leader's attributes and behaviors align with followers' implicit expectations. Keller (1999) expanded on this notion by linking personality traits to leadership characteristics like sensitivity, commitment, and charisma. Furthermore, early socialization, particularly exposure to parental traits, influences idealized leadership models, emphasizing the importance of formative experiences. Incorporating cognitive science into leadership research highlights the role of self-regulation, emotional intelligence, and social perception in leadership success (Shondrick et al., 2010). However, while cognitive and personality-based perspectives contribute to understanding leadership effectiveness, they do not fully account for the impact of cultural context on leadership behaviors and perceptions.*

Leadership theories have historically been developed within Western frameworks, particularly in the United States, raising concerns about their applicability across different cultural settings (Peterson & Hunt, 1997). Cultural dimensions such as power distance, individualism-collectivism, and paternalism significantly influence leadership behaviors and effectiveness (Hofstede, 1980; House, 2004). In South Korea, where high power distance is prevalent, authoritarian leadership is more accepted than in the United States, where abusive supervision is widely rejected (Atwater et al., 2021). These cultural variations underscore the importance of validating leadership models across diverse cultural landscapes to determine their broader relevance (Javidan et al., 2004). Findings from the GLOBE study, which examined leadership across 62 countries, further emphasize these differences (House, 2004; Javidan et al., 2004). In Confucian Asian societies, such as South Korea, China, and Japan, self-protective leadership is favored, emphasizing hierarchy, procedural decision-making, and face-saving behaviors. Conversely, Nordic European cultures prioritize participative leadership due to their emphasis on egalitarianism and low power distance (Northouse, 2025) . Similarly, Anglo cultures (e.g., the United States, the UK, and Canada) align more closely with Nordic Europe, favoring participatory and charismatic leadership, whereas Confucian Asian cultures place less emphasis on participative leadership (Atwater et al., 2021). These findings highlight the necessity of context-sensitive approaches to leadership studies.

DoS provides a valuable theoretical lens for examining leadership across cultural contexts by explaining how leaders balance autonomy with cultural expectations. Cross-cultural psychology research has demonstrated that leadership prototypes and self-regulatory processes vary across societies (Laungani, 2007). In South Korea, a high power distance culture, leaders with high DoS are better able to navigate hierarchical structures while maintaining core leadership values. Such leaders can integrate traditional Confucian principles such as respect for authority, harmony, and social order, with transformational leadership elements. In contrast, in Italy, a low power distance culture, DoS allows leaders to blend participatory decision-making with assertiveness, fostering an approach that balances collaboration with decisiveness. In an increasingly globalized workforce, effective leadership requires the ability to adapt behaviors to cultural expectations while maintaining a consistent leadership identity. DoS is essential in this process, as it facilitates emotional regulation, clear decision-making, and cultural adaptability in leadership roles. As leadership research moves beyond Western-dominated models, integrating cultural dimensions with DoS offers a more holistic perspective on leadership effectiveness across cultural boundaries.

Cross-cultural organizational research has extensively examined the relationship between national cultural orientations and leadership effectiveness. Hofstede's (1980; 2010) cultural dimensions framework remains central to understanding variations in leadership expectations across different societies (Chai et al., 2016; Hofstede et al., 2010). Key cultural dimensions, including power distance, uncertainty avoidance, masculinity/femininity, long-term orientation, and individualism/collectivism, help explain leadership structures and organizational dynamics. The individualism-collectivism dimension, in particular, plays a crucial role in shaping leadership expectations ((Berry et al., 1997; Markus & Kitayama, 1991; Schwartz, 1994; Triandis, 1989). In collectivist cultures, such as those influenced by Confucian philosophy, leadership tends to prioritize social cohesion, hierarchical stability, and collective well-being. In contrast, individualistic cultures emphasize autonomy, innovation, and direct engagement with authority figures (Dewey, 1930; Dumont, 1986).

Bowen's Family Systems Theory (1978) offers a complementary framework for examining how cultural orientations impact leadership effectiveness. Leaders with high DoS can regulate their emotional responses, remain clear-headed in high-pressure situations, and maintain constructive interpersonal relationships without excessive emotional dependence or detachment. The expression of DoS varies across cultures, requiring comparative analysis. In Mediterranean cultures such as Italy, where social expressiveness and familial ties are strong, DoS manifests as a balance between autonomy and emotional closeness (Lampis et al., 2020; Manzi et al., 2006). Italian leadership styles often integrate participatory decision-making with relational warmth. In contrast, in Confucian collectivist cultures such as South Korea, DoS aligns with hierarchical stability and deference to authority (Moleiro et al., 2017; Sorokowska et al., 2017). South Korean leaders must reconcile Confucian values of group harmony and respect for seniority with modern leadership expectations. These cultural distinctions significantly impact leadership effectiveness and expectations. Leaders in highly individualistic cultures like the United States, Canada, Germany, and the UK are expected to embody autonomy, innovation, and self-reliance (Erdem & Safi, 2018). Leadership in these societies prioritizes independent decision-making and risk-taking. In collectivist cultures, such as China, India, South Korea, and Middle Eastern nations, leadership is more relational, focusing on group cohesion and consensus-building (Dwairy, 2004; Triandis, 2001). Hybrid cultures, such as those found in Southern Europe (e.g., Italy and Spain), combine elements of both individualistic and collectivistic tendencies, requiring leaders to navigate relational warmth while maintaining assertiveness (Lampis et al., 2020; Rodríguez-González et al., 2020).

Bowen's DoS framework offers a valuable perspective on how leaders from different cultural contexts regulate emotions, sustain clarity, and cultivate trust within organizations ((Jankowski et al., 2013; Lampis et al., 2017; Rodríguez-González et al., 2019; Skowron et al., 2009; Tuason & Friedlander, 2000). Leaders with low DoS tend to experience more significant stress, emotional instability, and dysfunctional relational patterns, negatively impacting their leadership effectiveness (Peleg, 2005; Tuason & Friedlander, 2000). Therefore, this study seeks to explore the role of DoS in shaping leadership effectiveness across cultural contexts, focusing on Italy and South Korea with the aim to provide a deeper understanding of culturally adaptive leadership styles, trying to answer this research question:

RQ: How does DoS influence leadership adaptability in distinct cultural contexts such as Italy and South Korea?

Methodology. *To examine the impact of cultural differences on the relationship between DoS and leadership behaviors in Italy and South Korea, this research uses a quantitative approach through the on-site administration of psychological questionnaires at young adults aged 18-30. This period of life is a critical period for establishing relational and autonomous capacities, making it a suitable focus for analyzing how DoS influences leadership traits such as emotional regulation, team cohesion, and decision-making.*

The first tool used was the DoS Inventory-Revised (DSI-R) (Skowron & Friedlander, 1998; Skowron & Schmitt, 2003) a 46-item self-report tool assessing four dimensions: Emotional Reactivity (ER); I-Position (IP); Emotional Cutoff (EC); Fusion with Others (FO). Responses were rated on a six-point Likert scale, with higher scores indicating stronger self-differentiation. The Italian version demonstrated good reliability (Lampis et al., 2017), while the Korean version was translated with native speaker supervision (Cho & Chung, 2002; Chung & Gale, 2006; Kim et al., 2015).

The second psychological tool used was the Outcome Questionnaire-45.2 (OQ-45.2) (Lambert et al., 1996), which assesses psychological distress across three domains: Symptom Distress (SD), Interpersonal Relations (IR), Social Role (SR).

Participants were native citizens of either Italy or South Korea, aged 18 or older. After excluding incomplete responses, the final sample comprised 352 individuals (201 females, 151 males). Recruitment followed a non-probabilistic sampling method, collecting 186 participants from Italy (2022) and 166 from South Korea (2023). Data was analyzed using SPSS version 20. Statistical analyses included reliability assessments, descriptive statistics, and inferential tests to examine the relationship between DoS and leadership traits. Internal consistency was measured using Cronbach's alpha.

Responses were rated on a five-point Likert scale, with higher scores indicating more significant distress. The tool has validated translations in both Italian (Lambert & Ogles, 2004; Lo Coco et al., 2006) and Korean (Kim et al., 2015; Kim & Chung, 2006) and had high internal consistency for both samples.

Results. *A one-way ANOVA examined cross-cultural differences in DSI-R subscales and OQ-45.2 scores.*

Key findings included: Korean participants showed higher emotional cutoff (EC) and lower emotional reactivity (ER) than Italians. Korean participants reported lower psychological distress. A negative association was found between DoS and psychological distress across both cultures. Higher ER and EC levels correlated with increased psychological distress in both groups. Lower IP scores were linked to higher distress. FO was significantly correlated with psychological distress only in Italians. Hierarchical multiple regression analyses identified significant predictors of distress: the Italian sample predicted greater distress than the Korean sample.

These findings suggest that DoS plays a more decisive role in predicting psychological distress in Italy than South Korea. Differentiation mechanisms vary culturally, with FO acting as a protective factor in Korea but unrelated in Italy.

Our findings reveal significant cultural variations in ER and EC between Italian and Korean young adults, reflecting cultural norms around hierarchy, emotional expression, and relational dynamics. These results confirm that leadership models must be adapted to cultural contexts, with DoS as moderating role in leadership style development across societies.

In Italy, higher ER and lower EC promote a leadership style centered on relational closeness, emotional engagement, and participatory decision-making. This aligns with the Mediterranean emphasis on social bonds and emotional openness, fostering trust, creativity, and team motivation. Leaders with a high DoS enhance emotional intelligence, enabling them to navigate team dynamics with empathy and attunement. This participative leadership style strengthens collaboration and trust, yet high ER may lead to impulsive decision-making and interpersonal conflicts if not effectively managed. To optimize leadership outcomes, Italian leaders should refine emotional regulation strategies to balance expressiveness with composure, ensuring emotional engagement remains a leadership asset rather than a liability.

In contrast, South Korean leaders exhibit higher EC and lower ER, reflecting societal values of harmony, hierarchy, and emotional moderation. Leadership in this context emphasizes composure, conflict de-escalation, and team cohesion, reinforcing collectivist organizational practices. The high EC observed in Korean participants aligns with Confucian values prioritizing social hierarchy and group harmony. Avoiding emotional entanglement is a protective strategy, enabling leaders to uphold group stability while minimizing conflicts (Bond, 1988; Byung-Ho, 2001; Han, 1989; Hofstede, 1980). In this setting, leaders with high DoS successfully navigate hierarchical structures while maintaining clarity in decision-making. They balance authority with relational harmony, ensuring team stability and cultural adherence to consensus-driven decision-making. However, excessive EC may hinder authentic interpersonal connections, potentially impacting team morale and communication. Effective leaders must regulate emotional expression to avoid alienating their teams.

These findings underscore the importance of cultural sensitivity in applying DoS to cross-cultural leadership effectiveness. Addressing our research question, what role does DoS play in shaping culturally adaptive leadership styles in Italy and South Korea? We can that in individualistic cultures such as Italy, leadership effectiveness is linked to autonomy, innovation, and personal accountability. Leaders with high DoS manage emotional reactivity and foster individual contributions while maintaining meaningful relationships. Italy's cultural blend of individualism and collectivism enables leaders to adopt participative leadership styles, leveraging relational closeness without compromising decision-making autonomy. DoS enhances emotional intelligence and conflict resolution, reinforcing trust and collaboration within teams. On the other hand, in collectivistic cultures like South Korea, leadership emphasizes group harmony, hierarchical respect, and relational cohesion. DoS functions differently, prioritizing relational harmony over autonomy. Emotional regulation (lower ER) and EC serve as cultural assets, helping leaders navigate hierarchical structures while minimizing conflicts. Effective leaders maintain personal clarity while ensuring group cohesion and fostering trust and stability.

Research limitations. *Despite its valuable insights, this study has limitations. First, while DoS was analyzed in a Korean sample, the measurement tool (DSI-R) was not fully validated for this cultural context. A culturally adapted version would enhance cross-cultural comparisons. Future studies should focus on validating a Korean version of the DSI-R to improve its empirical utility.*

Second, the study involved two distinct ethnic groups from two countries. While the sample included young adults with cultural backgrounds, sample sizes were limited, and gender imbalances were present, particularly in the Italian group. Future research should incorporate more gender-balanced samples to increase generalizability. Additionally, as this study focused on specific life stages, replicating research across different age groups and additional collectivist or Mediterranean cultures will be essential for broader applicability.

Another potential limitation is self-report measures, which may introduce monomethod bias. While the DSI-R is a widely recognized tool, Bowen (1978) emphasized the importance of qualitative methods such as family history interviews, genograms, and observational studies for analyzing differentiation processes. Future research should incorporate qualitative approaches to gain deeper insights into self-differentiation and its role in leadership and well-being across cultures.

Managerial implications. *Understanding the role of DoS in leadership can provide valuable insights for managers operating in diverse cultural contexts. Leaders who develop a high level of DoS can adapt their leadership styles to align with cultural expectations, enhancing team cohesion and organizational effectiveness. In individualistic cultures like Italy, managers with high DoS can effectively regulate emotional responses, engage in open dialogue, and foster a participative work environment. While emotional expressiveness is encouraged, excessive emotional fusion, where personal and professional boundaries blur, can also enhance trust, collaboration, and creativity within teams. For organizations operating in Italy, leaders should focus on clear and direct communication and balanced decision-making, ensuring that relational closeness does not compromise authority and efficiency. In collectivistic cultures, such as South Korea, DoS is particularly valuable in balancing hierarchical respect with team cohesion, reflecting the deeply rooted Confucian traditions. South Korean managers often take on a paternalistic leadership style, prioritizing group harmony and collective well-being. Leaders with high DoS demonstrate emotional clarity and composure, allowing them to maintain stability in high-pressure situations. Given that emotional control and relational harmony are prioritized in Korean workplaces, managers who develop DoS can minimize workplace conflicts, navigate hierarchical structures effectively, and foster a sense of security within teams.*

Therefore, for global businesses and multinational organizations, DoS provides a critical leadership competency that supports cultural adaptability. Leaders who can adjust their emotional regulation and relational engagement based on cultural expectations will be better equipped to manage cross-cultural teams. In Italy, this means encouraging open discussions and collaborative problem-solving, whereas in South Korea, it involves upholding structured leadership while maintaining relational sensitivity. Companies with diverse teams should invest in leadership training programs that

enhance DoS, enabling managers to balance personal autonomy with cultural awareness. Additionally, organizations expanding into new cultural markets can benefit from developing leadership frameworks that integrate DoS principles, ensuring that leaders are both culturally responsive and organizationally effective. While DoS specific expression varies, emphasizing relational sensitivity in South Korea and participative engagement in Italy, its core function remains the same: equipping leaders with the ability to navigate cultural complexities while maintaining personal and organizational integrity.

Originality of the paper. *This research offers a novel contribution to leadership studies by integrating DoS theory with cross-cultural leadership frameworks. While previous studies have explored leadership through the lenses of personality traits, implicit leadership theories, and cultural dimensions, little research has examined how DoS mediates leadership adaptability across different cultural settings. By focusing on how leaders balance autonomy and relational interdependence, this study provides a fresh perspective on leadership effectiveness as a dynamic interplay between psychological self-regulation and cultural expectations. Unlike traditional leadership studies that predominantly rely on Western-centric models, this research bridges individualistic and collectivistic paradigms, offering a comparative analysis of leadership styles shaped by cultural norms and emotional differentiation. Italy, representing a hybrid cultural model (blending individualism with collectivism), and South Korea, a Confucian collectivist society, provide contrasting yet complementary case studies to explore how DoS enables leaders to regulate emotions, manage hierarchical relationships, and enhance team cohesion.*

Additionally, this study extends Bowen's Family Systems Theory beyond its conventional applications in psychology and family dynamics, demonstrating its relevance in organizational behavior and leadership development. By linking emotional regulation, self-concept, and cultural adaptation, this research provides new theoretical insights and practical managerial implications for global organizations. Ultimately, this study challenges existing leadership paradigms, advocating for a culturally adaptive and psychologically informed approach to leadership effectiveness in diverse organizational landscapes.

How Incubators and Accelerators Foster Startup Internationalization

MIRKO OLIVIERI[1] CHIARA CANTÙ[2] LALA HU[3]

Abstract

In an increasingly globalized market, startups, as new ventures, face significant challenges in their internationalization process, including regulatory obstacles, cultural differences and the need to establish awareness in foreign markets. This study explores the role of accelerators and incubators in supporting startups' international expansion. Through a qualitative approach based on 11 semi-structured interviews with professionals, our findings highlight that incubators and accelerators provide startups with tailored programs for internationalization, mentorship and key resources. Specifically, accelerators facilitate rapid market entry by offering networking opportunities, investor access and training, while incubators provide long-term support to overcome cultural and regulatory barriers and develop the business plan effectively to achieve the growth stage. This study contributes to the literature by offering a novel perspective on how accelerators and incubators facilitate the internationalization process of startups, particularly offering tangible and intangible resources and fostering the development of business relationships. Finally, the findings of this research offer managerial implications for professionals and policymakers operating in the startup's ecosystem.

Framing of the research. *Nowadays, startups are no longer confined to their local markets, but they aim to expand globally to survive and stay competitive in dynamic industries (Mintz and Lilien, 2024; Olivieri and Hu, 2025). However, achieving international markets poses significant challenges, such as facing new regulatory landscapes, cultural differences and establishing business relationships with foreign actors without being known. In this scenario, accelerators and incubators emerged as key actors in addressing these challenges, offering startups tailored programs, mentorship and resources to facilitate their internationalization process (Dourado Freire et al., 2023; Runfola and Monteverde, 2023). For example, accelerators and incubators equip startups with key resources, such as insights and knowledge about the international target markets, and provide companies with specific skills, such as the ability to manage social media for marketing purposes (Hussain and Barman, 2025). Moreover, with their programs, these actors support startups in identifying funding opportunities to support their finance capacity (Paoloni and Modaffari, 2022), as well as establishing business relationships with international suppliers, partners and institutions. According to Grilli and Marzano (2023), startups located in academic accelerators are more likely to establish research and development alliances, while new ventures belonging to public accelerators are more likely to establish commercial alliances. As recently demonstrated by Pinto and Rua (2023), the development of a strong network of connections and the sharing of skills promoted by accelerators allows startups to better understand the markets they wish to penetrate: accelerators, in fact, connect entrepreneurs, investors and other international entities favoring a more credible market entry.*

Accelerator centers provide robust infrastructural support to innovative ventures (Fuad et al., 2024). Moreover, they enable information exchange among partners from different countries, thereby increasing trust (Schepis, 2021). Accelerators can also act as drivers of competition among early-stage startups (Moritz et al., 2021). Costa et al. (2024) argued that organizations such as accelerators and incubators should focus on developing an internationalization intention in their participants if their startups plan to internationalize. International entrepreneurship literature underscores that global business models hold a crucial role in firm performance and increases the resilient growth of local economies (Henn et al., 2022).

Accelerators and incubators are characterized by commonalities and differences. Accelerators relate to limited-duration programs, that support the startups entrepreneurial processes. The key resources provided by accelerators to startups involve a small amount of seed capital, co-working space, and relevant opportunities in terms of networking, educational and mentorship programs that consider a graduation event (Cohen et al., 2019). In addition, corporate accelerators are company-supported programs, characterized by limited duration, that support startups entrepreneurial process via mentoring, education and company-specific resources (Del Sarto et al., 2024; Kohaler, 2016).

In a different perspective, according to Hackett and Dilts (2004, p. 57), a business incubation center is defined as "a shared office space facility that seeks to provide its incubatees (the tenants) with a strategic, value-adding intervention system of monitoring and business assistance […] with the objective of facilitating the successful new venturing

development while simultaneously containing the cost of their potential failure […] It is a network of individuals and organizations". The value provided by incubators to new firms includes access to networks as part of their value proposition (Bibeau et al., 2024; Hansen et al., 2000). Such incubators are often located inside the Innovation Hubs or the Science Parks that support the innovation process for tenants and other actors involved in R&D projects. Incubation is considered as a model of start-up facilitation (Bruneel et al., 2012) supporting startups performance (Hou et al., 2022). Over the years, the relevance of incubators for startups' growth has been associated with the provision of specialized services to sustain the startups' time-to-market and to facilitate the entrance of startups into a network characterized by technological and commercial players (Hausberg and Korreck, 2020).

The feature that accelerators and incubators share is networking, as they facilitate interconnected business and non-business relationships with heterogeneous organizations (Pauwels et al., 2016). In particular, this feature has proven to be crucial to the internationalization process of startups, considering the sharing of resources and the development of activities enabled by organizations belonging to national and international context. Access to external resources is considered a key factor for networking, as these resources allow for complex problem solving, reduced development time and cost, commercialization and faster diffusion of innovation (Aarikka-Stenroos et al., 2017).

Purpose of the paper. *Although scholars have focused on the internationalization of startups (e.g., Costa et al., 2024; Forsberg and Hulsink, 2024; Schepis, 2021), the role of accelerators and incubators in this process remains unexplored (Pinto and Rua, 2023). Thus, this study seeks to answer the following research questions: 1. How do accelerators and incubators support startups in their internationalization process? 2. What are the resources that accelerators and incubators provide to startups?*

Methodology. *The aim of this ongoing study is to investigate how incubators and accelerators contribute to the internationalization process of startups. Considering our explorative research aim, we opted for a qualitative approach (Yin, 1994) based on semi-structured interviews with professionals operating in accelerators and startups which participated in programs offered by these accelerators (Creswell and Creswell, 2018). Although the data collection phase is still ongoing, since July 2022 we collected 11 interviews with senior managers, manager partners, heads of incubation & open innovation and other professionals with experience in supporting startups during their internationalization process. Particularly, we interviewed 6 startups operating in international markets, 3 incubators, an accelerator and a venture capital firm.*

The semi-structured interviews followed a protocol defined by the researchers based on existing literature on the topic of the internationalization of new ventures. Although the topics covered in the interviews remained unchanged, the protocol was adapted depending on the role of the key informants. In particular, the key informants operating in startups were first asked to share their professional path, then the ways in which their companies are supported in their internationalization, the role of key actors, such as suppliers, institutions and investors, and the relationships with them. Key informants working in incubators and accelerators were asked to illustrate the role of their organizations in the internationalization strategies of new businesses, focusing on the programs offered to entrepreneurs. Key informants were asked to provide concrete examples and to tell stories that happened in their organizations. Finally, the researchers asked the key informants to share any interesting information on the topic which had not emerged from the questions included in the interview protocol. The interviews were conducted between 2022 and 2024 via Microsoft Teams and lasted approximately one hour. With the consent of the key informants, the interviews were recorded and transcribed.

The interview transcripts represent the material used by researchers in the data analysis phase, together with other documents shared by key informants, such as company presentations, reports, press releases and magazine articles. All materials were analyzed with coding strategies. Specifically, the open, axial and selective coding strategy was adopted to constantly compare the data with each other (Corbin and Strauss, 1990). As the coding process continued, themes related to the research object emerged and were interpreted and discussed by the researchers according to an a priori categorization based on what emerged from the literature review.

Results. *The preliminary findings of this research highlight the key role that incubators and accelerators play in facilitating the internationalization of startups, focusing on (1) the duration of the programs offered, (2) the type of services and tangible and intangible resources provided, (3) the networking development. However, some differences also emerged in the role of incubators and accelerators.*

As regards the duration of the programs offered, accelerator programs have a limited duration and support new ventures to reach the next step, such as attracting investors with a new round of investments or entering a new market. On the contrary, incubators offer support which can last some years in their organization plus additional support in connected organizations, such as innovation hubs, adapting to the needs of the startup with the aim of promoting its growth over time. In this vein, incubators provide tutorship services, supporting entrepreneurs in business plan development and mentorship services, based on the intermediation with big corporations and SMEs belonging to Innovation hubs.

Regarding the type of services and tangible and intangible resources provided, startups that participate in these programs exhibit a significantly enhanced ability to enter foreign markets. On the one hand, accelerators provide access to a network of mentors with international expertise, investors and local partners of the target market. In addition, accelerators often offer equity investment to their startups. On the other hand, incubators provide entrepreneurs consultancy services which prepare them to face the challenges associated with internationalization, such as a better understanding of foreign markets and local regulations, as well as the adaptation of the business ola to international context. Indeed, our results reveal that incubators play a crucial role in helping startups overcome cultural, regulatory

and operational barriers, facilitating the achievement of the growth stage through networking. Moreover, accelerators offer insights, for example about international customer preferences, which are key when accessing foreign markets. With their acceleration programs, accelerators assist startups in adapting their product offerings to align with the demands of various international targets. To this end, accelerators provide key resources and skills to entrepreneurs, such as training programs for specific tools.

Finally, regarding the development of relationships with key actors, incubators and accelerators offer opportunities to startups to participate in international events, pitch to investors and establish strategic partnerships. These opportunities enhance the credibility and visibility of startups in international contexts.

Research limitations. *This study has some limitations. First, the research approach based on semi-structured interviews with a limited number of key informants limits the generalizability of the results. This study could therefore be extended through interviews with other key informants operating both in startups and in incubators and accelerators.*

Second, the internationalization process of startups has not been analyzed from a longitudinal perspective. Thus, to investigate more deeply the role of accelerators and incubators in startups' internationalization strategies, this research could in the future include longitudinal case studies which consider the role of these actors over time.

Finally, this study did not consider the characteristics of the different international markets approached by startups supported by accelerators and incubators. The research could therefore continue considering the specificities of different international contexts.

Managerial implications. *This study presents various implications for professionals and policymakers operating in the startup's ecosystem. First, findings highlight the active role played by incubators and accelerators in startups' internationalization by providing capabilities, shaping strategies and overcoming barriers to access international markets. Incubators and accelerators favor startups' internationalization offering tangible resources (e.g., infrastructure, technical support) and intangible resources (e.g., knowledge, access to networks, trust reinforcement).*
Second, as previously pointed out by Donaldson et al. (2025), our findings confirm that these actors should tailor their support based on a startup's innovation level, providing customized training, mentorship and networking opportunities. In this regard, incubation and acceleration programs can be jointly developed with policymakers. Indeed, the role of accelerators in startups' internationalization is effective only if they are part of a larger network of actors (Noronha and Pillai, 2025), which include institutions, local partners, venture capitalists, etc. startups may become less reliant on business incubators (Gao et al., 2021) due to the experience they have gained and the direct contacts and networks they have established in the market.

Originality of the paper. *Although the academic debate has addressed the issue of the internationalization of startups in recent years (e.g., Kuster and Rezende, 2022; Olivieri and Testa, 2024), there is paucity of research on the role of accelerators and incubators in supporting the access of new ventures to international markets. This study contributes to the academic debate by highlighting how accelerators and incubators intervene in the internationalization process of startups.*

In particular, the findings of this research contribute to the academic debate by offering an original perspective on the role of accelerators and incubators in the context of international entrepreneurship (Zahra & George, 2017). The data analysis shows that both incubators and accelerators play a crucial role in enabling startups to build relationships with international actors and activating tangible and intangible resources. However, the activities of accelerators and incubators in this process are different. For example, accelerators focus on accelerating relationships with investors and mentors, while incubators promote long-term business relationships and the strengthening of key capabilities for entrepreneurs. In this vein, the preliminary results of our research highlight that the phenomenon of network building should be further explored in future studies on startups' internationalization.

Key words: *accelerators, incubators, internationalization, startups, business relationships*

Between innovation and skepticism: AI's role in international strategic decisions for the food and beverage sector

BARBARA FRANCIONI[1] ALICE AIUDI[2] IZABELA KOWALIK[3]

Abstract

The expanding integration of artificial intelligence (AI) in international business strategies has transformed decision-making processes. Nevertheless, skepticism persists, particularly among small and medium-sized enterprises (SMEs). This study explores AI adoption in international strategic decision (ISD) processes, focusing on managerial resistance to AI-driven decision-making, and identifying key psychological and functional barriers. Using a card-based game methodology, it investigates two Italian SMEs operating in the food and beverage sector. Findings reveal concerns over AI's compatibility with business culture, trust in algorithmic decisions, and the perceived trade-offs between AI efficiency and human expertise. Moreover, the discussion indicates that AI is seen as a complementary tool rather than a substitute for human judgment, with significant barriers linked to digital skills, transparency, and risk perception. This study enriches the body of research in international business by shedding light on the phenomenon of AI while also underlying the factors contributing to resistance or cautious adoption of AI-driven technologies in ISDs. Furthermore, it provides practical recommendations and actionable insights for firms seeking to integrate AI into their strategic operations effectively.

Framing of the research. *Digital transformation is a key priority today, requiring firms to integrate innovative technologies to improve data management. This transformation includes many technologies and advancements that are considered state-of-the-art, such as AI, additive manufacturing, the Internet of Things (IoT), and robotic automation (Strange et al., 2022). Among these, AI has emerged as a transformative force, fundamentally reshaping decisions by overcoming human limitations (Dwivedi et al., 2021; Kumar et al., 2022).*

Extensive research has documented the multifaceted advantages of AI for businesses, including improved decision-making capabilities, enhanced competitiveness, and increased operational efficiency (Magistretti et al., 2019; Denicolai et al., 2021). In the international business (IB) context, AI holds the potential to revolutionize firms' internationalization strategies by improving market selection processes, optimizing manufacturing locations, and refining global trade policies (OECD, 2022). As firms face the complexities of global competition, understanding the role of AI in shaping international strategic decisions (ISDs) becomes imperative. AI alters traditional paradigms, equipping firms with new tools to gain a competitive advantage in global markets (Feliciano-Cestero et al., 2023).

One particularly critical ISD that AI can influence is International Market Selection (IMS), a strategic decision process through which firms identify and prioritize foreign markets for expansion (Francioni et al., 2015). The literature has long recognized IMS' role in determining the success of strategic performance and IB operations (Brouthers et al., 2009; Martín Martín et al., 2022). Given the complexities of evaluating foreign market opportunities (He et al., 2016), selecting the wrong markets can result in substantial losses and missed opportunities, underscoring the need for methodical, and data-driven decision-making (Papadopoulos & Martín Martín, 2011). Other ISDs linked to IMS include the entry mode choice (Francioni et al., 2015), the selection of market segments and key international partners, such as distributors, suppliers, and customers.

Prior studies have explored the application of AI in international decision-making, such as Fish (2006) employing Kohonen Self-Organizing Maps to facilitate market selection. More recently, the capabilities of large language models, such as ChatGPT, have demonstrated potential in identifying optimal foreign markets for new product launches and clustering international markets based on shared attributes. These advancements suggest that AI could catalyze accelerating firms' global expansion efforts. By leveraging AI-driven analytics, firms, particularly small and medium-sized enterprises (SMEs) that often lack formal internationalization strategies (Vissak & Francioni, 2013; Musso & Francioni, 2014), can identify high-potential markets with greater precision.

However, despite its promising potential, technical and organizational barriers persist, such as AI complexity and data quality concerns (Paschen et al., 2020). Moreover, a critical gap exists in understanding the psychological and

DOI 10.7433/SRECP.SP.2025.01

organizational factors that shape AI adoption for ISDs. The extant literature primarily focuses on AI's technical capabilities and economic benefits, while little attention has been paid to the underlying managerial attitudes influencing AI adoption decisions. Indeed, a crucial impediment to AI adoption lies in decision-makers' attitudes, specifically, their confidence or skepticism regarding AI-driven decision-making. While some executives recognize AI's strategic value, others hesitate to delegate critical business decisions to algorithms. The phenomenon of algorithmic aversion has been widely studied in behavioral research, yet its implications for managerial decision-making in IB remain underexplored (Mahmud et al., 2023). In particular, the Innovation Resistance Theory (IRT) is the most used in resistance literature (Talwar et al., 2023), reflecting this reluctance to use algorithms. One of the key benefits of IRT is its comprehensive approach to categorizing adoption barriers to innovations, which is divided into functional and psychological categories (Mahmud et al., 2023). Specifically, functional barriers, such as those pertaining to usage, value, and risk, arise when individuals perceive a significant shift due to the adoption of innovation. Psychological barriers arise when people's preexisting beliefs clash with the adoption of innovations and are related to tradition and image (Arif et al., 2020; Kushwah et al., 2019; Ram and Sheth, 1989). IRT is used in this perspective to investigate the relationships between perceived obstacles and algorithm aversion (Lindebaum et al., 2020), offering a strong analytical lens that helps explain why people reject innovations (Kushwah et al., 2019). Notably, while IRT has been employed in consumer and innovation adoption contexts, its application to ISDs and specifically to AI resistance within them remains underexplored. This study fills this gap by explicitly using IRT to interpret managerial reluctance in adopting AI for ISDs, distinguishing it from existing models that focus primarily on technical or economic factors. Through this approach, the paper connects AI resistance to deeper psychological and organizational dynamics, offering a novel framework for IB scholars. To the author's knowledge, no previous study applied the IRT in the context of AI adoption for ISDs.

Purpose of the paper. *Based on the above, this paper aims to examine the adoption of AI as a transformative tool in international business strategies, particularly emphasizing its role in supporting ISDs. By addressing the dimensions and gaps identified, the study primarily seeks to explore the sources of resistance and skepticism in decision-makers involved in internationalization decisions hindering AI adoption. To achieve this, focusing on SMEs, the study leverages IRT as a framework to analyze the factors contributing to such resistance in the internationalization context, including infrastructural and organizational challenges (Paschen et al., 2020). Ultimately, this research offers recommendations to help organizations overcome resistance to AI adoption and guarantee better alignment across different organizational levels. By addressing these barriers, the study aims to support the integration of AI technologies into IB strategies.*

Methodology. *This study adopts the card-based game method as the primary research approach because it has gained recognition for facilitating structured yet flexible discussions, proving particularly effective in eliciting insights from participants by engaging them in interactive situations (Müthel & Saunders, 2008). Specifically, this methodology enables the integration of semi-structured interviews within a dynamic framework that encourages active participation and reflection among participants (Rowley et al., 2012). Unlike traditional interview methods, this approach promotes deeper engagement by using visual and tactile elements (cards representing key concepts, challenges, and opportunities) which enhance discussion and stimulate creativity. Moreover, the method's versatility in addressing multi-criteria decision-making scenarios is particularly relevant to this study. It enables participants to evaluate trade-offs between competing priorities, such as perceived benefits versus risks of AI adoption. By leveraging this method, the paper aims to uncover detailed insights into how AI can support ISDs like IMS while addressing organizational barriers to its implementation.*

The interview scenario was designed to systematically capture the strategic decision-making processes of firms concerning AI adoption and internationalization. A semi-structured interview framework incorporated open-ended and scaled-response questions to balance qualitative insights with quantifiable data. The interview was divided into key thematic sections, including company background, internationalization strategies, AI adoption, and the structured card-based game to assess barriers and drivers of AI implementation in strategic decisions. The conception of the cards started with a priori categorization, creating cards and categories based on the literature, following a deductive approach (Miles et al., 2014). In the following step, the category set was enriched and complemented with some concepts that spontaneously appeared during the interviews, thus adopting a mixed inductive-deductive approach (Müthel & Saunders, 2008). The cards showed and represented factors influencing AI adoption, and they were elaborated on and created through the themes identified by the IRT framework and other barriers and skepticism sources highlighted in the literature. The card game served as an interactive component, prompting respondents to categorize and prioritize perceived challenges and enablers of AI integration, especially concerning ISDs. For this reason, cards showing a specific ISD were also given during the interview, and participants were asked to physically connect these cards through arrows to demonstrate their priorities and connections visually. The concepts laid down by participants formed conceptual maps. Other empty cards were finally given so participants could use the inductive approach to generate novel concepts and ideas. The main cards used are represented in Table 1.

The study examined two case studies within Italy's food and beverage. This sector was selected due to its economic significance since the food industry represents the second most important one of Italian economy, making Italy the 10th exporter in the world (Caiazza & Volpe, 2014). The semi-structured interviews and the card-game sessions were conducted with the key decision-makers in ISDs from each SME. Participants include the export managers of the companies, who are responsible for making internationalization decisions. The names of the companies are labelled as Firm A and Firm B for confidentiality reasons.

Tab. 1: Cards used in the interview scenario

Aversion to Change	Cost Perception	Cultural and Ethical Alignment	Data Privacy Concerns	Digital Skills Barriers
Fear of Job Displacement	Image and Reputation Attachment	Integration with Human Expertise	Interoperability Problems	Levels of Transparency of AI technologies
Levels of Trust in AI	Perceived Effectiveness	Tradition Attachment	Risk Barrier	Usage Barrier
Value Barrier	Entry Mode Choice	International Market Selection	Partners Selection	Segment Selection

Results. *The qualitative data from the card-based game methodology highlight key patterns in internationalization strategies, AI adoption barriers, and attitudes toward digital transformation. Both companies demonstrate proactive and reactive internationalization strategies, with market selection and entry mode choices driven by a mix of structured decisions and emergent opportunities. In line with previous SME internationalization research (Vissak & Francioni, 2013; Musso & Francioni, 2014), neither firm follows a rigid, data-driven market selection process. Instead, decisions are based on networks, trade fairs, and demand signals from foreign distributors and customers. In this sense, firm A relies heavily on local distributors, leveraging their expertise to facilitate international expansion without direct market presence. Conversely, firm B has experimented with direct sales and e-commerce, even though its primary focus remains building trusted partnerships through selective engagement with key buyers. This is confirmed by Schweizer (2015), reporting that instead of using logical calculations, decision-makers act emotionally and focus on affordable loss, and Sarasvathy (2001) affirming that SMEs lack the resources and knowledge necessary to make them adopt a causal logic and therefore, they apply effectual logic, guiding managers' decisions under specific conditions where resources cannot be easily acquired and therefore, they proceed through experimentations.*

Concerning the AI topic, a key emergent theme across both cases is the coexistence of curiosity and skepticism towards the tools. While firm A demonstrates a greater degree of skepticism, rooted in reliance on traditional business relationships and artisanal expertise, firm B exhibits a more exploratory attitude, particularly in leveraging AI for communication and content creation. Neither firm systematically integrates AI into core strategic decision-making processes such as IMS, entry mode selection, or partner evaluation. In general, the skepticism surrounding AI adoption in this respect is linked to multiple factors.

First, there is a lack of internal competencies. Both firms indeed cite limited in-house AI expertise as a primary barrier. While large multinational corporations have dedicated data analytics teams (Meltzer, 2018), SMEs often lack the resources or technical skills to integrate AI-driven decision-making fully. This echoes previous findings on digital transformation challenges in SMEs (Paschen et al., 2020).

Second, there is a substantial misalignment between business culture and ethics: AI adoption is perceived as potentially incompatible with company culture, particularly for firms like firm A, where product quality and human relationships are central to the business model. This sentiment aligns with studies on algorithm aversion in managerial decision-making (Mahmud et al., 2023), where decision-makers prefer human intuition over AI-generated recommendations, particularly in high-stakes business contexts. Moreover, there is a spread feeling of uncertain cost-benefit perception. Both firms express concern over the perceived costs versus tangible benefits of AI implementation. While larger companies can justify AI investments through economies of scale, SMEs often find it challenging to see a clear return on investment. Consequently, AI is perceived more as a supplementary tool for operational tasks (e.g., marketing, translation, data processing) rather than as a transformative driver of strategic decision-making. Interestingly, while AI is met with cautious optimism for enhancing efficiency, its role in creative and intuitive aspects of decision-making remains contested. Firm A's experience with AI-generated content (e.g., product descriptions and label designs) reflects a broader concern regarding AI's inability to capture brand identity and cultural nuances. Similarly, firm B acknowledges AI's potential in information processing but remains hesitant about its reliability in market intelligence and customer engagement strategies.

Specifically, during the card-based game, both companies identified key sources of skepticism and barriers to the adoption of AI in their ISDs. Their responses highlighted distinct yet overlapping concerns, particularly regarding IMS, EMS, and broader internationalization strategies. In firm B, the export manager emphasized how the perceived cost of AI adoption and its misalignment with company culture and ethics created hesitation in integrating AI into IMS. The company, operating in the agri-food sector, relies on deeply relational and experiential market expansion strategies, making it difficult to imagine AI as a replacement for the intuitive and trust-based process of entering new markets. The manager also expressed concerns about AI's compatibility with human expertise in EMS, particularly in areas where tacit knowledge, interpersonal connections, and adaptive decision-making play a fundamental role. Furthermore, the fear that AI could eventually displace specific professional roles, particularly in market scouting and internationalization planning, added another layer of skepticism. When discussing partner selection and segment selection, the respondent did not explicitly associate specific AI skepticism categories with these phases but did raise broader concerns about the digital skill gap, transparency and trust issues, and risk perception, suggesting that the company lacks the internal knowledge to use AI effectively and remains doubtful about the reliability of algorithmic recommendations for evaluating new markets or foreign partners. Unlike firm B, firm A took a more integrated approach, considering AI-related skepticism as a challenge affecting all internationalization strategies rather than distinguishing between specific choices. The respondent highlighted interconnected barriers to AI adoption, including a lack of digital skills within the company,

skepticism about AI's efficiency, and concerns about implementation costs. He also emphasized how AI's incompatibility with human expertise and business processes created a significant limitation, particularly in a company where international growth is built on long-term relationships, artisanal expertise, and brand authenticity. Additionally, he expressed a strong perception of risk, worrying that reliance on AI-generated insights could lead to market miscalculations or poor partner selection, further reinforcing the company's preference for experience-driven, adaptive decision-making over data-driven automation.

These findings align strongly with the IRT framework. Functional barriers such as "cost perception", "usage barrier," and "risk barrier" were evident across both firms, illustrating how practical limitations hinder AI adoption in strategic decisions. Alongside these, psychological barriers, particularly "adherence to tradition", "concern for image and reputation" and "misalignment with culture and ethics" emerged as critical factors in shaping managerial resistance, revealing how deep-seated cultural values and identity concerns further compound the hesitation toward AI-driven decision-making.

Furthermore, in this wave, participants also highlighted new themes and wrote on the empty cards (thus following the inductive approach) pointing out new barriers or elements that might hinder the implementation of AI tools in ISDs. Specifically, both firms explicitly identified human-related elements as key barriers to AI adoption, even with different emphases. Firm A, on the one hand, pointed to "human sensibility" as a fundamental reason for resisting AI-based decision-making in international expansion strategies. The firm's identity is strongly rooted in craftsmanship, tradition, and artisanal production, making the adoption of AI for strategic decision-making seem antithetical to the company's core values. AI-generated recommendations, particularly in branding, market selection, and partner evaluation, are perceived as lacking the understanding that human intuition and experience provide.

On the other hand, firm B raised concerns regarding the general "human component", arguing that the firm's commercialization and internationalization processes rely on relationships and tacit knowledge. In this view, AI cannot replace the social and relational aspects inherent in business negotiations, customer acquisition, and partner selection. The manager emphasized that their export market success depends on product quality and the ability to communicate its value through direct interactions, which AI is not currently perceived as capable of replicating. This resistance to AI due to human-centered concerns aligns with broader discussions in algorithm aversion literature (Mahmud et al., 2023), where decision-makers in highly relational industries often prefer human judgment over algorithmic processing, particularly in domains that involve subjective assessments and trust-based relationships. The emerged inductive themes further reinforce IRT's utility in capturing non-technical dimensions of resistance, extending its application to the field of strategic decisions.

The skepticism toward AI-driven ISD appears to be deeply embedded in the food and beverage sector's characteristics. Unlike industries where data-driven decision-making is dominant (e.g., finance, logistics, and e-commerce), relationships strongly influence internationalization in food and beverage SMEs. These findings suggest that AI adoption in IB strategies may not be a one-size-fits-all approach. Sectors characterized by important levels of human interaction, sensory engagement, and brand heritage, such as food and beverage, are more likely to resist full AI automation in decision-making processes. This perspective aligns with previous research on sectoral differences in digital transformation (Kutnjak et al., 2019), where AI implementation is more readily embraced in data-driven and automation-intensive industries than in culture-dependent sectors. Despite AI's advanced analytical capabilities, experienced managers retain ultimate decision-making authority, relying on relational trust, tacit knowledge, and iterative learning to navigate international markets. This reflects a broader trend in IB research, where decision-makers favor AI as a support tool rather than a substitute for human expertise (Jarrahi, 2018).

Both cases demonstrate that AI adoption in internationalization processes is not merely a technological issue but a deeply embedded organizational and cultural challenge, especially in food and beverage, where authenticity, human interaction, and adaptive decision-making play a central role. While both firms acknowledge AI's potential to improve operational efficiency, their decision-makers remain skeptical about its capacity to support highly risky strategic decisions, particularly in areas where human factors still shape the market selection, entry modes, and partner engagement. These findings align with broader discussions on AI adoption in SMEs, reinforcing that sectors characterized by high relational intensity and strong cultural heritage may exhibit greater resistance to AI-driven decision-making than industries where data analytics and automation play a more central role in strategic planning.

Research limitations. *Despite the insights the study provided into the intersection of AI adoption and strategic decisions in SMEs within the food and beverage sector, several limitations should be acknowledged. First, the research is based on two case studies, which, while offering rich qualitative depth, limit the generalizability of the findings to a broader population of SMEs. Moreover, the food and beverage industry presents unique sectoral characteristics, such as a strong firm reliance on tradition, sensory-based consumer preferences, and relationship-driven market expansion, which may not entirely represent other industries where AI adoption is more prevalent. Additionally, another limitation stems from the rapidly evolving nature of AI technology. Furthermore, given that AI capabilities and applications continue to advance at a rapid pace, the conclusions of the study might not be applicable for very long. Lastly, while the analysis, including international decision-makers, provides a comprehensive view, it may not fully capture the perspectives of all stakeholders involved in AI adoption decisions, such as external consultants or even the intermediaries adopted by SMEs for their export activities. Moreover, since the study is based in Italy, its findings may have limited applicability and generalizability to other contexts. These limitations should be considered when interpreting the results and could serve as starting points for future research in this domain.*

Managerial implications. *The findings of this study suggest that AI adoption in ISD requires a balanced, tailored approach. Rather than replacing human expertise, AI should serve as a supportive tool, enhancing efficiency while respecting the intuitive and relational nature of decision-making in SMEs, especially in food and beverage. Managers must bridge the digital literacy gap, ensuring that employees understand AI's capabilities and limitations. Without it, skepticism persists, preventing firms from leveraging AI's potential. A significant barrier to AI adoption is its perceived misalignment with business culture. AI is often seen as incompatible in industries where trust, craftsmanship, and relationships define success. To overcome this, firms must gradually integrate AI, first applying it to low-risk tasks such as data analysis and trend forecasting before expanding its role in ISD. This allows managers to test AI's value while controlling high-stakes decisions. Another key challenge is the uncertain perception of AI's cost-benefit ratio. Unlike large companies, SMEs find it difficult to justify AI implementation without clear and immediate returns. Policymakers and industry associations should support SMEs by providing financial incentives, training programs, and access to affordable AI solutions. Given industry's emphasis on human relationships and brand authenticity, AI must be implemented to complement these values rather than undermine them. Beyond operational efficiency, managers should reimagine AI to amplify human capabilities rather than automate intuition. AI-driven insights could serve as a "second opinion" mechanism, helping leaders challenge their biases and refine their strategic decisions without feeling displaced by technology. AI could enhance storytelling, personalize customer engagement, and strengthen international branding efforts in sectors like food and beverage, where narrative and heritage are competitive advantages. Additionally, AI can play a transformative role in international negotiations and partner selection, identifying trust signals in global markets that human intuition alone may overlook. By combining AI-driven data with experiential knowledge, managers can navigate international expansion with greater precision, ensuring that technology supports rather than disrupts the art of deal-making. In this way, by gradually integrating AI, enhancing a culture of experimentation, and maintaining human expertise at the core of decision-making, SMEs can harness AI's potential without compromising relational strengths.*

Originality of the paper. *The originality of this study lies in its sector-specific focus on AI adoption in ISD in the food and beverage industry. In this sector, digital transformation is often met with skepticism due to its reliance on craftsmanship, relational trust, and cultural heritage. While much of the existing research on AI adoption has concentrated on large companies, this paper focuses on SMEs operating in a relational context, offering a fresh perspective on how AI fits into traditional business models. One of the key contributions of this study is its application of IRT as a framework in creating the cards used during the interview with the case studies to explain the psychological and functional barriers that hinder AI adoption in ISD. While previous literature has explored AI's technical capabilities and economic benefits, little attention has been paid to why decision-makers resist AI despite its potential advantages. This study fills this gap by showing that algorithm aversion is not just a technical concern but is also deeply rooted in organizational culture, trust, and human intuition. Another novel element is the card-based game methodology applied during the interviews. It provides a more interactive and engaging way to capture managerial attitudes and behavioral dynamics surrounding AI adoption. Unlike traditional surveys or structured interviews, this method allows for a more nuanced exploration of decision-making factors, uncovering implicit concerns that might not emerge through conventional data collection techniques. This methodological innovation enhances the depth of insight into how AI is perceived, debated, and prioritized by decision-makers in SMEs. This study also contributes to IB literature by highlighting that AI adoption is not uniform across industries. While data-driven sectors often embrace AI for automation and efficiency, SMEs in relationship-intensive industries like food and beverage are more resistant due to their reliance on tacit knowledge, brand authenticity, and personal relationships in internationalization strategies. The inductive approach used also allows for the identification of the new cards and themes especially highlighting the "human" centrality within the ISDs, showing a specific connotation of both "sensibility" and "human component" as a whole concept. These findings suggest that AI implementation in such sectors must be adapted to respect these unique characteristics, reinforcing the idea that AI should complement rather than replace human expertise. By addressing these dimensions, this paper enhances academic discussions and practical applications in AI and IB, underscoring that AI adoption is not a one-size-fits-all process and that its success depends on a gradual, context-sensitive, and strategically aligned approach. This study provides actionable insights for managers and policymakers on navigating digital transformation while maintaining the human-centric strengths that define competitive advantage in traditional industries.*

Corruption as a Tool in International Business: Conflicting Strategies at Company and Country Level

SERGIO ERNESTO VALENTINI[1]

Abstract

In the era of sustainable globalization and digital transformation, international marketing is increasingly called upon to align with ethical standards and societal expectations. However, a systemic threat persists beneath this imperative: corruption. This paper interrogates the underexplored role of corruption not as a random failure or external constraint, but as a ***deliberate, internalized strategy*** *within global marketing practices. It posits that in high-stakes sectors-where procurement opacity, competitive pressure, and institutional weaknesses converge-corruption operates as a "fifth P" in the marketing mix: Payoff.*

Drawing on interdisciplinary literature and an original cluster analysis of 16 European countries across four major indices (Transparency International CPI, Basel AML Index, World Justice Project Rule of Law, and Eurobarometer), this study identifies discrepancies between expert assessments and public trust. It demonstrates that corporate corruption is not merely a by-product of weak governance but often embedded in marketing strategies used to gain market access, influence decisions, and outcompete rivals. The findings reveal that marketing and compliance operate in tension-one rewarding performance, the other enforcing legality-creating fertile ground for unethical conduct.

The paper advocates a transformative view of marketing-beyond communication and compliance-toward a proactive role in ethical risk governance and institutional accountability. It contributes to the sustainability discourse by linking corruption to reputational, economic, and social risks, proposing new metrics and models for recognizing, measuring, and managing corruption as a strategic variable.

Ultimately, it calls for a renewed scholarly and managerial lens that frames corruption not as a peripheral anomaly, but as a core challenge for responsible internationalization, requiring structural reform, educational innovation, and systemic scrutiny. Marketing can and must lead-not merely follow-in restoring trust and fairness in global commerce.

Framing of the research. *Strategic Corruption as the Silent Partner in Global Marketing*

Literature Review: Corruption in International Marketing

Corruption integration within marketing literature is underdeveloped. Lambsdorff (2007) and Rose-Ackerman (1999) have laid foundational work on corruption's economic impact, yet its function as a marketing strategy is less frequently explored. Managerial Complicity and Organizational Culture are another overlooked determinant in bribing behaviours. Corruption is rarely the work of rogue individuals. As argued in Clegg et al. (2007) and Crane & Matten (2016), management is not ethically neutral. Ethics-based marketing literature calls for compliance, transparency, and corporate governance reform (Kotler & Lee, 2005), yet there's growing recognition that ethics alone cannot counter corruption when it is structurally embedded in marketing ecosystems, particularly in public procurement-heavy sectors and the gap between ethical marketing theory and real-world business conduct persists.

As Uhlenbruck et al. (2006) and Martin et al. (2009) show, bribery can evolve into an entrenched marketing strategy used to overcome market entry barriers, influence regulators, or manipulate competitors. Spencer and Gomez (2011) refer to this as the "grey market advantage", where firms internalize bribery costs into competitive pricing models. While most executives would never publicly admit to these tactics, their effectiveness in securing contracts and market dominance makes them hard to ignore. The long-term consequences-legal penalties, reputational damage, consumer backlash-are devastating (Schlegelmilch & Öberseder, 2010).

Ethics and corruption are embedded in business practice, not just abstract principles (Clegg et sal., 2007) and global corporations operate across diverse ethical standards (Crane and Matten, 2016).

Research frames corruption as a market entry tool, especially in regions with weak institutions (Sartor & Beamish, 2014). Firms use bribery not just to expedite bureaucracy, but to directly manipulate demand, gain shelf space, secure distribution rights, and outmanoeuvre competition (Martin et al., 2007). The concept of the "grey market advantage" has emerged to describe firms that internalize bribery costs as part of competitive pricing models (Spencer & Gomez, 2011).

The current focus on "Country-Level" Corruption is inconsistent with hard realities: it has strong limitations when focusing too much on country-level perception (Kaufmann et al. 2010). Critiques exist on simplistic national corruption explanations, and Husted (1999) introduced cultural and business-system variables to explain the interlocking of wealth

DOI 10.7433/SRECP.SP.2025.01

generation, cultural propensity, and corruption behaviour. Alysandratos et al. (2024) demonstrated that taking a bribe is considered less acceptable than offering one, thus swaying the ethical balance in favour of the richer (the corruptor) against the poorer (the corrupted) and in general people hold nationality based inaccurate stereotypes regarding the propensity to accept bribes (Dorrough et al. 2023). This raises the problem of national stereotypes regarding who is more likely to offer or accept bribes-biases that misdirect anti-corruption policies and dilute accountability.

Companies in high-stakes sectors are vulnerable to corruption pressures, particularly and often times the marketing function coexists in tension with compliance-one incentivized by results, the other by rules (Clarke and Xu, 2002). As we mentioned earlier on, certain sectors are especially vulnerable to corrupt marketing practices, and at public level and institutional blind spots also exist.

Illegal marketing exists, and it goes by a name most scholars prefer to ignore-corruption. It operates as a "below-the-line" activity, an iceberg lurking beneath the visible strategies of multinational firms, especially in sectors like defence, pharmaceuticals, public contracts, automotive and infrastructure. Despite its central role in global competition, corruption remains the elephant in the room of marketing scholarship. Corruption is an aspect of marketing that no one wants to acknowledge-because no one can explain why a firm truly wins a contract when the decisive advantage is an untraceable, morally and legally unacceptable activity: bribing. Businesses thrive on secrets-proprietary know-how, patented processes, competitive pricing, and private client data-corruption is the dirtiest secret of all. Corruption is often mischaracterized as merely a public sector issue or a problem confined to specific countries, while it is fundamentally a people's problem-rooted in individual behaviour and organizational culture. It transcends borders and institutional types, manifesting as a strategic tool wielded by both public servants and corporate executives alike. Public corruption is not just a failure of governance-it is enacted by people against their own organizations. By contrast, in the corporate world, corruption becomes a calculated mechanism for gaining unfair competitive advantages for individuals (either as money taking bribes or enhancing performance for career and advancement purposes) and for the companies themselves. Corruption must be recognized not as a set of isolated incidents, but as a systemic issue that deeply market access or favourable terms. These actions are not peripheral-they are embedded within the strategic marketing playbook, disguised through intermediaries, inflated "consulting" fees, structuring of contracts that accommodate under-the-table agreements, or extravagant promotional campaigns. Thus, corruption becomes a structural element of international business strategy, not merely a moral lapse or legal anomaly. In this context, corruption is not always overt. It is often embedded within the strategic marketing and business development processes-ranging from the selection of local intermediaries to sponsorship of state-linked entities or the. Corruption is often a structural component of how international marketing strategies are conceived and executed: a form of illegal international marketing deserving to be studied and measured like any other market force. In industries where contracts are often worth billions and involve complex transnational stakeholders, the incentives for unethical practices are high. Enormous financial stakes, long project timelines, and opaque regulatory frameworks converge, make them fertile ground for unethical conduct. Companies vying for competitive advantage may resort to bribery, influence-peddling, or opaque lobbying .

This pervasive dynamic is captured by the notion of strategic corruption--the deliberate use of unethical or illegal practices as a calculated tool to gain and maintain for competitive positioning, market penetration and business advantage. This is corruption as deliberate policy, embedded within broader corporate strategies. Marketing plays a hidden yet critical role in enabling or countering this strategy. It becomes a tool not only for creating brand equity but also for concealing the less savoury dimensions of international expansion. Marketing can act as a smokescreen, obscuring corrupt dealings behind layers of branding, CSR initiatives, and misleading public narrative and scrutiny. The impact of corruption on sustainability is threefold: economical, environmental and societal. Economic sustainability is jeopardized by corruption practices as they expose private companies to substantial economic risks: the penalties for corruption range include financial fines, exclusion from entire markets, all the way to receivership and leading to the closing of the company themselves. Overlooking the threat to company's very existence posed by indulging in corruption practices may therefore be a very costly exercise. Companies often take advantage of their international operations to behave irresponsibly as regards the economic, environmental and social impacts of their activities, instead of pursuing forms of sustainable internationalization (Valentini, 2003).

Marketing holds also the power to shine a light on corruption, foster transparency, and champion ethical business conduct. When aligned with corporate integrity and societal accountability, marketing can serve as a tool for transformation-shaping both public opinion and organizational behaviour toward ethical norms.

This dual role-either complicit or reformative-places marketing at the centre of the debate over corruption and ethical conduct in international business. Corruption may help a company achieve short-term growth, win contracts, or enter restricted markets, but it simultaneously undermines public trust, distorts fair competition, weakens democratic institutions undermines, and perpetuates inequality. This contradiction places marketing at a critical crossroads. The tension between business gains and societal harms is not merely an ethical dilemma but a structural one, revealing the fractures between profit-driven logic and the principles of fairness, accountability, and sustainability. Marketing professionals, compliance officers, senior executives all find themselves navigating this tension daily. Their decisions ripple across not only their organizations but also the societies in which they operate, in boardrooms, advertising campaigns, and stakeholder engagement strategies every day.

Corruption is not confined to the domains of marketing or compliance. It is a deeply transversal issue that cuts across sociology, political economy, legal studies, and business ethics. The funds spent are company resources-strategically

allocated by senior executives, including CEOs, and integrated into organizational budgets and marketing plans. These activities are seldom disclosed, making them invisible and hard to measure, yet they follow deliberate strategies like any other form of market investment.

Private sector corruption often blends personal and corporate benefit under the guise of competitive necessity. This is not merely unethical; it is illegal-and yet it is frequently tolerated when the payoff is short-term profit. When state-owned enterprises (SOEs) or multinational corporations use extraterritorial marketing bribes to win contracts in poorer nations, the moral and legal implications are immense. Despite this, the marketing field remains largely unaware of the extraterritorial dimensions of corruption.

Purpose of the paper. *This study aims to fill a critical gap in both academic literature and practical understanding by exploring how corruption-particularly in the private sector and within international marketing-is currently measured. While corruption is often described as immeasurable or intangible, a variety of indices, rankings, and qualitative tools have been developed over the years to capture its prevalence. These methodologies often differ in scope, assumptions, and cultural sensitivity-leading to inconsistent or even contradictory representations of the same environments but hold similar views and results. What is missing is a comparative, critical assessment that evaluates how these indices converge or diverge in measuring private-sector corruption across different countries, sectors, and regulatory contexts. We examine these methodologies, seeking points of overlap and divergence. In doing so, it seeks to go beyond broad national characterizations while acknowledging that the reality of corruption is not neatly captured by quantitative data alone.*

Ultimately, this inquiry aspires to lay the groundwork for a more nuanced, multidimensional, and globally relevant approach to the study of corruption in business. It contributes to ongoing debates in marketing, compliance, sociology, international law, and business ethics, arguing that corruption must be treated not as a moral outlier but as a mainstream business strategy that demands systemic scrutiny. In doing so, it invites scholars, practitioners, and policymakers to shift their focus: from a narrow obsession with national reputations to a broader, more incisive analysis of how organizations operate, compete, and often succeed through illicit means.

Methodology. *Cluster Analysis of European Corruption Indices*

We carried out a data-driven cluster analysis of European countries based on multiple corruption and governance indices, aiming to highlight misalignments between expert evaluations and public perception.

The analysis used the following indices:

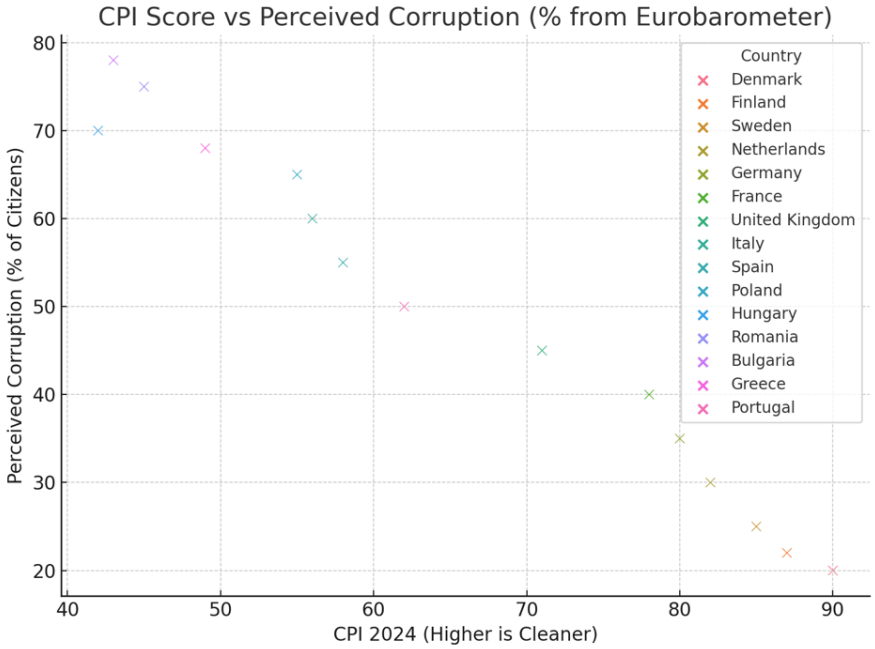
- *Transparency International Corruption Perceptions Index (CPI 2024)*
- *Basel Institute Anti-Money Laundering Index (Basel AML 2024)*
- *World Justice Project Rule of Law Index (2023)*
- *Eurobarometer 2024 Special Survey 548 on Corruption (Public Perception)*

Transparency International Corruption Perceptions Index (CPI) focuses on public sector corruption capturing perceived levels of corruption in the public sector within a country

Basel AML Index measures the risk of money laundering and related financial crimes in countries and jurisdictions around the world, with a composite methodology.

World Justice Project Rule of Law Index: focuses on how laws are applied, a complementary perspective to perception-based indices

Special Eurobarometer 523 Survey on Corruption measured the public citizen perception and trust toward institutions and companies.



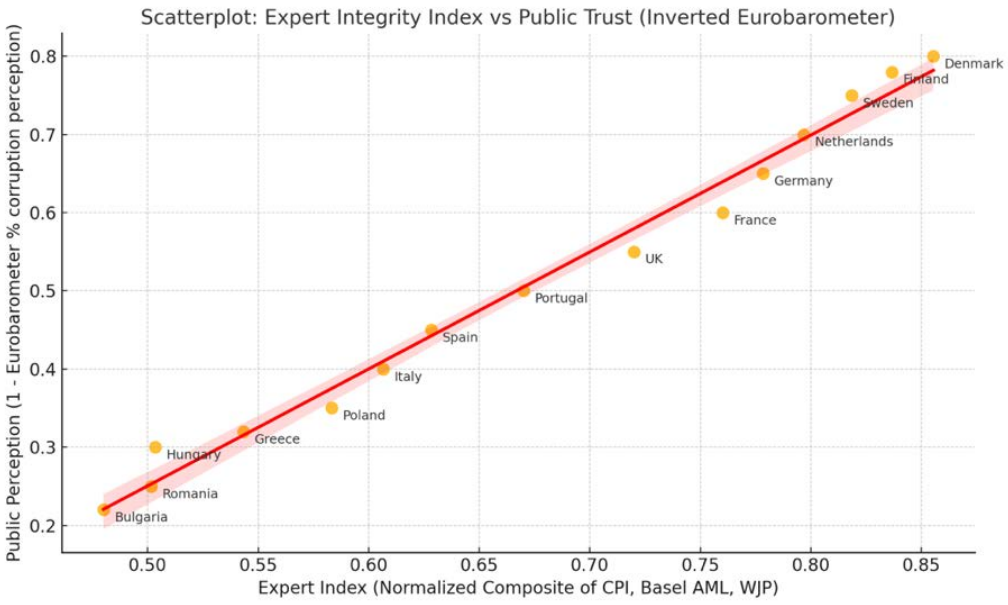
Normalized values were computed for all metrics, and a discrepancy index was calculated to measure the gap between expert assessments and public trust.

Results. *Comparative Corruption & Governance Dataset (Europe)*

Country	CPI 2024 Score	Basel AML Index 2024 Score	WJP Rule of Law Index 2023 Score	Eurobarometer 2024: % Who Believe Corruption is Widespread
Denmark	90	2.24	0.89	20%
Finland	87	2.30	0.87	22%
Sweden	85	2.45	0.85	25%
Netherlands	82	2.60	0.83	30%
Germany	80	2.75	0.81	35%
France	78	2.90	0.79	40%
United Kingdom	71	3.10	0.76	45%
Italy	56	4.20	0.68	60%
Spain	58	3.95	0.70	55%
Poland	55	4.50	0.65	65%
Hungary	42	5.10	0.60	70%
Romania	45	5.25	0.58	75%
Bulgaria	43	5.40	0.55	78%
Greece	49	4.80	0.62	68%
Portugal	62	3.50	0.74	50%

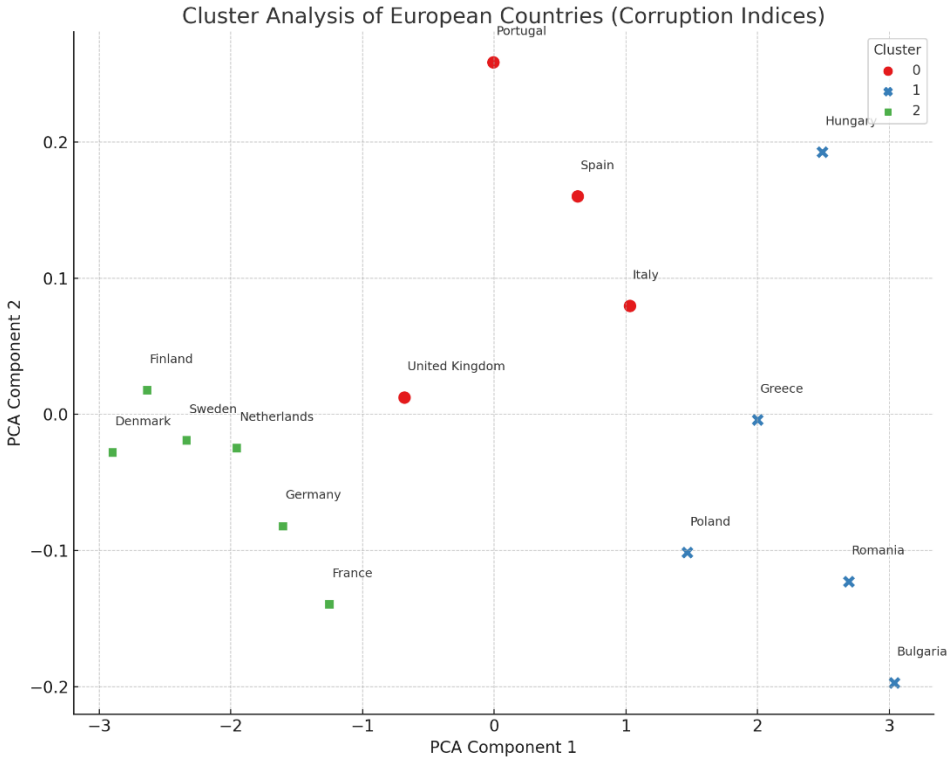
CPI scores range from 0 (highly corrupt) to 100 (very clean). Basel AML Index scores range from 0 (low risk) to 10 (high risk). WJP Rule of Law Index scores range from 0 (lowest adherence to rule of law) to 1 (highest adherence). Eurobarometer percentages represent the proportion of citizens who believe corruption is widespread in their country.

Chart 1: CPI SCORE VERSUS PERCEIVED CITIZEN CORRUPTION



- *X-axis: Transparency International's CPI 2024 (higher = cleaner public institutions).*
- *Y-axis: Eurobarometer's % of people who think corruption is widespread (higher = more public concern).*

Next, a Discrepancy Index was computed, to enable visualization of discrepancies.
To analyze country discrepancies among the four indices the following methodology was used:
Normalization of All Indices
Scaling of each index between 0 and 1(inverting where higher scores mean more corruption)
Computing of a "Discrepancy Index" for each country as follows:



- *Discrepancy = Avg(Expert Indices) - Public Perception*
- *Expert Indices = average of normalized CPI, Basel AML (inverted), and WJP.*
- *Public Perception = inverted Eurobarometer (1 - corruption widespread %).*

Chart 2: EXPERT ASSESSMENT INDEX VS. PUBLIC TRUST

Here's a cluster visualization based on governance and corruption indices using PCA, grouping countries are grouped into three clusters based on CPI (Corruption Perceptions Index), Basel AML Index (inverted), World Justice Project Rule of Law Index and Eurobarometer perception of corruption (inverted). Each marker represents a country, and proximity indicates similar governance/perception profiles. Cluster differences might reveal High performers with aligned expert and public trust, Reputational gaps (high performance, low trust) and Underperforming systems with public awareness or denial.

Chart 3: COUNTRY SCATTERPLOT

Countries were clustered in groups:

- *Aligned reputations (high trust, high performance)*
- *Undervalued countries (low trust, high performance)*
- *Overvalued countries (high trust, weak governance)*
- *Systemically weak (low trust, low performance)*

Cluster Profiles

Cluster 0 - Mixed Integrity with Moderate Trust Gap

- *Countries: United Kingdom, Italy, Spain, Portugal*
- *Profile:*
  - *Avg CPI: 61.8 (moderate)*
  - *Avg Basel AML: 3.69*
  - *Avg Rule of Law: 0.72*
  - *Avg Public Perception of Corruption: 52.5%*

Insight: These countries exhibit moderately strong governance indicators but suffer from higher public skepticism. This trust gap may reflect ongoing reputational legacies or internal inconsistencies between policy and enforcement. Marketing efforts in these countries must navigate public distrust while showcasing real reforms and transparency.

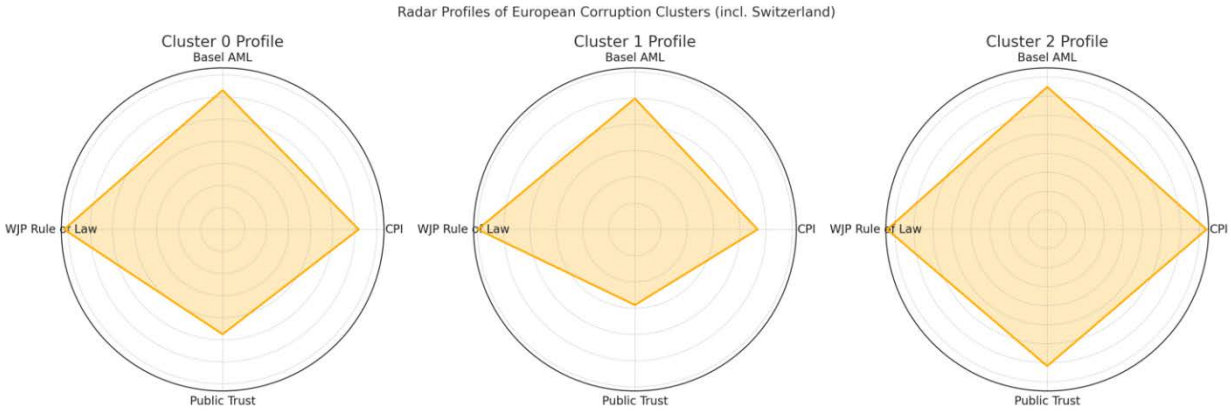
Cluster 1 - Systemic Trust and Governance Challenges

- *Countries: Poland, Hungary, Romania, Bulgaria, Greece*
- *Profile:*
  - *Avg CPI: 46.8 (low)*
  - *Avg Basel AML: 5.01*
  - *Avg Rule of Law: 0.60*
  - *Avg Public Perception of Corruption: 71.2%*

Insight: This cluster shows the lowest integrity scores across all indices and the highest public perception of corruption. Governance is weak, and public distrust is very high. High alignment between expert ratings and citizen

sentiment-though both negative. International marketing strategies here must prioritize compliance, local engagement, and multi-stakeholder partnerships to rebuild trust.

Cluster 2 -



- *High Governance and Institutional Trust*

Countries: Denmark, Finland, Sweden, Netherlands, Germany, France, Switzerland

- *Profile:*
- *Avg CPI: 83.7 (high)*
- *Avg Basel AML: 2.54*
- *Avg Rule of Law: 0.84*
- *Avg Public Perception of Corruption: 28.7%*

Insight: These countries demonstrate high institutional quality and relatively low public concern about corruption. Marketing in these regions can leverage strong national reputations and focus on ethical branding and leadership in sustainability practices. Strong institutions and public trust. France slightly drags perception but still belongs to the high-integrity cluster.

Here are the radar charts showing the average governance and perception profiles for each cluster,

CLUSTER ANALYSIS

The cluster analysis suggests that a one-size-fits-all approach to anti-corruption marketing is ineffective. Instead, firms should align their strategies with local perceptions and governance realities. Countries with a high discrepancy index require greater transparency and demonstrable impact to restore trust. Meanwhile, high-performing clusters offer models for ethical value-based marketing.

Research limitations. *As the definition of corruption varies across cultures, it would be important top ensure a coherent approach to how corruption is defined. It is also worth noting the 4 different indices analyzed are from uneven sources and in some cases (AMLA Basel, WJP rule of law index) are not directly related to corruption but to the best proxy activity available. Finally, while the CPI and rule of law are related to public corruption, Basel index relates to business corruption and the Eurobarometer survey encompasses both.*

Managerial implications. *Corruption as a marketing tool in international business*

Corruption is defined: "to offer, promise or give any undue pecuniary or other advantage, whether directly or through intermediaries, to a foreign public official, for that official or for a third party, in order that the official act or refrain from acting in relation to the performance of official duties, in order to obtain or retain business or other improper advantage in the conduct of international business. The definition, contained in the OECD's "Convention on Combating Bribery of Foreign Public Officials in International Business Transactions" focuses almost exclusively on corruption in the public sector, considering private corruption only a residual activity, mainly encouraged by corrupt public officers. Therefore corruption, particularly in international marketing, has traditionally been treated as an external threat-a political or legal hazard to be managed by compliance departments of companies that would like to compete fairly but must unwillingly face the harsh realities of corrupt countries and cultures, a price to pay often to operate in under-developed on developing countries. With this approach, bribes are a cost to the company that reduces their margins and impossible to avoid without exiting from important or lucrative markets if competitors without scruples are left alone to deal with them.

A more critical and less sanitized lens reveals a different reality: corruption often functions as a deliberate strategic tool, embedded within the marketing apparatus itself. We propose to reframe corruption not as peripheral but as a "Shadow 4P marketing mix" that distorts the classic 4Ps model (Product, Price, Place, Promotion), adding an unofficial "fifth P": Payoff. Far from being random or incidental, corporate corruption is often deliberate, financed, and organizationally embedded, supported by an unethical culture of performance-maximization at all costs and requires reconsidering Porter's Framework and adding - wherever applicable - illegal activities.

The classic 4Ps framework-Product, Price, Place, Promotion-also offers a helpful lens for analyzing how corruption becomes embedded in marketing practice. In markets where bribery is normalized, each of the 4Ps is actively distorted:

- *Product: Specifications may be written to favour a particular supplier, especially in public procurement. Companies have both been implicated in manipulating product designs to lock competitors out of contracts.*
- *Price: Bribery becomes a hidden component of pricing strategies. Prices are inflated to include unofficial payments, rendering bribery "cost-free" for the corruptor-although not risk-free.*
- *Place (Distribution): Corrupted intermediaries control supply chains, securing exclusive shelf access or distribution rights.*
- *Promotion: Instead of promoting to end users, corrupt firms target purchasing managers and public officials with illicit incentives, bypassing traditional consumer persuasion entirely.*

This model transforms the marketing mix into a "shadow mix": one that drives competitive advantage through unethical influence rather than market value. Private companies and state-owned enterprises have allegedly engaged in these practices, not only in emerging markets where enforcement is weak, but also in developed countries in a collusive relationship with political decision makers.

Unlike traditional marketing tools, corruption circumvents rational consumer choice and institutional rules, relying on covert, often institutionalized influence. This strategy becomes especially dangerous in public procurement-heavy sectors-such as infrastructure, ICT, defence, and healthcare-where opacity, scale, and complexity make oversight difficult. This "Payoff Marketing" can be unknown to some competing companies, as by definition corruption behaviours are collusive in nature and kept as hidden as possible by those engaging in it.

Corruption also reshapes buyer-seller relationships. Instead of building customer loyalty through branding, firms bind purchasing managers through bribes. These managers become the most "loyal" clients-not because of brand strength, but because they are locked into exclusive, unethical transactions. This creates an illusion of legitimacy, particularly prevalent in sectors where entry timing is critical: early access, guaranteed by corrupt deals, eliminates competition before markets even open. A corruptive behaviour need not be prevalent: firms may blend corrupt strategy within normal operations, and behave asymmetrically across countries, distribution channels and even products. Corporate structures and marketing campaigns continue to operate as if business were being conducted ethically, masking deep structural flaws.

Corruption in international marketing is not a fringe issue. It is strategic, internalized, and outcome-defining, particularly in high-stakes sectors and poorly regulated markets. By reframing corruption as a "shadow marketing mix," we reveal its operational mechanics and ethical implications. Policymakers, marketers, and scholars must look beyond compliance rhetoric and tackle the structural incentives that normalize corruption. Without this shift, marketing will remain complicit in a cycle that trades short-term gains for long-term legitimacy and sustainability.

Unlike other marketing tools, however, it bypasses every rational purchasing decision, short-circuiting procurement processes with illicit influence. No executive would openly admit to it, and no textbook teaches it. Yet it is precisely because it is hidden, strategic, and outcome-defining that it demands our attention. If we analyze corruption using Porter's classic marketing mix-the 4Ps-we find it touches product (design specs rigged to favour one supplier), price (inflated to include bribes), place (distribution controlled by corrupted intermediaries), and promotion (incentives paid to decision-makers, not consumers).

In the realm of international marketing, corruption functions as a powerful-albeit unethical-application. It has been utilized by some of the world's largest multinational enterprises (MNEs) to secure contracts, dominate markets, and outmanoeuvre competitors. In these cases, price ceases to be a barrier; in fact, it often includes the cost of bribes, rendering the corruptive behaviours "cost-free" to the corruptors (albeit not risk free).

At the point of sale, corruption is often a facilitator. Corrupt category managers may deliberately withhold competitors' products from shelves or skew restocking practices to favour bribing suppliers. In terms of positioning, corruption ensures early market access and dominance, effectively eliminating competition before the market even opens.

Moreover, purchasing managers become the most "loyal" clients-not because of brand affinity, but because corruption locks them into exclusive, unethical relationships.

This paper explores how corruption has evolved into a covert yet integral part of global marketing strategy, challenging the ethical foundations of international business and calling for renewed attention from policymakers, marketers, and scholars alike.

Corruption is not an accidental activity. People in companies seldom if ever corrupt using their own personal resources, Therefore, corruption with company money is at best undetected, more frequently supported and approved internally, fined to do so, for the company to cut corners and obtain undue and unfair advantages over competitors. Management - far from being morally neutral - is complicit in these activities with an unethical culture of performance at all costs.

Originality of the paper. *We propose to include illegal marketing represented by corruption activities as a 5th P of the marketing mix, the illegal Payoff aspect, always denied but widespread in practice. The future of international marketing lies not just in communicating value, but in actively creating ethical value. To do so, marketing must move beyond compliance rhetoric and adopt a transformative function within the organization. Anti-corruption literacy in business education and marketing training is underemphasized, in stark contrast with the relevant corruption scandals that abound. More attention to corruption dynamics in marketing by academia and practitioners could really have a*

transformational effect on marketing, reframing international marketing activities from potentially law infringing behaviours to a truly sustainable ethical driver .

This paper has highlighted the often-ignored role of corruption as both a barrier and a tool in international marketing. By examining the systemic, involvement of marketing in private and public sector corruption, it becomes clear that international marketing does not operate in a vacuum-it is both a mirror and a mold of institutional integrity.

This is the first comparative analysis of four different corruption measurement indices, to assess the consistency of perceptions and actual occurrence of corruption incidents in public and private activities. It shows relevant asymmetries between countries, confirming that bribe payers are not sufficiently exposed in comparison with the negative impact they have on market transparency and fair trade, effectively distorting - or attempting to influence - their commercial results in third countries in their favour.

Cluster analysis carried out to group European countries in different groupings linked to their positioning in the four indices chosen and the relative discrepancies between them shows that countries with a high discrepancy index require greater transparency and demonstrable impact to restore trust. Meanwhile, high-performing clusters offer models for ethical value-based marketing.

This study provides empirical grounding for to shift focus away from oversimplified, country-level indices and toward sector-specific, firm-level, and organizational analysis. Only then can we begin to understand and confront the structural role of corruption in international marketing practice and more broadly in business.

Key words: *Corruption, Competitiveness, International Marketing, Compliance, Sustainability,*
